The early stages in the manufacture and use of nets are difficult to trace because materials were perishable and tools simple, but there is strong evidence that nets were employed by the hunter-gatherers of southern Europe from Upper Paleolithic times. Primitive netting was fabricated with thread or cord made from a wide range of vegetable fibres (bark, bast, leaves, roots, and stems) and animal tissues (hide, sinew, hair, intestine, and baleen).

Modern nets, generally machine-made, are composed either of vegetable fibres (such as cotton, hemp, flax, manila, and sisal) or of man-made fibres (such as nylon, polyester, polypropylene, and polyethylene). The man-made fibres are inherently rotproof, whereas vegetable fibres must be treated against rot with substances such as tar.

The primary types of net used for fishing are drift nets, surrounding (encircling, or encompassing) nets, and trap nets. Drift nets—which include gill and trammel nets used at the surface and bottom-set nets used on the seabed—capture fish by entangling them. Gill and trammel nets are used principally to catch herring and salmon and are the most common drift nets. In commercial fishing, a long fleet of drift nets, often several miles in length, is suspended vertically with a line of corks or other floats at the top and a line of lead weights at the bottom. Adjustable floats maintain the net at the desired depth, and lighted marker buoys are placed at intervals. These nets are dropped from a ship at sunset because they can be seen by the fish if dropped during daylight. After the boat anchors, the net drifts all night. As a fish attempts to swim through a gill net, its head penetrates the mesh, and a section of twine slips under its gill cover, entangling it. The trammel net, on the other hand, is composed of two outer panels of large-mesh netting enclosing an inner panel of finer netting. It entangles the fish in pockets formed by the passing of the inner net through the mesh of the outer net.

Surrounding nets are fine, heavy nets that capture fish by encircling them. Seine nets, trawls, dredges, and long lines are all varieties of surrounding nets. Of these, the most widely used are the seine and the trawl. Beach, or drag, seines can be hauled onto a beach with their contents; others, called purse seines, are operated from boats in deep water far from the shore. A steel cable that runs through rings at the bottom of the purse seine is pulled up to close the net. Seine nets (also known as ring, or round, nets) are used to catch sardines, herring, pilchards, salmon, and tuna. The other principal form of surrounding net is the trawl, a bag-shaped net that is dragged by a specialized vessel (trawler) along the bottom of the sea or in midwater. Trawls are used to catch cod, haddock, plaice, and sole, which are trapped in the net when it is pulled to the surface.

Trap nets are stationary nets that are staked to the shore or in estuaries. They form a labyrinth-like chamber into which fish can easily enter, and from which they cannot easily escape. Salmon, trout, and eels are the principal catch.

Although nets are primarily used in commercial fishing, they also are used in land capture of animals (birds, butterflies, and much larger animals), and they have many uses in industry, sports, and horticulture.

Netaji (Indian revolutionary): *see* Bose, Subhas Chandra.

Netanya, also spelled NATANYA, city, west-central Israel. It lies on the Mediterranean coast, 19 miles (30 km) north of Tel Aviv–Yafo. Because of its proximity to the West Bank, the city was a frequent target of bombings by Palestinian terrorists at the beginning of the 21st century.

Netanya was founded in 1928 and named for the American-Jewish merchant and philanthropist Nathan Straus (1848–1931). The site was originally established as a noncollective agricultural settlement (moshav) devoted to citrus cultivation. Jewish immigration from Nazi-held European countries after 1933, and further immigration after World War II, gave it an increasingly urban character, and Netanya is now the focus of a large urban agglomeration.

Diamond cutting and polishing, which constitutes one of Israel's most important industries, is centred there. Although diamond trading is principally conducted on the Diamond Exchange at Ramat Gan, most of the actual workshops are at Netanya. A new industrial area developed in Netanya since 1950–52 includes textile mills and factories producing rubber and plastic articles, complex machinery, and raw materials for the pharmaceutical industries. Just south of the city is one of Israel's largest breweries. Netanya has also developed as a resort centre. Inc. 1948. Pop. (1999 est.) 154,900.

Netanyahu, Benjamin, byname BIBI (b. Oct. 21, 1949, Tel Aviv, Israel), Israeli politician and diplomat who was his country's prime minister from 1996 to 1999.

Netanyahu's father was the historian Benzion Netanyahu. In 1963 the family moved to Philadelphia, where Netanyahu attended high school. He enlisted in the Israeli military in 1967 and later joined the elite special operations unit Sayeret Matcal. In 1972 he participated in the rescue of a hijacked airliner at Ben-Gurion Airport near Tel Aviv. He attended the Massachusetts Institute of Technology in 1972–75 (M.B.A. 1976), interrupting his studies in 1973 to serve in the Yom Kippur War.

In the 1980s Netanyahu served his country as a deputy to the Israeli ambassador to the United States (1982–84) and as Israel's ambassador to the United Nations (1984–88). Elected to the Knesset (Israeli parliament) as a member of the Likud party in 1988, he became deputy minister of foreign affairs (1988–91) and a deputy minister in the coalition cabinet of Labour Prime Minister Yitzhak Rabin (1991–92). He was elected leader of the Likud in 1993.

Netanyahu was noted for his opposition to the Israel-PLO peace accords signed in Oslo in 1993 and the resulting Israeli withdrawals from the West Bank and Gaza Strip. By early 1995 the governing Labour Party was favoured to win elections scheduled for the following year, but Rabin's assassination weakened Labour's appeal, and a series of suicide bombings in Israel by Muslim militants early in 1996 was instrumental in turning public opinion in Likud's favour. Netanyahu narrowly defeated Prime Minister Shimon Peres in the May 29, 1996, election, the first in which the prime minister was directly elected. At 46, he became the youngest person ever to serve as Israel's prime minister.

Netanyahu's tenure was marked by deteriorating relations with Syria and the Palestinians. His decision in September 1996 to open an ancient tunnel near Al-Aqsa Mosque angered Palestinians and sparked intense fighting. With tensions still high, Netanyahu reversed his earlier opposition to the Oslo accords and agreed to withdraw Israeli troops from most of the West Bank town of Hebron, though pressure from his government's right wing led him to reduce the amount of land to be transferred to Palestinian control during the next phase of Israel's scheduled withdrawal from the West Bank. In 1998 Netanyahu and Palestinian leader Yāsir ʿArafāt participated in talks that led to the Wye Memorandum, the terms of which included placing as much as 40 percent of the West Bank under Palestinian control. In response, several right-wing factions resigned from Netanyahu's governing coalition.

In 1998 the Knesset dissolved the government, and new elections were called for May 1999. Hindered by a fragmented right and by voters' dislike of his inconsistent peace policies and his often abrasive style, Netanyahu was defeated by the Labour candidate Ehud Barak.

netball, popular game in girls' schools in England and several other Commonwealth countries, similar to six-player girls' basketball in the United States. It is played on a hard-surfaced rectangular court 100 feet long and 50 feet wide (30 by 15 m), clearly marked into three zones with half circles 16 feet in radius at either end for shooting. The goalposts stand 10 feet high with ringed nets at the top through which the ball must pass from above to score a point. The rings are 15 inches (38 cm) in diameter, and the ball is of leather or rubber, about 8.5 inches in diameter and 14–16 ounces (400–450 g) in weight.

The game is played between two teams, each consisting of seven players—three centre players, two attackers, and two defenders, with each player restricted in movement to certain areas of the court. The ball must be passed from hand to hand from player to player, and no one may run with it. The centre players try to pass the ball up the court into the circle for the attackers to shoot (only the two attackers may shoot). The defenders, by guarding their opponents and by intercepting passes, try to prevent goals from being scored. A game consists of four 15-minute periods or two 20-minute halves.

At the beginning of the 21st century, there were more than two million netball players worldwide. In 1998 netball became a medal sport at the Commonwealth Games.

Netherlandic language, English DUTCH, or FLEMISH, Netherlandic NEDERLANDS, Flemish VLAAMS, a West Germanic language that is the national language of The Netherlands and, with French, one of the two official languages of Belgium. Although speakers of English usually call the Netherlandic of The Netherlands "Dutch" and the Netherlandic of Belgium "Flemish," they are the same language.

Netherlandic, which occurs in both standard and dialectal forms, is the language of most of The Netherlands, of northern Belgium, and of a relatively small part of France along the North Sea, immediately to the west of Belgium. Netherlandic is also used as the language of administration in Suriname and the Netherlands Antilles. Afrikaans, which is a derivative of Netherlandic, is one of the official languages of South Africa.

The spoken language exists in a great many varieties ranging from Standard Netherlandic (Algemeen Beschaafd Nederlands, or "General Cultured Netherlandic")—the language used for public and official purposes, including instruction in schools and universities—to the local dialects that are used among family, friends, and others from the same village (these exist in far more variety than does the English of North America). Standard Netherlandic is characterized grammatically by the loss of case endings in the noun.

In Belgium efforts were made to give Netherlandic equal status with French, which had assumed cultural predominance during the period of French rule (1795–1814). In 1938 Netherlandic was made the only official language of the northern part of Belgium.

The use of Standard Netherlandic together with the local dialect is much more widespread among the people of The Netherlands than it is in Belgium. The dialects of the area bounded roughly by Amsterdam, The Hague, and Rotterdam are closer to Standard Netherlandic than are those of the other dialect areas.

Together with English, Frisian, and German, Netherlandic is a West Germanic language. It derives from Low Franconian, the speech of the Western Franks, which was restructured through contact with speakers of North Sea Germanic along the coast (Flanders, Holland) in the period around AD 700. The earliest documents in the Netherlandic language date from approximately the end of the 12th century, although a few glosses, names, and occasional words appeared somewhat earlier.

Netherlands, Reformed Churches in The: *see* Reformed Churches in The Netherlands.

Netherlands, The, officially KINGDOM OF THE NETHERLANDS, Dutch NEDERLAND, or KONINKRIJK DER NEDERLANDEN, byname HOLLAND, country located in northwestern Europe. Extending 175 miles (282 km) from north to south and 110 miles (177 km) from east to west, the country is bounded on the north and west by the North Sea, on the east by Germany, and on the south by Belgium. The national capital is Amsterdam and the seat of government is The Hague. Area 16,163 square miles (41,863 square km), of which almost 20 percent is inland water. Pop. (1992 est.) 15,163,000.

The Netherlands

A brief treatment of The Netherlands follows. For full treatment, *see* MACROPAEDIA: Netherlands, The.

For current history and for statistics on society and economy, *see* BRITANNICA BOOK OF THE YEAR.

The land. The Netherlands is divided into two distinct regions. The higher one, in the south and east, consists mostly of undulating plains and a few high ridges rarely exceeding 350 feet (107 m) above sea level. Vaalser Hill (1,053 feet [321 m]), in the extreme southeast, is the highest point in the country. The low region, in the southwest, west, northwest, and north, constitutes most of the country and consists of the common delta of the Rhine, Meuse (Dutch and Flemish: Maas), and Schelde (French: Escaut) rivers. The coastal areas of The Netherlands are almost completely below sea level. Much of this part of the country has been wrested from the sea by a process of careful water management, drainage, and reclamation that dates back to the 12th century, though the really large projects were carried out in the 20th century. Since the 12th century some one-fifth of The Netherlands' land area has been reclaimed from the sea. Steam, diesel, and electric pumps have replaced windmills in keeping the polders (flat land diked against the sea) drained.

A long range of coastal sand dunes, reinforced by high man-made dikes, encloses the polders and protects a great part of the low region from encroaching tides, enabling the reclaimed lands to be used for agriculture and settlement. The largest reclaimed areas in the north are in the IJsselmeer (Lake IJssel [formerly part of the Zuiderzee]), which was created by a barrier dam in the 1930s; and those lands in the south (involving the estuaries of the Rhine, Meuse, and Schelde rivers) reclaimed by the dams of the Delta Project, which in the 1980s and '90s closed the sea inlets of the southwestern province of Zeeland. The Rhine, Meuse, and Schelde are the country's largest rivers.

The climate of The Netherlands is temperate and largely influenced by the North Sea and the Gulf Stream. The average temperature is about 49° F (9° C), ranging from 35° F (2° C) in January to 63° F (17° C) in July. The country's average annual rainfall is 31 inches (790 mm), with rainfall being highest in summer (August). A long growing season and excellent grazing lands on the polders have greatly helped the nation's dairy industry. The Netherlands ranks among the top exporters of cheese, butter, and eggs in the world. Almost three-fifths of the land is used for agriculture, about one-third of it in pasture and more than one-fourth in farms and market gardens. Export-oriented cultivation of ornamental plants, flowers, and bulbs, especially the tulip—the country's national symbol—has become a major industry. Hothouse cultivation produces cucumbers, tomatoes, lettuce, and flowers—all chiefly for export.

The Netherlands' reserves of natural gas are one of the largest in western Europe and provide about one-half of domestic energy requirements. Other mineral resources include petroleum, salt, and coal.

The people. The ethnic composition is predominantly Dutch with some Turks, Moroccans, and Germans. The modern Dutch are believed to be descended from a mixture of pre-Germanic and Germanic groups that later came to be identified as Frisians, Saxons, and Franks. Immigrants to The Netherlands have historically included French Huguenots, Salzburgers, Swiss, Spanish and Portuguese Jews, Indonesians, and Surinamese. The nation is about equally divided between Roman Catholics and Protestants, although as much as one-third of the population profess no religious affiliation.

The annual rate of population growth of The Netherlands continued to decline in the late 20th century. The birth rate, which is less than half that of the period of 1945–54, is relatively low; the low death rate is relatively unchanged. Life expectancy is high: 74 years for males and 80 for females. Those under 15 years of age constitute a relatively low 18 percent of the population and those over 60 a substantial 17 percent.

Immigration, which exceeds emigration, is mostly from Turkey, Morocco, the United Kingdom, and the former Dutch colony of Suriname. Emigration has declined since 1975. The major destinations of emigrants are Turkey, the United Kingdom, and Germany.

Although the country's overall population density is high, two-fifths of the population lives in the three west-central provinces of Zuid-Holland, Noord-Holland, and Utrecht, in which are located the cities of Amsterdam, Rotterdam, The Hague, and Utrecht. In the northeastern provinces the population density is markedly lower. There is an internal movement of population from the western to the eastern provinces. Urban areas account for more than 88 percent of The Netherlands' population.

The economy. The Netherlands has a developed market economy based largely on financial services, light and heavy industries, and trade. Industries are heavily concentrated in the provinces of Noord-Holland, Zuid-Holland, and Utrecht. The gross national product (GNP) is growing more rapidly than the population; the GNP per capita is similar to those of other developed western European countries.

The agricultural sector accounts for less than 5 percent of the gross domestic product (GDP) and employs a similar percent of the work force. Agriculture is highly mechanized and dominated by truck farming. Although wheat and certain other staples must be imported, the country is one of Europe's largest exporters of farm produce. Chief crops include sugar beets, potatoes, vegetables and melons, and wheat. Dairy cattle are raised principally in Friesland and Noord-Holland; large numbers of pigs are also raised.

Because of The Netherlands' scarcity of mineral resources, it is dependent on large imports of metallic ores, fuels, and other raw materials. The one exception to this is the natural gas found in Groningen province and the North Sea. Much of western Europe's petroleum is imported through the port city of Rotterdam, which has a complex of storage facilities, oil refineries, and petrochemical works. Electricity is generated mainly by domestic and imported fuels.

The country's manufacturing industries account for approximately one-fifth of the GDP and employ one-sixth of the work force. Industries are concentrated in the urban agglomerations of Amsterdam, Utrecht, Haarlem, Rotterdam, and The Hague. Chief manufactures include foodstuffs, synthetic fibres, petroleum products, and electrical machinery.

The Netherlands Trade Union Confederation, formed in 1975 by the federation of two large trade unions, represents approximately 1,000,000 workers; separate unions represent Roman Catholics and Protestants. The Foundation of Labour was established in 1945 and mediates between employers and employees.

Exports from The Netherlands equal about one-half of its GNP. Rotterdam is Europe's leading port and is linked by an extensive network of inland waterways to the western European hinterland. The Netherlands belongs to the Benelux Economic Union; most of the country's external trade is with other members of the European Economic Community. Principal trading partners include Germany, Belgium and Luxembourg, the United Kingdom, and France.

Government and social conditions. The Kingdom of The Netherlands, which includes the self-governing island of Aruba and the former colony of the Netherlands Antilles, is a constitutional monarchy with a parliamentary form of government. As head of state the hereditary monarch has mainly formal prerogatives. The country's 1814–15 Constitution, which was subsequently revised and amended, vests legislative power in a bicameral parliament, the Staten-Generaal (States General), composed of a 75-member First Chamber and a 150-member Second Chamber. The members of the First Chamber are elected to six-year terms by members of provincial councils; members of the Second, which has greater authority, are directly elected to four-year terms. Executive power is exercised by an appointed Cabinet under the leadership of the prime minister. The judiciary is headed by the Supreme Court.

Social welfare programs receive a major share of budget expenditures (about one-fifth of the total). Programs include old-age, disability, and survivors pensions, children's allowances, and reimbursement of exceptional medical expenditures for all residents. Employees receive health benefits and services, compensation for work injury, and unemployment relief. Health conditions are comparable to those of other developed countries. A chronic housing shortage led to controversial government programs, including subsidization of both public and private construction, and rent control in urban areas.

The Dutch population is almost entirely literate. Education is compulsory between the ages of 5 and 16. The educational system consists of both public and state-subsidized private schools. The majority of children attend private, usually denominational schools. Higher education is provided through colleges, universities, and technical institutes.

The press is vigorous in terms of both diversity and editorial quality. The Dutch broadcasting system is operated by the Netherlands Broadcasting Corporation, encompassing several private organizations of religious, political, and independent orientations that provide the majority of programming.

Cultural life. The predominant art form in The Netherlands has been painting. Not surprisingly, the country contains several notable art museums. Located in Amsterdam are the Rijksmuseum, particularly noted for its collection of 17th-century Dutch paintings; the Rijksmuseum Vincent van Gogh, housing hundreds of paintings and drawings by van Gogh; and the Stedelijk Museum, which contains a large collection of contemporary art. The Rijksmuseum Kröller-Müller in Otterlo also contains a world-renowned collection of paintings by van Gogh. Mauritshuis in The Hague has a large collection of 17th-century paintings, and the Boymans–van Beuningen Museum in Rotterdam is also notable.

The 20th-century movement known as De Stijl widely influenced Western art and architecture. Prominent in the movement were Piet Mondrian and Theo van Doesburg.

Dutch theatre and literature are little known internationally. Musical life, however, is intense, and the Amsterdam Concertgebouw Orchestra is world famous.

History. Celtic and Germanic tribes inhabited the Netherlands at the time of the Roman conquest (1st century BC). In the early 5th century AD, an invasion of Germanic tribes ended Roman rule. The Frankish Merovingian dynasty followed the Romans but was supplanted in the late 7th century by Pepin II and his successors, the most famous of whom was Charlemagne.

From the early 10th to the mid-14th century, secular and ecclesiastical principalities emerged and struggled for dominance. In the early 16th century the Netherlands became a province of the Spanish Habsburgs. During the Reformation the northern provinces were converted to Calvinism, and Prince William of Orange (1533–84) led a Calvinist-inspired revolt against Spain. In 1579 the northern provinces broke away from Spain and established the United Provinces of the Netherlands.

War between the United Provinces and Spain continued into the 17th century, but in 1648 Spain finally recognized Dutch independence. During the 17th century the Netherlands, with extensive colonial holdings, became the leading commercial nation in Europe. Following English efforts to curtail Dutch maritime power, the Netherlands went to war with England in 1652–54. In 1688 the English Parliament invited William of Orange, stadtholder, and his wife, Mary Stuart, to rule England as William III and Mary II. William then used the combined resources of England and the Netherlands to wage war on Louis XIV's France. During the 18th century, Dutch maritime power declined, and commerce became more dependent on the English.

Following the French Revolution, the Netherlands became the Batavian Republic (1795–1806), a French protectorate. After 1814 the new Kingdom of The Netherlands included Belgium and Luxembourg until the Belgians gained independence in the revolt of 1830. A new constitution (1848) was modeled after the British system, giving the States General (the parliament) supreme power. In the late 19th century, The Netherlands underwent industrial expansion and began to regain the prosperity that it had lost during the previous century.

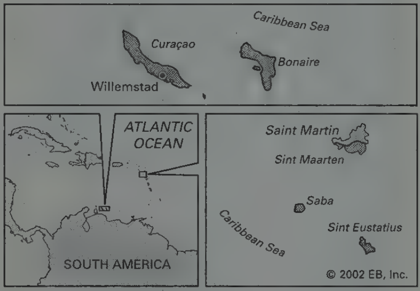
The Netherlands remained neutral during World War I but was occupied by Germany during World War II. During the occupation many hostages were taken and many Jews were deported to concentration camps.

After the war The Netherlands abandoned its neutral status and joined the North Atlantic Treaty Organization (1949) and the European Economic Community (1958; now part of the European Union). Postwar governments were composed of Catholic People's and Labour party coalitions. From the late 1950s until the early '70s the reorganized Catholic People's Party, which included Protestants, controlled the government. Since the 1970s, governing coalitions have included at least two of the three main parties (Christian Democrats, Liberals, and Labour) in various combinations.

From the 1950s until the '70s, The Netherlands enjoyed an economic boom, and its political parties united in support of generous social welfare benefits. By the end of the 20th century, The Netherlands had acquired an international reputation for liberal social policies, including lenient drug laws, legal recognition of same-sex partnerships, tolerance for minorities, and environmental protections.

Netherlands, United Provinces of the: *see* Dutch Republic.

Netherlands Antilles, Dutch NEDERLANDSE ANTILLEN, five islands in the Caribbean Sea, an autonomous part of The Netherlands since 1954. The islands are in two widely separated groups: the northern group lies at the northern end of the Lesser Antilles and consists of Sint Eustatius, the southern part of Saint Martin (Dutch: Sint Maarten), and Saba; the southern islands lie about 500 miles (800 km) to the southwest, off the coast of Venezuela, and consist of Bonaire and Curaçao (until 1986 the island of Aruba was also included). The capital, on Curaçao, is Willemstad. Area 309 square miles (800 square km). Pop. (1994 est.) 197,069.



Netherlands Antilles

A brief treatment of the Netherlands Antilles follows. For full treatment, *see* MACROPAEDIA: West Indies.

For current history and for statistics on society and economy, *see* BRITANNICA BOOK OF THE YEAR.

The land. The southern islands, less than 50 miles (80 km) off the Venezuelan coast, are rather low-lying, rocky, and dry. The larger of the islands is Curaçao (171 square miles [444 square km]), with the highest elevations, rising to 1,230 feet (375 m). Bonaire, the smaller island (111 square miles [288 square km]), about 20 miles (32 km) east of Curaçao, has elevations of up to 787 feet (240 m). The southern islands have a dry tropical climate, annual rainfall often falling below 22 inches (550 mm) per year. The average temperature of 81° F (27° C) varies little year-round, and the easterly trade winds offer moderating breezes. The sparse vegetation includes a variety of cacti and other drought-resistant plants. The islands are out of the general path of Caribbean hurricanes.

The northern islands consist of volcanic rock, and elevations are higher than in the southern group, reaching 2,910 feet (887 m) on Saba. The northern islands are also smaller, the largest being Saint Martin (33 square miles [85 square km]), only the southern portion (13 square miles [34 square km]) of which is part of the Netherlands Antilles. The rainfall and vegetation are heavier in the northern islands than in the southern.

The people. The racially mixed population of the Netherlands Antilles includes strains of European, African, and American Indian stock. The predominantly black northern group reflects the cultural influence of its British-related neighbours, while the southern islands, with stronger ties to Venezuela and Colombia, show a more marked Latin influence. Whites form small minorities on all of the islands except Saba, where there is about an even division between black and white. Curaçao has about three-fourths of the total population, most of whom live in Willemstad, the Netherlands Antilles' largest city. The next most populous island is the Dutch part of Saint Martin.

Papiamento, a mixture of Spanish, Portuguese, and Dutch, is common in the south, as is Spanish; English is also spoken, especially in the northern group. Dutch is the official language, though it is not widely spoken. About three-fourths of the population is Roman Catholic, and one-tenth of the people are members of various Protestant denominations. There are also several small Jewish communities, said to be the oldest continuous Jewish communities in the Americas.

The economy. The southern islands' proximity to the Venezuelan oil fields, their location on well-established shipping routes, and their deep natural harbours have made the refining, storage, and transshipment of oil the mainstay of the economy, particularly on Curaçao. The government offers many important fiscal and tax incentives to encourage the development of new industry, especially tourism, which has become a major business on all five islands and has lessened the islands' dependence on petroleum refining. The islands' relative political stability has made the territory attractive to foreign investment, and Willemstad has become a Caribbean centre for banking and other financial services. Agriculture, especially in the southern islands, is limited by insufficient rainfall and thin topsoil. Aloes for pharmaceutical products and oranges for Curaçao liqueur are grown on Curaçao. Most food must be imported. The only natural resources on the islands are phosphates and salt, and, with the exception of oil refining on Curaçao, there are only a few light industries. Almost all manufactured goods must be imported. Saint Martin has developed a fishing industry, and there is some livestock raising. Most of the islands' drinking water is obtained through distillation. The gross national product (GNP) declined during the 1980s because of the downturn in world demand for petroleum, Aruba's separation from the Netherlands Antilles, and a static tourist industry on the islands, but the petroleum and tourist trades improved somewhat by the mid-1990s. Venezuela, the United States, and The Netherlands are among the islands' main trading partners.

Transportation is considerably more developed in the economically more important southern islands. Most of the islands' roads are on Curaçao. All of the islands have airfields, those on Curaçao, Bonaire, and Saint Martin being of international class. Interisland air service is also provided. The main port is Willemstad.

Government and social conditions. Executive authority is vested in the sovereign of The Netherlands and is exercised by a governor nominated by the local government and appointed by the crown. A Council of Ministers responsible to the Legislative Assembly is appointed by the governor for his assistance. The Assembly, called the Staten, has 22 members elected to four-year terms by popular vote. The islands are allotted members proportionally, with Curaçao having the largest number. The central government is fully autonomous in internal affairs, and there are local governments for Curaçao, Bonaire, and the northern group of islands.

The Netherlands Antilles has a relatively high standard of living by comparison with other Caribbean islands. The state's generally strong economy and a stable government have brought improved conditions in housing and social welfare. Health is enhanced by a dry tropical climate, and high health standards are maintained on the islands, all of which have hospital facilities. Birth and death rates are low compared to other developing nations. School attendance is fairly high, although it is not compulsory, and illiteracy is rare. Higher education is available at the University of the Netherlands Antilles (founded in 1970) in Willemstad. The islands have both radio and television broadcast facilities. Daily papers and a number of weekly and monthly periodicals are printed in Papiamento, Dutch, or English.

History. In 1499 Alonzo de Ojeda, a Spanish navigator, landed on Curaçao, and in 1527 the Spanish took possession of that island as well as Bonaire and Aruba. Peaceful Arawak Indians inhabited the islands at the time of the Europeans' arrival. The Dutch Windward Islands to the north were occupied by warlike Carib Indians when the islands were sighted by Christopher Columbus in 1493. The Dutch came to Curaçao in 1643, wishing to establish an entrepôt for the flourishing trade of the region. Bonaire and Aruba were occupied about the same time, and the Dutch remained in control of the three islands thereafter, except for brief periods of British rule during the Napoleonic Wars. The Dutch Windward Islands changed hands numerous times but remained in Dutch hands from the beginning of the 19th century. In 1845 the six islands (then including Aruba) were officially formed into the Netherlands Antilles. The emancipation of slaves in 1863 was a blow to the economy of Curaçao, which was the Caribbean centre of the slave trade. The territory did not fully recover until the early 1900s, with the discovery of the Venezuelan oil fields and the subsequent development of oil refineries in the southern islands. In 1954 the islands became an integral part of The Netherlands, with full autonomy in domestic affairs. A movement toward full independence made progress during the 1970s and early '80s. In 1986 Aruba seceded from its federation with the Netherlands Antilles, although, like the remaining five islands, it remained linked to The Netherlands in matters of defense and foreign affairs. In 1994 the remaining constituent members of the Netherlands Antilles voted to preserve their federation.

Netherlands East Indies (Indonesia): *see* Dutch East Indies.

Netherlands Reformed Church, The, Dutch NEDERLANDSE HERVORMDE KERK, largest Protestant church in The Netherlands, the successor of the established Dutch Reformed Church that developed during the Protestant Reformation in the 16th century. Reforming interest emerged in the Netherlands early in the Reformation. The emperor Charles V instituted the Inquisition against the Reformation in the Netherlands as early as 1522. The struggle for freedom from Spain was begun by the Netherlands as a protest in demand for greater liberties, including religious, within Charles's empire. Eventually, the Netherlands became free, and the Reformed Church was established. The first general synod of the Dutch Reformed Church took place in 1571, and, subsequently, other synods were held. The presbyterian form of church government was adopted, and the Belgic Confession (1561) and the Heidelberg Catechism (1562) were accepted as the doctrinal standards.

In the 17th century a theological controversy arose over the doctrine of predestination—*i.e.,* that God elects or chooses those who will be saved. The followers of Jacobus Arminius, a Dutch professor and theologian, rejected the strict Calvinist doctrine of predestination, while the followers of Franciscus Gomarus, a Dutch theologian, upheld a strict interpretation of predestination. To settle the controversy, the Synod of Dort (1618–19) was convened. It produced the canons of Dort, which condemned the theology of the Arminians (also called Remonstrants) and set forth a strict interpretation of predestination. These canons, along with the Belgic Confession and the Heidelberg Catechism, came to constitute the theological basis of the Dutch Reformed Church.

In 1798 the Dutch Reformed Church was disestablished, but it remained partly under government control. In 1816 King William I reorganized the church and renamed it The Netherlands Reformed Church. Theological disputes in the 19th century resulted in separations from the church, but it nevertheless remained the dominant Protestant church in The Netherlands.

In the 20th century the church grew stronger, and in 1951 it adopted a new constitution. Many private Protestant schools were established after public schools stopped teaching religion.

Neto, Agostinho, in full ANTÔNIO AGOSTINHO NETO (b. Sept. 17, 1922, Icolo e Bengo, Angola—d. Sept. 10, 1979, Moscow Russia, U.S.S.R.), poet, physician, and first president of the People's Republic of Angola.

Neto first became known in 1948, when he published a volume of poems in Luanda and joined a national cultural movement that was aimed at "rediscovering" indigenous Angolan culture (similar to the Negritude movement of the French-speaking African countries). His first of many arrests for political activities came shortly thereafter in Lisbon, where he had gone to study medicine.

Neto returned home as a doctor in 1959 but was arrested in the presence of his patients in June 1960 because of his militant opposition to the colonial authorities. When his patients protested his arrest, the police opened fire, killing some and injuring 200. Neto spent the next two years in detention in Cape Verde and in Portugal, where he produced a new volume of verse. In 1962 he managed to escape to Morocco, where he joined the Angolan liberation movement in exile. At the end of 1962 he was elected president of the Movimento Popular de Libertação de Angola (MPLA).

When in 1975 Angola became independent, it was divided among its three warring independence movements. The MPLA forces, however, with Cuban help, held the central part of the country, including the capital, and Neto, a Marxist, was proclaimed president.

Neto was widely recognized as a gifted poet. His work was published in a number of Portuguese and Angolan reviews and was included in Mário de Andrade's *Antologia da Poesia Negra de Expressão Portuguesa* (1958).

Netscape Communications Corp., American developer of Internet software, with headquarters in Mountain View, Calif.

The company was founded in 1994 as Mosaic Communications Corp. by James Clark and Marc Andreessen. Clark had previously founded and been chairman of Silicon Graphics, Inc. In 1993, while a student at the University of Illinois, Urbana-Champaign, Andreessen had led the development of the Mosaic Internet browser. With the ability to display colourful graphics and a simple point-and-click interface for finding, viewing, and downloading data, Mosaic made the Internet widely accessible for the first time beyond the scientific branches of academia and the government.

In 1994 the company made available its new browser, Navigator, over the Internet. As part of an out-of-court settlement with the University of Illinois, which had trademarked the Mosaic name, the company soon changed its name to Netscape Communications. Meanwhile, Netscape continued to extend its line of server applications and to roll out Navigator upgrades, adding features such as electronic mail (*q.v.*) and news. By 1996 Netscape claimed that more than 38 million people were using Navigator, making it the most popular personal-computer application ever.

In the fall of 1995, the Microsoft Corporation (*q.v.*) began an urgent campaign to turn toward the Internet by offering its own free browser. As a result, Netscape's market share among browser users, previously estimated at over 80 percent, began to decline. Netscape also placed a greater emphasis on sales of server applications and corporate services, and it released a new product, Communicator, which combined the Navigator browser with workgroup-collaboration features designed to appeal to corporate customers.

In an effort to regain market momentum, Netscape declared Navigator and Communicator free and made the programs' source code available to other developers for customizing and enhancement. Netscape was purchased by America Online, Inc., in November 1998.

netsuke, ornamental togglelike piece, usually of carved ivory, used to attach a medicine box, pipe, or tobacco pouch to the obi (sash) of a Japanese man's traditional dress. During the Tokugawa period (1603–1868), netsukes were an indispensable item of dress as well as being fine works of miniature art.

Netsuke, carved ivory, 19th century; in the Tokyo National Museum

By courtesy of the Tokyo National Museum

Because the members of the newly risen merchant class, ranking below the samurai, were not permitted to wear jewelry, netsukes took the place of other personal adornment. Originally carved from boxwood, netsukes were first made in various kinds of ivory during the first half of the 18th century. In the latter part of the 18th century, netsuke makers devised a method of inlaying, using coral, ivory, pearl shell, horn, and precious metals on lacquer and wood; some of these substances also were used for inlaying ivory. Even very small ivory netsuke carvings were sometimes inlaid in this manner. With the end of the Tokugawa regime, leading to new customs of dress, and the introduction of the cigarette shortly thereafter, netsukes became obsolete, though some were still carved to supply the demand of foreign residents and tourists. *See also* inrō.

Neuber, Caroline, *née* FRIEDERIKE CAROLINE WEISSENBORN (b. March 9, 1697, Reichenbach, Saxony [Germany]—d. Nov. 30, 1760, Laubegast, near Dresden), actress-manager, a major influence on the development of modern German theatre.

Rebelling against her tyrannical father, she ran away with a young clerk, Johann Neuber, at the age of 20 and married him in 1718. They served their theatrical apprenticeship in the traveling companies of Christian Spiegelberg (1717–22) and Karl Caspar Haack (1722–25). In 1727 they formed their own company and were granted a patent by the elector of Saxony, Frederick Augustus I, to perform at the Leipzig Easter Fair. As early as 1725 Caroline Neuber's acting had attracted the attention of Johann Christoph Gottsched, the critic and drama reformer who modeled his work on classical French tragedy and comedy. "Die Neuberin," as he came to call her, substituted in her company a careful learning of parts and rehearsal for the heavily improvised farces and harlequinades that then dominated the German stage. The collaboration of Gottsched and Neuber, which lasted until 1739, is usually regarded as the turning point in the history of German theatre and the start of modern German acting.

Caroline Neuber, lithograph by C. Lödel after E.G. Hausmann

Deutsche Fotothek Dresden

Returning to Leipzig in 1737 after three years of engagements in other German cities, the Neuber company found that their patent, after the death of Augustus in 1733, had gone to the company of Johann Ferdinand Müller, a proponent of the old improvisations and harlequinades. Caroline Neuber reacted with a bravura gesture: on stage she enacted the banishment of Harlequin from the theatre. The company never regained its hold, and the addition of musical interludes between the acts proved inadequate to offset the current popularity of the musical shows. In 1740, on the invitation of the empress Anna, the Neuber company introduced modern theatre to Russia. But the empress died in 1741, and by the time the company returned to Leipzig, Gottsched had allied himself with another company. His differences with Caroline Neuber intensified: she replaced the togas he had specified for his play *Der sterbende Cato* with flesh-coloured tights; he attacked her in his reviews; she represented him in a prologue as a bat-eared censor; an obscene pamphlet in reply cast aspersions on the actress' private life.

In 1747 she quit the stage but in the following year returned with a new company, which successfully presented G.E. Lessing's first play, *Der junge Gelehrte.* Indifferent success, however, dogged the company as it played at Dresden, Frankfurt, and Warsaw, as well as Leipzig. In 1753–54 Caroline Neuber attempted to establish herself in Vienna but failed; and the outbreak of the third Silesian War (1756), her husband's death (1759), and the bombardment of Dresden (1760) forced her to leave. She died in a peasant's hut, and, although she was refused burial in holy ground, a monument was erected in 1776, commemorating her as "the foundress of good taste in the German theatre." She had already been immortalized as Madame Nelly in J.W. von Goethe's *Wilhelm Meister.*

Neubrandenburg, city, Mecklenburg–West Pomerania *Land* (state), northeastern Germany, near the northern end of Tollense Lake, where the Tollense River flows out of the lake. It lies about 53 miles (85 km) south of Stralsund. Founded in 1248 by the margraves of Brandenburg as a fortified outpost, it lay near the intersection of a trade route running between Schwerin and Güstrow and the road from Stralsund to Berlin. The town passed to Mecklenburg about 1300 and was the capital of the duchy of Mecklenburg-Stargard from 1352 to 1471. During those years it prospered, chiefly as a result of its weaving industry and its function as a market centre. Its fortunes declined thereafter, as it was plundered during the Thirty Years' War, devastated by two great conflagrations (1679, 1737), and further battered by the Napoleonic wars. Neubrandenburg recovered somewhat in the second half of the 19th century.

Though its medieval fortifications are well-preserved, most of its medieval buildings were destroyed by bombing in World War II. Much rebuilt after 1952, Neubrandenburg has engineering, food-processing, chemical, wood, leather, and paper industries as well as the Institute of Agricultural Sciences of the University of Greifswald. Pop. (1998 est.) 77,312.

Neuchâtel (French), German NEUENBURG, *canton,* western Switzerland, bordering France to the northwest and Lake Neuchâtel to the southeast and bounded by the cantons of Bern on the northeast and Vaud on the southwest. It lies in the central Jura Mountains and is drained by Lake Neuchâtel (leading to the Rhine) and Le Doubs River (leading to the Rhône). Its three regions are a low-lying strip along the lake called Le Vignoble (from its vineyards); an intermediate region, Les Vallées, comprising the two principal valleys of the canton (the Ruz Valley, watered by the Seyon, and the Travers Valley, watered by L'Areuse), which lie at an elevation of 2,300 feet (700 m); and the highest region, the Neuchâteloises Mountains (3,000–3,500 feet [915–1,065 m]), mainly composed of a long valley in which stand the industrial centres of La Chaux-de-Fonds, Le Locle, La Sagne, Les Ponts-de-Martel, and La Brévine. Neuchâtel (*q.v.*) is the capital.

Novum Castellum (Neuchâtel) was first mentioned in the will of Rudolf III, the last king of Burgundy, who died in 1032. About 1034 the town and its territories were granted in fief to Count Ulrich von Fenis, whose dynasty gradually increased its dominion, until by 1373 it held practically all the area of the present canton. In 1406 Neuchâtel entered into union with Bern. It passed in the early 15th century to the lords of Freiburg im Breisgau in the German Rhineland and in 1504 to the French ducal house of Orléans-Longueville. The Reformation was introduced there in 1530 by Guillaume Farel, the French preacher, and Neuchâtel became a principality in 1648. With the extinction of the house of Orléans-Longueville in 1707, the area passed to Frederick I, the first king of Prussia. The nominal role of the Prussian king lasted until 1848, with a brief interval from 1806 to 1814 when the principality was granted by Napoleon to his marshal, Louis-Alexandre Berthier. It was admitted to the Swiss Confederation in 1815 as the 21st canton and the only nonrepublican member, its hereditary rulers the last to maintain their position in Switzerland. A republican form of government was established by a peaceful revolution in 1848, and after long negotiations and several attempts at counter-revolution, including the so-called Neuchâtel crisis (1856), the king of Prussia renounced his claims to sovereignty in 1857.

The population is mainly French-speaking and about two-thirds Protestant and one-third Roman Catholic. In addition to excellent wineries, some fruit is grown in Le Vignoble, and horses are raised. There are pastures for cattle in the valleys, and some cheese is made. The most valuable mineral product is asphalt, concentrated in the Travers Valley. The most characteristic industry is watchmaking, which has been prominent since the early 18th century in the highland valleys of La Chaux-de-Fonds, Le Locle, and Fleurier. An oil refinery is located at Cressier. Road and rail communications are highly developed. Area 310 square miles (803 square km). Pop. (1999 est.) 165,594.

Neuchâtel (French), German NEUENBURG, capital (since 1815) of Neuchâtel *canton,* western Switzerland, on the northwestern shore of Lake Neuchâtel, at the mouth of the Seyon River, partly on the slopes of the Chaumont (3,566 feet [1,087 m]) and partly on land reclaimed from the lake. A Burgundian town by the 11th century, it was chartered in 1214. It was the centre of the former countship and principality (1648–1707) of Neuchâtel. Historic landmarks include the medieval castle (now the seat of the cantonal administration) and the Collégiale Notre-Dame (12th–13th century), now Protestant and containing the monumental tomb of the counts (1372). There are several fine 17th- and 18th-century patrician dwellings, including the Hôtel du Peyrou (*c.* 1765) and the town hall (1784–90), which is in classic style. The town's institutions include the University of Neuchâtel (founded as an academy in 1838), the Institute of Physics, the Swiss Laboratory of Horological Research, the commercial school, the conservatory of music, the museum and public library in the Collège Latin, the cantonal observatory, and the fine Musée des Beaux-Arts. The city has an important wine market and its manufactures include watches, chocolate, tobacco, and paper. Pop. (1998 est.) 31,740.

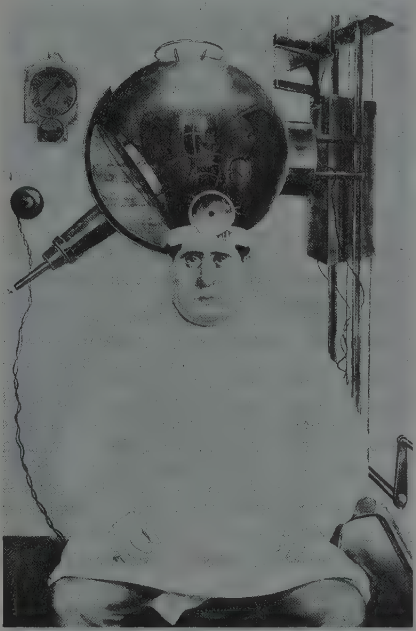
Neuchâtel, Lake, French LAC DE NEUCHÂTEL, German NEUENBURGERSEE, Latin LACUS EBURODUNENSIS, largest lake wholly in Switzerland; its area of 84 square miles (218 square km) is divided among the cantons of Neuchâtel, Vaud, Fribourg, and Bern. Lakes Neuchâtel, Biel (Bienne), and Morat, connected by canals, are survivors of a former glacial lake in the lower Aare valley, at the base of the Jura Mountains. Lake Neuchâtel is about 23.5 miles (38 km) long and from 3.75 to 5 miles (6 to 8 km) wide; it lies at an elevation of 1,407 feet (429 m), and its greatest depth is 502 feet (153 m). The Thièle River enters at its southwestern end and issues from it at its northeastern end. The lake also receives the Areuse and Broye rivers. The northwestern shore (Neuchâtel canton) is the most thickly settled, and the slopes are covered with vineyards. On the north shore is La Tène, famous for prehistoric finds, which gives its name to the late Iron Age culture.

Neuchâtel crisis (1856–57), tense episode of Swiss history that had repercussions among the Great Powers of Europe. The Congress of Vienna (1814–15), in its general settlement of territorial questions after the Napoleonic Wars, ordained that Neuchâtel (or Neuenburg) should have a dual status: it was to be a canton of the reorganized Swiss Confederation and, at the same time, a hereditary principality belonging personally to the king of Prussia but separate from the Prussian kingdom. This arrangement caused dissatisfaction among the people of Neuchâtel, and in March 1848, when the Swiss were revising their constitution and when France, Germany, Austria, and Italy were all being shaken by revolutionary movements, a successful insurrection established a republic there. Frederick William IV of Prussia, preoccupied with his kingdom's troubles, could take no effective counteraction at the time. Four years later, in the London Protocol of 1852, the other Great Powers formally acknowledged his rights in Neuchâtel, but with the proviso that Prussia should do nothing to assert them without their concurrence. In September 1856 there was an unsuccessful pro-Prussian coup d'etat in Neuchâtel, conducted by loyalist aristocrats under the leadership of members of the family of Pourtalès. When its leaders were arrested, Frederick William appealed to the Swiss Federal Council for their release and also asked the French emperor Napoleon III to intercede for them. The Swiss at first persisted in declaring that the rebels must be brought to trial. Prussia severed diplomatic relations with Switzerland and began preparations for war—though it remained doubtful whether the south German states, under Austrian influence, would allow Prussian troops to cross their territory and though Great Britain was ready to back France in support of Switzerland. Napoleon III at last, in January 1857, induced the Swiss to release the prisoners into temporary exile, on the understanding that he would then negotiate a final settlement of the main question in Switzerland's favour; and, after a conference of the neutral powers in Paris (March–April), a treaty was signed on May 26, 1857, whereby Frederick William renounced his sovereignty over Neuchâtel, keeping only the princely title.

Neue Künstlervereinigung, English NEW ARTISTS' ASSOCIATION, group founded in 1909 by Wassily Kandinsky, Alexey von Jawlensky, Gabriele Münter, and numerous others who were united by opposition to the official art of Munich rather than by similarity of style. Joined by Adolf Erbslöh, Alexander Kanoldt, Alfred Kubin, Marianne von Werefkin, Karl Hofer, and several other artists as well as lay people, the group held its first exhibition in December 1909, at Moderne Galerie Tannhäuser, Munich. The works exhibited, which primarily reflected Jugendstil and Fauvist styles, were not favourably received by the critics or the public. Their second exhibition, held September 1910 at Tannhäuser, was international in scope, including, in addition to their works, those of Pablo Picasso, Georges Braque, Georges Rouault, Kees van Dongen, André Derain, Maurice de Vlaminck, Henri Le Fauconnier, and David and Vladimir Burlyuk. The exhibition was denounced for, among other things, including foreign artists, especially Russians, who were considered dangerous to Bavarian culture.

While preparing for their third exhibition, held December 1911 at Tannhäuser, differences in aesthetic outlook caused a split in the group, partially brought on by the jury's rejection of Kandinsky's large, rather abstract painting, "Last Judgment." Franz Marc (the last painter to join the group) and Kandinsky, favouring freedom of expression, were aligned against the more conservative art historian Otto Fischer (who later became the group's spokesman), Kanoldt, and Erbslöh. Kandinsky and Marc left the association (as did Münter and Kubin) and together formed Der Blaue Reiter, exhibiting their works that same month at Tannhäuser, in rooms adjoining those of the Neue Künstlervereinigung.

Neue Sachlichkeit (German: New Objectivity), a group of German artists in the 1920s whose works were executed in a realistic style (in contrast to the prevailing styles of Expressionism and Abstraction) and who reflected what was characterized as the resignation and cynicism of the post-World War I period in Germany. The term was fashioned in 1924 by Gustav F. Hartlaub, director of the Mannheim Kunsthall. In a 1925 exhibition assembled at the Kunsthalle, Hartlaub displayed the works of the members of this group: George Grosz, Otto Dix, Max Beckmann, Georg Schrimpf, Alexander Kanoldt, Carlo Mense, Georg Scholz, and Heinrich Davringhausen.



"Dr. Mayer-Hermann," by the Neue Sachlichkeit painter Otto Dix, oil and tempera on wood, 1926; in the collection of the Museum of Modern Art, New York

By courtesy of the Museum of Modern Art, New York, gift of Philip C. Johnson

Various trends and styles have been noted within Neue Sachlichkeit. Three subdivisions are sometimes proposed. The Veristic includes the socially critical (and frequently bitter) works of Grosz, Dix, and the early Beckmann. The Monumental, or classical, is represented by Schrimpf, Kanoldt, Mense, and Davringhausen, whose paintings displayed smooth, cold, and static qualities, partially derived from the Italian *pittura metafisica* (*see* Metaphysical painting); the term Magic Realism, one of the names sometimes applied to the entire Neue Sachlichkeit movement, best describes the style of these particular painters. Finally, the Rousseau school includes works by Walter Spiess and Scholz, for example, which are deliberately naive, emulating the style of the French painter Henri Rousseau.

Although many Neue Sachlichkeit artists continued working in representational styles after the 1920s, the movement itself ended with the rise of Nazism.

Neue Zürcher Zeitung (German: "New Zürich Newspaper"), abbreviation NZZ, daily newspaper published in Zürich and generally considered one of the world's great newspapers.

It was founded as a weekly, the *Zürcher Zeitung*, in 1780. Reorganized in 1821, the paper became the *Neue Zürcher Zeitung* and appeared twice weekly. By 1869—the year after the paper became a joint stock company with shares held by Zürich citizens—there were two daily editions, and in 1894 there were three daily editions.

NZZ is tabloid in size but not in demeanour. Its gray visage is one of the most austere in the world. The paper is characterized by careful, nonsensational, thoughtful reporting; by highly informed and extremely thorough analysis; and by background information that is supplied as a context for every important story. The large proportion of space that *NZZ* devotes to international news is remarkable by any other paper's standards. It maintains a correspondent, and sometimes two—an economist and a political observer—in more than 30 major world cities. Since its founding, *NZZ* has appealed to intellectuals, government officials, business and political leaders, and others interested in deep coverage of significant world developments.

To ensure accuracy and objectivity, the paper has sometimes withheld its coverage of major events until they could be reported dispassionately. On the other hand, *NZZ* has never hesitated to present the facts when they were assembled—it was banned in Germany from 1934 onward for reporting that Hermann Göring, and not the Communists, had been responsible for the Reichstag fire. Since 1945, during the Cold War years and after, the *Neue Zürcher Zeitung* has won wide acclaim for its balanced news coverage. Its regular readers are numerous in every important world capital, from the Kremlin to the White House.

Neuenburg (Switzerland): *see* Neuchâtel.

Neuenburgersee (Switzerland): *see* Neuchâtel, Lake.

Neuengamme-Ring, series of German Nazi concentration camps situated in marshy country near the community of Neuengamme, a suburb of the port of Hamburg. The first camp was established in 1940 to provide slave labour for local armaments industries, and a string of related camps was added from 1942 on as the inmate population expanded. According to German estimates, some 82,000 prisoners died in these camps, many from disease, malnutrition, and exhaustion, others from the effects of medical experiments, and several thousand on May 3, 1945, during a British air raid on Elbe River ships to which inmates had been transferred.

Neuf, Pont (bridge): *see* Pont Neuf.

Neuhof, Theodor, Baron, Neuhof also spelled NEUHOFF (b. Aug. 24/25, 1694, Cologne—d. Dec. 11, 1756, London), German adventurer. An indefatigable intriguer in military, political, and financial affairs throughout Europe, he was for a time (1736–43) the nominal king of Corsica under the style of Theodore I.

After serving in the French and Bavarian armies, Neuhof went to England and then to Spain to conduct negotiations on behalf of Sweden. Later he was involved in the speculations of the Scottish financier John Law. In Genoa he convinced some Corsican prisoners that he would free their island from Genoese tyranny if they made him king. With their help and that of merchants in Tunis, he landed on Corsica, where he was proclaimed king. At first he fought successfully against Genoa, but, after his defeat, a civil war broke out on Corsica, and he fled late in 1736. Twice, in 1738 and 1743, he returned to the island but failed to reestablish his authority. Imprisoned in London for debt, he secured his release by mortgaging his "kingdom."

Neuilly, Treaty of (Nov. 27, 1919), peace treaty between Bulgaria and the victorious Allied powers after World War I that became effective Aug. 9, 1920. Under its terms Bulgaria was forced to cede lands to Yugoslavia and Greece (thus depriving it of an outlet to the Aegean) involving the transfer of some

300,000 people; to reduce its army to 20,000 men; and to pay reparations, 75 percent of which were later remitted.

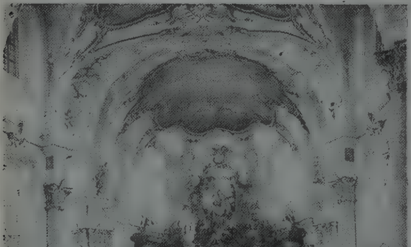
Neuilly-sur-Seine, residential northwestern suburb of Paris, France. It lies in Hauts-de-Seine *département,* west of the capital and north of the Bois de Boulogne. Its main thoroughfare is the wide avenue de Charles de Gaulle, which is a prolongation of the Champs-Élysées and of the avenue de la Grande Armée. The 18th-century Pont de Neuilly, which bridges the avenue over the Seine River at the suburb's western border, is regarded as an outstanding piece of engineering; it was rebuilt and widened to 115 feet (35 m) in 1935–40. Pop. (1999) 59,874.

Neukölln, *Bezirk* (district) in the southern part of the city of Berlin, Germany. Medieval village churches still mark the centres of the four old villages—Rixdorf, Britz, Buckow, and Rudow—around which the district grew. During World War II Neukölln suffered far less damage from Allied bombing than did other parts of Berlin, and as a consequence after the war many businesses and industries relocated there. Large housing estates were built, and Neukölln became the most populous district in the city. While it is a shopping and entertainment centre, meat-packing, chemical, pharmaceutical, motor-vehicle, and other plants also give the district a strong industrial base. Area 17 square miles (45 square km). Pop. (1990 est.) 303,100.

Neumann, Balthasar, in full JOHANN BALTHASAR NEUMANN (b. 1687, Eger, Bohemia, Austrian Habsburg domain [now Cheb, Czech Republic]—d. Aug. 19, 1753, Würzburg [Germany]), German architect who was the foremost master of the late Baroque style.

Neumann was apprenticed to a bell-founder and in 1711 emigrated to Würzburg, where he gained the patronage of that city's ruling prince-bishop, a member of the Schönborn family, after working on military fortifications. In 1719 Neumann began directing construction of the first stage of the new Residenz (palace) for the prince-bishop in Würzburg, and he was soon entrusted with the planning and design of the entire structure. Work on the Residenz continued at intervals after Neumann's own death in 1753, though by the 1740s it had advanced far enough for the painter G.B. Tiepolo to decorate the palace's enormous ceilings.

Neumann began designing other buildings as well, starting in the 1720s with the Schönborn Chapel (1721–36) in Würzburg Cathedral, the priory church at Holzkirchen (1726–30) outside Würzburg, and the abbey church at Münsterschwarzach (1727–43). He did buildings for other members of the Schönborn family and was eventually put in charge of all major building projects in Würzburg and Bamberg, including palaces, public buildings, bridges, a water system, and more than a dozen churches. Neumann designed numerous palaces for the Schönborns, including those for the prince-bishops at Bruchsal (1728–50) and Werneck (*c.* 1733–45). In the 1740s he designed his masterpiece, the pilgrimage church at Vierzehnheiligen (1743–53), as well as the pilgrimage church known as the Käppele (1740–52) near Würzburg and the abbey church at Neresheim (1747–53).



Interior of the church of Vierzehnheiligen, Ger., by Balthasar Neumann, 18th century
GEKS

Neumann showed himself a great master of composition in the interiors of his churches and palaces. The walls and columns in his buildings are diminished, disguised, or opened up to create startling and often playful effects while nevertheless retaining a sense of symmetry and harmony. Neumann made ingenious use of domes and barrel vaults to create sequences of round and oval spaces whose light, airy elegance is highlighted by the daylight streaming in through huge windows. The free and lively interplay of these elements is accented by a lavish use of decorative plasterwork, gilding, and statuary and by wall and ceiling murals.

Neumann, John von (mathematician): *see* von Neumann, John.

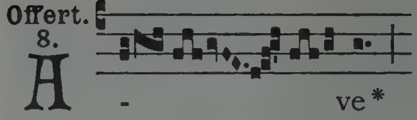
Neumann, Saint John (Nepomucene) (b. March 28, 1811, Prachatice, Bohemia [now in Czech Republic]—d. Jan. 5, 1860, Philadelphia, Pa., U.S.; canonized 1977; feast day January 5), bishop of Philadelphia, a leader in the Roman Catholic parochial-school system in the United States.

After studies at the University of Prague, Neumann's interest in missions in the United States took him to New York, where he was ordained in 1836. In 1840 he joined the Redemptorists, a religious congregation dedicated to parish and foreign missions, and later became superior of all Redemptorists in the United States. In 1852 Pope Pius IX named him bishop of Philadelphia.

Neumann spent the rest of his life building churches, schools, and asylums for his diocese. He was devoted to education and was the first ecclesiastic to organize a diocesan school system in the United States. Neumann was canonized as the first American male saint in 1977.

Neumann line, any of the fine, straight, scratchlike marks that appear when some iron meteorites are cut open and the exposed surface polished and etched. The lines reveal an internal structure thought to result from some violent strain, such as a collision between astronomical bodies, that the meteorite was subjected to before its fall. They are named for their discoverer, German mineralogist Franz Ernst Neumann (1798–1895).

neume, in musical notation, a sign for one or more successive musical pitches, predecessor of modern musical notes. Neumes have been used in Christian (*e.g.,* Gregorian, Byzantine) liturgical chant as well as in medieval polyphony (music in several voices, or parts) and some secular monophony (music consisting of a single melodic line). Early neumes developed from Greek textual accents that were gradually modified into shapes showing pitch direction and vocal ornament. These staffless, or chironomic, neumes facilitated recall of a memorized melody in accordance with the semi-oral musical practices of the time. Before long, neumes were "heighted" so as to suggest specific melodic lines. A musical staff of four lines evolved about the year 1000. Neumes placed on the staff showed exact pitch, allowing a singer to read an unfamiliar melody. By about 1200, neumes had assumed the characteristic square shapes still used in the modern notation of Gregorian chant. Whether and how neumes indicated rhythm remains a subject of controversy. Musical notes with time values evolved from neumes in the last half of the 13th century.



Neumatic notation from the plainsong "Ave Maria"
From *Liber Usualis* (1952); reproduced by permission of Desclee & Co., Belgium

A distinct system of neumes is employed for the notation of the Buddhist chant of India, Tibet, China, and Japan. It is perhaps a borrowing from the Nestorians of ancient Central Asia.

Neuquén, *provincia,* west-central Argentina. It is bordered by the high peaks of the Andes Mountains and Chile (west), the Colorado River and tributaries (north), and the Limay River (south). The western part of the *provincia* has intermontane lakes with some stands of forest. In the east are large plains with stunted vegetation and many saline deposits. The city of Neuquén (*q.v.*), the *provincia* capital, is at the confluence of the Neuquén and Limay rivers, which form the Negro River at the extreme eastern corner of the *provincia.* In addition to part of Nahuel Huapí National Park, the *provincia* has the Lanín and Laguna Blanca national parks.

Apples, pears, grapes, and plums grown in irrigated valleys adjacent to the lower Neuquén and Limay rivers provide an important source of income; sheep are grazed in the west. The exploitation of petroleum and natural gas remains significant near Neuquén city and the town of Cutral-Có. Area 36,324 square miles (94,078 square km). Pop. (1999 est.) 540,384.

Neuquén, city, capital of Neuquén *provincia,* west-central Argentina. It is located at the confluence of the Neuquén and Limay rivers, which there form the Negro River. Founded in 1904, the city is a market centre for the adjacent fruit-growing area, which became more productive in the 1970s with the completion of the El Chocón Dam on the Limay River and the Cerros Colorados Dam on the Neuquén River. Fruits are processed locally, and many bodegas (wine cellars) are nearby. The city's industries manufacture heavy equipment and construction materials for the oil fields to the north and west. Pop. (1989 est.) 327,374.

neural crest, group of embryonic cells that are pinched off during the formation of the neural tube (the precursor of the spinal cord) but that do not remain as a part of the central nervous system. The cells of the neural crest migrate to numerous locations in the body and contribute to the formation of diverse structures, mostly associated with the nervous system. The factors determining their migration and differentiation are not known.

The most conspicuous of the neural crest derivatives are the melanocytes, cells in the deep layers of the epidermis that contain pigment and are responsible for skin coloration. In the head region the neural crest cells contribute significantly to the formation of the facial bones. Odontoblasts, the cells that give rise to the dentine of the teeth, have their origin in the neural crest, as do many of the cranial nerve cells. The neural crest also contributes to the formation of the meningeal covering of the brain and is the source of Schwann cells, which surround and insulate nerve fibres in the peripheral nervous system. In addition to Schwann cells and melanocytes, the neural crest of the trunk region gives rise to paired chains of sympathetic nerve ganglia and to certain cells of the adrenal gland.

neural tube defect, any congenital defect of the brain and spinal cord as a result of abnormal development of the neural tube (the precursor of the spinal cord) during early embryonic life, usually accompanied by defects of the vertebral column or skull. In normal development a plaque of nerve tissue forms along the surface of what will become the back of the fetus; this tissue folds into a closed tube that develops into the structures of the central nervous system. Malformations occur because the tube fails to close properly, because parts of it are missing, or because part of the tube is blocked.

Failure of the tube to close in some degree is the basic defect underlying spina bifida, meningocele, myelocele, and meningomyelocele. Spina bifida is caused by the failure of the vertebrae to form over the back of the spinal cord, leaving the nerve unprotected. It usually occurs in the sacral or lumbar regions at the base of the spine, the final section of the neural tube to close. All the other neural tube defects in this group are particular forms of spina bifida.

In spina bifida occulta, or hidden spina bifida, the vertebrae fail to completely enclose the spinal cord, but the latter is normal in form and is covered by the skin of the back. This form of the defect has no effect on body functions and may go undetected for life.

In more serious forms of spina bifida, part of the spinal cord is left uncovered by the skin or actually protrudes from the spinal column. In myelocele, the spinal cord is exposed so that nerve tissue lies exposed on the surface of the back without even a covering of skin or of the meninges, the membranous tissue surrounding the brain and spinal cord. Meningocele occurs when these meninges protrude through the vertebral defect, forming a fluid-filled sac. Meningomyelocele is a compound defect in which the protruding sac contains some nervous tissue as well. If any of these defects communicate with the central canal of the spinal cord, the prefix syringo- is added to the name; hence, a syringomyelocele is an open defect containing nerve tissue and opening into the spinal cord.

Children born with the more serious forms of spina bifida experience paralysis in those parts of the body below the site involved. The legs may be completely paralyzed, and bladder and bowel functions may be absent or impaired. Spina bifida defects can be treated surgically early in life; success is greatest with meningocele, because paraplegia or other disabilities associated with myelocele can complicate therapy.

Another form of open neural tube defect, encephalocele, occurs when a meningeal sac containing brain tissue protrudes from the skull. The outlook for affected individuals depends on the amount of nervous tissue involved.

Hydrocephalus, an accumulation of fluid within the brain, occurs when normal passages for the cerebrospinal fluid that fills the neural tube are partially or completely blocked. The brain and skull are greatly enlarged because of the fluid pressure. Hydrocephalus occurs in one or two of every 1,000 live births and was routinely fatal until surgical techniques for shunting the excess fluid out of the central nervous system were developed; today it need not cause any intellectual impairment if recognized and treated promptly.

neuralgia, cyclic attacks of acute pain occurring in the distribution of a peripheral sensory nerve; the cause of the pain is unknown, and pathological changes in nerve tissue cannot be found. Neuralgia is frequently confused with another disorder, neuritis, but the terms are not synonymous. There are two principal types of neuralgia: trigeminal neuralgia (tic douloureux) and glossopharyngeal neuralgia.

Trigeminal neuralgia is a complex of symptoms of unknown cause characterized principally by brief attacks of severe pain along any of the branches of the trigeminal nerve (lying on the skull in front of the ear). The disease may occur at any age after puberty but usually begins somewhat after middle age. It affects women more frequently than men. The intense pain is usually described by patients as "stabbing," "shooting," or "lightning-like" and extremely brief. In early stages of the disease, these pains last for less than a minute or two, with weeks or months between attacks. As the condition progresses, the periods between attacks become shorter. Areas around the nose and mouth become hypersensitive and, when touched, trigger an attack. Attacks are also touched off by talking, eating, drinking, or exposure to cold. Analgesics offer temporary relief. The condition can be cured permanently by severing the sensory root of the nerve proximal to the ganglion. Simple decompression of the roots and of the posterior part of the ganglion have had some good results.

Glossopharyngeal neuralgia is a relatively rare disorder characterized by recurring severe pain in the pharynx, tonsils, back of the tongue, and middle ear. The cause is unknown, and the disease usually has its onset after age 40, more frequently in males than in females. The pains may be excruciating, beginning in the throat and radiating to the ears or down the side of the neck. They may occur spontaneously or be triggered by sneezing, coughing, yawning, chewing, or talking. The attacks are usually separated by long intervals and, when they do occur, last only a few seconds to a minute or two. Medical treatment is usually ineffective, for the attack subsides before analgesics exert their action. Surgery is indicated in extreme cases. *See also* neuritis.

Neurath, Konstantin, Baron (Freiherr) **von** (b. Feb. 2, 1873, Klein-Glattbach, Ger.—d. Aug. 14, 1956, Enzweihingen, W.Ger.), German diplomat who was Adolf Hitler's foreign minister from 1933 to 1938.

After studying law at the Universities of Tübingen and Berlin, Neurath entered the German foreign service in 1903. After World War I he served as minister to Denmark (from 1919), ambassador to Italy (from 1922), and ambassador to Great Britain (from 1930). From June 1932 he was foreign minister in the Papen and Schleicher cabinets and retained his post after Hitler became chancellor in 1933. In this post Neurath lent a veneer of conservative respectability to Hitler's expansionist foreign policy. In February 1938 he was ousted by Hitler in favour of Joachim von Ribbentrop, and in March 1939 he was appointed *Reichsprotektor* for Bohemia and Moravia. During his tenure of office there, he abolished the Czech political parties and trade unions, instituted the Nürnberg racial laws in the protectorate, and made Czechoslovakian industry work for the German war effort. Nevertheless, in September 1941 Neurath was told by Hitler that his rule was "too lenient" and was dismissed.

He was captured by French troops in the closing days of World War II in Europe and was brought to trial before the International Military Tribunal at Nürnberg, found guilty, and sentenced to 15 years of imprisonment. He was released from Spandau prison in November 1954 after serving eight years and one month.

neuritis, inflammation of one or several nerves. The characteristic symptoms of neuritis include pain and tenderness; impaired sensation, strength, and reflexes; and abnormal circulation and sweating in the distribution of the inflamed nerve or nerves.

A unique feature of the nerve fibre is its extraordinary length. In its course a nerve may lie next to skin or bone or it may pass through muscles or tunnels. All these anatomic vicissitudes represent hazards, and, indeed, neuritis frequently results from such mechanical injuries as adjacent tissues pressing on a nerve or blows delivered on a nerve running just underneath the skin. Nerve fibres are housed in connective tissue that may become infected, scarred, or invaded by tumours, events that may cause injury to nerve fibres.

There are many causes of neuritis, but in general it may be said that when neuritis affects one nerve (mononeuritis) or a plexus of nerves (plexitis), the cause commonly is a mechanical one; that when several single nerves are affected simultaneously (mononeuritis multiplex), the cause often is a vascular or allergic one; and that when widely separated nerves are affected (polyneuritis), the cause often is toxic, metabolic, viral, or allergic. The symptoms of neuritis are usually confined to the specific portion of the body served by the inflamed nerve.

Inflammations of sensory neurons in a nerve fibre cause sensations of tingling, prickling, burning, boring, or stabbing pains that are worse at night and are aggravated by touch or temperature change. The inflammation of the motor part of a nerve (*i.e.,* those neurons that transmit impulses to muscles) causes symptoms ranging from muscle weakness to complete paralysis. Muscles in the area served by the affected nerve lose tone, become tender, and may atrophy. A notable form of mononeuritis is Bell's palsy, which is caused by the inflammation of a facial nerve and which causes a characteristic distortion of the facial muscles.

The treatment of neuritis is directed toward the causative agent. Analgesics may be required for pain. Under proper therapy, recovery is usually rapid in less severe cases; repetition of the original cause may bring about recurrence. In severe cases, recovery may be incomplete, with some residual motor and sensory disturbances. *See also* neuralgia.

neurofibromatosis, either of two hereditary disorders characterized by distinctive skin lesions and by benign, progressively enlarging tumours of the nervous system. Neurofibromatosis type 1, also known as von Recklinghausen's disease, is much the more common of the two disorders and is present in about one of every 3,000 live births. This type is characterized by the presence of café-au-lait (pale brown) spots on the skin and the formation of numerous benign soft tumours arising from the abnormal growth of nerves. The café-au-lait spots may be present at birth or infancy, and the neurofibromas and other tumours appear in late childhood or early adulthood; the latter can sometimes result in grossly disfiguring effects owing to their large size. The course of the disease is progressive in most cases. Neurofibromatosis type 2 is a much rarer inherited disease marked by tumours of the auditory canal in the ear and by small numbers of café-au-lait spots.

Neurofibromatosis 1 is passed on as an autosomal dominant trait, and the child of someone with the disease has a 50-percent chance of developing it. About half of all cases of the disorder, however, result from genetic mutation at conception rather than from familial inheritance. In 1990 scientists identified a gene on human chromosome 17 that is responsible for neurofibromatosis type 1; a defective version of this gene allows nerve cells to grow without restraint, resulting in neurofibromas.

neurogenic arthropathy, also called CHARCOT'S JOINT (after Jean-Martin Charcot, a 19th-century French neurologist), massive destruction of a stress-bearing joint, with development of large flanges and spurs of new bone at the sides of the joint. The condition eventually causes inability to use the joint but is accompanied by little or no sensation of pain or discomfort. The disorder accompanies damage to the nervous system in which sensory knowledge of joint position and strength is lost; the affected individual is not aware of overuse or injury so that destructive changes can develop quickly.

The most common cause of Charcot's joint is tabes dorsalis, a form of nervous system disease that occurs in untreated tertiary venereal syphilis; the knee, hip, ankle, and lower back are most often affected. Neurogenic arthropathy of the foot occurs as a complication of diabetes. Other diseases that destroy the sense of joint position or of pain may also cause Charcot's joint, such as leprosy, spinal cord injury, or pernicious anemia. Treatment involves complete protection of the joint from further stress or injury, commonly by the use of a brace.

neurohormone, any of a group of substances produced by specialized cells (neurosecretory cells) structurally typical of the nervous, rather than of the endocrine, system. The neurohormones pass along nerve-cell extensions (axons) and are released into the bloodstream at special regions called neurohemal organs. Neurohormones thus constitute a linkage between sensory stimuli (events or conditions perceived by the nervous system) and chemical responses (endocrine secretions that act on other tissues of the endocrine system or on tissues of other systems, such as those involved with excretion or reproduction).

The neurohormones in most mammals include oxytocin and vasopressin, both of which are produced in the hypothalamic region of the brain and secreted into the blood by the neurohypophysis (part of the pituitary gland). A second group of neurohormones, called releasing hormones (the first of which was chemically identified in 1969), also originates in the hypothalamus. The members of this group, however, are transmitted within the neural cells to a second locus in the brain, from which they pass in the bloodstream to the adenohypophysis, which also is a part of the pituitary gland. There they either stimulate or inhibit the release of the various adenohypophysial hormones.

A third group of neurohormones includes the enkephalins and other endorphins, first observed in 1975 in the course of investigations of the mechanism of action of morphine and other analgesics. The endorphins are effective in relieving pain, a property apparently related to their function as neurotransmitters, passing nerve impulses from one neuron to another. Their neurohormonal activity is manifested by their stimulation of the secretion of somatotropin and vasopressin by an indirect process involving a site (other than the secretory neuron) in the central nervous system. *See also* endorphin.

neurolinguistics, the study of the neurological mechanisms underlying the storage and processing of language. Although it has been fairly satisfactorily determined that the language centre is in the left hemisphere of the brain in right-handed people, controversy remains concerning whether individual aspects of language are correlated with different specialized areas of the brain. One kind of research carried on in this field is the study of aphasia, a condition of the brain in which language ability is impaired or destroyed. Temporary aphasia has been induced by electrically stimulating the cortex of conscious patients in order to determine the location of the various functions of language. Although very general centres of language have been proposed, it seems that there are no highly specialized centres. Several cases have been reported of patients who, after having their left hemisphere of the brain removed, adapted in the right hemisphere the language function that the left hemisphere had had. In general, however, though progress is being made in this field, very little is known for certain about the neurological aspects of language.

neurology, medical specialty concerned with the diagnosis and treatment of functional or organic disorders of the nervous system (*i.e.,* the brain, spinal cord, and nerves).

The modern science of neurology has developed in the past two centuries. The first scientific studies of nerve function in animals were done in the early 18th century by Stephen Hales and Robert Whytt, but clinical neurology was still relatively unexplored territory until the middle of the 19th century.

Important contributions to neurological knowledge were made in the mid- and late 19th century. New knowledge was gained about the causes of aphasia, epilepsy, and about motor problems arising from brain damage. The mapping of the functional areas of the brain through selective electrical stimulation also began at this time. Despite these contributions, however, most new knowledge of the brain and nervous functions came from studies of animals and from the microscopic analysis of nerve cells.

The diagnosis of neurological disease was greatly improved by Hans Berger's invention in the 1920s of the electroencephalograph, which records electrical brain activity. With this device, with the analysis of cerebrospinal fluid obtained by the spinal tap, and with the development of cerebral angiography (*q.v.*), neurologists were able to increase the precision of their diagnoses and develop specific therapies and rehabilitative measures. Further aiding the diagnosis of brain disorders were the development of computerized axial tomography (CAT scans) in the early 1970s and nuclear magnetic resonance (NMR) imaging in the 1980s, both of which yielded detailed, noninvasive views of the inside of the brain. (*See* brain scanning.)

Another major development was the introduction of specific drug therapies for neurological conditions. The identification of chemical agents in the central nervous system and the elucidation of the roles these substances play in the transmitting and blocking of nerve impulses led in the mid- and late 20th century to a wide array of drugs that could correct or alleviate various neurological disorders. Neurological surgery, or neurosurgery, is a medical specialty related to neurology. It is perhaps the most difficult and delicate of the surgical disciplines, but it too has benefited from CAT scans and other increasingly precise methods of locating lesions and other abnormalities in nervous tissues. Neurological disorders have always been among the most subtle and baffling of human illnesses, and despite continuing advances in their field, neurologists remained unable to effectively treat many disorders of the nervous system.

neuromuscular blocking agent, also called CURARIFORM DRUG, any of various drugs that interfere with the transmission of stimulatory impulses from nerve to muscle. The drugs affect the action of acetylcholine, a compound that is released by nerve endings and taken up by receptor sites in muscle cells to initiate muscle contraction.

Competitive or stabilizing neuromuscular blocking agents compete with acetylcholine for the receptor sites. Curare and its synthetic analogs are such drugs, used to induce muscle relaxation in surgery.

Depolarizing agents produce an immediate and prolonged depolarization of the muscle receptors, thus paralyzing muscle response by preventing the receptors from responding to acetylcholine. *See also* ganglion blocking agent.

neuromuscular junction, also called MYONEURAL JUNCTION, site of chemical communication between a nerve fibre and a muscle cell. It is analogous to the synapse between two neurons. A nerve fibre divides into many terminal branches, each terminal ending on a region of muscle fibre called the end-plate. Embedded in the end-plate are thousands of receptors, which are long protein molecules that form channels through the membrane. Upon stimulation by a nerve impulse, the terminal releases a chemical neurotransmitter (acetylcholine) from spheres called synaptic vesicles. The neurotransmitter then binds to the receptors, the channels open, and sodium ions flow into the end-plate. This initiates the end-plate potential (*q.v.*), the electric event that leads to contraction of the muscle fibre.

neuron, also called NERVE CELL, basic cell of the nervous system in vertebrates and most invertebrates from the level of the cnidarians upward. It transmits nerve impulses. A typical neuron has a cell body containing a nucleus and two or more long fibres. Impulses are carried along one or many of these fibres, the dendrites, to the cell body; in higher nervous systems, only one fibre, the axon, carries the impulse away from the cell body. Bundles of fibres from neurons are held together by connective tissue and form nerves. Some neurons of large vertebrates are several feet long. A sensory neuron is a nerve cell that transmits impulses from a receptor such as those in the eye or ear to a more central location in the nervous system. A motor neuron is a nerve cell that transmits impulses from a central area of the nervous system to an effector such as a muscle.

neuronal junction (biology): *see* synapse.

neuropteran, a member of the insect order Neuroptera, which is now generally restricted to the lacewings but formerly included also the dobsonflies and alderflies (now assigned to the order Megaloptera) as well as the snakeflies (order Raphidiodea). Between them the three groups comprise some 4,600 species.

A brief treatment of neuropterans follows. For full treatment, *see* MACROPAEDIA: Insects.

The three orders that constitute the broad sense of neuropteran are thought to have evolved from a common stem, that of the scorpionfly (Mecoptera), from which they diverged at different times during the Carboniferous Period (about 325,000,000 to 345,000,000 years ago). There are structural resemblances between the three orders, and they live in similar habitats. Neuropterans are found all over the world.

Neuropterans have long antennae and two pairs of transparent, net-veined wings, which in lacewings range from 2 to 50 mm (0.08 to 2 inches) in span. Although the wings are intricately structured, these insects are not strong fliers. When at rest the wings fold, rooflike, over the body. The neuropterans are generally carnivorous, feeding mostly upon smaller, soft-bodied insects, such as mites, ants, and aphids, and on insect eggs and larvae. Their mouth structures are adapted for piercing and chewing. The larvae of most Neuroptera species live on land; megalopteran larvae are aquatic, while raphidiodean larvae live under loose tree bark. Like the adult forms, the larval forms are generally predacious.

Neuropterans lay their eggs loosely in soil or cement them to some surface. The females of the Megaloptera lay their eggs in water. Raphidiodean females have an ovipositor, or egg-laying organ, with which they deposit their eggs in fissures in tree bark. Neuropteran larvae spin double cocoons, one inside the other. After pupation the emerging adults generally cut themselves free with their mandibles.

Little is known of the feeding habits of the adult neuropterans except that they are frequently nocturnal. Both larval and adult forms serve as food for many larger species of insects, as well as for birds and bats. They are also an important food source for trout and other freshwater fish and are often used as bait.

neurosecretory cell, a type of neuron, or nerve cell, whose function is to translate neural signals into chemical stimuli. Such cells produce secretions (neurohormones) that pass along the nerve cell axon and are typically released into the bloodstream at special regions (neurohemal organs) in which the axon endings are in close contact with blood capillaries. Neurosecretory cells occur in most multicellular animals and are usually distinguished from other neurons by the unusually large size of the cell nucleus, axon endings, and the cell itself.

neurosis: *see* psychoneurosis.

neurotransmitter, also called CHEMICAL TRANSMITTER, or TRANSMITTER SUBSTANCE, any of a group of chemical agents released by neurons (nerve cells) to stimulate neighbouring neurons, thus allowing impulses to be passed from one cell to the next throughout the nervous system.

The site where neurons meet is called the synapse and consists of the axon terminal (transmitting end) of one cell and the dendrite (receiving end) of the next. A microscopic gap called a synaptic cleft exists between the neurons. When a nerve impulse arrives at the axon terminal of one cell, a chemical substance is released through the presynaptic membrane, traveling in milliseconds across the synaptic cleft to the postsynaptic membrane of the adjoining neuron. The chemical release is stimulated by the cell's electrical activity.

Although a large number of chemical substances are believed to act as neurotransmitters, only a few have been identified. Among those known are acetylcholine, norepinephrine (noradrenalin), dopamine, and serotonin. Some chemical agents, such as acetylcholine, excite (activate) neurons, while others act as inhibiting substances. Research has shown that some psychoactive (mind-altering) drugs function by changing synaptic activities. *See also* nervous system.

Neusalz (Poland): *see* Nowa Sól.

Neusatz (Yugoslavia): *see* Novi Sad.

Neuschwanstein, elaborate castle built atop a rock ledge over the Pöllat Gorge in the Bavarian Alps (near Füssen, Ger.) by order of Bavaria's King Louis II, called "Mad Ludwig." Begun in 1869 and left unfinished at Louis's death in 1886, this lavish stronghold is an eccentric romantic reconstruction of a medieval castle, complete with walled courtyard, indoor garden, spires, towers, and an artificial cave. Its two-story throne room is modeled after a Byzantine basilica; stars decorate its blue vaulted ceiling, which is supported by red porphyry columns.

Louis was a patron of Richard Wagner, and wall paintings throughout the castle depict Wagnerian themes: the life of Parsifal in the 4th-floor Singers' Hall; the Tannhäuser saga in the study; Lohengrin in the great parlour.

Neuschwanstein became a popular tourist attraction in the 20th century.

Neuse River, river in northeast-central North Carolina, U.S. It is formed by the junction of the Flat and Eno rivers in Durham county. Named for the Neusiok Indians, it flows about 300 miles (480 km), generally southeast past Kinston, the head of navigation. At New Bern, 35 miles (56 km) from the Atlantic Ocean, the Neuse is joined by the Trent River to form an estuary 5 miles (8 km) wide and about 40 miles (64 km) long. The river flows past Croatan National Forest on its way to the Atlantic Ocean.

Neuserre, also spelled NYUSERRE, sixth king of the 5th dynasty (*c.* 2465–*c.* 2325 BC) of Egypt; he is primarily known for his temple to the sun-god Re at Abū Jirāb (Abu Gurab) in Lower Egypt. The temple plan, like that built by Userkaf (the first king of the 5th dynasty), consisted of a valley temple, causeway, gate, and temple court, which contained an obelisk (the symbol of Re) and an alabaster altar. The sun-temple reliefs revealed an exceptionally high development of artistry and technique. Few written records were left from Neuserre's reign, but the pyramid he used as a burial place has been located at Abū Ṣīr near the sun temples of Abū Jirāb. Though impressive in size, Neuserre's pyramid was exceeded both in height and in length by his sun temple, indicating the unusual prominence of the cult of Re during the 5th dynasty.

Neusiedler Lake, German NEUSIEDLERSEE, Hungarian FERTŐ-TÓ, lake in Burgenland (eastern Austria) and northwestern Hungary, named from the Austrian town of Neusiedl and the Hungarian word for "swamp lake." Formed several million years ago during the Pleistocene Epoch, probably as a result of tectonic subsidence, it is Austria's lowest point (377 feet [115 m] above sea level). The lake is 22 miles (36 km) long and 4–9 miles (6–14 km) wide. Neusiedler Lake is fed by a small stream and probably by underground sources and is slightly saline with no natural outflow. It is very shallow (rarely more than 4–6 feet deep) and fluctuates in level and size (135 square miles [350 square km]) with climatic variations. A canal (built 1873–95) connects it to the Rabnitz (Hungarian: Répce) River, which is a tributary of the Danube. A heavy reed growth along the lake's shores supports many species of rare and migratory birds, which are protected by an international sanctuary and a biological station. The lake provides raw materials for the cellulose industry and serves as a recreation area for nearby Vienna. Major lakeside towns are Neusiedl, Podersdorf, and the wine centre of Rust.

Neusiedler Lake from Burgenland, Austria

Neusohl (Slovakia): *see* Banská Bystrica.

Neuss, city, North Rhine-Westphalia *Land* (state), western Germany. It lies on the west bank of the Rhine, opposite Düsseldorf.

Founded about 12 BC as a Roman fortress (the Novaesium of Tacitus), it was captured by the Franks and renamed Niusa. It was chartered in 1187–90. As the chief town of the northern part of the archbishopric of Cologne, it was unsuccessfully besieged by Charles the Bold in 1474–75. It was sacked by Alessandro Farnese in 1586 and passed to Prussia in 1816. The Church of St. Quirinus (1209), with its Baroque dome (1741), and the town hall (1634–38) were damaged in World War II but have been restored. The 13th-century Obertor (a massive gatehouse, part of the medieval fortifications) houses the Clemens-Sels Museum, and the Zeughaus (1639), or arsenal, is a concert hall.

Neuss is now an important rail junction, port, grain market, and industrial centre. Its harbour is accessible to small oceangoing ships. The city's manufactures include machinery, chemicals, and processed foods. Pop. (1991 est.) 147,019.

Neustadt an der Weinstrasse, formerly NEUSTADT AN DER HAARDT, city, Rhineland-Palatinate *Land* (state), southwestern Germany. It lies on the eastern slope of the Haardt Mountains, at the mouth of the Speyer-Bach. Founded in 1220 and chartered in 1275, its historic buildings include the Casimirianum (the seat of Heidelberg University, 1578–83, now a convention hall), the town hall (formerly a Jesuit college), and the Stiftskirche ("Collegiate Church"), which is a Gothic abbey church dating from the 14th century.

Neustadt is the administrative centre of Rheinhessen-Pfalz district. The city is located in the Weinstrasse ("Wine Route"), the centre of the German wine trade. The Deutsche Weinlesefest ("Wine Festival") is held annually in the city, which is also the site of a training and research institute of viticulture and horticulture. The city's convenient location and picturesque setting at the foot of Mount Kalmit (2,208 feet [673 m]) make it a favourite tourist base. Its other economic activities include food processing and the manufacture of metal products and paper. Pop. (1991 est.) 51,988.

Neustettin (Poland): *see* Szczecinek.

neuston, group of organisms found on top of or attached to the underside of the surface film of water. The neuston includes insects such as whirligig beetles and water striders, some spiders and protozoans, and occasional worms, snails, insect larvae, and hydras. It is distinguished from the plankton, which only incidentally becomes associated with the surface film.

Neustria, during the Merovingian period (6th–8th century) of early medieval Europe, the western Frankish kingdom, as distinct from Austrasia, the eastern kingdom. By derivation, Neustria was the "new" (French *neuf;* German *neu*) land—*i.e.,* the area colonized by the Franks since their settlement in northern Gaul. It corresponded roughly to the area of present France west of the Meuse and north of the Loire rivers. In the 7th century Austrasia and Neustria were rivals, but the victory of Pepin of Herstal, mayor of the palace in Austrasia, over the Neustrians at Tertry (687) assured the ultimate ascendancy of Austrasia. In the later Merovingian period, Neustrian writers used the names Neustria and Francia (France) interchangeably, implying that Neustria formed the heart and core of the Frankish lands. Later, the name Neustria came to denote a much smaller area, and, by the 11th and 12th centuries, it was sometimes used synonymously with Normandy.

Neutra (Slovakia): *see* Nitra.

Neutra, Richard Joseph (b. April 8, 1892, Vienna, Austria—d. April 16, 1970, Wuppertal, W.Ger.), Austrian-born American architect known for his role in introducing the International Style into American architecture.

Neutra, 1968

By courtesy of Dion Neutra, Richard and Dion Neutra Architects and Associates

Educated at the Technical Academy, Vienna, and the University of Zürich, Neutra, with the German architect Erich Mendelsohn, won an award in 1923 for a city-planning project for Haifa, Palestine (now in Israel). Neutra moved to the United States the same year, working briefly for the firm of Holabird and Roche in Chicago and at Taliesin in Spring Green, Wis., with Frank Lloyd Wright.

Neutra's most important early work was the Lovell House, Los Angeles (1927–29), which has glass expanses and cable-suspended balconies and is stylistically similar to the work of Le Corbusier and Ludwig Mies van der Rohe in Europe. Throughout the 1930s he designed houses in the International Style.

Shortly after World War II, Neutra created his most memorable works: the Kaufmann Desert House, Palm Springs, Calif. (1946–47), and the Tremaine House, Santa Barbara, Calif. (1947–48). Elegant and precise, these houses are considered exceptionally fine examples of the International Style. Carefully placed in the landscape, Neutra's houses often have patios or porches that make the outdoors seem part of the house. He believed that architecture should be a means of bringing man back into harmony with nature and with himself and was particularly concerned that his houses reflect the way of life of the owner.

During the 1950s and '60s Neutra's works included office buildings, churches, buildings for colleges and universities, housing projects, and cultural centres. After 1966 he was in partnership with his son, the firm name becoming Richard and Dion Neutra Architects and Associates. He died while on a tour of Europe. Among his voluminous writings are *Survival Through Design* (1954), *Life and Human Habitat* (1956), and an autobiography, *Life and Shape* (1962).

Neutral, French NEUTRE, a confederacy of Iroquoian-speaking Indians who lived in what are now southern Ontario, western New York, northeastern Ohio, and southeastern Michigan. They received their name from the French because they were neutral in the known wars between the Iroquois and the Huron before the mid-17th century. Their neutrality did not extend to all other tribes, and during the early 17th century the Neutral were at war with groups to the west, particularly the Potawatomi. Neutral villages of bark-covered houses were situated on high, defensible ground; their economy was based on agriculture, supplemented by game, which was plentiful in this area.

During the war between the Huron and the Iroquois in 1648–49, the Neutral attempted to gain favour with the Iroquois by seizing those Huron who had sought refuge with them as well as other Huron; the Iroquois nevertheless attacked and destroyed the Neutral in 1650–51. The last mention of them as an independent group was a report of 800 members of the tribe living in the vicinity of Detroit, Mich., in 1653. The remainder were either killed or absorbed by the Iroquois.

neutral monism, in the philosophy of mind, theories that hold that mind and body are not separate, distinct substances but are composed of the same sort of neutral "stuff."

David Hume, an 18th-century Scottish skeptic, developed a theory of knowledge that led him to regard both minds and bodies as collections of "impressions" ("perceptions"), the primary data of experience. Bertrand Russell, a 20th-century British logician and philosopher, called the neutral entities "sensibilia" and argued that mind and matter are "logical constructions." William James, the American pragmatist, held that the neutral primary stuff is not a series of atomistic perceptions but is a "booming, buzzing confusion" that he termed "pure experience," with mind, or consciousness, and body as names of discernible functions within it.

Neutral-monist theories have been criticized as inadequate in their account of either mind or body. Hume himself said (*A Treatise of Human Nature*) that his concept of mind as a bundle of perceptions inadequately accounts for the identity and simplicity of the mind. Others have criticized the notion that physical bodies comprise some sort of primary experience as implicitly idealistic. Hence, the central problem for neutral monism is seen as that of specifying clearly the nature of the neutral stuff without qualifying it in an exclusively mental or physical fashion.

neutralism, also called NONALIGNMENT, in international relations, the peacetime policy of avoiding political or ideological affiliations with major power blocs. The policy was pursued by such countries as India, Yugoslavia, and many of the new states of Asia and Africa during the period of the Cold War (1945–90). These countries refused, for the most part, to align themselves with either the communist bloc, led by the Soviet Union, or the Western bloc, led by the United States. Though neutralist in this sense, they were not neutral or isolationist, for they participated actively in international affairs and took positions on international issues.

Neutralism must also be distinguished from neutrality, which is a term in international law referring to the rules that states are obliged to follow during a legal state of war in which they are not belligerents.

The widespread espousal of neutralism as a distinct policy was a post-World War II phenomenon, but similar policies were followed, though to a lesser extent, prior to that period. The so-called isolationist policy and the avoidance of entangling alliances, advocated for the United States by presidents George Washington and Thomas Jefferson and pursued during the European wars between France and Great Britain following the French Revolution and for a century after the peace of 1815, were analogous to the 20th-century policy of neutralism.

In the second half of the 20th century, many nations took up the position of neutralism. With the meeting at the Bandung Conference (1955) of 29 countries for the purpose of, among other issues, establishing their neutralism, the Nonaligned Movement was conceived. The first meeting of the nonaligned nations was in Belgrade in 1961. A growing number of neutral nations met again in 1964, 1970, and roughly every three years thereafter. The some 100 states that eventually became involved in this movement justified their position on a number of grounds. They declined to assume that the United States, the Soviet Union, or any other country necessarily intended to embark upon aggressive action designed to violate their territorial integrity, and therefore they refused to enter into alliances or collective defense arrangements directed against particular states. The new nations of Asia and Africa, which made up the largest group of neutralist states, were mostly former colonies of the western European powers. These new nations were, on the one hand, wary of permanent and close alignments with these powers in the Western bloc for fear of being drawn into a newer form of dependence; on the other hand, though generally attracted by offers of economic assistance from (and often the anti-Western rhetoric of) various communist countries, they feared that intimate ties with the Soviet Union could also threaten their independence. As a practical matter, a neutralist policy often enabled them to get much-needed economic assistance from both power blocs.

The Nonaligned Movement experienced considerable difficulty in establishing a unified policy on many issues in international affairs. Many of the member nations were enemies (such as Iran and Iraq), and true nonalignment proved an elusive goal. With the end of the Cold War and the breakup of the Soviet Union (1991), neutralism lost much of its usefulness as a guiding principle in many nations' foreign relations.

neutrality, the legal status arising from the abstention of a state from all participation in a war between other states, the maintenance of an attitude of impartiality toward the belligerents, and the recognition by the belligerents of this abstention and impartiality. Under international law this legal status gives rise to certain rights and duties between the neutral and the belligerents.

The laws concerning the rights and duties of neutrality are contained, for the most part, in the Declaration of Paris of 1856, Hague Convention V, 1907 (neutrality in land war), and Hague Convention XIII, 1907 (neutrality in maritime war). One of the first recommendations of the last convention was that, when war breaks out between certain powers, each nation wishing to remain impartial should normally issue either a special or general declaration of neutrality. Such a declaration, however, is not required by international law. A neutral state may, during the course of the hostilities, repeal, change, or modify its position of neutrality, provided that such alterations are applied without bias to all belligerents.

The most important of the rights that result from a state of neutrality is the right of territorial integrity. Belligerents may not use a neutral's territory as a base of operations or engage in hostilities therein. This right applies not only to neutral territory and water but extends to air space above that territory as well. Under the Hague Rules of Air Warfare, 1923 (which never became legally binding), neutrals have the right to defend their air space from passage of belligerent aircraft. The emergence of ballistic missiles and space satellites as tools of warfare, however, has raised questions regarding the extent of a state's upper boundary.

A neutral also has the right to maintain diplomatic communications with other neutral states and with the belligerents; the right to demand compliance with its domestic regulations designed to secure its neutrality; and the right to require belligerents not to interfere with the commercial intercourse of its citizens, unless such interference is warranted by international law.

The events of World Wars I and II foreshadowed a breakdown of some of the basic concepts of neutrality. With the German invasion of Belgium, the Italian invasion of Greece, the British occupation of Iceland, and the passage by the United States of the Lend-Lease Act (1941), the traditional rules of neutrality appeared no longer viable. By the middle of the 20th century new developments in the law of neutrality were evident. (1) The total character of modern war, with its use of economic as well as mechanized means of warfare, has sharply reduced the traditional area of freedom of the neutral. (2) Under the provisions of the Charter of the United Nations, neutrality, as a permissive legal status, disappears for those members that the Security Council "calls upon" or requires in specific instances to take military or other measures of coercion against an aggressor (Articles 41, 48). (3) The socialization of national economies may result in a lessening of neutral trade; many business enterprises that could formerly trade with belligerents as private traders could no longer legally do so as state enterprises.

Neutre (people): *see* Neutral.

neutrino, type of fundamental particle with no electric charge, little or no mass, and one-half unit of spin. Neutrinos belong to the family of particles called leptons, which are not subject to the strong nuclear force. There are three types of neutrino, each associated with a charged lepton—*i.e.,* the electron, muon, and tau.

The electron-neutrino was proposed in 1930 by the Austrian physicist Wolfgang Pauli to explain the apparent loss of energy in the process of beta decay, a form of radioactivity. The Italian-born physicist Enrico Fermi further elaborated (1934) the proposal and gave the particle its name. An electron-neutrino is emitted along with a positron in positive beta decay, while an electron-antineutrino is emitted with an electron in negative beta decay.

Neutrinos are the most penetrating of subatomic particles because they react with matter only through the weak interaction. Neutrinos do not cause ionization, because they are not electrically charged. Only 1 in 10 billion, traveling through matter a distance equal to the Earth's diameter, reacts with a proton or neutron. Electron-neutrinos were first experimentally observed in 1956, when a beam of antineutrinos from a nuclear reactor produced neutrons and positrons by reacting with protons.

Another type of neutrino, produced when pi mesons (pions) decay, was conclusively shown (1962) to be a different species: the muon-neutrino. Although they are as unreactive as the other neutrinos, muon-neutrinos were found to produce muons but never electrons when they react with protons and neutrons. In the mid-1970s, particle physicists discovered yet another variety of charged lepton, the tau. A tau-neutrino and tau-antineutrino are associated with this third charged lepton.

All types of neutrino have masses much smaller than those of their charged partners, if indeed they have any mass at all. For example, experiments show that the mass of the electron-neutrino must be less than 0.0004 that of the electron. There is, however, no compelling theoretical reason for the mass of the neutrino to be exactly zero. Indeed, the shortfall in the number of neutrinos detected on Earth from the nuclear reactions in the core of the Sun (the so-called mystery of the missing solar neutrinos) may well be explicable if one or more of the neutrino types has a small mass. *See also* lepton.

neutron, one of the constituent particles of every atomic nucleus except ordinary hydrogen; it has no electrical charge and its mass is nearly 1,840 times that of the electron.

A brief treatment of neutrons follows. For full treatment, *see* MACROPAEDIA: Atoms: Their Structure, Properties, and Component Particles.

Neutrons and protons constitute more than 99.9 percent of an atom's mass. These two types of nuclear particles, commonly called nucleons, interact through the so-called strong force and bond in various proportions to form the different atomic species of the chemical elements. The neutron possesses an intrinsic angular momentum (*q.v.*) and a magnetic moment—*i.e.,* it behaves like a minute magnet in ways that suggest that it is an entity of moving electric charges. Like the proton and other baryons, the neutron appears to consist of three quarks, extremely small subatomic particles that are thought to be among the fundamental components of matter (*see also* quark).

A free neutron—one that is not incorporated into a nucleus—is subject to radioactive decay of a type called beta decay. It can break down into a proton, an electron, and an antineutrino (the antimatter counterpart of the neutrino, a particle with no charge and little or no mass). Because it readily disintegrates in this manner, the neutron does not exist in nature in its free state but must be produced artificially. Since free neutrons are electrically neutral, they pass unhindered through the electrical fields within atoms and so constitute a penetrating form of radiation, interacting with matter almost exclusively through relatively rare collisions with atomic nuclei.

The neutron was discovered in 1932 by the English physicist James Chadwick. Within a few years after this discovery, many investigators throughout the world were studying the properties and interactions of the particle. It was found that various elements, when bombarded by neutrons, undergo fission—*i.e.,* a type of nuclear reaction that occurs when the nucleus of a heavy element is split into two nearly equal fragments. During this reaction each fissioned nucleus gives off additional free neutrons, as well as those bound to the fission fragments. In 1942 a group of American researchers, under the leadership of the physicist Enrico Fermi, demonstrated that enough free neutrons are produced during the fission process to sustain a chain reaction. This development led to the construction of the atomic bomb. Subsequent technological breakthroughs resulted in the large-scale production of electric power from nuclear energy. The absorption of neutrons by nuclei exposed to the high neutron intensities available in nuclear reactors has also made it possible to produce large quantities of radioactive isotopes useful for a wide variety of purposes (*see* radioactive isotope). Furthermore, the neutron has become an important tool in pure research. Knowledge of its properties and structure is essential to an understanding of the structure of matter in general. Nuclear reactions induced by neutrons are valuable sources of information about the atomic nucleus and the force that binds it together.

neutron, thermal: *see* thermal neutron.

neutron bomb, also called ENHANCED RADIATION WARHEAD, specialized type of small thermonuclear weapon that produces minimal blast and heat but which releases large amounts of lethal radiation. The neutron bomb delivers blast and heat effects that are confined to an area of only a few hundred yards in radius. But within a somewhat larger area it throws off a massive wave of neutron and gamma radiation, which can penetrate armour or several feet of earth. This radiation is extremely destructive to living tissue. Because of its short-range destructiveness and the absence of long-range effect, the neutron bomb would be highly effective against tank and infantry formations on the battlefield but would not endanger cities or other population centres only a few miles away. It can be carried in a Lance missile or delivered by an 8-inch (200-millimetre) howitzer, or possibly by attack aircraft.

In strategic terms, the neutron bomb has a theoretical deterrent effect: discouraging an armoured ground assault by arousing the fear of neutron bomb counterattack. The bomb would disable enemy tank crews in minutes, and those exposed would die within days. U.S. production of the bomb was postponed in 1978 and resumed in 1981.

neutron capture, type of nuclear reaction in which a target nucleus absorbs a neutron (uncharged particle), then emits a discrete quantity of electromagnetic energy (gamma-ray photon). The target nucleus and the product nucleus are isotopes, or forms of the same element. Thus phosphorus-31, on undergoing neutron capture, becomes phosphorus-32. The heavier isotope that results may be radioactive, so that neutron capture, which occurs with almost any nucleus, is a common way of producing radioactive isotopes.

Neutron capture is also named neutron-gamma, or (η,γ), reaction from the bombarding particle (η for neutron) and the emitted particle (γ for gamma-ray photon) and sometimes called neutron radiative capture because of the prompt emission of only electromagnetic radiation. Among the natural elements, boron, cadmium, and gadolinium are the best absorbers of slow neutrons by the capture process.

neutron optics, branch of physics dealing with the wave behaviour of neutrons, the electrically neutral subatomic particles that are present in all atomic nuclei except those of ordinary hydrogen. A beam of free neutrons, produced in nuclear reactors by ejecting neutrons from the core of atoms in reactions such as fission, is reflected, scattered, or diffracted by materials on which the beam is directed.

In particular, in contrast to fast neutrons, which act more exclusively as particles when they strike materials, slow neutrons have longer wavelengths of about 10^{-10} metre (or about an angstrom unit), which corresponds to the distance between atoms in crystals. Slow neutrons scattered by the atoms in solids undergo mutual interference (similar to the behaviour of X rays and light) to form diffraction patterns from which details of crystal structure and magnetic properties of solids are deduced.

neutron star, any of a class of extremely dense, compact stars thought to be composed primarily of neutrons. Neutron stars are typically about 20 km (12 miles) in diameter but have a mass roughly the same as the Sun's. Thus, their mean densities are extremely high—about 10^{14} times that of water. This approximates the density inside the atomic nucleus, and in some ways a neutron star can be conceived of as a gigantic nucleus held together by its own gravity. In the centre of the star, where the pressure is greatest, the material is thought to consist mainly of hyperons and mesons. The intermediate layers are mostly neutrons and are probably in a "superfluid" state. The outer 1 km (0.6 mile) is solid, in spite of the high temperatures, which might be as high as 1,000,000 K. The surface of this solid layer, where the pressure is lowest, is composed of an extremely dense form of iron.

Another important characteristic of neutron stars is the presence of very strong magnetic fields, upwards of 10^{12} gauss, which causes the surface iron to be polymerized in the form of long chains of iron atoms. The individual atoms become compressed and elongated in the direction of the magnetic field and can bind together end-to-end, forming "whiskers," which probably extend out from the surface. Below the surface, the pressure becomes much too high for individual atoms to exist.

The discovery of pulsars in 1967 provided the first evidence of the existence of neutron stars. Pulsars are generally believed to be rotating neutron stars. The very short periods of the Crab and Vela pulsars (33 and 83 milliseconds, respectively) rule out the possibility that they might be white dwarfs. The pulses appear to result from electrodynamic phenomena generated by their rotation and their strong magnetic fields, as in a dynamo. There is also evidence that certain binary X-ray sources, such as Hercules X-1, contain neutron stars. Cosmic objects of this kind appear to emit X rays by compression of material from companion stars accreted onto their surfaces.

Most investigators believe that neutron stars are formed by supernova explosions in which the collapse of the central core of the supernova is halted by rising neutron pressure as the core density increases to about 10^{15} grams per cubic cm. If the collapsing core is more massive than about two solar masses, however, a neutron star cannot be formed, and the core would presumably become a black hole (*q.v.*).

Neuwied, city, Rhineland-Palatinate *Land* (state), western Germany, on the right bank of the Rhine (there bridged to Weissenthurm) near the Wied stream, just northwest of Koblenz. Founded in 1653 by the Count of Wied for religious refugees, it was chartered in 1662 and became a flourishing commercial and craftsman's town in the 18th century. Seat of the county (principality after 1784) of Wied-Neuwied until 1806, when it was included in the duchy of Nassau, the town passed to Prussia in 1815. In 1904 it absorbed the village of Heddesdorf, where Roman fortifications have been excavated. One of the city's historic landmarks is the Baroque castle (1707–57) of the princes of Wied. Industries include iron and steel production, engineering, and the manufacture of wood products and chemicals and of pumice building materials made from the local volcanic sand. Pop. (1998 est.) 67,566.

Consult the INDEX *first*

Neva, Battle of the (July 15, 1240), military engagement in which the Novgorod army defeated the Swedes on the banks of the Neva River; in honour of this battle the Novgorod commander, Prince Alexander Yaroslavich, received the surname Nevsky. The conflict between the Swedes and the Novgorodians was based largely on Swedish efforts to expand into northwestern Russia and to force the conversion of the Russians from Greek Orthodoxy to Roman Catholicism. Calculating that the Mongol conquest of Russia (1240) had deprived Novgorod of military support from other Russian cities, the Swedes, led by Earl Birger, landed at the Neva's mouth and attempted to block Novgorod's approach to the Baltic Sea. Alexander led an army against them and destroyed most of the Swedish force. Birger sailed back to Finland with the few Swedish survivors.

Neva River, river in St. Petersburg *oblast* (province), northwestern Russia. The river issues from Lake Ladoga at Petrokrepost and flows 46 miles (74 km) west to the Gulf of Finland in the Baltic Sea. Its drainage basin covers 109,000 square miles (282,000 square km) and includes Lakes Ladoga, Onega, and Ilmen and the Svir and Volkhov rivers. Freeze-up lasts from early December to late April. The river derives importance not only from its navigability by large ships—it forms part of the White Sea–Baltic and Volga-Baltic waterways—but also from the presence of St. Petersburg city at its mouth.

Nevada, constituent state of the United States of America lying in the arid Great Basin portion of the western mountain region of the country. The capital is Carson City.

A brief treatment of Nevada follows. For full treatment, *see* MACROPAEDIA: United States of America.

Separated by the Sierra Nevada from California on the west, Nevada is also bounded by Oregon and Idaho to the north, Utah to the east, and Arizona to the southeast. Nevada extends about 480 miles (720 km) north to south and 320 miles (515 km) east to west.

Human settlement in the area has spanned more than 20,000 years. Cave dwellers left picture writings on rocks in the Valley of Fire in southern Nevada, and Basket Makers and Pueblo Indians also flourished there. At the time of initial European contact, the main Indian groups in the area were the Mohave, Paiute, Shoshoni, and Washoe.

Spanish missionaries from New Mexico and Hudson Bay Company fur traders traversed the region in the 18th and early 19th centuries. During the 1830s and '40s American settlers and gold seekers traveled across the Great Basin to reach California. Nevada came under U.S. sovereignty through the Mexican Cession of 1848. The discovery of the Comstock Lode, a rich deposit of silver, in 1859 at Virginia City brought a rapid influx of settlers and prospectors, prompting the formation of the Nevada Territory in 1861. In need of silver and Senate votes during the American Civil War, the federal government encouraged Nevadans to seek admission to the Union. Congress accepted the proposed state constitution and voted Nevada the 36th state in 1864. The state prospered and declined through boom and bust cycles of mining and cattle raising until the 1930s, when a combination of legal gambling, reduced divorce requirements, and the construction of the Hoover Dam established the basis for economic growth. In the 1950s the state became the main testing site for atomic-energy experiments and the site of major military munitions depots. About 85 percent of Nevada's land is owned by the federal government.

Most of Nevada lies within America's Basin and Range Province. The Great Basin section of this area is characterized by rugged parallel mountain ranges, long, flat valleys, and sandy, alkaline deserts. The flow of the state's rivers is sustained largely by melting winter snows and spring rainfall. Almost all drain into alkaline lakes or shallow mudflats that have no outlets and largely evaporate during the summer. The Colorado River flows through dammed reservoirs along the southeastern boundary.

The climate is semiarid and arid. The high Sierra Nevada along the western boundary cause clouds of Pacific origin to drop their moisture before reaching Nevada. Rainfall varies from 4 inches (100 mm) in the southeast to 24 inches (610 mm) in the northwestern mountains. Temperatures vary from an average July high in the south of 86° F (30° C) to an average January low in the north of 24° F (−4° C). Climate and soil conditions are not suitable for cultivation without irrigation, but ranching and forage production is well developed in most valleys.

Nevada has experienced rapid population growth since the 1950s. Nonetheless, it remains one of the least densely populated states. About 85 percent of the population is classified as urban, and most of the urban population is concentrated in the metropolitan areas of the two largest cities, Las Vegas and Reno. Almost 90 percent of the population is white; only a small percentage is black. About one-half of the 13,200 American Indians live on reservations scattered across the state. Some 54,000 Nevadans are Spanish-speaking, and several thousand others trace their ancestry to Basque sheepherders.

Although the traditional bases of Nevada's economic life, mining and agriculture, remain important, they are far overshadowed by tourist-supported trade and service industries and governmental activity. A surge in gold-mining activities occurring during the 1980s increased the state's mineral-production value, reversing the trend caused by the virtual shutdown of the copper industry in 1977. Other important minerals mined are silver, barite, and mercury. Tourism and its related activities in the Las Vegas and Reno areas constitute the state's leading industry. Long centres of legal and state-regulated gambling, these cities are also major convention and entertainment centres. Liberal divorce laws made Nevada a place for quick and simple divorces. The rural counties of central Nevada have legalized, regulated prostitution. Las Vegas and Reno offer excellent opportunities for scenic and recreational activities at Lake Mead and Lake Tahoe. Military and defense installations and other government agencies are major employers in the state.

Nevada's tourism industry is heavily dependent on air transportation, and both Las Vegas and Reno have international airports. Three major railroads and two interstate highways cross Nevada from east to west.

Nevadans traditionally have mingled rural conservatism and the individualism of the Old West. With the sophisticated resort industries and the influx of residents, however, Las Vegas and Reno have developed marked metropolitan characteristics. Both cities support symphony orchestras, have commercial and public art galleries, and regularly feature famous entertainers. The University of Nevada at Reno and the University of Nevada, Las Vegas, sponsor lectures, concerts, and theatrical productions. Nevada's frontier heritage is commemorated at festivals, pageants, parades, and rodeos. The partially restored ghost town of Virginia City, most famous of all the western mining camps, and the old federal mint building (Nevada State Museum) in Carson City emphasize the state's mining traditions. Area 110,561 square miles (286,352 square km). Pop. (2000) 1,998,257.

Nevadan orogeny, a mountain-building event in the Sierra Nevada region of eastern California, believed to have taken place in the latest Jurassic time (about 144 million years ago). The term now is generally expanded for numerous orogenic pulses in the western portion of the Cordilleran Geosyncline of western North America that range in age from Late Jurassic to Early Cretaceous (from about 163 million to 97.5 million years ago).

Evidence for the early phases of the Nevadan orogeny consists of Late Jurassic igneous intrusions and folding and thrust faulting on the western slope of the Sierra Nevada and in the Klamath Mountains of northern California. Medial and late phases of the Nevadan orogeny are represented by the formation of vast batholiths (igneous bodies greater than about 104 square km [40 square miles] in area) of Early Cretaceous age in southern California, the Sierra Nevada, in Idaho, and in British Columbia. Folding and faulting of strata in western Nevada also may be attributed to the Nevadan orogeny.

The Nevadan orogeny may have been the result of underthrusting of the western portion of the North American Plate by oceanic crust, along a former oceanic trench located in the western portion of the Cordilleran Geosyncline.

Nevado de Toluca National Park, park in Mexico *estado* ("state"), central Mexico. It is situated in the municipality of Zinacantepec, on the Mexico–Toluca–Guadalajara highway west of Mexico City. Established in 1936, it has an area of 259 square miles (671 square km). The park lies in the Nevado de Toluca (or Zinantecatl) Mountains, which rise above 15,025 feet (4,580 m). Among the park's chief features are an extinct, snowcapped volcano 10,381 feet (3,164 m) high, in the crater of which are picturesque lagoons that reflect glaciers and clouds. The crater's rim is reached by a road that is said to be the highest in the country. The lower slopes of the mountains are heavily wooded with pine and oyamel.

Nevāʾī, ʿAlī Shīr (Turkish poet): *see* Navāʾī, (Mīr) ʿAlī Shīr.

névé (snow): *see* firn.

Nevele Pride (foaled 1965), American harness racehorse (Standardbred), the fastest trotter in history. He won 57 victories out of the 67 races he entered, earning more than $870,000 in his career of three seasons. Foaled by Thankful and sired by Star's Pride, Nevele Pride was irritable and eccentric, occasionally kicking and biting dignitaries as well as his grooms. Trained and driven by Stanley Dancer, he won 26 of his 29 contests as a two-year-old and set a world record for the mile at Lexington, Ky. He went on to set further records as a three-year-old, and again as a four-year-old. In 1969, running against time at Indianapolis, Ind., he beat Greyhound's 31-year-old world record by running the mile in 1:54$\tfrac{4}{5}$. In 1968 Nevele Pride won the trotting Triple Crown: the Hambletonian, the Kentucky Futurity, and the Yonkers Futurity. In 1969 his owners Louis Resnick and Nevele Acres sold Nevele Pride to the Stoner Creek Stud of Lexington, Ky., for the highest price ever paid for a trotter, $3,000,000. In his career Nevele Pride was named Harness Horse of the Year for three consecutive years and established eight world trotting records, including mile records for a five-eighths-mile track (1:58), mile track (1:54$\tfrac{4}{5}$) and half-mile track (1:56$\tfrac{4}{5}$ sec). He raced the last two years with a hairline crack in his left front pastern. In 1975 his foal Nevele Thunder was syndicated for a then record $1,500,000.

Nevelson, Louise, *née* BERLIAWSKY (b. Sept. 23(?), 1899/1900, Kiev—d. April 17, 1988, New York City), American sculptor known for her large, monochromatic abstract sculptures and environments in wood and other materials.

In 1905 she moved with her family from the Ukraine to Rockland, Me. She married businessman Charles Nevelson in 1920 and later left her husband and child to pursue her artistic ambitions. In 1929 she began studying with Kenneth Hayes Miller at the Art Students League in New York City, and in 1931 she studied with Hans Hofmann in Munich.

Nevelson's first individual exhibition was held in New York City in 1941. Her early figurative sculptures in wood, terra-cotta, bronze, and plaster (*e.g.,* "Ancient Figure," 1932) show a preoccupation with blockish, interlocking masses that recall the sculpture of Central America (where she traveled in the 1940s) and anticipate her mature style. It was also in the figurative work that her characteristic found objects (objets trouvés) first appeared, here as stylized features and appendages (*e.g.,* "The Circus Clown," 1942).

After enduring years of poverty and critical neglect, Nevelson by the 1950s had both developed her mature sculptural style and begun to earn significant critical recognition. By this time she was working almost exclusively with abstract forms. She is best-known for works dating from this period; these consist of open-faced wooden boxes that are stacked to make freestanding walls. Within the boxes are displayed carefully arranged and highly suggestive collections of abstract-shaped objects mingled with chair legs, pieces of balustrades, and other found objects and pieces of bric-a-brac. The boxes and their contents are painted a single colour, usually black, though she coloured sculptures in white or gold as well. These accumulations of architectural debris and vaguely recognizable objects elicit a sense of mystery and antiquity while also achieving infinitely varied formal tensions between the objects so displayed, thanks to her skill at arranging them. Many of these pieces bear mystical titles (*e.g.,* "Sky Cathedral," 1958; "Silent Music II," 1964; "Sky Gate—New York," one of her largest wall sculptures, World Trade Center, New York City, 1978).

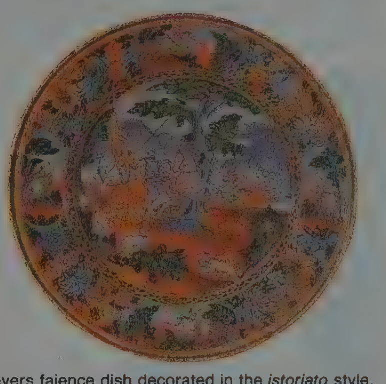
Major museums began purchasing Nevelson's wall sculptures in the late 1950s, and in the following decades she won recognition as one of the foremost sculptors of the second half of the 20th century. In 1967 the first major retrospective of her work was presented at the Whitney Museum of American Art in New York City. During the 1970s and '80s Nevelson expanded the variety of materials used in her sculptures, incorporating objects made of aluminum, Plexiglas, and Lucite.

Nevers, city, capital of Nièvre *département,* Bourgogne *région,* central France, south-southeast of Paris. Situated on the high right bank of the Loire River at its confluence with the Nièvre River, it is a typical old provincial town that has been modernized after the establishment of new industries in the vicinity. At the end of the Roman era it was known as Nevirnum, a name believed to be a contraction of its earlier Roman name Noviodunum Aeduorum. In the Middle Ages it changed hands among the powerful families of Europe several times. In the 16th century it was acquired by the Gonzaga family of Mantua who introduced the manufacture of ceramics into Nevers. The cathedral of Saint-Cyr-et-Sainte-Juliette, built between the 11th and 16th centuries, has been restored after being severely damaged by bombing in World War II. The former palace of the dukes of Nevers now houses the law courts. The chapel of the Saint-Gildard convent contains the body of St. Bernadette Soubirous, the visionary of Lourdes, who lived at Nevers from 1860 to 1879. The modern industrial economy of the city includes electrical and nonelectrical machinery, railway equipment, rubber, and the traditional ceramics, which are somewhat in decline. Pop. (1982) 42,768.

Nevers, Ernie, byname of ERNEST ALONZO NEVERS (b. June 11, 1903, Willow River, Minn., U.S.—d. May 3, 1976, San Rafael, Calif.), American collegiate and professional football and baseball player, who was considered one of the greatest football players of all time.

Nevers played at tackle for Superior (Wis.) High School, and as a fullback at Stanford University (Calif.) he was called by Pop Warner the greatest player he had ever coached. He was All-American (1925) and won 11 letters at Stanford, in baseball and basketball as well as in football. He played professional football with the National Football League (NFL) Duluth Eskimos (1926–28) and with the NFL Chicago Cardinals as a player-coach (1929–31), after which he retired. During his brief career, he was a brilliant iron-man player. His 40 points (six touchdowns, four conversions) scored in a game against the Chicago Bears in 1929 remained a league record in the 1980s. Nevers also played professional baseball as a pitcher with the American League St. Louis Browns (1926–28). After retirement from football as a player, he was coach at Lafayette College (Easton, Pa.; 1936) and served on the coaching staff at the University of Iowa (Iowa City; 1937). He served in the Marine Corps during World War II and after the war was a businessman in San Francisco. He was elected to the football Hall of Fame in 1963.

Nevers faience, French tin-glazed earthenware introduced from Italy to Nevers in 1565, by two brothers named Corrado. As the Conrade family, they and their descendants dominated Nevers faience manufacture for more than a century. The earliest authenticated piece of Nevers, dated 1589, is a large oval polychrome dish depicting a mythological subject, the triumph of Galatea.

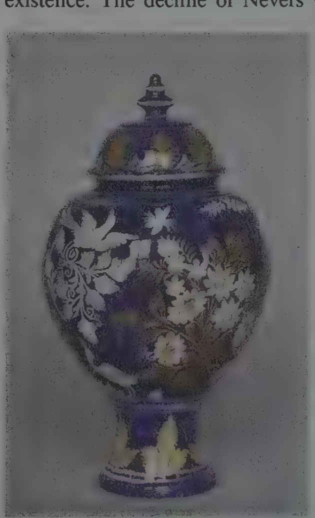


Nevers faience dish decorated in the *istoriato* style, mid-17th century; in the Victoria and Albert Museum, London

By courtesy of the Victoria and Albert Museum, London

Although inspired by Italian models, this first period of Nevers faience already showed a freedom in interpretation that was to grow more distinctive in the post-Conrade period, after 1674. Nevers became the first French centre to use Chinese decorative motifs. Nevers also shows the Chinese influence in choice of colour, though it added a distinctive manganese purple to the original blue and white of the Chinese ware of the time.

At almost the same period, Nevers produced vases in the "Persian manner" (*Bleu Persan*); these too were free interpretations. Besides these costly wares, Nevers produced cheaper ones: the so-called *faience parlante,* pots and plates illustrated with scenes from everyday life treated in a satirical manner, and the *faience patriotique,* bearing political slogans of the time. Only six factories remained in 1797 out of the 11 in 1743; two of these are still in existence. The decline of Nevers was caused



Nevers faience jar in the "Persian manner," second half of the 17th century; in the Victoria and Albert Museum, London

less by the Revolution than by the competition of cheaper English earthenware.

Nevers glass figure, any of the ornamental glassware made in Nevers, Fr., from the late 16th century through the early 19th. Only a few inches high, they have been mistaken for fine porcelain but were made of glass rods and tubes and were often made on a wire armature. The subjects are religious, mythological, historical, allegorical, or anecdotal. Nevers glass owes its origins, like Nevers faience, to an influx of Italian workers in the 16th century, notably to the Sarode family. The first known French glassworkers in Nevers were Jean Prestereau (1595) and his son Léon. Allegedly, Louis XIII, as a child, played with toy glass animals from Nevers. Similar glass objects were made elsewhere in France; and often it is difficult to distinguish Nevers wares, though the figures are, like Nevers faience, generally dull yellow, white, red, or blue.

Neves, city, Rio de Janeiro state, Brazil, on the eastern shore of the Baía de Guanabara opposite Rio de Janeiro city, just southwest of São Gonçalo. Originally a Guarulhos Indian village, Neves in 1566 became the site of one of the first chapels constructed in the Baía de Guanabara region, the Nossa Senhora de Neves (Our Lady of the Snows) chapel, built by João Afonso Malheiro. A suburb of Rio de Janeiro as well as of Niterói, the largest eastern bay city, just to the south, Neves, together with São Gonçalo to the northeast, now constitutes the most important suburban industrial centre in the Greater Rio area. It has an important nonmetallic-mineral industry (extraction and processing of barite, quartz, ceramic clays, granite dimension stone), with a large metallurgical plant and shipyards; other industries produce machinery, rubber, and chemical and pharmaceutical products. Railroads and highways link Neves with downtown Niterói as well as with inland communities. It is the terminus of a railroad that runs eastward to Cape Frio. Pop. (1980 prelim.) 138,130.

Nevi'im (Hebrew), English THE PROPHETS, the second division of the Hebrew Bible, or Old Testament, the other two being the Torah (the Law) and the Ketuvim (the Writings, or the Hagiographa). In the Hebrew canon the Prophets are divided into (1) the Former Prophets (Joshua, Judges, Samuel, and Kings) and (2) the Latter Prophets (Isaiah, Jeremiah, Ezekiel, and the Twelve, or Minor, Prophets: Hosea, Joel, Amos, Obadiah, Jonah, Micah, Nahum, Habakkuk, Zephaniah, Haggai, Zechariah, and Malachi).

This canon, though somewhat fluid up to the early 2nd century BC, was finally fixed by a council of rabbis at Jabneh (Jamnia), now in Israel, *c.* AD 100.

The Protestant canon follows the Septuagint, the Greek version of the Old Testament. It calls the Former Prophets the Historical Books, and subdivides two of them into I and II Samuel and I and II Kings. Some Roman Catholic and Eastern Orthodox versions further divide Kings into four books. I and II Maccabees are also included in the Roman and Eastern canons as historical books.

The Prophets in the Protestant canon include Isaiah (which appears in two books in some Catholic versions), Jeremiah, and Ezekiel from the Hebrew Latter Prophets. The Minor Prophets (The Twelve) are treated as 12 separate books; thus the Protestant canon has 17 prophetic books. The Roman Catholics accept the book of Baruch, including as its 6th chapter the Letter of Jeremiah, both considered apocryphal by Jews and Protestants.

Neville, John: *see* Northumberland, John Neville, earl of.

Neville, Richard: *see* Warwick, Richard Neville, 1st (or 16th) earl of.

Neville's Cross, Battle of (Oct. 17, 1346), English victory over the Scots—under David II—who, as allies of the French, had invaded England in an attempt to distract Edward III from the Siege of Calais (France). Edward, however, had foreseen the invasion and left a strong force in the northern shires. The battle took place near Durham and resulted in a decisive defeat for the Scots. David was captured, southern Scotland was occupied, and the English were able to pursue the French war. David remained a prisoner of the English until 1357.

Nevin, Ethelbert Woodbridge (b. Nov. 25, 1862, Edgeworth, Pa., U.S.—d. Feb. 17, 1901, New Haven, Conn.), U.S. composer of light songs and piano pieces.

Nevin studied in New York City, Boston, and Berlin, first appearing as a pianist in Pittsburgh (1886) and later in Boston, Chicago, New York City, and other U.S. cities. His early songs on English and German texts were influenced by Schubert and Schumann. His later pieces, in a lighter style, include the much-loved "Rosary" (1898) and "Mighty lak' a Rose" (1900). His best known piano piece was "Narcissus" (1891), from the *Water Scenes*.

His brother Arthur Finley Nevin (1871–1943), a composer and conductor, did research on the music of the Blackfoot Indians and used this music in his opera *Poia* (Berlin, 1910).

Nevin, John Williamson (b. Feb. 20, 1803, Strasburg, Pa., U.S.—d. June 6, 1886, Lancaster, Pa.), U.S. Protestant theologian and educator who contributed to the "Mercersburg theology"—a movement that attempted to counter the popular Protestant revivalism of antebellum America.

After graduating from the Princeton Theological Seminary in 1826, Nevin taught there and at the Western Theological Seminary before teaching at the Mercersburg Seminary (Pa.), a German Reformed institution (1840–53). He also headed Marshall College (1841–53), teaching at Franklin and Marshall College after its merger in 1853 and serving as president from 1866 to 1876.

In 1843 Nevin published *The Anxious Bench,* an influential criticism of the revivalism and disregard for confessional traditions of such evangelists as Charles Grandison Finney. Nevin argued for the importance of church life and the sacramental side of Christianity, particularly for the importance of the Roman Catholic doctrines of Baptism and the Eucharist. These ideas, expressed in the *Mercersburg Review,* which he co-founded and edited from 1849 to 1853, were the foundation of the Mercersburg theology, a philosophy also influenced by F.A. Rauch (1806–41) and Philip Schaff (1819–93).

Nevin's other major writings include *Biblical Antiquities,* 2 vol. (1827); *The Mystical Presence* (1846); and *History and Genius of the Heidelberg Catechism* (1847). A biography by Theodore Appel, *The Life and Work of John Williamson Nevin,* was published in 1889.

Nevinnomyssk, city, Stavropol *kray* (region), western Russia, on the Kuban River at the mouth of the Bolshoy (Great) Zelenchuk River. Until the mid-1950s it was an agricultural market town, but in 1962 a chemical complex utilizing nearby natural gas reserves was constructed. A fertilizer plant was opened in 1962, and enlarged in 1965. Since 1968 plastics and chemical fibres have been manufactured. Nevinnomyssk is a rail centre, with freight yards and workshops; it is also the starting point of the Nevinnomyssk Canal, which provides irrigation to Stavropol and Krasnodar *kray* and Rostov *oblast*. Pop. (1997 est.) 133,000.

Nevins, Allan (b. May 20, 1890, Camp Point, Ill., U.S.—d. March 5, 1971, Menlo Park, Calif.), U.S. historian, author, and educator, known especially for his eight-volume history of the American Civil War and his biographies of American political and industrial figures. He also established the country's first oral history program.

Nevins was raised on a farm in western Illinois and educated at the University of Illinois. While completing postgraduate studies there, he wrote his first book, *The Life of Robert Rogers* (1914), about the Colonial American frontier soldier who fought on the Loyalist side. After graduation Nevins joined the New York *Evening Post* as an editorial writer and for nearly 20 years worked as a journalist. During this period he also developed his credentials as a historian; he compiled and edited a collection of documents entitled *American Social History as Recorded by British Travellers* (1923); wrote two works on U.S. history, *The American States During and After the Revolution, 1775–1789* (1924) and *The Emergence of Modern America, 1865–1878* (1927); and produced a biography of explorer John Charles Frémont, *Frémont, The West's Greatest Adventurer* (1928).

In 1928 he accepted a post at Columbia University (New York City), where he remained for the next 30 years. While at Columbia Nevins produced an impressive body of work, including two Pulitzer Prize-winning historical biographies: *Grover Cleveland, A Study in Courage* (1932) and *Hamilton Fish, The Inner History of the Grant Administration* (1936). In 1948 he inaugurated the oral history movement in the United States, establishing at Columbia a project for preserving on tape interviews with notable figures whose views of current affairs would interest future historians.

Mandatory retirement from the Columbia faculty (1958) ended neither his career as a teacher nor his scholarly contributions as a historian. Having established himself as a leading authority on the American Civil War with the major portion of his eight-volume work—*Ordeal of the Union,* 2 vol. (1947), *The Emergence of Lincoln,* 2 vol. (1950), and *The War for Union,* 4 vol. (1959–71)—Nevins headed the nation's Civil War Centennial Commission (1961–66) and helped to edit the commission's 15-volume Impact Series. He joined the Huntington Library, San Marino, Calif., served as a visiting professor at the University of Oxford (1964–65), and wrote the final volumes of his Civil War series.

Among his other works are *John D. Rockefeller, The Heroic Age of American Enterprise,* 2 vol. (1940; rewritten and expanded as *A Study in Power: John D. Rockefeller, Industrialist and Philanthropist,* 1953); a three-volume work (in collaboration with Frank E. Hill) on Henry Ford and the Ford Motor Company; and, with Henry Steele Commager, *America, The Story of a Free People* (1942).

Nevison, John, also called WILLIAM NEVISON, Nevison also spelled NEVINSON (b. 1630/40, Yorkshire, Eng.—d. March 15, 1685, Knavesmire, near York), Yorkshire highwayman of Restoration England, made famous in ballads and folklore.

Beginning as a youthful thief, Nevison furthered his escapades in Holland, where he was arrested for thievery and imprisoned, escaped, fought with English regiments in Flanders, and then deserted for England. In Yorkshire he became an extortioner and highwayman, eventually in partnership with Thomas Tankard and Edward Bracy. Arrested more than once, he managed reprieves and escapes; but, betrayed by an inn mistress, he was again arrested, tried, and hanged at Knavesmire.

Nevsky, Aleksandr (prince of Novgorod): *see* Alexander Nevsky, Saint.

nevus, plural NEVI, congenital skin lesion, or birthmark, caused by abnormal pigmentation or by proliferation of blood vessels and other dermal or epidermal structures. Nevi may be raised or may spread along the surface of the skin. In other types, such as the blue nevus, proliferative tissue is buried deep within the dermis, the lower layer of the skin.

Most types of nevi are formed by the overgrowth of normal skin components that retain their usual functions. Some nevi, however, are precancerous and lose their normal organization when they become malignant. Premalignant nevi include the sebaceous nevus, a congenital formation containing hair follicles and sebaceous glands, and the giant pigmented, or bathing trunk, nevus, a large, irregular, dark brown or black patch associated with malignant melanoma. Some pigmented nevi, such as the blue nevus and the junctional nevus, may be associated with skin cancers but are not considered precancerous. Other pigmented nevi may be associated with systemic diseases; café-au-lait spots, light brown spots that can occur anywhere on the body, occur naturally in 10 percent of the white population but may also be a symptom of Albright's disease. Mongolian spot, a blue-black patch on the lower back, occurs in 90 percent of American Indian, black, and Asiatic persons.

Although pigmented nevi are among the most common of these skin growths, other varieties of nevus are also known. Vascular nevi, or hemangiomas, produce the familiar "port wine stain" birthmark; they are composed of blood vessels and often resolve themselves with time. Epidermal nevi, of which the sebaceous nevus is an example, develop from the proliferation of normal epidermal tissues and are usually flesh-coloured or yellowish.

New Age movement, religious movement that was popular in the 1970s and '80s. It looked forward to a "New Age" of love and offered a taste of the coming era through personal transformation. The movement adhered to esotericism, a religious perspective based on the acquisition of mystical knowledge known in the West since the 2nd century AD, originally as Gnosticism and then later as Rosicrucianism, theosophy, and ritual magic.

The roots of the movement can be found in the late 19th century when Helena Petrovna Blavatsky, cofounder of the Theosophical Society, announced a New Age. Her ideas were continued by disciples such as Annie Besant in the 20th century. As expectations of a New Age increased in the 1960s, a new organization was formed, the Universal Foundation. Its wealthy leader, Anthony Brooke, predicted an apocalyptic event in 1967. Although the event never took place, a network of New Age groups emerged.

The idea of a New Age movement was born in 1970, with the ideas of American theosophist David Spangler. He believed that the release of new waves of spiritual energy, signaled by astrological changes (*e.g.,* the movement of the Earth into a new cycle known as the Age of Aquarius), had initiated the coming of the New Age. He suggested that people use this energy to make manifest the New Age. Spangler's view made believers in the New Age responsible for its arrival.

Spangler presented his ideas in a set of popular books beginning with *Revelation: The Birth of a New Age* (1976) and attracted many leaders from older occult organizations to the growing movement. Simultaneously, periodicals were published to disseminate information and to create a sense of community within the movement, and bookstores opened that sold New Age books, videos, and meditative aids.

The movement predicted that a New Age of heightened spiritual consciousness and international peace would arrive and bring an end to all society's ills. This transformation would result from the spiritual awakening of the general population. The movement also held that a foretaste of the New Age could be obtained through personal spiritual growth, and some believed that the New Age had already arrived.

Traditional occult practices (*e.g.,* tarot reading, astrology, and yoga) were used to assist personal transformation and to bring about "planetary healing" and societal transformation. Believers in the New Age sought to integrate divinatory practices (astrology, tarot, and I Ching) with psychological counseling.

Channeling and the use of crystals were identified with the movement. Many New Agers claimed to establish contact with preternatural or extraterrestrial entities who spoke through them on a wide range of spiritual topics. Crystals were thought to be reservoirs of transformative powers that could be released for personal benefit and were popular items at New Age stores and conventions.

Despite the popularity of the Harmonic Convergence—a set of gatherings at various places around the world on Aug. 16–17, 1987, designed to bring about a leap in human consciousness—the New Age movement had lost its momentum by the end of the 1980s. At that time, Spangler and the editors of several New Age periodicals announced that although they still adhered to the movement's goals, they no longer believed in the coming New Age. By the mid-1990s, New Agers in Europe spoke of the move from "New Age to Next Stage."

The New Age movement proved to be one of the West's most significant religious phenomena of the 20th century. Although its vision of social transformation died, the movement attracted hundreds of thousands of adherents. More than one-fifth of adults in the West give credence to astrology; an equal number have practiced some form of meditation. Three to five million Americans identified themselves as New Agers or as accepting the movement's beliefs in the late 1980s. The continuing presence of New Age thought is evident in the New Age bookstores and organizations that are found in nearly every urban centre.

(J.G.M.)

New Albany, city, seat (1819) of Floyd county, southeastern Indiana, U.S. It lies along the Ohio River (bridged) opposite Louisville, Ky. It was founded in 1813 by Joel, Abner, and Nathaniel Scribner, who named the settlement for Albany, N.Y., the capital of their home state. By the 1840s and early '50s, New Albany had become the largest city in Indiana and, owing to its location just below the falls of the Ohio and near abundant forests, an important steamboat-building centre. The modern city's diversified manufactures include plastics, machinery, metal products, and plywood. Indiana University Southeast (1941) is in the city. The boyhood home (*c.* 1830) of poet-dramatist William Vaughn Moody is preserved, as are the Scribner House (1814) and the Culbertson Mansion (1867–69). Inc. city, 1839. Pop. (2000) 37,603.

New Apostolic Church, church organized in Germany in 1863, as the Universal Catholic Church, by members of the Catholic Apostolic Church who believed that new apostles must be appointed to replace deceased apostles and rule the church until the Second Coming. The present name was adopted in 1906.

The church emphasizes the gifts of the Holy Spirit, which include prophecy, speaking in tongues, and healing. Sacraments are baptism, Holy Communion, and holy sealing (the "dispensing and reception of the Holy Spirit"). Sealing can only be conferred by the laying on of hands on the head of a member by an apostle, and it assures the member of participation in Christ's rule on Earth for 1,000 years after he returns. Like the Latter-day Saints, the church teaches that the sacraments can be received by a living member for a dead person.

The church is ruled by the chief apostle and the other apostles, who appoint bishops, district elders, pastors, and evangelists. By the late 20th century the New Apostolic Church had more than 2,000,000 members, most of them in Germany. Its headquarters are in Zürich, Switz.

New Artists' Association: *see* Neue Künstlervereinigung.

New Bedford, city, Bristol county, southeastern Massachusetts, U.S. It lies at the mouth of the Acushnet River on Buzzards Bay, 54 miles (87 km) south of Boston. The site, settled by Plymouth colonists in 1652, was originally part of Dartmouth. A fishing community was established there in 1760. By 1765 it had developed into a whaling port and shipbuilding centre. The *Dartmouth,* which in 1767 was the first ship launched there, was one of the "teaships" involved in the Boston Tea Party (1773). Because the town's deepwater harbour was used by American privateers during the American Revolution, it was attacked (Sept. 5, 1778) and burned by British forces. Following

The Seamen's Bethel (chapel), New Bedford, Mass., with cenotaphs described in Herman Melville's *Moby Dick* on the walls

Mark Sexton

a rapid recovery, it was separately incorporated (1787) as the town of New Bedford. By 1820 New Bedford was one of the world's leading whaling ports; in the mid-19th century three-fifths of the U.S. whaling fleet, which totaled more than 700 vessels, was registered there. The site was immortalized by Herman Melville in *Moby Dick.*

Following the decline in whaling, New Bedford turned to the manufacture of cotton fabrics but was adversely affected by the movement of the textile industry to the Southeast during the 1920s. A diversified economy now prevails with the manufacture of electrical equipment and machinery, rubber goods, textiles, and photography supplies. Services and trade are also important. The city is still a major fishing port.

The New Bedford Whaling Museum, the 19th-century fishing schooner *Ernestina,* and the Seamen's Bethel (Whaleman's Chapel) reflect the city's historic and seafaring past. A 13-block section of the city was designated as New Bedford Whaling National Historical Park in 1996. Inc. city, 1847. Pop. (2000) city, 93,768; New Bedford PMSA, 175,198.

New Bern, city, seat (1722) of Craven county, eastern North Carolina, U.S. It lies at the confluence of the Neuse and Trent rivers. The second oldest town in the state, New Bern was settled in 1710 by Freiherr (baron) Christophe von Graffenried of Bern, Switz. It was incorporated in 1723 after near destruction by Native Americans and served as the colonial and state capital from 1746 to 1792. Tryon Palace, built in 1767–70 by the royal governor, was the first capitol; it was restored (1952–59) as a state historic site. The first and second provincial congresses in North Carolina opposing the British met there in 1774 and 1775. New Bern had a thriving seaport trade through Pamlico Sound until it was captured by Union forces in 1862 and occupied for the remainder of the American Civil War. Its connection with the Intracoastal Waterway and the port at Morehead City (southeast) has made it the service centre for nearby summer resorts, a U.S. Marine Corps air station, and farmlands. The city's manufactures today include chemicals, boats, wood products, and plumbing fixtures.

The New Bern National Cemetery has the graves of many Civil War dead. One of the first public schools for African Americans was established in New Bern in 1862, and Craven Community College was opened in 1965. Pop. (2000) 23,128.

New Britain, largest island of the Bismarck Archipelago, southwestern Pacific, in Papua New Guinea. It is situated 55 miles (88 km) east of the Huon Peninsula of mainland eastern New Guinea. Measuring 370 miles (600 km) long by 50 miles (80 km) at its widest, the crescent-shaped island has an area of approximately 14,100 square miles (36,500 square km) and a 1,000-mile (1,600-kilometre) coastline bordered by reefs. From narrow coastal plains, it rises to a rugged central mountain spine composed of the Whiteman, Nakanai, and Baining ranges, with several peaks exceeding 7,000 feet (2,100 m). There are three areas of active volcanism: in the extreme west, on the north coast bordering Open and Kimbe bays, and in the northeast on the Gazelle Peninsula near Rabaul, where the Matupi and Vulcan cones present a constant threat to that town, the largest settlement on the island. An eruption in 1937 killed 263 people. The island has an equatorial climate.

New Britain was sighted in 1616 by the Dutch navigator Jakob Le Maire, who believed it was part of a landmass including New Guinea and New Ireland. His theory was disproved (1699–1700) by William Dampier, an Englishman who named the island, and Philip Carteret, who found St. George's Channel (east) in 1767. As Neu-Pommern (New Pomerania), the island became part of a German protectorate in 1884. It was mandated to Australia following World War I, taken by the Japanese in 1942, and reoccupied in 1945. It subsequently formed part of the UN Trust Territory of New Guinea and was administered by Australia. It became part of Papua New Guinea in 1975 when that nation attained independence.

The most developed and populous area of the island is the Gazelle Peninsula in the northeast, where, on the rich coastal plains, copra and cocoa are produced and marketed through Rabaul, Kokopo, and Keravat. These same crops (as well as oil palms) are raised at other points along the coast and shipped from smaller harbours such as Talasea in the northwest. A feature of this development was the success of local cooperative societies. A variety of other crops is grown for local consumption. In the interior, a system of shifting cultivation is practiced involving a rotation of plots used only at long intervals. Other island resources are timber, copper, gold, iron, and coal. Pop. (1990 prelim.) 302,023.

New Britain, city, coextensive with the town (township) of New Britain, Hartford county, central Connecticut, U.S. Settled as the Stanley Quarter to the north in 1686 and followed later by the Great Swamp settlement to the south, the area became the New Britain parish of Farmington in 1754. In 1785 Berlin town, including New Britain parish, was separately incorporated from Farmington. Metalworking began in New Britain in the 18th century. By 1850 it was a manufacturing centre producing tools, locks, and other hardware. Such products and machinery are also the city's principal modern industries. It is the seat of Central Connecticut State University (1849). Inc. town and borough, 1850; city, 1871; town and city consolidated, 1905. Pop. (2000) 71,538.

New Brunswick, one of four Atlantic provinces of Canada and one of four original members of the Dominion of Canada (1867). With Nova Scotia and Prince Edward Island, it forms the grouping known as the Maritime Provinces. With an area of 28,355 square miles (73,440 square km), it is bounded on the west by the U.S. state of Maine, on the north by the province of Quebec, on the east by the Gulf of St. Lawrence and the Northumberland Strait, and on the south by the Bay of Fundy. Its capital is Fredericton.

A brief treatment of New Brunswick follows. For full treatment, *see* MACROPAEDIA: Canada.

New Brunswick was a part of the original Acadia, a seaward region inhabited by Micmac and Malecite Indians of the Algonquian-speaking group. Prior to the mid-18th century there were only a small number of French fur traders and settlers in the region. Acadia subsequently was the scene of a British-French struggle for control of the territory. Following the British capture of Fort Beauséjour in 1755, the French-speaking Acadians were expelled to reduce French influence in the area. A British proclamation in 1763 incorporated the area now known as New Brunswick into Nova Scotia; a few hundred Acadians returned, and a small number of New Englanders settled in the area. It remained sparsely populated until the influx of some 14,000 loyalist refugees from the United States after the American Revolution; as a result the area was separated from Nova Scotia, and the province of New Brunswick was established in 1784. The British government gave very little encouragement to its new province until 1808, when Britain granted tariff preferences to the timber resources of the North American colonies, a move made when Napoleon's blockade cut off the Baltic supply of shipbuilding timber to the British. For New Brunswick, this historical incident provided an opportunity that helped usher in the so-called age of wood, wind, and water, an era of prosperity based on timber exports and a flourishing shipbuilding industry. Self-government was granted by Britain in 1848. In 1854 New Brunswick signed a reciprocity treaty with the United States. New Brunswick entered into confederation with Canada in 1867.

New Brunswick's forest cover has been increasing since 1950 and now occupies about 90 percent of the province. The principal trees are balsam fir, red and black spruce, pine, and hemlock. There are increasing numbers of deer and moose. Several rivers are famous for their Atlantic salmon, while trout, bass, and pickerel also attract sport fishing.

Forestry and lumbering are the province's largest industries, and pulp and paper production represents its largest single component, with many sawmills operating. The forests supply material for lumber, plywood, chipboard, fuel, and Christmas trees and provide wide employment. Fishing continues to be important in the provincial economy, with lobster, crab, scallops, cod, and various other North Atlantic species making up the bulk of the catch. In the second half of the 20th century, the mining of zinc, copper, lead, and silver in the northeast had become increasingly important. New Brunswick's industrial development has been spurred by the development of hydroelectric power, supplemented by coal- and oil-fired and nuclear generating stations.

Saint John is a major port through which a high proportion of Canada's external trade passes. This is especially true during the winter months when traffic on the St. Lawrence Seaway is curtailed. The province is served by highways, airlines, and railways.

New Brunswick's government since entering the Canadian Confederation in 1867 has comprised the unicameral Legislative Assembly, elected (by universal adult suffrage) generally to a four-year term. The leader of the majority party in the assembly becomes the premier and selects the Executive Council from the assembly. Another member of the executive branch is the lieutenant governor, chosen by Canada's governor-general as the British monarch's representative.

Compulsory elementary and secondary public education is free through grade 12 and features bilingual English and French instruction. Vocational and technical training are offered in secondary school and also for adults. Higher education is available from the University of New Brunswick, with a campus (Canada's oldest, founded in 1785) at Saint John and another campus at Fredericton; l'Université de Moncton, with three branch campuses, offering bilingual instruction; the private Mount Allison University at Sackville, founded 1842 as a Wesleyan institution; and St. Thomas University at Fredericton, a Roman Catholic institution.

New Brunswick has a favourable cultural climate. The Acadians, against all odds, have preserved their French cultural inheritance, and the province has a large French-speaking minority. Fredericton is the home of the first native Anglo-Canadian school of poetry, that of William Bliss Carman (1861–1929) and Sir Charles Roberts (1860–1943). Lord Beaverbrook, the British newspaper magnate who grew up in New Brunswick, left as a legacy to his home province the Lord Beaverbrook Art Gallery, which houses treasures of English and Canadian painting. Many artists of national repute reside in the province. Fredericton is also famous for its Playhouse theatre. All four of the province's universities support creative arts. A pioneer village has been reconstructed at Kings Landing near Fredericton. The Fort Beauséjour National Historic Park near Sackville reminds visitors of the French and British roots of the province. Pop. (1999) 754,741.

New Brunswick, city, seat of Middlesex county, eastern New Jersey, U.S. It lies along the Raritan River, at the terminus of the old Delaware and Raritan Canal, 22 miles (35 km) south-southwest of Newark. The site, first known as Prigmore's Swamp, was settled in 1681 by John Inian. Called Inian's Ferry (1713), it was renamed for George I of England, who was also the Duke of Brunswick. George II granted it a town charter in 1730. General George Washington's troops, retreating from New York, occupied the town in 1776, evacuating at the approach of the British under General William Howe, who remained there for about seven months. Washington returned after the Battle of Monmouth (1778) and, while there, issued orders for the march south culminating in the victorious Battle of Yorktown. During this period the town's port was a base for privateers who preyed upon British ships around Manhattan.

The Camden and Amboy Railroad (later the Pennsylvania) reached New Brunswick in 1838. Since the late 19th century, when Robert W. and James W. Johnson established a firm (Johnson & Johnson) to make adhesive tape and surgical dressings, New Brunswick has been a major producer of hospital supplies and pharmaceuticals. The city's other manufactures include clothing, chemicals, leather goods, and automobile parts.

Rutgers University was founded there as Queen's College in 1766 and was made the state university in 1945. New Brunswick Theological Seminary, the oldest theological school in the United States, founded in 1784, has been in the city since 1810. On Nov. 6, 1869, New Brunswick was the scene of the first intercollegiate football game, between Rutgers and Princeton. Inc. city, 1784. Pop. (1992 est.) 42,387.

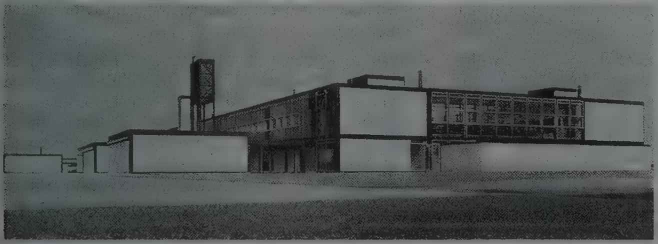
New Brutalism, one aspect of the International Style of architecture that was created by Le Corbusier and his leading fellow architects Ludwig Mies van der Rohe and Frank Lloyd Wright and that demanded a functional approach toward architectural design. The name was first applied in 1954 by the English architects Peter and Alison Smithson to the post-1930 style of the major French architect Le Corbusier.

Le Corbusier's expressionist interpretation of the International Style involved the use of monumental sculptural shapes and of raw, unfinished molded concrete, an approach that, in contrast to Mies van der Rohe's use of glass and steel, represented a New Brutalism to the English architects. Brutalism, as a reform movement, advocated the return to functionalist principles—in services, materials, and structure. The Smithsons, Sir Denys Lasdun, and other New Brutalist architects displayed a willful avoidance of polish and elegance in their buildings, in which such structural elements as steel beams and precast concrete slabs are exposed to view and convey a stark, austere rectilinearity.



Hunstanton School, Norfolk, Eng., by Alison and Peter Smithson, 1954, in the style known as New Brutalism

The Architectural Review

New Caledonia, officially TERRITORY OF NEW CALEDONIA AND DEPENDENCIES, French TERRITOIRE DE LA NOUVELLE-CALÉDONIE ET DÉPENDANCES, French overseas territory in the southwestern Pacific, consisting of the islands of New Caledonia and Walpole, the Isle of Pines (Île des Pins), and the island groups known as Loyalty, Bélep, Huon and Surprise, and Chesterfield. Since 1975 France has also claimed Matthew and Hunter islands, but this is disputed by Vanuatu. The territory extends northwestward in a double chain and is located about 900 miles (1,450 km) northwest of New Zealand. The Chesterfields, a small group of uninhabited atolls, lie about 370 miles (595 km) west of the northern tip of New Caledonia island. Nouméa on New Caledonia island is the territorial capital. Area 7,172 square miles (18,576 square km). Pop. (1994 est.) 183,000.

A brief treatment of New Caledonia follows. For full treatment, *see* MACROPAEDIA: Pacific Islands.

For current history and for statistics on society and economy, *see* BRITANNICA BOOK OF THE YEAR.

The land. New Caledonia island, known as Grande Terre ("Mainland"), at 6,467 square miles (16,750 square km) constitutes most of the territory's land area. It is a cigar-shaped high continental island, approximately 250 miles (400 km) long and 30 miles (48 km) wide, with a chain of mountains running down the centre of the island and rising to the highest peaks in the territory, Mount Panié (5,341 feet [1,628 m]) and Mount Humboldt (5,308 feet [1,618 m]). The nearby Isle of Pines and Bélep Islands are geologically part of New Caledonia, the whole island group being surrounded by a great barrier and fringing reef. The island group is tilted toward the southwest, where excellent harbours are found in drowned valleys. The mountains slope steeply downward to rolling hills and the coastal plains. Rivers, which are found only on the main island, are swift and carry heavy silt loads in periodic floods.

Of the other islands, Maré and Lifou in the Loyalty group and Walpole are raised atolls, and Maré has two interior volcanic hills. Lifou is noted for its coral limestone caves. The remaining islands are atolls or reef islands; Matthew and Hunter are active volcanoes.

The climate is subtropical, with mean annual temperatures at sea level ranging between 71° F (22° C) and 75° F (24° C). Rainfall, heaviest from December to March, when typhoons also may strike, annually averages 80 inches (2,000 mm) on the south-southeast sides of the higher mountainous islands, where the trade winds blow, and ranges down to 40 inches (1,016 mm) on the west-northwest sides. Droughts occasionally occur on the islands' drier western sides.

About three-fourths of the vegetation is unique to the islands, and it is largely drought-resistant. Conifers dominate higher elevations of New Caledonia island and give way to beach forest with lianas and brush. In drier parts of the western coast of New Caledonia island, niaouli, or cajeput, trees and savanna-like grassland occur, while mangroves are found in swampy coastal areas.

Mammals are rare but include the Polynesian rat, bats, feral pigs, and the introduced Sumatra deer. Birds are more common and include duck, cuckoo, flycatcher, rail, parakeet, pigeon, the flightless kagu, and shore birds. There are lizards, scorpions, and centipedes, and insects, including colourful butterflies, are numerous. Fish, turtles, sea snakes, and crustaceans proliferate in the reef and surrounding sea.

The main island has rich mineral deposits of nickel, iron ore, manganese, silver, chromite, and cobalt. Its reserves of nickel are among the largest in the world. Phosphate deposits occur on some of the atolls and raised coral islands.

The people. Indigenous Melanesians (Kanaks) constitute more than two-fifths of the population of New Caledonia; Europeans, mainly French, about one-third; Wallisians and Tahitians one-eighth; and Javanese and others, including Vietnamese, the remainder. The Loyalty Islanders have a Polynesian intermixture. New Caledonia island's Melanesians live primarily on reservations, which constitute less than 10 percent of the island but include almost all of the Loyalty group, Bélep, and the Isle of Pines. French is the official language, and a number of Melanesian dialects are spoken. Most New Caledonians are Christian, almost two-thirds being Roman Catholic and about one-fifth Protestant. Muslims, mainly Javanese, make up a small fraction of the population. The birth rate is significantly higher than those of developed countries, but the death rate is somewhat lower. One-third of the population is less than 15 years old. Life expectancy is about 69 years. The coastal and urban areas of New Caledonia have the highest population density; about two-fifths of the total population lives in Nouméa.

The economy. The developing, mainly free-enterprise economy is based largely on mining and metallurgy and on tourism and is highly dependent on France. The gross national product (GNP) per capita ranks among the highest of those of developing countries. Depressed metal prices worldwide in the 1970s and political strife in the '80s, however, have resulted in periods of economic recession.

Agriculture contributes about 2 percent of the gross domestic product (GDP), although only 1 percent of the land is arable. More than one-seventh of the labour force is employed in agriculture. Cash crops include coffee, copra, and coconut-palm oil. Potatoes, vegetables, and corn (maize) are grown commercially, and yams, taro, and sweet potatoes are grown for subsistence, mainly by the Melanesians. The small islands rely heavily on coconuts, copra, subsistence crops, and fishing. Pastures occupy about 15 percent of the land, and cattle, pigs, and goats are raised for domestic needs. About one-third of the land is forested, but lumbering does not fully meet domestic needs. Commercial fishing includes aquaculture of shrimp, oysters, and trochus, besides sea fishing.

Mining and metallurgy are principal industries and account for about 28 percent of the GDP. New Caledonia ranks among the leading nickel-mining nations worldwide. A foundry on the outskirts of Nouméa produces partly refined nickel for export. Chromite ore is also mined. Other industries produce corrugated iron sheets, cement, soap, chemicals, plastics, beer, and soft drinks.

Tourism has grown considerably with hotel expansion; it provides a major source of foreign-exchange earnings. Cruise ships account for more than two-fifths of tourists annually.

Shipping between the islands is important; Nouméa is the principal port, and there are more than 20 smaller ports. Nouméa has an international airport, and the domestic Air Calédonie serves numerous local airfields.

In the early and mid-1980s New Caledonia's exports were far below imports in value, largely because of slackness in the world nickel market. Nickel ore, ferronickel, and nickel matte are the main exports (about three-fourths of the total), followed by chromite, fish, coffee, and copra. Imports are mainly fuels, machinery, transport equipment, and food products. The main trading partners are France, Japan, the United States, and Australia.

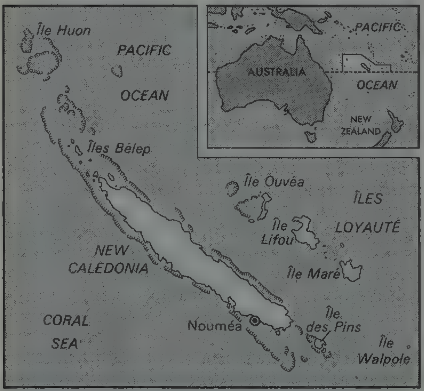
Government and social conditions. As a French Overseas Territory, New Caledonia sends two deputies to the French National Assembly and one to the Senate. The territory is administered by three autonomous regional councils that are overseen by a French-appointed high commissioner. The three regional councils together form the Territorial Congress, an advisory legislative house that has its own elected president. The 54 members of the Territorial Congress are elected by universal suffrage.

Nouméa's Gaston Bourret Hospital and the Pasteur Institute for research, supported by inland medical centres staffed by military health personnel, augment private clinics and doctors. The Department of Education supervises church and free public primary, secondary, and vocational schools. French-government Radio Nouméa broadcasts in French daily, and there is also one government-controlled television channel. There are several daily newspapers, as well as other weekly and monthly publications.

Nouméa is the site of the headquarters of the South Pacific Commission, founded 1947. In 1983 the government set up the Land Reform Board and the Office for the Development of the Interior and the Islands to oversee redistribution of land to the Melanesians. Nouméa has a museum and a marine- and botanical-research centre, and there are several music, dance, and ethnic associations.

History. Lapita, on the Foué Peninsula on New Caledonia island, is the type site for lapita ware, which indicates an Austronesian presence in the area about 2000–1000 BC. On the Isle of Pines, obsidian from New Britain was excavated, indicating long-distance trade, and there are also very early earthen and stone mounds. Melanesian paddle-incised ceramics on the Isle of Pines have been dated to about 900 BC, and there is also a distinctive ethnographic ware, akin to Papua New Guinea types. Taro terraces also indicate the existence of a sophisticated culture before the time of European contact.

While Louis-Antoine de Bougainville may have sighted the islands in 1768, Captain James Cook in 1774 landed and named the main island New Caledonia (after the Roman name for Scotland). Bruni d'Entrecasteaux in 1792 was the first French explorer, and in the 1830s London Missionary Society members reached the Loyalty islands. Roman Catholic French missionaries followed in 1840. The French annexed the group in 1853 after missionaries and, in 1850, the members of a French survey ship were killed and eaten by the islanders. New Caledonia was under French military governors from 1853 to 1884 and was a penal colony from 1864 to 1897. Nickel was discovered in 1863, but development, which began in 1870, was hampered by frequent indigenous uprisings until 1917. New Caledonians joined General Charles de Gaulle's Free French movement in 1940, and beginning in 1942 the United States used the islands as a military base, built roads and airfields, and began the modernization process. In 1946 the group became a French Overseas Territory, and in 1958 the first popular election of ministers and members of the Council of Government was held. The council was increased in size in 1976 as demands for autonomy grew. In the early 1980s the native Melanesians (Kanaks) pressed for independence from France. Although the Kanaks were a minority, their movement gained momentum and led, in 1984, to a proposal from French President François Mitterrand for five years of autonomy to culminate in a vote for independence in 1989. When the plan was rejected in elections in November 1984, largely through the efforts of the anti-independence factions (mostly people of French descent), militant Kanaks reacted violently, and a period of riots, general strikes, and disruption campaigns ensued. After sending troops to the island to restore order, the French government had to postpone independence. Many Kanaks refused to participate in a 1987 referendum in which the New Caledonian electorate voted overwhelmingly in favour of remaining part of France. In 1988 the country was placed under direct French rule for a year as a step toward an independence referendum in 10 years.



New Caledonia and Dependencies

New Castile, Spanish CASTILLA LA NUEVA, historic provincial region, central upland Spain. It generally includes the area of the Moorish kingdom of Toledo annexed to the former kingdom of Castile in the 11th century AD. In modern Spanish geographic usage, New Castile as an administrative region included the provinces of Ciudad Real, Cuenca, Guadalajara, Madrid, and Toledo. Its area was 27,940 square miles (72,363 square km). After 1979 all but Madrid were incorporated into the new *comunidad autónoma* ("autonomous community") of Castile-La Mancha (*q.v.*). For history, *see* Castile.

New Castle, city, New Castle county, northern Delaware, U.S. It is just south of Wilmington, on the Delaware River, there linked to New Jersey by the twin Delaware Memorial Bridges. The original settlement, called Santhoeck, was established in 1651, when Peter Stuyvesant, the Dutch administrator, built Fort Casimir there. The settlement was seized by the Swedes in 1654 but was regained by the Dutch in 1655. It was named Niew Amstel and was made the Dutch capital of the southern Delaware region, but it was renamed in 1664 (probably for William Cavendish, Earl, later Duke, of Newcastle), after its capture by the British that year. William Penn, the English Quaker, took possession of it in 1682. An early cultural centre, New Castle was the seat of the Lower Counties-on-Delaware (1704–76). On Sept. 21, 1776, a convention of counties meeting there formed the state of Delaware, and New Castle served briefly as state capital until the latter was moved to Dover in 1777. Three signers of the Declaration of Independence (George Read, George Ross, and Thomas M'Kean) at one time lived in New Castle.

The Immanuel Church (Episcopal; 1703–*c.* 1710) is a historic landmark. Other colonial landmarks include Amstel House Museum (*c.* 1730); Old Dutch House, perhaps the state's oldest dwelling, built in the late 1600s and now maintained as a museum; the Old State (Court) House (restored); and The Green (town square), laid out by Peter Stuyvesant in 1655. Wilmington College was opened (1967) in New Castle. The city's industries include the manufacture of rayon, steel, shoes, paint; and drugs. Inc. 1875. Pop. (1990) 4,837.

The old Immanuel Church, New Castle, Del.

Milt and Joan Mann—CameraMann

New Castle, city, seat (1822) of Henry county, eastern Indiana, U.S. It lies along the Blue River, 50 miles (80 km) east of Indianapolis. Founded in 1819 and named by Ezekiel Leavell for his hometown in Kentucky, it was incorporated in 1839. In 1900 a decade of expansion began when automobile and piano manufacturing, as well as other industries, were started there. During this same period, the large-scale commercial growing of roses was developed. New Castle's diversified manufactures now include automobile parts and steel products. A nearby farm, now a state memorial, was the birthplace (1867) of aviation pioneer Wilbur Wright. Pop. (1990) 17,753.

Consult the INDEX *first*

New Castle, city, seat (1849) of Lawrence county, western Pennsylvania, U.S. It lies at the juncture of the Shenango, Mahoning, and Beaver rivers and in the foothills of the Allegheny Mountains, 20 miles (32 km) southeast of Youngstown, Ohio. Originally the site of a Delaware Indian capital, it was settled in about 1798 by John Stewart, who built an iron furnace and named the place for the English industrial city of Newcastle upon Tyne. Laid out in 1802, it became the terminus for the Erie Extension Canal in 1833. Local deposits of coal, iron ore, limestone, and fire clay provided a natural base for industry. The city's manufactures include steel and allied products, pottery, chemicals, and leather goods. Moraine State Park and the McConnell's Mill recreation area are nearby. Inc. borough, 1825; city, 1869. Pop. (1990) 28,334.

New China News Agency (NCNA), Pinyin XINHUA, Wade-Giles romanization HSINHUA, news agency of the People's Republic of China, founded in 1929 as the press outlet of the Chinese Communist Party. The agency is headquartered in Peking and has offices around the world. NCNA has domestic and international services for Chinese and non-Chinese media. Like other news media in China, it operates under governmental control, and its releases reflect official policies and promote state programs. These strictures were greatly tightened in the 1960s during the Cultural Revolution, when many Chinese journalists were jailed for deviating from its standards, but were substantially relaxed after the fall from power of the Gang of Four a decade later.

New Church, also called SWEDENBORGIANS, church organized in the General Conference of the New Church, the General Convention of the New Jerusalem in the U.S.A., and the General Church of the New Jerusalem. Its members are followers of the theology of Emanuel Swedenborg, the 18th-century Swedish scientist, philosopher, and theologian. Swedenborg did not himself found a church, but he believed that his writings would be the basis of a "New Church," which he related to the New Jerusalem mentioned in the biblical Book of Revelation.

Shortly after Swedenborg's death, a group of his followers in England decided to establish a separate church. In 1788 the first building for New Church worship was opened in Great East Cheap, London, and was rapidly followed by others. In 1789 a conference met in the London church, and, except for 1794–1806 and 1809–14, the General Conference of the New Church has met annually.

Swedenborg's writings on religion were introduced into the United States in the 1780s. The first society was organized in Baltimore in 1792, and the first American ministers were ordained in 1798. The General Convention of the New Jerusalem in the U.S.A. was founded in 1817 in Philadelphia. Differences of interpretation within the convention led to the formation in 1897 of a separate group, the General Church of the New Jerusalem.

Worship in the Swedenborgian churches is almost always liturgical. Preaching of the Scriptures is based on Swedenborg's teaching that Scripture should be interpreted spiritually. Baptism and the Lord's Supper are the two sacraments of the church. To the established Christian festivals is added New Church Day (June 19).

Church government in the three New Church groups varies. The British General Conference and the U.S. General Convention annually appoint a general council, which, with a ministerial council, is the controlling authority. The General Church is episcopal. Candidates for the ministry, apart from those trained in Africa for service there, normally pass through a full-time four-year course in one of the two U.S. colleges (in Cambridge, Mass., and Bryn Athyn, Pa.) or in Woodford Green, Essex, Eng., before being ordained.

The three groups have extensive mission operations, with emphasis on Africa. New Church societies, generally small, are found in many parts of the world. Australia has its own conference, closely allied to that in Britain. The New Church groups in continental Europe are nearly all assisted from the United States.

New Comedy, Greek drama from about 320 BC to the mid-3rd century BC that offers a mildly satiric view of contemporary Athenian society, especially in its familiar and domestic aspects. Unlike Old Comedy, which parodied public figures and events, New Comedy features fictional average citizens and has no supernatural or heroic overtones. Thus, the chorus, the representative of forces larger than life, recedes in importance and becomes a small band of musicians and dancers who periodically provide light entertainment.

The plays commonly deal with the conventionalized situation of thwarted lovers and contain such stock characters as the cunning slave, the wily merchant, the boastful soldier, and the cruel father. One of the lovers is usually a foundling, the discovery of whose true birth and identity makes marriage possible in the end. Although it does not realistically depict contemporary life, New Comedy accurately reflects the disillusioned spirit and moral ambiguity of the bourgeois class of this period.

Menander introduced the New Comedy in his works about 320 BC and became its most famous exponent, writing in a quiet, witty style. Although most of his plays are lost, *Dyscolus* survives, along with large parts of *Perikeiromenē, Epitrepontes,* and *Samia.* Menander's plays are mainly known through the works of the Roman dramatists Plautus and Terence, who translated and adapted them, along with other stock plots and characters of Greek New Comedy, for the Roman stage. Revived during the Renaissance, New Comedy influenced European drama down to the 18th century. The commedia erudita, plays from printed texts popular in Italy in the 16th century, and the improvisational commedia dell'arte that flourished in Europe from the 16th to the 18th century used characters and plot conventions that originated in Greek New Comedy. They were also used by Shakespeare and other Elizabethan and Restoration dramatists. Rodgers and Hart's *The Boys from Syracuse* (1938) is a musical version of Shakespeare's *Comedy of Errors,* which in turn is based on Plautus' *Menaechmi* and *Amphitruo,* which are adaptations of Greek New Comedy.

New Criticism, post-World War I school of Anglo-American literary critical theory that insisted on the intrinsic value of a work of art and focused attention on the individual work alone as an independent unit of meaning. It was opposed to the critical practice of bringing historical or biographical data to bear on the interpretation of a work.

The primary technique employed in the New Critical approach is close, analytic reading of the text, a technique as old as Aristotle's *Poetics.* The New Critics, however, introduced refinements into the method. Early seminal works in the tradition were those of the English critics I.A. Richards (*The Principles of Literary Criticism,* 1924) and William Empson (*Seven Types of Ambiguity,* 1930). The movement did not have a name, however, until the appearance of John Crowe Ransom's *The New Criticism* (1941), a work that loosely organized the principles of this basically linguistic approach to literature.

To the New Critics, poetry was a special kind of discourse, a means of communicating feeling and thought that could not be expressed in any other kind of language. It differed qualitatively from the language of science or philosophy, but it conveyed equally valid meanings. Such critics set out to define and formalize the qualities of poetic thought and language, utilizing the technique of close reading with special emphasis on the connotative and associative values of words and on the multiple functions of figurative language—symbol, metaphor, and image—in the work.

New Deal, the domestic program of the administration of U.S. President Franklin D. Roosevelt between 1933 and 1939, which took action to bring about immediate economic relief as well as reforms in industry, agriculture, finance, waterpower, labour, and housing, vastly increasing the scope of the federal government's activities. The term was taken from Roosevelt's speech accepting the Democratic nomination for the presidency on July 2, 1932. Reacting to the ineffectiveness of the administration of President Herbert Hoover in meeting the ravages of the Great Depression, American voters the following November overwhelmingly voted in favour of the Democratic promise of a "new deal" for the "forgotten man." Opposed to the traditional American political philosophy of laissez-faire, the New Deal generally embraced the concept of a government-regulated economy aimed at achieving a balance among conflicting economic interests.

Much of the New Deal legislation was enacted within the first three months of Roosevelt's presidency, which became known as the Hundred Days. The new administration's first objective was to alleviate the suffering of the nation's huge number of unemployed workers. Such agencies as the Works Progress Administration (WPA) and the Civilian Conservation Corps (CCC) were established to dispense emergency and short-term governmental aid and to provide temporary jobs, employment on construction projects, and youth work in the national forests. Before 1935 the New Deal focused on revitalizing the country's stricken business and agricultural communities. To revive industrial activity, the National Recovery Administration (NRA) was granted authority to help shape industrial codes governing trade practices, wages, hours, child labour, and collective bargaining. The New Deal also tried to regulate the nation's financial hierarchy in order to avoid a repetition of the stock market crash of 1929 and the massive bank failures that followed. The Federal Deposit Insurance Corporation (FDIC) granted government insurance for bank deposits in member banks of the Federal Reserve System, and the Securities and Exchange Commission (SEC) was formed to protect the investing public from fraudulent stock-market practices. The farm program was centred in the Agricultural Adjustment Administration (AAA), which attempted to raise prices by controlling the production of staple crops through cash subsidies to farmers. In addition, the arm of the federal government reached into the area of electric power, establishing in 1933 the Tennessee Valley Authority (TVA), which was to cover a seven-state area and supply cheap electricity, prevent floods, improve navigation, and produce nitrates.

In 1935 the New Deal emphasis shifted to measures designed to assist labour and other urban groups. The Wagner Act of 1935 greatly increased the authority of the federal government in industrial relations and strengthened the organizing power of labour unions, establishing the National Labor Relations Board (NLRB) to execute this program. To aid the "forgotten" homeowner, legislation was passed to refinance shaky mortgages and guarantee bank loans for both modernization and mortgage payments. Perhaps the most far-reaching programs of the entire New Deal were the Social Security measures enacted in 1935 and 1939, providing old-age and widows' benefits, unemployment compensation, and disability insurance. Maximum work hours and minimum wages were also set in certain industries in 1938.

Certain New Deal laws were declared unconstitutional by the U.S. Supreme Court on the grounds that neither the commerce nor the taxing provisions of the Constitution granted the federal government authority to regulate industry or to undertake social and economic reform. Roosevelt, confident of the legality of all the measures, proposed early in 1937 a reorganization of the court. This proposal met with vehement opposition and ultimate defeat, but the court meanwhile ruled in favour of the remaining contested legislation. Despite resistance from business and other segments of the community to "socialistic" tendencies of the New Deal, many of its reforms gradually achieved national acceptance. Roosevelt's domestic programs were largely followed in the Fair Deal of President Harry S. Truman (1945–53), and both major U.S. parties came to accept most New Deal reforms as a permanent part of the national life.

New Delhi, the capital of India, constituting part of the city and union territory of Delhi (*q.v.*).

New Democratic Party (NDP), French NOUVEAU PARTI DÉMOCRATIQUE, Canadian political party with a democratic socialist position, favouring a mixed public-private economy, broadened social benefits, and an internationalist foreign policy.

The party grew out of the Co-operative Commonwealth Federation (CCF), founded in 1933 as Canada's first political party representing small farmers and workers. By the time the CCF came to power in Saskatchewan in 1944, it had a national organization, ran candidates in all sections of the country, and polled an appreciable popular vote; but it was never large enough to become the official opposition, nor did it hold the balance of power between the two major parties, the Liberals and the Progressive Conservatives. In 1956 most of Canada's labour groups united in the Canadian Labour Congress, which in August 1961 formed the New Democratic Party, incorporating the CCF but welding a stronger working arrangement with organized labour. (The provincial party in Saskatchewan retained the CCF name until 1967.) The NDP's longtime base has been among the farmers of Manitoba and Saskatchewan and the urban workers of British Columbia and Ontario. It was able to form governments in Saskatchewan, Manitoba, and British Columbia intermittently from the 1940s to the 1990s, in the Yukon Territory from the 1980s, and in Ontario, Canada's largest and richest province, in the 1990s.

New Economic Policy (NEP), the economic policy of the government of the Soviet Union from 1921 to 1928, representing a temporary retreat from its previous policy of extreme centralization and doctrinaire socialism. The policy of War Communism, in effect since 1918, had by 1921 brought the national economy to the point of total breakdown. The Kronshtadt Rebellion of March 1921 convinced the Communist Party and its leader, Vladimir Lenin, of the need to retreat from socialist policies in order to maintain the party's hold on power. Accordingly, the 10th Party Congress in March 1921 introduced the measures of the New Economic Policy. These measures included the return of most agriculture, retail trade, and small-scale light industry to private ownership and management while the state retained control of heavy industry, transport, banking, and foreign trade. Money was reintroduced into the economy in 1922 (it had been abolished under War Communism). The peasantry were allowed to own and cultivate their own land, while paying taxes to the state. The New Economic Policy reintroduced a measure of stability to the economy and allowed the Soviet people to recover from years of war, civil war, and governmental mismanagement. The small businessmen and managers who flourished in this period became known as NEP men.

But the NEP was viewed by the Soviet government as merely a temporary expedient to allow the economy to recover while the Communists solidified their hold on power. By 1925 Nikolay Bukharin had become the foremost supporter of the NEP, while Leon Trotsky was opposed to it and Joseph Stalin was noncommittal. The NEP was dogged by the government's chronic inability to procure enough grain supplies from the peasantry to feed its urban work force. In 1928–29 these grain shortages prompted Joseph Stalin, by then the country's paramount leader, to forcibly eliminate the private ownership of farmland and to collectivize agriculture under the state's control, thus ensuring the procurement of adequate food supplies for the cities in the future. This abrupt policy change, which was accompanied by the destruction of several million of the country's most prosperous private farmers, marked the end of the NEP. It was followed by the reimposition of state control over all industry and commerce in the country by 1931.

New England, region, northeastern United States, including the states of Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, and Connecticut.

The region was named by Captain John Smith, who explored its shores in 1614 for some London merchants. New England was soon settled by English Puritans whose aversion to idleness and luxury served admirably the need of fledgling communities where the work to be done was so prodigious and the hands so few. During the 17th century the population's high esteem for an educated clergy and enlightened leadership encouraged the development of public schools as well as such institutions of higher learning as Harvard (1636) and Yale (1701). Isolated from the mother country, New England colonies evolved representative governments, stressing town meetings, an expanded franchise, and civil liberties. The area was initially distinguished by the self-sufficient farm, but its abundant forests, streams, and harbours soon promoted the growth of a vigorous shipbuilding industry as well as of seaborne commerce across the Atlantic Ocean.

In the 18th century, New England became a hotbed of revolutionary agitation for independence from Great Britain, and its patriots played leading roles in establishing the new nation of the United States of America. In the early decades of the republic, the region strongly supported a national tariff and the policies of the Federalist Party. In the 19th century, New England was characterized culturally by its literary flowering and a deep evangelical dedication that frequently manifested itself in zeal for reform: temperance, abolition of slavery, improvements in prisons and insane asylums, and an end to child labour. The antislavery movement finally came to predominate, however, and New England stoutly supported the cause of the Union in the American Civil War (1861–65).

As the American frontier pushed westward, migrants from New England transplanted their region's patterns of culture and government to new frontiers in the Midwest. The Industrial Revolution successfully invaded New England in this period, and manufacturing came to dominate the economy. Such products as textiles, shoes, clocks, and hardware were distributed as far west as the Mississippi River by the itinerant Yankee peddler. Both before and after the American Civil War, a new labour force from Ireland and eastern Europe flooded New England's urban centres, causing an ethnic revolution and forcing the traditional Protestant religions to share their authority with Roman Catholicism.

The 20th century witnessed many changes in New England. In the years following World War II, the region's once-flourishing textile and leather-goods industries virtually deserted the region for locations farther south. This loss came to be offset by advances in the transport-equipment industry and such high-technology industries as electronics, however, and by the late 20th century New England's continued prosperity seemed assured owing to the proliferation of high-technology and service-based economic enterprises in the region.

New England, Council for, in British American colonial history, joint stock company organized in 1620 by a charter from the British crown with authority to colonize and govern the area now known as New England. Drawing from landed gentry rather than merchants, the company was dominated by its president, Sir Ferdinando Gorges, who intended to distribute the land as manors and fiefs among the council's 40 members with the idea of establishing a monolithic, aristocratic, Anglican province. This plan was unsuccessful, however, and New England colonization was dominated by two vigorous, Nonconformist, middle-class enterprises—the Pilgrims (1620) and the Massachusetts Bay Company (1629). To untangle confused land titles under the council and to resolve conflicting lines of political authority, the Massachusetts Bay Company took possession of its charter directly from the king, thus eliminating the Council for New England as an intermediary.

New England Confederation, also called UNITED COLONIES OF NEW ENGLAND, in British American colonial history, a federation of Massachusetts, Connecticut, New Haven, and Plymouth established in May 1643 by delegates from those four Puritan colonies. Several factors influenced the formation of this alliance, including the solution of trade, boundary, and religious disputes, but the principal impetus was a concern over defense against attacks by the French, the Dutch, or the Indians. Because of their divergence from accepted Puritan precepts, Rhode Island and Maine were refused admission to the confederation.

According to its articles of agreement, the New England Confederation was to be "a firme and perpetual league of friendship and amytie," and its government was to be composed of a directorate of eight commissioners, two from each colony. The commissioners were expected to meet annually or more often, if necessary. The articles authorized the commissioners to fix quotas for men and expenses during wartime, to arbitrate disputes with foreign powers or other colonies, to ensure extradition of escaped servants, prisoners, and other fugitives, and to regulate Indian affairs. Six affirmative votes were required to approve the decisions of the confederation; failing that, the pending issue would be referred to the legislatures of the member colonies.

The New England Confederation did achieve some of its goals, but the alliance ultimately proved to be weak, since its decisions were only advisory and were often ignored by Massachusetts, its strongest member. The confederation's influence declined with the merger of Connecticut and New Haven (1662–65), though it continued to exist until the Massachusetts charter was forfeited in 1684. The New England Confederation had represented the first significant effort by English colonists to form an intercolonial alliance for mutual benefit.

Consult the INDEX *first*

New England Glass Company, American glass company that was situated in East Cambridge, Mass., from about 1818 until 1888. In the latter year the company's owner, Edward D. Libbey, met a strike of his workers by moving the factory to Toledo, Ohio, where it is still active as the Libbey-Owens-Ford Company. The New England Glass Company made a large variety of wares ranging from pocket bottles and tumblers to attractive art glasses by techniques of molding, mechanical pressing, cutting, and engraving. Some of the finest of blown glass was produced by this factory; it was characterized by its high lead content, simplicity of line, and careful finish. New England glass was also famous for its rich colours, especially a ruby red. Another specialty of great public appeal was silvered glass, used to make doorknobs and tableware in imitation of silver. It is from the last decades of its production that some of the company's most successful art glasses date: a peachblow glass (*q.v.*), called Wild Rose, which is an opaque, coloured glass with a glossy finish shading from white to deep rose; the amberina glass (*q.v.*), with pale amber and ruby tones; and the Pomona, which has a frosted surface and a light-yellow colour.

New England Range, also called NORTHERN TABLELAND, section of the Eastern Highlands, or Great Dividing Range, northeastern New South Wales, Australia. The range extends 200 mi (320 km) north from the Moonbi Range (near Tamworth) to the Queensland border and 80 mi from east to west (10–50 mi inland from the coast). It is Australia's largest plateau, having 9,000 sq mi (23,000 sq km) above an elevation of 3,000 ft (900 m). The loftiest point is at Round Mountain (5,300 ft) on the eastern escarpment. The New England Range is generally wooded and is the source of many rivers, including the Richmond, Macleay, Clarence, Gwydir, Namoi, and Macintyre. The numerous river valleys are fertile and intensively cultivated with mixed crops, fruits, and potatoes. Cattle and sheep are grazed, timber is cut, and diamonds, sapphires, emeralds, gold, and tin are mined. Major centres are Inverell, Armidale, Glen Innes, and Tenterfield, which are linked by the New England (north–south) and the Oxley, Gwydir, and Bruxner (east–west) highways. The New England National Park, established in 1935, occupies 90 sq mi on the eastern slope of the range, 45 mi east of Armidale.

New England Renaissance: *see* American Renaissance.

New English Dictionary on Historical Principles, A (NED), the title of the original edition (1884–1928) of The Oxford English Dictionary (*q.v.*), which was the revised and corrected edition published in 1933.

New Forest, district, county of Hampshire, England, comprising the New Forest and its urbanized coastal fringe flanking Southampton Water and The Solent, together with rural areas around Ringwood and Fordingbridge in the west of the county. The old harbour of Hythe and the modern oil terminal of Fawley on Southampton Water are closely associated with the city (and district) of Southampton. Just to the west the Cistercian Abbey of Beaulieu has been developed into a major tourist attraction. From the old port borough of Lymington the residential and resort settlements along The Solent coast almost meet Christchurch, beyond the county boundary. Among them New Milton is the chief settlement. The Forestry Commission has its national headquarters at Lyndhurst. The district has an area of 291 sq mi (753 sq km). Pop. (1998 est.) 171,000.

New France, French NOUVELLE-FRANCE (1534–1763), the French colonies of continental North America, initially embracing the shores of the St. Lawrence River, Newfoundland, and Acadia (Nova Scotia) but gradually expanding to include much of the Great Lakes region and parts of the trans-Appalachian West.

The name Gallia Nova (New France) was first recorded in 1529 on a map prepared by the brother of Giovanni da Verrazano, who, in the service of France, had explored the coasts of North America in 1524 from what is now the Carolinas north to Nova Scotia. Then in 1534 the French seaman Jacques Cartier entered the Gulf of St. Lawrence and took possession of New France for King Francis I. In succeeding years Cartier ascended the St. Lawrence as far as the Lachine Rapids, to where Montreal now stands, and attempted, with Jean-François de La Rocque, sieur de Roberval, to found a colony near what is now Quebec. The colony failed, but out of these explorations the French fur trade with the Indians of the gulf and the river began.

Samuel de Champlain was employed in the interests of successive fur-trading monopolies and sailed into the St. Lawrence in 1603. In the next year he was on the Bay of Fundy and had a share in founding the first French colony in North America—that of Port Royal, now Annapolis Royal, Nova Scotia. In 1608 he began the settlement that was named Quebec, selecting a commanding site that controlled the narrowing of the St. Lawrence River estuary.

The fort at Quebec, however, attracted few residents, and Cardinal Richelieu, the chief minister of France, felt impelled to found in 1627 the Company of New France (Compagnie de la Nouvelle-France), popularly known as the Company of the Hundred Associates (Compagnie des Cent-Associés). It was granted the colony of New France, then comprising the whole St. Lawrence Valley, and for 15 years from 1629 it was to have complete monopoly of the fur trade. In return it was to take to New France 200 to 300 settlers a year. But war with England began, the company's first fleet was captured, and in 1629 Quebec itself surrendered to the English. It was restored by the Treaty of St. Germain in 1632, but the Company of New France never recovered from the blow, although it controlled New France until 1663. French colonization was slow for many years to come, and the fur trade remained the chief concern of everyone except the missionaries.

In 1663 King Louis XIV decided to cancel the charter of the Company of New France and make New France into a royal province, with a governor as the ceremonial and military head of the colony. In addition to creating a royal colony, the King sent a military commander, Alexandre de Prouville, the marquis de Tracy, and a regiment of soldiers who in 1666 defeated the Iroquois and forced them to make peace. It was then possible to proceed to populate and develop New France. More than 3,000 settlers, including girls of marriageable age, were sent out in the 1660s. Few followed thereafter, but by natural increase the population began to expand rapidly.

The first intendant, Jean Baptiste Talon (1665–68 and 1670–72), stimulated colonization and industry. He also pressed the exploration of the far west. Louis Jolliet explored the Mississippi until he was sure it flowed into the Gulf of Mexico, not into the Pacific Ocean. In 1671 Simon François d'Aumont (or Daumont, sieur de St. Lusson) at Sault Ste. Marie took possession of all the interior of the North American continent for France as an extension of New France.

Meanwhile, Britain and France were competing intensely for land and trade on the American continent. During King William's War (the North American extension of the War of the Grand Alliance; 1689–97), a New England fleet and army under Sir William Phips seized Acadia, but the French defied Phips's attempt to take Quebec in 1690. Then the French, under Louis de Buade, comte de Frontenac, began a series of border raids on New England, and finally marched into the Iroquois country. Meanwhile the brilliant young Canadian Pierre le Moyne, sieur d'Iberville, had conquered Hudson Bay, saved Acadia, and overrun Newfoundland. The war was ended by the Treaty of Rijswujk (1697) with New France holding Hudson Bay (but not Newfoundland) as well as all its former possessions. This was the work of Canadians, with little help from France. D'Iberville then set off to found Louisiana, another part of New France, in 1699. In 1700 and 1701 peace was made between the Iroquois and New France, and between the Iroquois and the Indian allies of New France. There were to be no more Iroquois wars, and New France stood at the height of its fortunes.

Its decline began almost at once. The English and their American colonists were to conquer all New France, but it was done in two stages. The first ended in 1713 with the conclusion of the War of the Spanish Succession. In 1710 Acadia had been seized again by the British, but in the next year an English expedition under Sir Hovenden Walker suffered serious losses along the St. Lawrence River and returned home. Most of the fighting was done in Europe, however, and the English victories there enabled them, by the Treaty of Utrecht that concluded the war, to recover Hudson Bay, limit French rights in Newfoundland, force the cession of Acadia (without Cape Breton Island), and to get a foothold in the western fur trade.

In 1756 the Seven Years' War in Europe began, and the American phase of this conflict, the French and Indian War, was to settle the fate of New France. For two years the French troops and Canadian militia were victorious. Then the British and American strength, fed by British sea power, began to tell. In 1758 Louisburg fell; in 1759 James Wolfe captured Quebec; and in 1760 Montreal surrendered and with it all of New France.

When the war was finally ended and peace was made by the Treaty of Paris in 1763, all New France east of the Mississippi, outside the environs of New Orleans, was ceded to Great Britain. Only two little islands, St. Pierre and Miquelon near Newfoundland, and the French fishing rights in Newfoundland, were left to France. But in what now became the province of Quebec more than 60,000 French Canadians became British subjects.

New General Catalogue of Nebulae and Clusters of Stars (*NGC*), basic reference list of star clusters, nebulas, and galaxies. It was compiled in 1888 by Danish astronomer Johan Ludvig Emil Dreyer, who based his work on earlier lists made by the Herschel family of British astronomers. Dreyer included some 8,000 celestial objects, a total raised to about 13,000 by his first and second *Index Catalogues* (*IC*), published in 1895 and 1908, respectively. With these supplements the *NGC* covers the entire sky, although many objects visible with modern instruments are not listed.

An object may be known by several designations; *e.g.*, the Crab Nebula is also called NGC 1952 and M 1, the latter being its number in the Messier catalog.

New Georgia Group, volcanic island group in the Solomon Islands, southwestern Pacific Ocean, 90 mi (145 km) northwest of Guadalcanal. The main islands (northwest to southeast) are Vella Lavella, Ranongga, Gizo, Kolombangara (cone-shaped, with a solfataric volcano, 5,800 ft [1,768 m]), Vona Vona, New Georgia (the largest, 50 mi long and 20 mi across at its widest point), Rendova, Tetepare, Vangunu, and Nggatokae. The islands are picturesque, surrounded by extensive reefs and lagoons; they are rugged and well forested, with a virtual absence of animal life and an abundance of rivers. New Georgia rises to two peaks, Vina Roni (3,300 ft) in the north and Nanggala Hill (2,670 ft) in the centre. Timber is produced on Gizo, New Georgia, and Kolombangara. Other products include copra, taro, sweet potatoes, and yams. During World War II, Japanese airfields were established at several places on New Georgia. U.S. forces took the islands from the Japanese on Oct. 7, 1943, after an intense struggle that began on June 29.

New Glarus, village, Green County, southern Wisconsin, U.S., on a branch of the Sugar River, 22 mi (35 km) southwest of Madison. Founded in 1845 by 193 immigrants from the canton of Glarus in Switzerland who had been driven from their homes by famine, it was organized on a semi-communal basis, with mineral rights and all streams and springs owned in common and the land apportioned by lot. The village (inc. 1901) is still largely populated by descendants of the original settlers. Located in a rich dairying region, New Glarus is noted for its Swiss cheese, as well as for Swiss-style embroidery. Tourism is important. Swiss Historical Village includes replicas of the buildings originally constructed on the site and a replica of a Swiss chalet. A Heidi (drama) Festival is held in June, a Swiss Volksfest celebrating Swiss Independence Day is held in August, and the Wilhelm Tell Festival in September includes the presentation of Friedrich Schiller's drama *Wilhelm Tell*. New Glarus Woods State Park is just south of the village. Pop. (1990) 1,899.

New Glasgow, town, Pictou county, northern Nova Scotia, Canada. It lies along the East River, 104 miles (167 km) northeast of Halifax. Founded in 1809, following the discovery of local coal deposits in 1798, it was named by William Fraser, a Scot, who surveyed the site and envisaged another Glasgow on the Clyde (the East River). It developed as a shipbuilding port and as a service centre for a farming and coal-mining region. The town now manufactures railway and heavy machinery, boilers, fabricated steel, tires, pulp and paper, and mattresses. *Samson,* the first Canadian locomotive built (1839) to operate on steel rails, may be seen at the town's Canadian National Railway station. Inc. 1875. Pop. (1991) 9,905.

New Granada, Viceroyalty of, Spanish VIRREINATO DE NUEVA GRANADA, in colonial Latin America, a Spanish viceroyalty, established temporarily between 1717 and 1724 and permanently in 1740, that included present Colombia, Panama (after 1751), Ecuador, and Venezuela and had its capital at Santa Fé (present-day Bogotá).

The separation of these territories from the viceroyalty of Peru, one of the principal colonial administrative changes effected by the Bourbon monarchs of Spain, reflected the growing population and increasing commercial importance of the area in the early 18th century. Subsequent commercial and political reforms and rising European demand for colonial products led to a period of prosperity and intellectual and cultural activity, which, however, exacerbated the divisions between peninsular Spaniards and middle- and upper-class Creoles. The viceroyalty ceased to exist in 1810, when most of the component jurisdictions ejected their Spanish officials. Initially the new governments swore allegiance to the Spanish monarch, and they did not begin to declare independence until the following year. A series of civil wars facilitated the temporary reconquest of the United Provinces of New Granada by Spain between 1814 and 1816, and the liberation of the area from Spanish rule was not completed until 1823. The name Estado de Nueva Granada ("State of New Granada") was adopted by Colombia in the period 1830–58.

New Granada Treaty (1846): *see* Bidlack Treaty.

New Guinea, island of the eastern Malay Archipelago, in the western Pacific Ocean, north of Australia. It is bounded by the Pacific Ocean to the north, the Bismarck and Solomon seas to the east, the Coral Sea and Torres Strait to the south, and the Arafura Sea to the southwest. The island covers an area of about 309,000 square miles (800,000 square km). New Guinea is administratively divided into two parts: its western half comprises Irian Jaya (formerly Irian Barat), a *provinsi* ("province") of Indonesia; and its eastern half comprises the major part of Papua New Guinea, an independent parliamentary state from 1975. *See also* Irian Jaya; Papua New Guinea. The second largest island in the world (after Greenland), New Guinea is about 1,500 miles (2,400 km) long (from northwest to southeast) and about 400 miles (650 km) wide at its widest (north to south) part.

An unbroken chain of mountains with peaks more than 13,000 feet (4,000 m) in elevation extends across New Guinea from the northwest to the southeast, rising to 16,503 feet (5,030 m) at Mount Jaya in western Irian Jaya. The summits of the chain are glaciated, and the mountains incorporate extinct volcanoes and elongated, fertile highland basins usually more than 4,900 feet (1,490 m) in elevation. To the north of the mountain chain is a deep structural trench occupied by the valleys of the Mamberamo, Sepik, Ramu, and Markham rivers. Fronting the north-central coastal plains of New Guinea is a series of fault-rimmed mountains that generally lie below 11,500 feet (3,505 m). The mostly lowland Bomberai Peninsula and the more mountainous Doberai Peninsula constitute the extreme northwestern part of the island.

South of the central mountain chain is the Fly-Digul shelf, a vast swampy plain crossed by numerous rivers including the Fly, Bian, Digul, Mapi, Pulau, and Lorentz. To the southeast the Owen Stanley Range extends about 200 miles (320 km) and forms a wide peninsula, separating the Solomon Sea to the north from the Coral Sea to the south.

The climate of New Guinea is basically tropical, with mean annual maximum temperatures ranging between 86° and 90° F (30° and 32° C) in the lowlands; daytime temperatures in the highlands generally exceed 72° F (22° C) year-round. The southeast trade winds blow for about seven months each year, and rainfall on the southward-facing slopes of the central highlands frequently exceeds 300 inches (7,620 mm) annually. Consequently, the Fly-Digul shelf and bordering highlands are one of the world's wettest places and also one of the least-inhabited. The central highlands receive rain throughout the year totaling between 100 and 160 inches (2,540 and 4,065 mm). Port Moresby on the southeastern coast receives only about 40 inches (1,016 mm) of rain per year.

Mangrove swamp is found along the coastline almost everywhere, and farther inland it is succeeded by nipa palm. Large stands of sago palm are found along the deltas and rivers of the southern coast. Primary lowland rain forest covers much of New Guinea up to about 3,300 feet (1,005 m) above sea level. In the central highlands above 3,300 feet, stands of oak, beech, and pine are common. Throughout most of the highland basins, much of the natural vegetation has been removed by the relatively intensive agriculture of the highlanders. The central highlands are the most densely populated part of the island. Swidden (slash-and-burn, or shifting) cultivation is practiced in the forested foothills to the north of the central highlands and in the grasslands of the Mamberamo and Sepik river basins, where the population is sparse. The north coast is also generally well populated.

New Guinea has a rich variety of plant life including orchids, figs, and species of false beech. Wildlife includes many reptiles and such marsupials as the tree kangaroo and phalanger. Notable birds are the cassowary (a large, flightless bird), the spectacular birds of paradise, and parrots.

Almost the whole of New Guinea is occupied by speakers of Papuan languages, the original settlers of the island, who live mainly in the interior and southern sections. Papuan societies are characterized by leadership invested in local "big men" and by reciprocal gift giving. Ethnic composition is complex among the Papuans, who speak some 700 different languages. On the northern coast, the eastern coast, and many of the offshore islands there are communities of speakers of Austronesian (Melanesian) languages. There are also some Polynesians, Chinese, and Europeans. Several pidgins, such as Tok Pisin and Hiri Motu, are widely spoken; Indonesian (the official language of Indonesia) and English (the official language of Papua New Guinea) are also spoken. Although about a third of Papua New Guinea's population is Roman Catholic and more than a quarter are Lutherans, traditional religious beliefs and rituals are still widely practiced, and most of the island's population is animist.

Copper and gold are the main mineral resources of the island. One of the largest concentrations of copper in the world is at Tembagapura, about 25 miles (40 km) southwest of Mount Jaya in Irian Jaya. Another major deposit of copper has been developed just inside Papua New Guinea among the headwaters of the Fly River at Ok Tedi. Large amounts of gold also are produced at Ok Tedi. Petroleum is produced in the Doberai Peninsula area of Irian Jaya and near Lake Kutubu in the central highlands of Papua New Guinea. Natural gas has been discovered in the Fly-Kikori area in Papua New Guinea.

The bulk of New Guinea's population are subsistence farmers. Yams, taro, sago, and bananas are the lowland staple foods, and the sweet potato is the main highland food; pig husbandry is widespread. Cash crops in Papua New Guinea include coffee, cacao, copra, palm oil, tea, and rubber; skyjack tuna, prawns, and timber are also exported. Internal transport consists of a few secondary coastal roads, riverboats, and airways, with the latter becoming increasingly important.

New Guinea was possibly occupied as early as 50,000 years ago; by about 7000 BC sedentary agriculture with extensive swamp drainage and irrigation was practiced in the highland basins. The island, especially the western half, was known to Indonesian and Asian seafarers centuries before it was known to Europeans. The Portuguese in 1511 were the first Europeans to sight the island but made no landing until 1527.

The Dutch claimed the western half of the island in 1828 as part of the Dutch East Indies. In the 1870s Captain John Moresby of Great Britain surveyed the southeastern coast, and by 1884 the southeastern quadrant of New Guinea had been annexed by Great Britain. The German New Guinea Company took over administration of the northeast quadrant in the same year. The administration of British New Guinea was passed to Australia in 1904, and its name was changed to the Territory of Papua.

Following World War I, German New Guinea was taken over by Australia as a mandated territory of the League of Nations in 1921. After Japan temporarily occupied large parts of the island during the early years of World War II, Australia combined its administration of the Territory of Papua and the New Guinea mandate into the Territory of Papua and New Guinea. Also after the war, the western half of the island, known as Irian Barat, was returned to Dutch control. Indonesia became independent in 1949, and a plebiscite was held in 1969 to decide Irian Barat's future; as a result it was annexed to Indonesia as the province of Irian Jaya. Papua New Guinea was granted independence within the British Commonwealth in 1975. Pop. (1990) Irian Jaya, 1,648,708; (1990 prelim.) Papua New Guinea, 3,097,559; entire island including minor adjoining islands, 4,746,267.

New Guinea plateless turtle: *see* pitted shell turtle.

New Hampshire, constituent state of the United States of America lying in the New England region of the country. The state capital is Concord.

A brief treatment of New Hampshire follows.

For full treatment, *see* MACROPAEDIA: United States of America: *New Hampshire.*

Facing the Atlantic Ocean along a short 13-mile (21-kilometre) southeastern coastline, New Hampshire is also bounded by Massachusetts on the south, Vermont on the west, Maine on the east, and the Canadian province of Quebec on the north. The state extends about 180 miles (290 km) from north to south and 90 miles from east to west.

The first European settlers found the region inhabited by various tribes of the Algonquian Indian culture, the most powerful of which were the Pennacooks. The first European settlement was a fishing and trading village established near Portsmouth in 1623. Settlements at Exeter, Dover, and Hampton followed shortly, and in 1641 the area came under the jurisdiction of Massachusetts. New Hampshire became a separate crown colony in 1679. After the American Revolution, in which the people of New Hampshire supported overwhelmingly the aims of the revolutionary leaders, New Hampshire became the ninth state to ratify the Constitution in 1788. The traditional annual town meeting serves to shape policy in virtually all the incorporated towns. Local government in New Hampshire's cities takes the form of a city council, a council-manager, or a commission system. Because it holds the earliest presidential primary election in the nation, New Hampshire has often furnished the first testing ground for successful candidates.

New Hampshire lies entirely within the Appalachian system, but it can be divided into three main regions: (1) the White Mountains, covering the northern one-third of the state and rising to 6,288 feet (1,917 m) at Mount Washington; (2) the glacier-scoured region of low mountains and lakes covering most of the southern two-thirds of the state; and (3) a narrow strip of coastal plain along the Atlantic Ocean. The ice sheet of the last glacial age covered the entire state, sculpting most of its present physical features. The state drains generally southward through the Merrimack and Connecticut river systems.

The New Hampshire climate is temperate, with cool summers and cold winters. The average summer temperature at Concord in the south is 70° F (21° C), and the average winter temperature at Mount Washington in the north is 6° F (−14° C). Average yearly precipitation at the two locations is 39 and 74 inches (990 and 1,880 mm), respectively, and is evenly distributed throughout the year. Annual snowfall averages 60 inches (1,524 mm) in the south and 200 inches (5,080 mm) on the northern mountains. Soils are not generally suitable for large-scale cultivation except in the river valleys. Forests cover more than 80 percent of the land.

Settlement of New Hampshire was primarily by English and Scots-Irish Protestants. Their descendants can be found in almost every town and city occupying the same property, even the same house, for several successive generations. The second largest ethnic group is the French Canadians, who first began to arrive immediately after the American Civil War seeking economic opportunities in the industrial cities. About half of the population is classified as urban, and only a tiny fraction is nonwhite. The people of the state are largely concentrated in the southern region. The area nearest to Boston has evolved into a commuter suburban region.

The economy of New Hampshire is based primarily on manufacturing and tourism. The main agricultural activities are dairying and the production of fruits and vegetables. The forests of the state provide lumber, paper, pulp, and maple syrup and sugar. The main mining activity is granite quarrying. Traditional shoemaking and textile and apparel industries have given over to electrical- and electronic-goods manufacturing. Tourists—attracted by the distinctiveness of the landscape and the varied seasonal recreational opportunites—account for a large portion of retail sales and service income.

New Hampshire's transportation facilities lie generally outside the mainstream of the nation's traffic flow, although the interstate-highway system provides rapid access northward from Boston. Many of the state's highways utilize scenic covered bridges and tree-lined country lanes. The main seaport is at Portsmouth, and the U.S. Navy has submarine building and repair facilities at its Portsmouth Naval Shipyard, located in Kittery (Maine) across the Piscataqua River from Portsmouth.

New Hampshire has a long-standing continuity of cultural and educational institutions. The MacDowell Colony for writers and composers, the Saint-Gaudens National Historic Site, and the Currier Gallery of Art are important in the arts. Summer theatres flourish in resort areas. Dartmouth College and the University of New Hampshire provide excellent higher-education opportunities. Area 9,279 square miles (24,032 square km). Pop. (2000) 1,235,786.

New Hampshire Grants, in the period before the American Revolution, the territory that subsequently became the state of Vermont. The area was initially claimed by New Hampshire, and the first land grant there was issued in 1749 by the first governor of New Hampshire, Benning Wentworth. By 1764, 131 townships had been chartered. In 1765 New York, which also claimed the territory, began issuing grants of its own, some of which conflicted with those already made by New Hampshire. Armed conflicts between the rival claimants were common, and the Green Mountain Boys (*q.v.*) were organized to expel the settlers from New York. The dispute was resolved when Vermont (originally New Connecticut) was established as an independent republic in 1777.

New Hampshire v. Louisiana (108 U.S. 76 [1883]), U.S. Supreme Court case (combined with *New York* v. *Louisiana*) concerning an attempt by the states of New Hampshire and New York to force Louisiana to pay interest on state bonds owned by citizens of the plaintiff states and assigned to those states for collection. Laws had been passed by New Hampshire in 1879 and by New York in 1880 under which a citizen of either of those states who held a valid, overdue claim against another state could assign the claim to his state in writing; the state attorney general could then bring suit against the defaulting state, and money that was recovered, less the costs of litigation, was to be given to the original owner. The Supreme Court dismissed the cases on the ground that the laws in question violated the spirit and purpose of the Eleventh Amendment to the United States Constitution, according to which "the judicial power of the United States shall not be construed to extend to any suit" brought against one of the United States by citizens of another state.

New Harmony, town, Posey county, southwestern Indiana, U.S., on the Wabash River, at the Illinois border, 22 miles (35 km) northwest of Evansville. The site was first occupied by prehistoric Mound Builders and later was a camping ground for Piankashaw and other Indians. The settlement of Harmonie was founded in 1814–15 by George Rapp, a German Pietist preacher who had first come to Pennsylvania in 1803 with his followers from Württemberg, Ger. When they later moved west, a prosperous Indiana colony evolved, but unrest brought on by hostile neighbours spurred the Rappite leaders to sell their holdings in 1825 to Robert Owen, a British reformer, who first came to the United States to found a cooperative community based on plans for mankind's salvation through "rational" thinking, cooperation, and free education. Owen renamed the town New Harmony. He was aided by William Maclure, a geologist, businessman, and philanthropist, who agreed to finance the schools and supply teachers, scientific equipment, and a library.

About 1,000 settlers responded to Owen's public appeal, but most were misfits who ate his rations, argued over government, and were unable to perform the menial tasks vital to such a community. Farms and workshops lay idle while virtual anarchy reigned. By May 1827, Owen's cash had been absorbed by payments for land and supplies, and he returned to Britain in 1828. The property was divided among Maclure and Owen's three sons, who, with some of the scientists and teachers, stayed on to develop one of the most notable pre-Civil War cultural centres in the United States. A laboratory, built by David Dale Owen (first U.S. geologist), was headquarters for what later became the U.S. Geological Survey. It has since been restored.

New Harmony is now an agricultural-trading centre. The town was made a national historic landmark in 1965, and many of the Harmonist and Rappite buildings have been restored, including the Fauntleroy Home (1822–40), the Rapp-Maclure Mansion (1814), Barrett-Gate House (1814), Dormitory Number 2 (1822), and the Restored Labyrinth (shrubbery) with its baffling pathways. The Roofless Church (1959) has a Jacques Lipchitz sculpture. The ashes of theologian Paul Tillich are interred in Tillich Park. The Workingmen's Institute (1894) was one of the nation's first free public libraries. Inc. 1850. Pop. (2000) 916.

New Haven, city, coextensive with the town ("township") of New Haven, New Haven county, south-central Connecticut, U.S. It is a port of entry on Long Island Sound at the Quinnipiac River mouth. Originally settled as Quinnipiac in 1638 by a company of English Puritans led by John Davenport and Theophilus Eaton, it was renamed in 1640, probably for Newhaven, Sussex, Eng. In 1643 it combined with several adjacent towns, including Milford and Guilford, to form the New Haven Colony, of which Eaton was governor until his death in 1658. Reluctantly, in 1664 New Haven Colony accepted absorption into the more liberal and democratic Connecticut Colony, which was based on Hartford and enjoyed a royal charter. From 1701 New Haven was co-capital with Hartford, a position it maintained in both colony and state until 1875. During the American Revolution it was sacked (July 5, 1779) by Loyalist forces under General William Tryon. The town was an important centre of Abolitionist sentiment during the American Civil War.

The Green, a park in downtown New Haven, Conn.
Ewing Galloway

New Haven's preeminence in many industrial fields is manifest in the number of inventions that first appeared there. These include Eli Whitney's mass-production technique, Charles Goodyear's vulcanized rubber, Samuel Colt's improved repeating revolver, Lee De Forest's Audion (elementary radio tube), and sulfur matches. The Winchester repeating rifle (the gun that "tamed the West") was made there, and the Winchester Gun Museum is there. Diversified manufacturing and shipping are the modern economic mainstays. In 1957 New Haven was one of the first Eastern cities to undertake wholesale urban renewal of its decaying downtown area, now exemplified in Church Street Center.

New Haven is noted for its educational and cultural institutions. It is the seat of Yale University (founded 1701 at Saybrook and moved to New Haven in 1716), Southern Connecticut State University (1893), Albertus Magnus College (1925), and South Central Connecticut Community College (1968). Pop. (1990) city, 130,474; New Haven–Meriden MSA, 530,180.

New Haven Railroad: *see* New York, New Haven and Hartford Railroad Company.

New Hebrides (islands, southwestern Pacific Ocean): *see* Vanuatu.

New Hope, borough and artists' colony, Bucks county, southeastern Pennsylvania, U.S., in a scenic wooded region along the west bank of the Delaware River (there bridged to Lambertville, N.J.), 33 miles (53 km) north-northeast of Philadelphia. The site, originally called Coryell's Ferry, was first settled in 1715. The present community, deriving its name from New Hope Mills (1790), was founded by William Lathrop in 1900 and has gained fame as a refuge for painters, writers, composers, and actors. New Hope abounds in craft shops, book shops, and galleries. It is crossed by a reconstructed section of the old Delaware Canal (in operation 1831–58), now a tourist attraction with mule-drawn barges. One of the nation's oldest summer theatres, the Bucks County Playhouse (dating from the 1780s), is in the borough. The New Hope and Ivyland Railroad comprises 14 miles (22.5 km) of track and a steam-powered train and coaches of the Victorian era. Washington Crossing State Park is 7 miles (11 km) south. Inc. 1837. Pop. (1990) 1,400.

New Humanism, critical movement in the United States between 1910 and 1930, based on the literary and social theories of the English poet and critic Matthew Arnold, who sought to recapture the moral quality of past civilizations in an age of industrialization and materialism. Reacting against the scientifically oriented philosophies of literary realism and naturalism, New Humanists refused to accept deterministic views of human nature. They argued that: (1) human beings are unique among nature's creatures; (2) the essence of experience is fundamentally moral and ethical; and (3) the human will, although subject to genetic laws and shaped by the environment, is essentially free. With these points of contention, the New Humanists—Paul Elmer More, Irving Babbitt, Norman Foerster, and Robert Shafer, to name only a few—outlined an entire program and aesthetic to incorporate their beliefs. By the 1930s the New Humanists had come to be regarded as cultural elitists and advocates of social and aesthetic conservatism, and their influence became negligible.

New Iberia, city, seat (1868) of Iberia parish, southern Louisiana, U.S., on the Bayou Teche (connected via canal with the Gulf Intracoastal Waterway), 20 miles (32 km) southeast of Lafayette. First settled in the 18th century by French, Spanish, and Acadians, it bears the ancient name of Spain (Iberia) and was laid out in 1835. In 1863 it was occupied (with nearby salt mines) by Union forces. It developed as a processing and shipping centre for salt, sugarcane, rice, peppers, vegetables, and oil and acquired some light manufacturing. New Iberia has retained strong French characteristics and is the site of Shadows-on-the-Teche, a restored antebellum mansion. The Louisiana Sugar Cane Festival is held annually in September. Nearby are the Longfellow-Evangeline State Commemorative Area, a federal livestock experimental station, and Avery and Jefferson islands, noted for their scenic gardens. Inc. 1839. Pop. (1990) 31,828.

New Ireland, island of the Bismarck Archipelago and *provinsi* ("province"; established 1977) of Papua New Guinea. The island, lying just north of New Britain, from which it is separated by St. George's Channel, stretches for about 220 miles (350 km) from northwest to southeast but is very narrow, with the southeastern portion only 30 miles (48 km) wide and the 150-mile (241-kilometre) northwestern arm no broader than 15 miles (24 km) and as narrow as 5 miles (8 km). It is generally rugged, especially in the south, where the Rossel Mountains rise to more than 7,050 feet (2,150 m), and in the north, where the Schleinitz Range reaches 4,859 feet (1,481 m). Limestone highlands occupy much of the northwest, the Lelet Plateau averaging 2,000 feet (610 m) in elevation. Lihir island and Ambitle on New Ireland show solfataric and hot-spring activity, but there are no active volcanoes. There is a fringe of coastal plain leached by centuries of bush burning, and there are few good harbours.

New Ireland was sighted in 1616 by the Dutch navigator Jakob Le Maire, who believed it was part of a landmass including New Britain and New Guinea. This theory was disproved when Philip Carteret found St. George's Channel in 1767 and named the island Nova Hibernia (New Ireland). An unsuccessful settlement attempt was made in 1880. Annexed by Germany in 1884, it was renamed New Mecklenburg. After World War I the island was mandated to Australia. Occupied by the Japanese in 1942, it became part of the UN Trust Territory of New Guinea, administered by Australia, after World War II. When Papua New Guinea achieved independence in 1975, it became part of that country.

Commercial development is dominated by copra production, particularly on the east coast of New Ireland. Most of the inhabitants live in the north. This section is administered from Kavieng, the chief port, which is linked by an east-coast road to Samo. The southern portion is administered from Namatanai. The island of New Ireland has an area of 3,340 square miles (8,651 square km); the province, which includes Lavongai (New Hanover), the St. Matthias, Tabar, Lihir, Tanga, and Feni island groups, and Djaul Island, has an area of 3,700 square miles (9,600 square km). Pop. (1987 est.) province, 78,900.

New Jersey, constituent state of the United States of America lying on the Atlantic seaboard in the Middle Atlantic region of the country. The capital is Trenton.

A brief treatment of New Jersey follows. For full treatment, *see* MACROPAEDIA: United States of America: *New Jersey.*

New Jersey's only land boundary is with New York on the north. To the east lies the Atlantic Ocean, to the northeast across the Hudson River is New York City, and to the west across the Delaware River and Bay are Pennsylvania and Delaware. The state extends about 170 miles (270 km) from north to south and 75 miles (120 km) from east to west.

At the time of European exploration and settlement, the New Jersey area was inhabited by the Lenni-Lenape (Delaware) Indians. The first European to land in the area was the Florentine explorer Giovanni de Verrazano, sailing under the French flag in 1524. Henry Hudson, an Englishman exploring for the Dutch, arrived in 1609. The first settlements were fortified Dutch and Swedish trading posts along the Hudson and Delaware rivers.

The English took control of the region from the Dutch in 1664. In 1676 the province was divided into East Jersey and West Jersey, the former going to Sir George Carteret and the latter to a group of Quakers. The division continued until 1702, when New Jersey was reunited as a royal colony under the governor of New York. In 1738 New Jersey became a separate colony with its own governor and assembly. Early in the American Revolution, the colonial forces won key battles at Trenton (1776), Princeton (1777), and Monmouth (1778). Princeton was twice the site of the national capital during periods of 1783 and 1784. New Jersey became the third state to ratify the U.S. Constitution in 1787.

New Jersey can be divided into four parallel physiographic regions running northeast to southwest: (1) the rugged Ridge and Valley section of the northwest, where the Appalachians slice across the corner of the state; (2) the New England section, a southern extension of the ancient rocks of New England, to the southeast; (3) the rolling central Piedmont containing the industrial cities, the Hudson Palisades, and marshy meadowlands; and (4) the Coastal Plain, containing rich farmland, sandy beaches, dunes, marshes, and the Pine Barrens.

The New Jersey climate is humid continental, with a marked difference in winter temperature between the northwest and southeast. In the north the average temperature in winter is 28° F (−2° C) and in summer, 70° F (21° C). In the south the average temperature in winter is 35° F (2° C) and in summer, 71° F (22° C). Precipitation averages range from 44 to more than 48 inches (1,120 to 1,220 mm) a year, with August being the wettest month. The growing season is about 150 days in the north and 200 days along the southern coast. Soil conditions throughout the state are well suited for agriculture, and most of the land not built on or covered by marshes or forest is farmed.

New Jersey is the most densely populated state in the country. The population is unequally distributed geographically; roughly three of every four Jerseyans live north of Trenton, and 60 percent within 30 miles (48 km) of New York City. Across the Hudson from New York City is the industrial sprawl of New Jersey's four largest cities—Newark, Jersey City, Paterson, and Elizabeth. Every day thousands of New Jersey commuters travel from suburban homes to jobs in New York City and Philadelphia. Statewide, 89 percent of the population lives in areas classified as urban, thus making New Jersey one of the most urbanized states of the United States. Italian-Americans constitute the state's largest ethnic group. About 13 percent of the state's population is black, and about 7 percent is Hispanic.

The economy of New Jersey is based primarily on manufacturing, which employs about one-third of the work force. New Jersey's major manufactures are chemicals, in which it leads the nation, and electronic equipment. It holds high national ranking in the production of clothing, electrical machinery, toys, sporting goods, and stone, glass, and clay products. About 10 percent of the nation's research dollars are spent in New Jersey research facilities and laboratories. The resort industry, centred on the Atlantic shore, is also a major factor in the state's economy. Atlantic City, with its Boardwalk, fine old hotels, and gambling casinos, is one of the nation's largest year-round resorts and convention centres. Prosperous truck farms grow almost every kind of temperate-climate fruit and vegetable, but the spread of industry and housing is costing New Jersey much of its valuable farmland.

The New Jersey transportation system is primarily a funnel for goods and people moving between New York City and points north and between Philadelphia, Delaware, and points south. Its freeways and turnpikes, railroads, and airports are among the busiest in the world. The Port Authority of New York and New Jersey is a bistate commission empowered to finance and operate transportation facilities in the New York City metropolitan area. It oversees airports, tunnels, bridges, piers and container terminals, commuter bus and rail lines, and truck terminals. A similar, but smaller, transit complex exists in the Camden area, linking the South Jersey area with Philadelphia.

New Jersey, often regarded as a cultural adjunct of New York City and Philadelphia, has helped correct its reputation with the opening of the Garden State Arts Center and the Meadowlands sports complex. Museums, many operated in conjunction with historic sites or buildings, manifest rich cultural traditions focusing on the works of accomplished citizens such as Thomas Edison, Walt Whitman, and Woodrow Wilson. Major institutions include Rutgers and Princeton universities, as well as such institutions as the Institute for Advanced Study, the Educational Testing Service, and Bell Laboratories. Area 7,787 square miles (20,168 square km). Pop. (2000) 8,414,350.

New Jersey, State University of: *see* Rutgers, The State University of New Jersey.

New Kensington, city, Westmoreland county, western Pennsylvania, U.S., on the Allegheny River, and near the Pennsylvania Turnpike, just northeast of Pittsburgh. Established in 1891 by a group of Pittsburgh merchants interested in the reduction of aluminum, it was laid out on the site of Fort Crawford (built during the American Revolutionary period) and named for Kensington in London. Incorporated as a borough in 1892, it absorbed neighbouring Parnassus in 1931 and became a city in 1934.

New Kensington's manufactures include aluminum, steel, glass, textiles, and metal and petroleum products. Several industrial research-and-development centres are also located in the area. The New Kensington campus of Pennsylvania State University was opened in 1958. Pop. (2000) 14,701.

New Lisbon (Angola): *see* Huambo.

New Liskeard, town, Timiskaming district, eastern Ontario, Canada, at the northern end of Lake Timiskaming (an expansion of the Ottawa River), near the Quebec border. Originally known as Thornloe, the town developed on land that the provincial government opened for settlement in 1822. Its present name was derived from Liskeard, Eng., the birthplace of the town's founder, John Armstrong.

A market and distributing town for the surrounding farming, lumbering, and cobalt- and silver-mining region, New Liskeard also serves as a hunting and fishing resort. Industries include ironworks, dairies, canneries, and pulp and lumber mills. Pop. (2001) 4,906.

New London, city, coextensive with the township of New London, New London county, southeastern Connecticut, U.S. It is a port of entry on Long Island Sound at the mouth of the Thames River. Founded by John Winthrop the Younger in 1646, it was called Pequot until 1658. New London was chartered as a city in 1784. In 1709 Connecticut's first printing press was established there. A rendezvous of privateers during the American Revolution, it was attacked and burned (Sept. 6, 1781) by a large British force under the command of Benedict Arnold. New London has one of the deepest harbours on the Atlantic coast. The whaling industry began there in 1784, flourished in the early 19th century, but declined after 1846.

Playing field of the U.S. Coast Guard Academy, New London, Conn.

Alan Pitcairn from Grant Heilman

New London is the seat of the U.S. Coast Guard Academy (1876) and site of a U.S. Navy submarine base (1916) and the Underwater Sound Laboratory. These establishments greatly influence its economy, which includes the building of nuclear submarines. The city is the seat of Connecticut College (1911). Nearby is the Connecticut Arboretum and Mitchell College (1938). The Lyman Allyn Museum houses colonial artifacts. The annual Yale-Harvard boat races on the Thames finish at New London. The Eugene O'Neill Memorial Theater Center is in nearby Waterford. Pop. (2000) city, 25,671; New London–Norwich MSA, 293,566.

New Madrid, city, seat (1821) of New Madrid county, southeast Missouri, U.S., on the Mississippi River. It originated as an Indian trading post about 1783. The town was initiated in 1789 by an American Revolutionary War veteran, George Morgan, who had received a land grant from Spain, but it did not begin to flourish in farming and trade until after the purchase of the Territory of Louisiana by the United States in 1803. New Madrid's growth was slowed by violent earthquakes in 1811–12, as well as floods and shifting of the river's course, which caused several removals of the city to different sites. The town was the site of an American Civil War battle in 1862.

New Madrid's economic mainstay is diversified agriculture (cotton, soybeans, corn [maize], grain sorghum, and livestock). Aluminum ingots, electrical conductors, and clothing are manufactured there, and there is some lumbering. The Lilbourn site, a fortified prehistoric Indian ceremonial centre, is 6 miles (10 km) west. Inc. 1808. Pop. (2000) 3,334.

New Madrid Fault, also called NEW MADRID SEISMIC ZONE, deep-seated fracture in the Earth's crust trending southwest-northeast through Arkansas, Missouri, Tennessee, and Kentucky, U.S. Lying in the central area of the North American Plate, the rift is about 45 miles (70 km) wide and 190 miles (300 km) long. The deep fracture is overlaid by thick layers of rock, which in turn are overlaid by deep, unstable alluvial material relating to the Mississippi, Missouri, and Ohio rivers.

On Dec. 16, 1811, and Jan. 23 and Feb. 7, 1812, a series of three earthquakes—the largest in recorded American history—occurred near the frontier town of New Madrid, Mo. (epicentre 36.6° N 89.6° W), each measuring greater than magnitude 8.0. (Milder aftershocks occurred daily for more than a year.) The first shock was felt from Canada to New Orleans and as far away as Boston, Mass., and Washington, D.C. In the end, some 3,000 to 5,000 square miles (7,800 to 13,000 square km) were visibly scarred with the effects—causing such topographical changes as fissures, landslides, and upheavals, the creation and destruction of lakes and swamps, and the wasting of forests.

New Market, town, Shenandoah county, northwestern Virginia, U.S., in the Shenandoah Valley. Laid out in 1784 and early known as Crossroads, it was incorporated in 1796 and renamed for the famous English horseracing town. This small farming-resort community gained a place in American Civil War history when Confederate General John C. Breckinridge, in desperation, ordered the 257 cadets of the Virginia Military Institute in Lexington to join the fight in the hills to the north against the Union army of General Franz Sigel. The boy-cadets, under General Scott Shipp, marched 90 miles (145 km) from Lexington in three days and distinguished themselves against seasoned forces, taking prisoners and capturing a battery. The improbable battle (May 15, 1864), in which 10 cadets were killed and 47 were wounded, ended with Sigel's retreat northward. New Market Battlefield Park commemorates the cadets' heroism. Endless Caverns (north) and Shenandoah Caverns (south) are known for vivid colouring and fantastic rock formations. Pop. (2000) 1,637.

New Mexico, constituent state of the United States of America lying in the southwestern mountain region of the country. The capital is Santa Fe.

A brief treatment of New Mexico follows. For full treatment, *see* MACROPAEDIA: United States of America: *New Mexico.*

Rectangular except for a small panhandle in the southwestern corner, New Mexico is bounded on the north by Colorado, on the east by Oklahoma and Texas, on the south by Texas and the Mexican state of Chihuahua, and on the west by Arizona. New Mexico also touches Utah at a single point at its northwestern corner. The state extends about 400 miles (640 km) from north to south and 350 miles (560 km) from east to west.

Human settlement in the area has probably spanned 10,000 years. An agricultural Indian civilization developed irrigation systems, pueblos, and cliff dwellings whose ruins still dot the state. The more nomadic and aggressive Navajo and Apache Indians arrived from the north only a few centuries before the Spanish.

Treasure-seeking Spaniards from Mexico, notably Francisco Vázquez de Coronado, made the initial European contact in the early 16th century, thus establishing Spain's claim to the area. The first permanent Spanish settlement was made at Santa Fe, the present capital, in 1610. Missionary work was the predominant activity during the 1600s. Considerable Spanish settlement took place during the 1700s, Albuquerque being founded along the Rio Grande in 1706. Trade with the United States over the Santa Fe Trail had begun by 1821, when New Mexico became a part of the independent Republic of Mexico. The territory was ceded to the United States in 1848 following the end of the Mexican War. The New Mexico Territory was organized in 1850, and the eastern portion became New Mexico, the 47th state, in 1912.

New Mexico can be divided into three regions: (1) the high Great Plains of the eastern one-third, containing the Llano Estacado, (2) the north-south–running ranges of the Rocky Mountains of the central one-third, and (3) the high, mountainous plateau country of the western one-third. The Continental Divide traverses the entire length of western New Mexico. Most of the state has an elevation of more than 4,000 feet (1,200 m) above sea level. The Rio Grande, Pecos, and Canadian are the main rivers draining to the Atlantic, while the San Juan and Gila are the main rivers draining to the Pacific.

The climate of New Mexico is mostly semiarid and arid with low humidity and abundant sunshine. The mean annual temperature is 54° F (12° C), but seasonal extremes range from 116° to −50° F (47° to −46° C). Temperatures rise or fall by 5° F (3° C) with every 1,000 feet (305 m) of elevation, and nighttime temperatures tend to fall sharply. The average annual precipitation is 13 inches (330 mm), varying from 8 to 10 inches (203 to 255 mm) in the lower areas to 40 inches (1,015 mm) in the high mountains. Generally, precipitation is greatest in the eastern third of the state, least in the western third.

Between 1970 and 1980 New Mexico, like the other Sun Belt states, experienced a high rate of population increase (28 percent). The 144 percent population gain between 1940 and 1980 was in large part a result of the proliferation of federal expenditures in the state for defense and research and the discovery of oil and other minerals. In spite of the tremendous growth rate, New Mexico remains one of the most sparsely populated states. About two-fifths of the population is of Spanish origin, about one-half of whom are Mexican-Americans while the others are descendants of the original Spanish settlers, or Hispanos. Somewhat less than a tenth are American Indians, the largest tribal groups of which are the Navajo, Pueblo, Ute, Jicarilla, Mescalero Apache, and Zuni. Almost three-fourths of the population lives in areas classified as urban. The Albuquerque metropolitan area contains about one-third of the state's total population.

New Mexico's economy is largely dependent on the export of raw materials and on federal government expenditures. All of New Mexico's major rivers except the Gila are dammed within the state, and irrigated farming is the most important form of agriculture. The sale of beef accounts for more than one-half of agricultural-marketing receipts, followed by milk and hay. Oil and natural gas are by far the most important mineral resources, but the state also produces much of the country's supply of potash and uranium. Food processing, petroleum refining, smelting, construction materials, and railroad maintenance are leading industrial activities. Basic research and testing in nuclear energy have provided for the development of offshoot industries such as ordnance, electronics, and precision instruments. Large tourist expenditures in the state are a result of the distinctive Indian and Hispanic cultures, the varied scenery afforded by the natural landscape, and sporting and recreational opportunities.

The historical atmosphere of New Mexico and its fusion of three cultures—Indian, Hispanic, and Anglo—is represented by its unique architecture. Attracting artists in all fields from many parts of the nation and the world, Taos was the first to have an important art community, but it is now rivaled by Santa Fe and Albuquerque. Local Indians produce high-quality pottery, blankets, and silver jewelry. Spanish music and folk art have been largely preserved, and the Spanish language is widely spoken. Higher education is led by the University of New Mexico, in Albuquerque, established in 1888. The National Park Service administers Carlsbad Caverns National Park and numerous national monuments and historic sites. Area 121,593 square miles (314,925 square km). Pop. (2000) 1,819,046.

New Milford, borough (town), Bergen county, northeastern New Jersey, U.S., immediately north of Hackensack on the east bank of the Hackensack River. Early Dutch settlers established a plantation-type farm called Vriesendael, which was pillaged by Delaware Indians in 1643. In 1675 David Demarest (or des Marest), a French Huguenot, and his sons received a land grant, which included the former farm area. Two years later they established the first permanent settlement. Their mill, known as Demarest Landing, became a shipping point for iron ore. The home of Demarest's son Samuel is preserved in replica near the Steuben House Museum; the house of another son, David, stands on River Road. The New Bridge Inn (1739) is still in operation.

Originally included in Palisades township (organized in the 1800s), the borough was established in 1922 when three small settlements—Peetzburg, New Milford Manor, and New Bridge—amalgamated and incorporated as New Milford. It is primarily a residential suburb of New York City. Pop. (2000) 16,400.

New Model Army, army formed in February 1645 that won the English Civil War for Parliament. When war broke out in 1642, Parliament had at its command the local militia, or trainbands, of those districts supporting its cause, notably London, the eastern counties, and southeast England. But militia were always unwilling to fight far from their homes, so in addition Parliament authorized (as did King Charles I) its prominent supporters to raise troops of horse and infantry companies from among their own tenants and associates. These private parliamentary armies were perhaps in better condition than those raised for the king, because Parliament provided for their pay; but strategically they were not effective because of the lack of unified command. Toward the end of 1644 a dispute about the conduct of the war developed between Henry Montagu, Earl of Manchester, one of the main parliamentary generals, and his lieutenant general, Oliver Cromwell. In December Cromwell argued in a major speech that the war would never be brought to a conclusion unless Parliament's military resources were improved. There was already some general feeling that members of Parliament holding military command might be tempted to prolong the war in order to continue their personal power. As a result, the New Model Army was brought into existence; it was planned to comprise 11 regiments of horse of 600 men each, 12 regiments of foot of 1,200 men each, and 1,000 dragoons (mounted infantrymen). The cavalry, always easier to raise, were mainly veterans drawn from the original armies of Manchester, the Earl of Essex, and Sir William Waller; the infantry included some veterans from the armies, with a majority of pressed men drawn from London, the east, and southeast. In April 1645, by the Self-Denying Ordinance, members of Parliament resigned all military and civil office and command acquired since November 1640. Sir Thomas Fairfax (afterward 3rd Baron Fairfax—the "younger" Fairfax) was appointed captain general of the New Model Army, with authority to appoint his senior officers. The army's organization and the thorough training of its men were accomplished by Fairfax, not Cromwell, who, despite the Self-Denying Ordinance, became his leader of horse just before the great parliamentary victory at Naseby (June 14, 1645). After Naseby the army was mainly occupied in sieges, but it obtained such political power that eventually its authority eclipsed that of Parliament. Under Cromwell it won Dunbar and Worcester, the great battles of the Commonwealth period, against Charles II and the Scots.

New Moon, Hebrew ROSH ḤODESH (Hebrew: "Head of the Month"), the start of the Hebrew month, a minor Jewish festival on which fasting and mourning are not allowed. The modern observance consists principally in preserving the ancient custom of reciting a blessing on the Sabbath preceding the New Moon and in singing or reciting an abbreviated form of the Hallel psalms on the New Moon itself. In Old Testament times, Jews visited the Temple of Jerusalem for a special sacrifice, held a family celebration, and generally abstained from business and work.

New Nationalism, in U.S. history, political philosophy of Theodore Roosevelt, an espousal of active federal intervention to promote social justice and the economic welfare of the underprivileged; its precepts were strongly influenced by Herbert Croly's *The Promise of American Life* (1910). Roosevelt used the phrase "New Nationalism" in a 1910 speech in which he attempted to reconcile the liberal and conservative wings of the Republican Party. Unsuccessful, he became a Progressive and went on to promulgate his ideas as that party's presidential candidate in the election of November 1912. His program called for a great increase of federal power to regulate interstate industry and a sweeping program of social reform designed to put human rights above property rights. With the Republican vote split, Roosevelt and his New Nationalism went down to defeat before Democratic candidate Woodrow Wilson and his New Freedom.

New Negro Movement (literature): *see* Harlem Renaissance.

New Norfolk, town, southern Tasmania, Australia, on the Derwent River. In 1807–08 the inhabitants of Norfolk Island in the South Pacific Ocean were resettled in the area, and in 1811 the town site was chosen by Governor Lachlan Macquarie and named Elizabeth Town after his wife. It was renamed in 1827 by the settlers for their earlier island home. New Norfolk was gazetted a shire in 1863. Linked to Hobart (14 miles [23 km] southeast) by rail and the Lyell Highway, the town serves a locale yielding most of the hops used for brewing in Australia, as well as apples, oats, and sheep. Since 1941 the principal local industry has been the production of the nation's newsprint. Australia's first fish hatchery, Salmon Ponds (1864), is located on the Plenty River. Historic buildings include Bush Inn (Australia's oldest licensed hotel; 1815) and St. Matthew's Church (1825). Pop. (1996) 5,286.

New Orleans, city, state of Louisiana, southeastern U.S. The state's largest city, New Orleans commands the mouth of the great Mississippi–Missouri river system; it has developed a solid economic base as a major port, tourist resort, and industrial, educational, and medical centre. Area city, 199 square miles (516 square km); metropolitan area, 1,907 square miles (4,938 square km). Pop. (2000) city, 484,674; New Orleans MSA, 1,337,726.

A brief treatment of New Orleans follows. For full treatment, *see* MACROPAEDIA: New Orleans.

New Orleans is coextensive with Orleans parish (county) and is the core of an expanding metropolitan area defined by the parishes of Orleans, St. Bernard, Jefferson, and St. Tammany. The city is divided by the Mississippi River, which flows from the west to its mouth 110 miles (180 km) southeast in the Gulf of Mexico; the principal settlement is on the east (left) bank. Lake Pontchartrain borders the city to the north. Because the city's terrain lies as low as 5 feet (1.5 m) below sea level and has an average rainfall of 57 inches (1,425 mm), a levee system and proper drainage have been important. New Orleans has a moderate climate, with an average summer temperature of 77° F (25° C) and a winter average of 60° F (16° C).

New Orleans is primarily a commercial centre, with manufacturing playing a secondary role in its economic life. The busy harbour is the foundation of the metropolitan economy. A 30-year plan (1970–2000), called Centroport U.S.A., attempted to switch much of the port's activities from the Mississippi River to wharves and industrial complexes along the Gulf, thereby freeing river frontage for residential and recreational development.

The New Orleans metropolitan area is a fast-growing industrial region. Major manufactures include food products; clothing and accessories; stone, clay, and glass articles; primary metal and fabricated metal items; and transportation equipment. In recent years the petrochemical industry has become important, but it has also been the source of serious water pollution. Major exports include grains, agricultural products, fabricated metals, chemicals, textiles, oils, petroleum products, tobacco, and paperboard.

The decision to found New Orleans was made in 1717, and work began the next year. The original city was located on the east bank of the Mississippi along a sharp bend of the river. On the west bank a section called Algiers arose, linked since 1958 to the east bank by the Greater New Orleans Bridge.

The Creole architecture of the Vieux Carré (French: "Old Square"), or French Quarter, creates the atmosphere of a foreign city, combining native architectural ingenuity with adaptations of French colonial traditions and West Indian Spanish colonial styles. Important sites include Jackson Square, the French Market, Royal Street, Bourbon Street, Preservation Hall, and Dixieland Hall. World-renowned Creole cuisine is featured in many of the city's restaurants.

The cultural life of New Orleans is a synthesis of contributions by both whites (of French, Spanish, Irish, German, and Italian descent) and blacks, who constitute nearly equal parts of the population. The black heritage is particularly rich; it was here that black musicians gave birth to a fusion of blues, dance tunes, and hymns that became known as New Orleans jazz. Another major attraction of the city is the festive celebrations of its winter carnival and Mardi Gras. Other attractions include the city's unique above-ground cemeteries, the Aquarium of the Americas, the Historic Voodoo Museum, and the Contemporary Arts Center. Among New Orleans' institutions of higher learning are Tulane University (1834) and its affiliated institutions.

The Mississippi River–Gulf Outlet, part of a system of channels and passages between the river and the Gulf, has shortened ship passage to the Gulf by 40 miles (64 km). Several railways operate out of New Orleans with direct connections to many cities. The international airport is located 12 miles (19 km) from the city.

New Orleans, Battle of (Jan. 8, 1815), U.S. victory against Great Britain in the War of 1812. In the autumn of 1814 a British fleet of more than 50 ships commanded by General Edward Pakenham sailed into the Gulf of Mexico and prepared to attack New Orleans, which is strategically located at the mouth of the Mississippi River. On December 1 General Andrew Jackson, commander of the U.S. Army of the Southwest, hastened to the defense of the city. Jackson's army of between 6,000 and 7,000 troops consisted chiefly of militiamen and volunteers from southern states. Because of slow communications, news of the peace treaty between Britain and the United States that had been signed at Ghent (Dec. 24, 1814) did not reach the United States in time to avert the battle, in which Jackson's troops fought against 7,500 British regulars who stormed their position on Jan. 8, 1815. So effective were the earthworks and the barricades of cotton bales with which the Americans had fortified their position that the fighting lasted only half an hour, ending in a decisive U.S. victory and a British withdrawal. British casualties numbered more than 2,000 (289 killed); American, only 71 (31 killed). News of the victory reached Washington, D.C., at the same time as that of the Treaty of Ghent and did much to raise the low morale of the capital. The Battle of New Orleans greatly enhanced the reputation of Jackson as a national hero.

New Orleans, Battle of (April 25, 1862), naval action by Union forces seeking to capture the city during the American Civil War. A Union naval squadron of 43 ships under Admiral David G. Farragut entered the lower Mississippi near New Orleans and soon breached the heavy chain cables that were stretched across the river as a prime defense. Realizing that resistance was useless, Confederate General Mansfield Lovell withdrew his 3,000 troops northward, and the city fell on April 25. On May 1 General B.F. Butler led 15,000 Union troops into the city to take command for the remainder of the war. The permanent loss of New Orleans was considered one of the worst disasters suffered by the Confederacy in the western theatre of the war.

New Orleans Race Riot (July 1866), after the American Civil War, incident of white violence directed against black urban dwellers in Louisiana; the event was influential in focusing public opinion in the North on the necessity of taking firmer measures to govern the South during Reconstruction. With the compliance of local civilian authorities and police, whites in late July killed 35 New Orleans black citizens and wounded more than 100. This race riot was similar to many others throughout the South and, together with the establishment of the highly restrictive black codes, helped win a commanding majority for the Radical Republicans and their vigorous Reconstruction policies in the November 1866 national elections.

New Orleans style, in music, the first method of group jazz improvisation. Developed near the turn of the 20th century, it was not recorded first in New Orleans but rather in Chicago, Los Angeles, and Richmond, Indiana. Divided by many experts into white (the Original Dixieland Jazz Band and the New Orleans Rhythm Kings, which first recorded in 1917 and 1922, respectively) and black (cornetist Joe "King" Oliver's Creole Jazz Band and Kid Ory's Spike's Seven Pods of Pepper Orchestra, which first recorded in 1923 and 1922, respectively), it is traditionally said to have placed great emphasis on collective improvisation, all musicians simultaneously playing mutual embellishments. This was the case in the first recordings, but a portion was also given to solos and accompaniment in which a single instrument, such as cornet, occupied the foreground while others, such as clarinet and trombone, played obbligato with combinations of guitar and/or banjo and/or piano chording insistently on almost every beat. Many journalists use the term New Orleans style to designate those black musicians who performed in Chicago between 1915 and the early 1930s after having left their native New Orleans. Aside from Oliver and Ory, the strongest of these players were trumpeter Louis Armstrong, clarinetist–soprano saxophonist Sidney Bechet, clarinetist Jimmie Noone, drummer Warren "Baby" Dodds, and his brother, clarinetist Johnny Dodds. Armstrong and Bechet, in particular, helped to move the emphasis away from ensemble improvisation to a focus on solo improvisation, anticipating the later Dixieland (*q.v.*) style.

Revivals of the pre-1920s style included one with trumpeter Bunk Johnson, a black New Orleans native who was rediscovered by two jazz historians in 1939 and who reactivated his career in the 1940s; and another at Preservation Hall, an organization in New Orleans that into the 1990s continued to present improvised combo music by men who had lived in New Orleans during the music's formative period. Samuel Charters' *Jazz: New Orleans 1885–1963* (1963) is a historical study. *See also* Chicago style.

New People's Army (NPA), military arm of the Communist Party of the Philippines, Marxist-Leninist (CPP-ML), which is a Communist organization dedicated to achieving power in the Philippines by means of revolutionary insurrection. The CPP-ML was originally a Maoist faction that broke away from the largely passive, Soviet-oriented Philippine Communist Party in 1968–69 and formed the New People's Army shortly afterward. The NPA soon began guerrilla warfare against the regime of President Ferdinand Marcos, assassinating government officials and ambushing army troops. It gradually increased its strength through the 1970s and '80s, growing from about 350 armed members in 1971 to more than 20,000 by the late 1980s. The NPA spread from its original base in northern Luzon to islands throughout the Philippine archipelago, fashioning a nationwide network of supporters in rural areas and later in major cities as well. By the late 1980s the NPA had become the chief threat to the elected government of President Corazon Aquino, with whom the NPA refused to come to a negotiated settlement.

New Philadelphia, city, seat (1808) of Tuscarawas county, east-central Ohio, U.S. It lies along the Tuscarawas River, adjacent to the city of Dover, 20 miles (32 km) south of Canton. It was founded in 1803 by John Knisely, a tavern keeper from York, Pa. Named for Philadelphia, Pa., the community developed after the American Civil War, when the utilization of large local coal and clay deposits spurred industrial development.

Manufactures include textile machinery, construction equipment, machine tools, ceramics, plastics, and industrial fans. The Tuscarawas Campus of Kent State University (1968) is in the city. Ohio's major flood-control and recreation project, the Muskingum Watershed Conservancy District, is headquartered in New Philadelphia. The nearby Zoar Village (now a state memorial) was a commercial settlement (1817–98) founded by German Separatists. Ohio's first village, Schoenbrunn Village (1772–98; now restored as a state memorial), lies a few miles southeast. Inc. town, 1833; city, 1883. Pop. (2000) 17,056.

New Plymouth, city ("district") and port, Taranaki local government region, western North Island, New Zealand. It lies along North Taranaki Bight at the base of Mount Egmont (Taranaki). The settlement was founded in 1841 by the New Plymouth Company under the auspices of the New Zealand Company. In time, land disputes between New Plymouth's English immigrants and the native Maoris built up to the open hostilities of the 1860 Taranaki War. The town was designated a borough in 1877 and a city in 1949.

New Plymouth is New Zealand's chief dairy centre. Its artificial harbour makes it a major port, importing cement, petroleum products, and fertilizer and exporting dairy products and meats, which are chiefly produced in the vicinity and processed within the city. New Plymouth, noted for its parks, lies close to Egmont National Park and is a resort centre. Pop. (1999 est.) urban area, 48,900; (2001) district, 66,165.

New Providence Island, principal island of The Bahamas, between Andros Island (west) and Eleuthera Island (east). With a length of 21 miles (34 km) and a width of 7 miles, the island is mostly flat, with swamps and several shallow lakes. Nassau, the chief city, is also the capital of The Bahamas. New Providence's name supposedly derives from a 16th-century governor's thanks to Divine Providence for surviving a shipwreck: the "New" was added later to avoid confusion with a pirate stronghold off British Honduras. The island was settled in the late 17th century with the establishment of several British forts. Agriculture and fishing are important factors in the local economy; the island's rum reaches an international market. A world-famous tourist area has developed around the city of Nassau. Pop. (2000) 210,832.

New Quebec (region, Canada): *see* Nouveau-Québec.

New Republic, The, weekly journal of opinion that was one of the most influential liberal magazines in the United States from its founding in 1914. The magazine was begun by Willard Straight with Herbert David Croly as its editor. The journal reflected the progressive movement and sought reforms in American government and society. Among its early editors or contributors were Randolph Bourne, Walter Lippmann, and Malcolm Cowley.

Early on, *The New Republic* supported the formation of labour unions, the eight-hour workday, and woman suffrage. It also supported President Woodrow Wilson's foreign policy during World War I but later broke with him and opposed the Versailles Treaty. The magazine declined in the 1920s, when its liberal viewpoint was out of favour, but it revived in the 1930s. After early opposing him, *The New Republic* ended up supporting President Franklin D. Roosevelt's administration and his New Deal. In 1946 Roosevelt's former vice president, Henry A. Wallace, became the journal's editor and moved it further to the left until he was forced to resign. *The New Republic* adhered to its liberal orientation from the 1950s through the '70s, but in the 1980s the magazine began displaying an array of editorial opinion and commentary that reflected the resurgence of conservatism in American political thought. *The New Republic* has remained an influential journal of political commentary and analysis.

New Republic Party, Afrikaans NUWE REPUBLIKEINSE PARTY (NRP), South African political party founded in 1977 as the direct successor to the United Party (*q.v.*), which had governed South Africa from 1934 to 1948 and served as the major opposition party from 1948 on.

The majority faction of the United Party, seeing its party disintegrating by defections to other new parties and to the ruling National Party, decided formally to disband the party on June 28, 1977. On the next day the group founded the New Republic Party. The new party then had a holdover of 23 seats in the House of Assembly; the next year, in the general elections, the representation dropped to 10 members. In the elections of 1981 the representation declined further, to eight seats. The party's position as the major liberal opposition to the National Party had decisively been yielded to the Progressive Federal Party.

Generally liberal on nonracial questions, the New Republic Party favours a new federation of races governed by a parliament controlled by whites but containing representatives from other racial groups.

New River, river formed by the junction of North and South forks in Ashe county, northwestern North Carolina, U.S. It flows north across Virginia into West Virginia and joins the Gauley River, there dammed for hydropower, after a course of 255 miles (410 km), to form the Kanawha River in south-central West Virginia. Near Radford, Va., the New River is dammed to form Clayton Lake (hydroelectricity), and near Hinton, W.Va., the Bluestone Dam impounds a large flood-control reservoir. The 1,700-foot (518-metre) steel arch span of the New River Gorge Bridge, completed in 1977 near Fayetteville, W.Va., is the world's longest.

New Rochelle, city, Westchester county, southeastern New York, U.S. It lies along Long Island Sound, just northeast of New York City. Founded in 1688 by a group of Huguenot refugees, it was named for La Rochelle in France. Its modern suburban-residential character is emphasized by parks, golf courses, and shoreline recreation facilities. There are a few local light industries producing electrical equipment, surgical instruments, and plumbing supplies. The Thomas Paine Monument (dedicated in 1899), the postcolonial Paine Cottage (now a museum), and the Paine Memorial House (erected in 1925) honour the revolutionary author, who lived in a farm cottage in the locality from 1804 to 1806. Fort Slocum, used as a military base from 1862 to 1966, on offshore David's Island, is now privately owned. The College of New Rochelle was founded in 1904 and Iona College in 1940. Inc. village, 1857; city, 1899. Pop. (2000) 72,182.

New Romney, town ("parish"), Shepway district, county of Kent, England. It was formerly one of the medieval Cinque Ports (*q.v.*) of the English Channel coast but is now more than a mile from the sea. It is surrounded by Romney Marsh, a level tract built up largely in historic times by the silting of a former inlet. The marsh has been reclaimed to form very rich grazing for the summer fattening of a distinctive local breed of sheep. The River Rother once entered the sea at New Romney but changed its course in 1287, and the gradual accretion of land behind the shingle spit of Dungeness brought about the decline, as ports, of New Romney, Winchelsea, and Rye. Before 1563 the Brodhull, or annual assembly of the Cinque Ports, was held at New Romney. The town's old buildings still provide evidence of its former dignity and wealth, and many records of the Cinque Ports are kept in the town hall. Pop. (1991) 8,340.

New St. Mary (Florence): *see* Santa Maria Novella.

New St. Peter's Basilica: *see* Saint Peter's Basilica.

New Sarum (England): *see* Salisbury.

New School for Social Research, private coeducational institution of higher learning in New York City. The New School was established in 1919 as an informal centre for adult education, and it soon became the first American university to specialize in the continuing higher education of adults. The school received its charter in 1934, and that same year it established a graduate faculty of political and social science that was staffed mainly by refugee academics from Nazi Germany.

The New School now consists of the aforementioned graduate faculty, which grants advanced degrees in the social sciences; a division for adult education; a graduate school of management; a liberal-arts college; and the Parsons School of Design, a New York City-based art and design college that merged with the New School in 1970.

New Scotland Yard: *see* Scotland Yard.

New Shoreham, town, Rhode Island, U.S., coextensive with Block Island (*q.v.*).

New Siberian Islands, Russian NOVOSIBIRSKYE OSTROVA, archipelago, northeastern Russia, lying north of eastern Siberia in the Arctic Ocean, and dividing the Laptev Sea to the west from the East Siberian Sea to the east. It is separated from the Siberian mainland by Dmitry Laptev Strait.

The archipelago is administratively part of Yakutiya. The area of the islands is about 14,500 square miles (38,000 square km). The New Siberian Islands consist of three groups: to the south the Lyakhovskye Islands, separated by Sannikova Strait from the New Siberian Islands proper, and to the northeast the small De Long Islands. The New Siberian Islands proper consist of the large islands of Novaya Sibir, Belkovsky, Kotelny, and Faddeyevsky. Between the last two lies Bunge Island, a low sandy plain occasionally inundated by the sea.

The New Siberian Islands do not rise above 1,227 feet (374 m). The climate is severe and typically Arctic, with snow covering the ground for over nine months of the year. The vegetation is poor tundra, even bushes being absent, and there is much swamp and barren sand. Fauna include the Arctic fox, northern deer, and lemming, with an abundant bird life in summer.

New Smyrna Beach, city, Volusia county, northeastern Florida, U.S. It lies 14 miles (23 km) south of Daytona Beach, on the Atlantic coast, there bisected by the Hillsborough River (lagoon).

The site, once occupied by the Indian village of Caparaco and the Spanish mission of Atocuimi (1696), was colonized in 1767 by a mixed immigrant group of Greeks, Minorcans, and Italians led by Andrew Turnbull, a Scottish physician, who named the place New Smyrna for his wife's Turkish birthplace. Because of Revolutionary strife, the colony was abandoned in 1777 but not before sugarcane and indigo were planted and a system of irrigation-and-drainage canals was built. In 1803 settlement was renewed with land grants. Under the stimulus of the Florida East Coast Railway and the Atlantic Intracoastal Waterway, it developed as a processing and distribution point for citrus, farm produce, and seafood (especially shrimp). Tourism, boating, and sport fishing became economic assets, and in 1937, reflecting the white, sandy shore, "Beach" was added to the city's name. Industrial parks were subsequently established. New Smyrna Sugar Mill Historic Memorial (1830) is immediately west, and Canaveral National Seashore runs southward for 25 miles (40 km). Inc. town, 1887; city, 1903. Pop. (2000) 20,048.

New South Wales, state of southeastern Australia, occupying both coastal mountain and interior tableland parts of the continent. It is bounded by the Pacific Ocean to the east and the states of Victoria to the south, South Australia to the west, and Queensland to the north. It has an area of 309,433 square miles (801,428 square km).

A brief treatment of New South Wales follows. For full treatment, *see* MACROPAEDIA: Australia.

Physical and human geography. New South Wales is Australia's focal point of commercial farming, industry, and culture. Its dominant geographic feature is the Great Dividing Range, which separates the narrow coastal strip from the great plains to the west. The coastal strip varies from less than 10 to more than 50 miles (16 to 80 km) in width and is bounded along its entire length by a natural barrier of steep mountains and beyond them by a series of high plateaus, or tablelands, which slope gently to the west. The plains cover nearly two-thirds of the state. With the exception of the coastal strip, a great deal of New South Wales is naturally fertile, but agricultural potential is severely limited by inadequate and uncertain rainfall.

The natural vegetation ranges from the dense semitropical forest of the northeastern coast to the sparse plant life of the western plains. About a fifth of the state is forested, and a much larger area is covered with bush and shrub. The rich bird life includes many species of parrot and cockatoo, the flightless emu, the mound-building scrub turkey, and the mallee bird. Most of the species of marsupials (mammals that do not develop a placenta but carry their young in an external pouch) are represented. They include the wombat, the koala, the common and ring-tailed possum, the common and long-nosed bandicoot, and a variety of kangaroos and wallabies. Several species of poisonous snakes are found throughout the state.

Nearly two-thirds of the population of New South Wales is of British origin, many of Irish descent. Most of the rest are of southern European or Asian origin. Aborigines make up about 2 percent of the population.

The rural economy can be divided into four regions. The coastal strip is mostly used for dairy farming, the tablelands for sheep and cattle raising, and their western slopes for wheat cultivation. The plains are the sites of the great sheep stations, for more than 100 years the cornerstone of the state's economy. They still provide about a third of Australia's wool. The tenure of landholdings in New South Wales is mostly either freehold or leasehold from the Crown. Tenancy, as understood in Europe, is uncommon, and, except in the Western Division, most land is occupied by its owners. About three-fifths of the acreage under crops is devoted to wheat. Oats, corn (maize), and rice are also grown. Wine is produced in the Hunter Valley. New South Wales is economically the most important state of Australia in terms of livestock, timber, minerals, and manufactured goods.

The most developed mineral resource is coal, which is found in the central coastal area. Other mineral resources include silver, lead, zinc, copper, tin, and rutile. New South Wales is the most important timber-producing state, accounting for about half of Australia's production. Tuna fishing is the most important marine fishery.

New South Wales's economy is, like Australia's, essentially a developed private-enterprise economy, although the state government owns and manages the railways, some coal mines, and the production of electricity.

The state parliament is bicameral, and voting for the Legislative Assembly is compulsory. The three principal political parties are the Liberal, the Country, and the Australian Labor parties. The state has an Industrial Commission to settle industrial disputes, although the Australian Conciliation and Arbitration Commission (a national body) has become predominant.

New South Wales's capital, Sydney, has the oldest of Australia's symphony orchestras, housed in the Sydney Opera House (opened 1973). The Art Gallery of New South Wales has the best collection of Australian painting in Australia.

History. Originally, the name New South Wales was applied to the entire eastern third of Australia after the British explorer Captain James Cook claimed the territory for the British crown in 1770. New South Wales was gradually reduced to its present area as new territories were carved out: Tasmania, South Australia, Victoria, and Queensland (proclaimed in the 19th century), and the Australian Capital Territory. First settlement of the eastern coast consisted strictly of convicts and their jailers. By about 1815 other settlers had begun to arrive, attracted by the prospect of pastoral industry. Wool and fisheries products were exported to England, and New South Wales began to develop rapidly. The Aboriginal population that had inhabited the region was ravaged by disease and massacred for resistance to encroachment upon the land. The independent colony became an Australian state with the establishment of a Commonwealth government in 1901. Pop. (1991 prelim.) 5,731,926.

New South Wales, Art Gallery of, in Sydney, Australia, government-maintained art museum founded in 1874 with a grant from the state government. A new extension opened in 1972. The original resolution establishing the gallery authorized buying in London and in Sydney, and English 19th-century paintings and contemporary British art are particularly well represented. The museum has supported Australian artists since its foundation, and consequently it has one of the best collections of Australian art in the world.

New South Wales Corps (1789–1818), British military force formed for service in the convict colony of New South Wales; it figured prominently in the early history of Australia. With the arrival of the corps in 1790–92, the colony gained a new dynamic force: officers and soldiers received land grants, becoming soldier-settlers; many officers became involved in business ventures, most notably the rum trade; and the ranks of the corps also provided the colony with explorers, surveyors, and scholars. From the time of the departure of the colony's first governor, Arthur Phillip, in December 1792, until the arrival of Governor John Hunter in September 1795, the colony was administered by the commanding officer of the corps, first Francis Grose and then William Paterson. It was then that the officers' economic activity advanced fastest. The corps asserted itself in a different way by putting down the 1804 rebellion of Irish convicts (the Castle Hill Rising). The officer in charge of this operation, Major George Johnston, was later among the leaders of the corps' 1808 Rum Rebellion against the administration of Governor William Bligh, the celebrated victim of the earlier *Bounty* mutiny. Relations had long been strained with Bligh, who had accused the corps of corruption and ineptitude. After deposing him on Jan. 26, 1808, the corps controlled the colony until the arrival of Governor Lachlan Macquarie at the end of 1809. In the course of 1809, the name of the corps was changed to the 102nd Regiment of the Line as a preliminary to its recall to England. In May 1810 half of the regiment accepted reassignment, while the rest chose to remain in Australia and joined either the 73rd Regiment or the Veteran Corps. The 102nd Regiment subsequently saw service in the War of 1812 against the United States, was renumbered the 100th Regiment, and was disbanded in 1818.

New Spain, Viceroyalty of, Spanish VIRREINATO DE NUEVA ESPAÑA, the first of the four viceroyalties that Spain created to govern its conquered lands in the New World. Established in 1535, it initially included all land north of the Isthmus of Panama under Spanish control. This later came to include upper and lower California, the area that is now the central and southwestern portion of the United States, and territory eastward along the Gulf of Mexico to Florida. The viceroyalty of New Spain was also charged with governing Spain's Caribbean possessions. Later, in 1565, the newly conquered Philippines were placed under the jurisdiction of New Spain.

Although technically superior in governing authority, the viceroy in New Spain was hampered in practice from exerting that authority by the considerable independence of governors and royal *audiencias* in many of the subordinate areas. His power was largely confined to central and southern Mexico—from San Luis Potosí, Zacatecas, and Culiacán in the north to the Isthmus of Tehuantepec in the south. Within this territory, the viceroys of New Spain succeeded in converting the native population to Christianity, developing an array of educational institutions, and overseeing an economy based almost entirely on mining and ranching. During the first 100 years of Spanish rule, the Indian population of New Spain declined from an estimated 25 million to 1 million as a result of maltreatment, disease, and disruption of their cultures.

The first viceroy in New Spain was Antonio de Mendoza, who ruled from 1535 to 1549, then served as viceroy of Peru, where he died after one year in office. In New Spain, he dispatched Francisco Coronado on his expedition northward while ameliorating some of the worst abuses of the conquistadores. He supported the church in its work with the native population.

After a period of decline in the late 17th and early 18th centuries, the Viceroyalty of New Spain took on new life when refreshed by two distinguished men: Antonio Maria de Bucareli (1771–79) and Juan Vicente de Güemes Pacheco de Padilla, 2nd Count de Revillagigedo (1789–94); the latter was the last able viceroy in New Spain.

The Viceroyalty of New Spain managed to survive the early attempts at Mexican independence led by Miguel Hidalgo and José María Morelos. But it succumbed to the coalition forged by Agustín de Iturbide in 1821. Central America, which had been loosely joined to Mexico in the Viceroyalty of New Spain, was briefly annexed by the newly independent Mexican nation. In 1823, however, the people of Central America went their own way upon the overthrow of Iturbide's empire.

New Statesman, political and literary weekly magazine published in London, probably England's best-known political weekly, and one of the world's leading journals of opinion. It was founded in 1913 by Sidney and Beatrice Webb. He was a Fabian Socialist and she his political and literary partner, and their journal reflected their views, becoming politically an independent socialist forum for serious intellectual discussion, political commentary, and criticism. The magazine is famous for its aggressive and often satirical analysis of the British and world political scenes. Its contributors are drawn from among the most distinguished writers in Britain; as a result, its political commentary, cultural articles and critical reviews of the arts, and also its "Letters to the Editor" page, are known for their elegance and wit.

New Stone Age: *see* Neolithic Period.

New Style calendar: *see* Gregorian calendar.

New Sweden, only Swedish colony in America, established by the New Sweden Company in March 1638 and captured by the Dutch in 1655. The first expedition, including both Swedes and Dutchmen, was commanded by Peter Minuit, who purchased land from the Indians and named the settlement Fort Christina (later Wilmington, Del.) in honour of Sweden's queen. Johan Printz, who became governor in 1643, established additional settlements during his 10-year rule and attempted to deal with the Dutch, who considered the Swedes competitors and interlopers. He was succeeded in 1654 by Johan Claesson Rising, who arrived with more colonists and forced the Dutch to surrender Fort Casimir. The next year a Dutch force under Peter Stuyvesant laid siege to Fort Christina and compelled New Sweden's surrender. The Swedish colonists were allowed, however, to keep their lands and possessions and continue their customs.

New Territories, part of Hong Kong (*q.v.*), a special administrative region of China. It comprises an area of 373 square miles (966 square km) north of Kowloon Peninsula from Mirs Bay on the east to Deep Bay, an inlet of the Pearl River estuary, on the west and includes Lantau (Lantao) and other islands. Although much of the terrain is mountainous, the valleys are among the colony's most productive farmland. Since the 1950s residential and industrial development has spread into the area north of Kowloon city. The New Territories were leased to Great Britain from China in 1898 for 99 years. Pop. (1981) 1,304,000.

New Testament, second, later, and smaller of the two major divisions of the Christian Bible, and the portion that is canonical (authoritative) only to Christianity.

A brief treatment of the New Testatment follows. For full treatment, *see* MACROPAEDIA: Biblical Literature and Its Critical Interpretation.

Christians see in the New Testament the fulfillment of the promise of the Old Testament. It relates and interprets the new covenant, represented in the life and death of Jesus, between God and the followers of the Christ. Like the Old Testament it contains a variety of kinds of writing. Among its 27 books are selected recollections of the life and acts and sayings of Jesus in the four Gospels; a historical narrative of the first years of the Christian Church in Acts of the Apostles; Epistles or letters of advice, instruction, admonition, and exhortation to local groups of Christians—14 attributed to Paul, one (Hebrews) probably in error, and seven by three other authors; and an apocalyptic description of the intervention of God in history, the Book of Revelation.

The books are not arranged chronologically in the New Testament. The Epistles of Paul, for example, which address the immediate problems of local churches shortly after Christ's death, are considered to be the earliest texts. The books are instead arranged in a more logical narrative order, the Gospels telling the life of Jesus and his teachings; the Acts detailing the work of Christ's followers in propagating the Christian faith; the Epistles teaching the meaning and implications of the faith; and Revelation prophesying future events and the culmination of the divine purpose.

The setting of the New Testament within the Christian community is one factor that makes a biography of Jesus or a history of the 1st-century church difficult or impossible. The books of the New Testament were composed not in order to satisfy historical curiosity about the events they recount but to bear witness to a faith in the action of God through these events. A history of the New Testament is made difficult by the relatively short time span covered by its books when compared with the millennium and more of history described by the Old Testament. There is less historical information in the New Testament than in the Old, and many historical facts about the church in the 1st century therefore must be arrived at by inference from statements in one of the Gospels or Epistles. *See also* Gospel, or individual books by title; *compare* Old Testament.

New Thought, a mind-healing movement that originated in the United States in the 19th century, based on religious and metaphysical (concerning the nature of ultimate reality) presuppositions. The diversity of views and styles of life represented in various New Thought groups are difficult to describe because of their variety, and the same reason makes it virtually impossible to determine either membership or adherents. The influence of the various New Thought groups has been spread by its leaders through lectures, journals, and books not only in the United States but also in the United Kingdom, Europe, Asia, Africa, and Australia. Many adherents of New Thought consider themselves to be Christian, though generalizations about their relations to Christianity have been questioned.

Origins. The origins of New Thought may be traced to a dissatisfaction on the part of many persons with scientific empiricism and their reaction to the religious skepticism of the 17th and 18th centuries. The romanticism and idealism of the 19th century also influenced the New Thought movement, of which Phineas P. Quimby (1802–66) is usually cited as the earliest proponent. A native of Portland, Maine, Quimby practiced mesmerism (hypnotism) and developed his concepts of mental and spiritual healing and health based on the view that illness is a matter of the mind. Quimby's influence may be seen in the writings of Mary Baker Eddy and in the development of Christian Science (which she founded), although Mrs. Eddy retracted acknowledgment of dependence on her teacher. Quimby's influence was readily acknowledged by others. Warren F. Evans (1817–89), a Methodist and then a Swedenborgian minister (leader of a theosophical movement based on the teachings of the 18th-century Swedish scientist and theologian Emanuel Swedenborg), published a number of works exploring and systematizing the ideas of Quimby. These included *Mental Cure* (1869), *Mental Medicine* (1872), and *Soul and Body* (1876).

Julius Dresser (1838–93) was a popular lecturer who emphasized the theories of Quimby, and his son Horatio (1866–1954) spread the elder Dresser's teachings and later edited *The Quimby Manuscripts* (1921).

New Thought teachings and practices. Elements of New Thought may be traced to Platonism, based on the Idealism of the 5th–4th-century-BC Greek philosopher Plato, who held that the realm of ideas is more real than that of matter; to Swedenborgianism, especially Swedenborg's view that the material realm is one of effects whose causes are spiritual and whose purpose is divine; to Hegelianism, based on the views of the 18th–19th-century German philosopher G.W.F. Hegel, especially those concerning the external world, mental phenomena, and the nervous organism as the meeting ground of the body and the mind; to Orientalism, involving spiritual teachings of Eastern religions (*e.g.,* Hinduism); and, particularly, to the Transcendentalism (a form of Idealism) of the 19th-century American philosopher and poet Ralph Waldo Emerson.

Though it is difficult to summarize New Thought beliefs, since they are so varied and to so large a degree individualistic, it is possible to summarize some of the more prevalent views. As far as Christian Science is concerned, New Thought adherents do not accept Mary Baker Eddy's teaching or any other formulation as the final revelation. Rather, truth is viewed as a matter of continuing revelation, and no one leader or institution can declare with finality what is the nature of truth.

Moreover, New Thought does not oppose medical science, as Mrs. Eddy did, and it is essentially positive and optimistic about life and its outcome.

In 1916 the International New Thought Alliance (formed 1914) agreed upon a purpose that embraces some central ideas of most groups:

> To teach the Infinitude of the Supreme One; the Divinity of Man and his Infinite Possibilities through the creative power of constructive thinking and obedience to the voice of the indwelling Presence which is our source of Inspiration, Power, Health and Prosperity.

In 1917, at the St. Louis (Missouri) Congress, the alliance adopted a "Declaration of Principles." It was modified in 1919 and was printed in *New Thought* until revised in the 1950s.

This purpose and these principles emphasized the immanence of God, the divine nature of man, the immediate availability of God's power to man, the spiritual character of the universe, and the fact that sin, human disorders, and human disease are basically matters of incorrect thinking. Moreover, according to New Thought, man can live in oneness with God in love, truth, peace, health, and plenty. Many New Thought groups emphasize Jesus as teacher and healer and proclaim his kingdom as being within a person. Reference to Jesus or the Christ is totally omitted in the principles, however, as revised in 1954. New Thought leaders—unlike Quimby, it should be noted—have increasingly stressed material prosperity as one result of New Thought.

New Thought implies a kind of monism, or view of the oneness of the world, but it also has strong Gnostic (*i.e.,* dualistic, matter being opposed to spirit) undertones; that is, though New Thought is open to all, spiritual healing and strength of mind and body are available only to those who have the insights and who have been initiated into the movement at some point. There are no established patterns of worship, although the services often involve explication of New Thought ideas, testimony to healing, and prayer for the sick.

New Tōkaidō Line, high-speed rail line between Tokyo and Osaka that comprises the first segment of the Shinkansen Line (*q.v.*).

new town, a form of urban planning designed to relocate populations away from large cities by grouping homes, hospitals, industry and cultural, recreational, and shopping centres to form entirely new, relatively autonomous communities. The first new towns were proposed in Great Britain in the New Towns Act of 1946; between 1947 and 1950, 12 were designated in England and Wales and 2 in Scotland, each with its own development corporation financed by the government. The new towns were located in relatively undeveloped sites. Each was to have an admixture of population so as to give it a balanced social life. Proposed ultimate population figures of this first group of new towns ranged from 29,000 to 140,000. After 1961, target population figures for proposed new towns rose to 70,000 to 250,000.

The idea of new towns found favour in many other countries, notably in the United States, various countries of western Europe, and Soviet Siberia.

The chief criticism of new towns has been that they may be too static in conception. In Sweden, for example, a master plan prepared in 1952 envisaged establishing around the periphery of Stockholm some 18 communities, each with its own residences, places of employment, and shopping and cultural facilities. What was not satisfactorily anticipated in the plans, however, was the dramatic increase in commuting and other forms of personal mobility that obviated the need for the new towns to be so self-contained. Of the 27,000 wage earners in the suburb of Vallingby, for instance, 25,000 were found to be commuting out, half of them to the centre of Stockholm; in fact, Vallingby's own industries were drawing in commuters from outside.

New Ulm, city, seat of Brown County, southern Minnesota, U.S., on the Minnesota River, near the mouth of the Cottonwood, 75 mi (121 km) south of Minneapolis. Founded in 1854 by German immigrants, it was named for Ulm in Württemberg. The town was almost destroyed in the Sioux uprising of 1862; the Defenders' Monument next to the courthouse square commemorates the event. Overlooking the city on a bluff is a 102-ft (31-m) bronze statue (*c.* 1898) honouring Hermann (Arminius), a German tribal leader who inflicted a major defeat on the Romans at the Teutoburg Forest in AD 9. Dr. Martin Luther College dates from 1884. New Ulm's economy is based on agriculture (food processing), augmented by light manufacturing (chiefly electronic equipment and plastics). Nearby is Flandrau State Park and Ft. Ridgely (1854).

Building in traditional Germanic style, New Ulm, Minn.

Milt and Joan Mann from CameraMann

Inc. village, 1857; city, 1876. Pop. (1992 est.) 13,446.

New Wave, French NOUVELLE VAGUE, the style of a number of highly individualistic French film directors of the late 1950s. Preeminent among New Wave directors were Louis Malle, Claude Chabrol, François Truffaut, Alain Resnais, and Jean-Luc Godard, most of whom were associated with the film magazine *Cahiers du Cinéma,* the publication that popularized the auteur theory in the 1950s. The theory held that certain directors so dominated their films that they were virtually the authors of the film.

Films by New Wave directors were often characterized by a fresh brilliance of technique that was thought to have overshadowed their subject matter. An example occurs in Godard's *Breathless* (1960), in which scenes change in rapid sequence ("jump cuts") to create a jerky and disconnected effect. Although it was never clearly defined as a movement, the New Wave stimulated discussion about the cinema and helped demonstrate that films could achieve commercial along with artistic success. *See also* auteur theory.

New Westminster, city, southwestern British Columbia, Canada, on the Fraser River estuary, in the southeastern part of Vancouver metropolitan area. Founded in 1859 on a site chosen by Colonel Richard C. Moody, it was called Queensborough until renamed at the suggestion of Queen Victoria. New Westminster was the capital of colonial British Columbia (1859–66) and the province's first (1860) incorporated city. It was the scene of a disastrous fire in 1898.

New Westminster is one of western Canada's busiest ports, a major rail junction, and one of the province's largest industrial and marketing centres. Known for the manufacture of forest products, New Westminster also has other industries, including food processing (fruit and vegetables), distilling, brewing, shipbuilding, and oil refining. Pop. (1991) 43,586.

New Windsor (England): *see* Windsor.

New Windsor, town ("township"), Orange county, southeastern New York, U.S., on the Hudson River, immediately south of Newburgh. The old village, New Windsor Center (named for Windsor, Eng.), was laid out in 1749, and the town was established in 1763. George Clinton, first governor of New York, and his nephew De Witt Clinton were born there, at Little Britain. The New Windsor Cantonment, great winter camp of the Continental Army, has been reconstructed as a state historic site. There, at Temple Hill, George Washington ended a conspiracy among his officers and also established the Badge of Military Merit (forerunner of the Purple Heart). Pop. (1992 est.) 23,100.

New World monkey, also called PLATYRRHINE, any of certain anthropoid primates of the New World, as distinguished from the Old World forms (catarrhines). The term, in use since about 1812, covers the members of the families Callitrichidae (marmosets and tamarins) and Cebidae (capuchins, spider monkeys, and others). Characteristics include large, broadly separated nostrils; three premolars in each half of each jaw; relatively unopposable thumbs; and long, sometimes prehensile, tails.

New Year festival, any of numerous religious, social, and cultural observances worldwide celebrating the commencement of the New Year. Such festivals, which are among the oldest and most universally observed, generally include rites and ceremonies expressive of mortification, purgation, invigoration, and jubilation over life's renewal. This renewal is the essence of the New Year. It is, to varying degrees of explicitness in world cultures, a remembrance or repetition of the creation of the cosmos on the symbolic anniversary of its creation, in order that the gods, the cosmos, and the community may be strengthened.

The earliest-known record of a New Year's festival dates from about 2000 BC in Mesopotamia, where the New Year (Akitu) commenced with the new moon nearest the spring equinox (mid-March; Babylonia) or nearest the autumn equinox (mid-September; Assyria). The year began for the Egyptians, Phoenicians, and Persians with the autumn equinox (September 21) and for the Greeks, until the 5th century BC, with the winter solstice (December 21). By the Roman republican calendar the year began on March 1; after 153 BC the official date was January 1, and this was confirmed by the Julian calendar (46 BC).

In the Jewish religious calendar the year begins with the first day of the month of Tishri (September 6–October 5; Rosh Hashana [*q.v.*]). In early medieval times most of Christian Europe regarded March 25 (Annunciation Day) as the beginning of the year, though for Anglo-Saxon England New Year's Day was December 25. William the Conqueror decreed that the year start on January 1, but, later, England began its year with the rest of Christendom on March 25. January 1 was restored as New Year's Day by the Gregorian calendar (1582), immediately adopted by Roman Catholic countries. Other countries slowly followed suit: Scotland, 1660; Germany and Denmark, about 1700; England, 1752; Sweden, 1753; and Russia, 1918. Observances of the secular New Year in the West vary regionally but typically entail the preparation of a customary meal (as "hoppin' John," a dish of peas and rice, in the U.S. South) and the making of personal resolutions for the coming year.

Most Eastern New Year festivals retain a distinctly religious character. In Dravidian southern India, the Tamil New Year is celebrated at winter solstice with the three-day Poṅgal festival, marked by religious pilgrimages and the ritual boiling of new rice. In Bangladesh the New Year is marked by the worship of the Ganges.

Pre-Buddhist indigenous and Hindu influences are prominent in Southeast Asian festivals. In Thailand, Trut, or New Year (March/April), is of a mixed character. Buddhist monks exorcise ghosts from the vicinity and are presented with gifts. Oblations are made to various gods of Hindu origin. As people meet, water is playfully thrown by one on the other. Gambling, usually frowned upon, is permitted for the three-day festival.

Chinese New Year is celebrated officially for a month beginning in late January or early February. It is preceded by an expulsion of demons and by theatrical performances. Offerings are made to gods of hearth and wealth and to ancestors. Tibetans observe the New Year in February with feasting, visiting, and a relaxation of monastic discipline.

The celebration of the New Year on January 1–3 is the most popular annual festival in Japan. In some rural districts it continues to be observed according to the lunar-solar calendar on dates varying between January 20 and February 19, and the traditions connected with the festival confirm its original connection with the coming of spring and a time of rebirth. The festival is called in Japanese Ganjitsu ("Original Day"), signifying the beginning of the new year, and also Shōgatsu ("Standard Month"), referring to the belief that the good or bad fortune met with during the first few days of the new year may be taken as representative of the fortune for the entire coming year.

The Japanese festival is customarily celebrated with ceremonial housecleaning, feasting, and exchanging visits and gifts. The house gateway or entrance is often hung with a *shimenawa* (a sacred rope made of rice straw) to keep out evil spirits and decorated with fern, bitter orange, and lobster, signifying good fortune, prosperity, and longevity. Foods special to the holidays are *mochi* (cakes of rice paste) and *zoni* (a soup of vegetables and *mochi*). Traditional amusements are shuttlecock and *utagaruta,* a card game that involves matching lines of 100 poems.

Other Japanese observances—once widespread but now diminished—included, early on the first day, visits to Shintō shrines of the tutelary deities or to Buddhist temples. On the second day, arts and crafts were ritually recommenced. On the seventh day, a rice gruel containing seven purifying herbs was traditionally served and the decorations removed.

new-year's gift (plant): *see* winter aconite.

New York, constituent state of the United States of America, one of the Middle Atlantic states, lying in the eastern United States, bounded on the north by Lake Ontario and the Canadian provinces of Ontario and Quebec, on the east by Vermont, Massachusetts, and Connecticut, on the extreme southeast by the Atlantic Ocean, on the south by New Jersey and Pennsylvania, and on the west by Pennsylvania, Lakes Erie and Ontario, and the Canadian province of Ontario. The state capital is Albany on the Hudson River.

A brief treatment of New York follows. For full treatment, *see* MACROPAEDIA: United States of America: *New York.*

Two major groupings of Indians originally inhabited New York: the Algonquian-speaking Mohegan and Munsee, and the Iroquois confederacy of the Mohawk, Oneida, Onondaga, Cayuga, and Seneca. These Iroquois tribes sided with the British during the French and Indian War (1756–63).

New York was first settled as a colony of the Netherlands following the explorations (1609) of Henry Hudson on the river that bears his name. The Dutch founded Fort Orange (present-day Albany) in 1624 and New Amsterdam in 1625. The British took control of New Amsterdam in 1664 and renamed it New York.

The French defeat in 1763 encouraged New Englanders to settle in New York, and by the time of the American Revolution, its population was 163,000. Many of the Revolution's battles were fought in New York, including the important battle at Saratoga. New York was the 11th state to ratify the U.S. Constitution. By 1810 New York had grown to be the most populous state and was already the manufacturing, trade, and transportation centre of the country.

New York is divided into a number of physiographic regions, the largest of which is the Appalachian Highlands, covering half of the state and extending westward from the Hudson River valley to the state's southern and western boundaries. Within this region can be found the Catskill Mountains, the Finger Lakes, and the Delaware River basin. The Hudson-Mohawk Lowland follows the Hudson River to Albany (north) and then the Mohawk River to the west. A plateaulike region known as the Erie-Ontario Lowlands lies to the north of the Appalachian Highlands and west of the Mohawk valley. It extends along the southern shores of the Great Lakes. East of it lie the Adirondack Mountains, an ancient upland structurally distinct from the Appalachian Highlands to its south.

The state generally has warm summers and cold winters. A tendency to cloudiness across the state results in few completely clear days. Rainfall and snow produce a range of precipitation from 32 to 45 inches (810 to 1,140 mm) a year. The Catskills receive the greatest amount of precipitation, while the Erie-Ontario Lowlands receive the least. The regions east of Buffalo and Watertown receive an unusually heavy amount of snowfall.

New York was the nation's most populous state until the early 1960s, when it was overtaken by California. Since the colonial period, much of New York's growth has resulted from immigration funneled through the port of New York City, and even in the late 20th century millions of New Yorkers were foreign-born. Blacks comprised more than one-sixth of the total population and Hispanic persons more than one-eighth. Of the state's significant Puerto Rican minority, most live in New York City. New York was one of the few states that lost population between 1970 and 1980, and during the same period New York City's population declined by more than 10 percent. Subsequently, the state's population again increased, however, and the density of population has remained high.

New York had the largest economic output of any state in the union until the later 20th century. Its great economic strength arose from several factors, among them the commercial supremacy of New York City and its busy harbour, the state's access to the shipping lanes of the Great Lakes, and its role as a vital transportation link between the Atlantic coast and the Midwest.

New York ranked first among the states in manufacturing from 1830 to 1970, when it was surpassed by California. The manufacturing sector has continued to shrink since then, but the state remains high nationwide for total value added by manufacture. Buffalo is strong in many heavy industries, Rochester in photographic and optical equipment, and Syracuse and Utica-Rome in machinery, electronic equipment, and primary metals.

The state's economy is now dominated by services, and these are concentrated in New York City, which remains the chief financial centre of the United States. New York City is home to many corporate headquarters and to the major American stock exchanges. Its economy also relies on wholesale and retail trade, printing and publishing, advertising, government, education, insurance, television production, and tourism. Livestock, poultry, and dairy products are the major components of New York state's farm income. The main crops are hay, corn (maize), apples, grapes, and potatoes. Important minerals are stone, sand and gravel, zinc, and salt.

The Hudson-Mohawk Lowland has always been a major transportation artery for the state. Those rivers were the basis of the Erie Canal and the later New York State Barge Canal System. Through their valleys ran the New York Central Railroad to Buffalo and Chicago, and the New York State Thruway was built on the same course. The interstate port of New York and New Jersey is the largest centre for shipping in the United States. The New York City metropolitan area, served by three international airports, is one of the country's main points of entry. The state has an extensive network of highways, roads, and streets and is well served by railways.

New York City is also the nation's chief cultural centre, and many trends in fashion, theatre, television, and music emanate from it. New York City has long been one of the most important world centres of the print and broadcast news media. It is the seat of the United Nations. Cultural and related activities are not confined to New York City, however. Buffalo and Rochester have well-known art museums and outstanding symphony orchestras. The Eastman School of Music at Rochester is internationally known. The National Baseball Hall of Fame and Museum is in Cooperstown. Educational opportunities are plentiful. The State University of New York (est. 1948) is one of the most comprehensive educational organizations in the world. Area 53,013 square miles (137,304 square km). Pop. (2000) 18,976,457.

New York, State University of (SUNY), state-supported system of higher education established in 1948 with about 66 campuses located throughout the state of New York. SUNY was officially organized more than 150 years after the state legislature, in its first session (1784) after the American Revolutionary War, proposed a state university modeled after the French system—*i.e.,* a multi-institutional system with central administrative control. A Board of Regents was named to administer King's College (later renamed Columbia University), then the state's only college, and to start new colleges. But the regents were unable to get the new system started, and in 1787 control of Columbia was given over to its own board of trustees.

Until after World War II, the regents supported higher education by dispensing state scholarship funds and working closely with private colleges to establish educational policy. After the war it became apparent that existing universities did not have enough places to accommodate veterans and minority groups, who pressured the state to establish a free state-university system. In 1948 the state legislature approved a system that incorporated some existing schools and called for the construction of new colleges in underserved areas. A board of trustees was established to administer the system, replacing the regents in this role.

The system now includes university centres at Albany, Binghamton, Buffalo (the main centre for graduate work), and Stony Brook, 13 university colleges, 4 health sciences centres, 4 specialized colleges, 5 statutory colleges on the campuses of private universities, 6 colleges of technology, and more than 30 community colleges. The university colleges, or colleges of arts and sciences, include Empire State College in Saratoga Springs and SUNY branch campuses at Brockport, Buffalo, Cortland, Fredonia, Geneseo, New Paltz, Old Westbury, Oneonta, Oswego, Plattsburgh, Potsdam, and Purchase. The medical, or health science, centres are at Brooklyn, Buffalo, Stony Brook, and Syracuse. Total enrollment in the state university system exceeds 400,000 students.

New York Botanical Garden, one of the leading centres of botanical research and floristics in the United States. The 250-acre (101-hectare) garden, located in Bronx Park, New York City, has a plant collection consisting of about 12,000 species from almost every part of the world. Many of the specimens are displayed throughout the year in a conservatory that covers nearly 1 acre (0.5 hectare). Outdoor exhibits include a pristine 40-acre woodland, a rock garden, and a garden of native plants, as well as special collections of conifers, lilacs, and magnolias. Also located at the garden is one of the largest botanical libraries in the country and an herbarium of 5,700,000 dried reference specimens. Varied educational programs, some involving the use of these facilities, are offered to the public.

The New York Botanical Garden was founded in 1891, largely through the efforts of Nathaniel Lord Britton, a professor of botany at Columbia University. It was opened to the public in 1900. As the garden's first director, Britton initiated a program of botanical exploration that continues today, with studies being conducted in South America, especially the rainforests of the Atlantic Coast of Brazil and of the foothills of the Andes Mountains, and occasionally in other continents. In 1971 the garden acquired a large tract of land 70 miles (110 km) north of the city, for the establishment of the Mary Flagler Cary Arboretum. At the turn of the 21st century, the garden invested millions of dollars to expand its facilities as a state-of-the-art research centre.

New York Central Railroad Company, one of the major American railroads that connected the East Coast with the interior. Founded in 1853, it was a consolidation of 10 small railroads that paralleled the Erie Canal between Albany and Buffalo; the earliest was the Mohawk and Hudson, New York state's first railway, which opened in 1831.

The New York Central's moving spirit was Erastus Corning (1794–1872), four times mayor of Albany, who for 20 years had been president of the Utica and Schenectady, one of the consolidated roads. He served as president of the New York Central until 1864. In 1867 Cornelius Vanderbilt won control, after beating down the Central's stock, and combined it with his New York and Hudson railroads running from Manhattan to Albany.

Vanderbilt joined it to the Lake Shore and Michigan Southern Railway in 1873, extending his system from Buffalo to Chicago. He added the Michigan Central in 1871. Under his son William, the Central acquired the New York, West Shore, and Buffalo Railroad on the west side of the Hudson River in 1885. The system grew until it had 10,000 miles (16,090 km) of track linking New York with Boston, Montreal, Chicago, and St. Louis.

After World War II the New York Central began to decline. Between 1946 and 1958 it dropped four of its six fast daily passenger runs between New York and Chicago. Efforts to merge with its chief competitor, the also ailing Pennsylvania Railroad Company, culminated in 1968 with the creation of the Penn Central Transportation Company—a merger that later included the New York, New Haven and Hartford Railroad, in 1969. The new colossus had 21,000 miles (33,790 km) of track. Its creators hoped to achieve a division of labour, sending freight to New York and New England north along the New York Central's water-level route while the Pennsylvania main tracks served the industrial needs of Philadelphia, Baltimore, and the Delaware and Schuylkill valleys. The merger failed, however, and the new road was forced into bankruptcy in June 1970. Passenger services were taken over by the federally established National Railroad Passenger Corporation (Amtrak) in 1971. The company's other railroad assets were merged with five other lines in Consolidated Rail Corporation (Conrail) in April 1976, although the New York–Washington route was later transferred to Amtrak.

New York City, city and port located at the mouth of the Hudson River, southeastern New York state, northeastern U.S. New York

City is the centre of the largest urban agglomeration in the United States. It occupies Manhattan and Staten islands, the western end of Long Island, a portion of the mainland, and various islands in New York Harbor and Long Island Sound. Its urban area extends into neighbouring parts of New York, New Jersey, and Connecticut.

A brief treatment of New York City follows. For full treatment, *see* MACROPAEDIA: New York City.

The city consists of five boroughs (Manhattan, Brooklyn, Queens, the Bronx, and Staten Island [formerly Richmond]), which correspond to five counties of New York state (New York, Kings, Queens, Bronx, and Richmond, respectively). All are located near the point where the Hudson River empties into Upper New York Bay of the Atlantic Ocean. The city's only land boundaries are Westchester county on the north and Nassau county on Long Island to the east. The city's waterfront is used for shipping and recreation.

New York City is an ethnic melting pot where the most dramatic cultural contrasts are commonplace. It is among the most geographically and demographically complex of world cities, its economy one of the most diverse, and its cultural scene among the richest and most variegated.

The city may be described as a collection of many neighbourhoods, each with its own character and life-style. Manhattan is the economic and cultural heart of the city and is often considered to be "the city." Administration and services, however, have become increasingly decentralized as community planning boards have assumed more power in areas such as education, health, housing, and public works. Manhattan, the magnet for tourists and businessmen, is at first glance a city of skyscrapers, glaring lights, and frenetic pace. The shopping promenade of Fifth Avenue, the financial institutions of Wall Street, the residential mansions of Park Avenue, or the bohemian sections of the East Village and SoHo give typical impressions. Of the other boroughs, only Brooklyn has a similar ethnic heterogeneity and a similar range of social life, with commercial and industrial districts and residential areas ranging from the wealth of Brooklyn Heights to the poverty of parts of Bedford-Stuyvesant. Queens is mainly residential and middle class, and Staten Island is partly suburban but still rural in some areas. In the Bronx luxurious residences and solid middle-class apartments prevail in some sections, but other areas, especially the South Bronx, were once the scene of severe urban blight.

Ethnic pockets abound throughout Manhattan, from black and Spanish Harlem in the north to the various enclaves of the Lower East Side such as Little Italy and Chinatown. New York City has large numbers of Italians, Irish, Puerto Ricans, Asians, and West Indians, as well as the largest Jewish population of any city in the world. This ethnic and racial mix is the result of the waves of immigration that the city has absorbed during its history. The Statue of Liberty, located on Liberty Island off Manhattan, has long stood as a symbol of refuge and opportunity.

New York City is a centre of world trade and finance, communications, art and entertainment, and fashion. The city is the financial capital of the United States and holds the headquarters of many of the world's largest corporations. Wall Street in Manhattan is home to the nation's largest stock exchange and is the headquarters of the country's largest brokerage firms. With the headquarters of the nation's television and radio networks and the main offices of the largest advertising agencies, New York City is the heart of the mass media in the United States. Printing and publishing are important, and most of the nation's major publishing houses are based in midtown Manhattan. The city's economic life also depends on the diversity of its numerous small businesses and manufacturing establishments.

Service industries account for the greatest share of employment. The main nonmanufacturing employers include wholesale and retail trades; finance, insurance, and real estate; transport and public utilities; government; and construction. Wearing apparel, symbolized by New York City's famous garment district, is its major manufacturing industry. Other manufactures include chemicals and chemical products, electronic equipment, processed food, textiles, and fabricated metal products.

In the 1990s, New York City's financial stability grew, owing largely to a sustained boom on Wall Street. The city itself showed signs of invigoration, as seen in the transformation of Times Square from a seedy, crime-ridden district to a cleaned-up corporate mecca for tourists. The city's reduced crime rates received widespread recognition, as did revitalization projects such as the restoration of Grand Central Station.

The artists of New York City exhibit in a wide variety of forms, ranging from traditional crafts to the most avant-garde work, flavoured by complex blends of ethnic and national influences. Theatrical arts and entertainment are also important: Broadway is the synonym for musicals; Carnegie Hall is one of the most famous concert halls in the world; and the Lincoln Center for the Performing Arts is the home of the Metropolitan Opera, the New York City Opera, the New York Philharmonic, and the New York City Ballet. Though the importance of Broadway has declined, theatre is very much alive in the more venturesome Off-Broadway and Off-Off-Broadway productions. The city has numerous motion-picture theatres, among which are many revival and foreign-film houses.

The New York Public Library is one of the best research libraries in the world. Most famous among the city's many museums are the Metropolitan Museum of Art, the Museum of Modern Art, the Solomon R. Guggenheim Museum, the Whitney Museum of American Art, and the American Museum of Natural History. Many smaller museums house special collections. Art galleries featuring the work of the world's top artists are spread throughout the city, with enclaves in SoHo and Chelsea. The city's extensive system of public parks includes Central Park in Manhattan.

New York City has an extensive public university system. Outstanding private colleges and universities include Columbia, New York, Rockefeller, and Fordham universities, many medical schools, the New School for Social Research, and the Juilliard School.

New York City's subway system carries some 3.5 million of the mass-transit passengers in the metropolitan area, with the balance served by buses and commuter rail lines. The once-famous docks of Hell's Kitchen along the Hudson River in Manhattan have disappeared, and considerable shipping has shifted to the New Jersey side of the harbour. Rail lines radiate in all directions. International and domestic air service is provided by Kennedy, La Guardia, and Newark (New Jersey) international airports.

In 2001 the city was rocked by the September 11 attacks (*q.v.*), which destroyed the World Trade Center and killed some 2,800 people. Area city, 304 square miles (787 square km); metropolitan area, 1,384 square miles (3,585 square km). Pop. (2000) city, 8,008,278; New York PMSA, 9,314,235; New York–Northern New Jersey–Long Island CMSA, 21,199,865.

New York City Ballet, resident ballet company of the New York State Theatre at the Lincoln Center for the Performing Arts. The company, first named Ballet Society, was founded in 1946 by the choreographer George Balanchine (artistic director) and Lincoln Kirstein (general director) as a private subscription organization to promote lyric theatre. It is a descendant of the American Ballet company. In 1948 Ballet Society gave its first public performance at the Center Theater of the New York City Center of Music and Drama and changed the company's name to the New York City Ballet. From 1950 its prestige grew with foreign tours. It was moved to its present home in 1964. The company performs during summer sessions at the Saratoga Performing Arts Center in Saratoga, N.Y.

In addition to ballets choreographed by Balanchine, the company performed works by the choreographers Jerome Robbins (ballet master 1969–90), William Dollar, Todd Bolender, Francisco Moncion, Lew Christensen, and Sir Frederick Ashton. Its principal dancers have included Maria Tallchief, Tanaquil LeClercq, Melissa Hayden, Patricia Wilde, Violette Verdy, Suzanne Farrell, Gelsey Kirkland, Patricia McBride, Helene Alexopoulos, André Eglevsky, Jacques d'Amboise, Edward Villella, and Peter Martins.

After the death of Balanchine in 1983, Robbins and Peter Martins shared the responsibilities of ballet master. Robbins retired in 1990, and Martins continued in his charge.

New York Daily News, morning daily tabloid newspaper published in New York City, often the newspaper with the largest circulation in the United States.

The *New York Daily News* was the first successful tabloid newspaper in the United States. It was founded in 1919 as the *Illustrated Daily News* by Joseph Medill Patterson and was a subsidiary of the Tribune Company of Chicago. After a few months the paper changed its name to the *Daily News.* The *Daily News* attracted readers with its sensational coverage of crime, scandal, and violence, its lurid photographs, and its entertainment features. By 1930 its circulation had risen to 1,520,000; it reached 2,000,000 in the next decade.

The *New York Daily News* found abundant subject matter in the United States of the 1920s. Like other popular dailies, it gave prominence to political scandals. The paper devoted much attention to its photography; it was an early user of the Associated Press wirephoto service in the 1930s and developed a large staff of skilled photographers. In spite of strikes, rising production costs, and an unsuccessful attempt at an afternoon edition, the *Daily News* has continued to have one of the highest circulation rates in the United States.

New York Herald, American daily newspaper published from 1835 to 1924 in New York City. It was one of the first papers created in the penny-press movement and is often cited as the beginning of American journalism.

The *Herald* was founded by James Gordon Bennett, who pioneered aggressive methods of gathering news: he developed the interview as a reporting technique, hired foreign correspondents, and used the telegraph and carrier pigeons to speed the delivery of information. The *Herald* covered subjects that had not previously been considered newsworthy or had been inadequately reported, such as finance, sports, foreign events, society affairs, and the theatre. Bennett had an instinct for what interested the public, and under his direction the *Herald* developed a style of reporting that was sensational, high-spirited, and often sardonic, cynical, or malicious. The *Herald* had a larger staff and published more news than any other paper in the city.

His son, James Gordon Bennett, Jr., became managing editor in 1866, and he took over as editor the following year. The younger Bennett, although he was also a gifted editor and promoter, dissipated much of the

Herald's resources with his lavish living in Paris and London, running the *Herald* largely in absentia. He founded a Paris edition and otherwise contributed much to the paper's strengths, but when he died in 1918 he had extracted tens of millions of dollars from its earnings for his own comfort, and the paper was losing money when Frank Munsey bought it from the estate.

Munsey's intent was to build up the *Herald* by merging the morning edition of the *New York Sun* and the *New York Tribune* into it. He proceeded with the *Sun* maneuver, but the proprietors of the *Tribune,* Ogden and Helen Rogers Reid, rejected his offers for years, and finally he sold the *Herald* to them. In 1924 the *Herald* thus disappeared into the *New York Herald-Tribune,* which was a voice of moderate Republicanism and competent journalism for the next four decades. The paper began to decline after Ogden Reid's death in 1947, however, and after a protracted period of financial difficulties, it was shut down in 1966. It was survived by the onetime *Paris Herald* as the *International Herald-Tribune*.

New York Island (Kiribati): *see* Teraina Atoll.

New York, New Haven and Hartford Railroad Company, American railroad operating in southern New England and New York. It was absorbed by the Penn Central Transportation Company in 1969.

It was built up from about 125 small railroads, the earliest of which began operation in 1834 as the Hartford and New Haven Railroad. In 1872 the New York and New Haven Railroad Company joined with the Hartford and New Haven to form the New York, New Haven and Hartford. Eventually it had 1,800 miles (2,900 km) of main track.

The company electrified its track between New York and New Haven between 1907 and 1914; this was the first electrification of a main rail line in the United States. The opening of the Connecticut Turnpike in 1959 cut heavily into its revenues, and in 1961 it entered bankruptcy proceedings.

In 1969 the railroad merged with the Penn Central Transportation Company, which had been formed the previous year by the merger of the New York Central Railroad Company and the Pennsylvania Railroad Company. The Penn Central entered bankruptcy only two years later, however. Its passenger services were taken over by the federally established National Railway Passenger Corporation (Amtrak) in 1971, and its other railroad assets were merged with five other lines in the Consolidated Rail Corporation (*q.v.;* Conrail) in 1976.

New York Public Library (NYPL), one of the great libraries of the world and the largest city public library in the United States. It was established in 1895 through the consolidation of the privately endowed Lenox and Astor libraries and the $2,000,000 Tilden Foundation trust. The library's central building at 42nd Street and Fifth Avenue in New York City opened to the public in 1911. The still privately funded Research Libraries, plus 83 branch libraries augmented by bookmobiles, constitute the library, which contains more than 10,000,000 books and more than 10,000,000 manuscripts, as well as large collections of pictures, maps, books for the blind, films, and microfilms. Among the NYPL's special holdings are the Berg Collection of English and American literature, rare books and manuscripts from the 15th to the 20th century; and the Manuscripts and Archives Division, which includes, among other things, the H.L. Mencken papers and George Washington's farewell address, in his own hand.

New York school, those painters who participated in the development of contemporary art from the early 1940s in or around New York City. During and after World War II, leadership in avant-garde art shifted from war-torn Europe to New York, and the New York school maintained a dominant position in world art into the 1980s. Abstract Expressionism, the most important art movement to emerge after World War II, Minimal art, Pop art, and new realist styles of the late 1960s, among others, all had their beginnings in New York. *See also* Abstract Expressionism; Action painting; minimalism; Pop art.

New York State Canal System, also called BARGE CANAL, 520-mile- (837-kilometre-) system of state-owned, state-operated waterways linking the Hudson River with Lake Erie, with extensions to Lakes Ontario, Champlain, Cayuga, and Seneca. It incorporates the Erie Canal (*q.v.*), from Troy via Rochester to Tonawanda, north of Buffalo; the Champlain Canal, which joins the Erie Canal at Waterford and extends north to Whitehall; the Oswego Canal, which connects the Erie Canal at Three River Point (just north of Syracuse) and enters Lake Ontario at Oswego; and the Cayuga and Seneca lakes, connecting these at Montezuma with the Erie Canal. It can accommodate barges 300 feet (91 m) long, 43.5 feet (13 m) wide, with a draft of 12 feet (3.6 m) and a cargo capacity of 2,200 tons (2,000 metric tons). Authorized in 1903, it was completed in 1918. By the 1980s commercial shipping had declined through competition from pipeline, rail, and road transport. The system's popularity grew as a recreational attraction, however, aided by a major restoration program begun in the 1990s.

New York Stock Exchange (NYSE), world's largest marketplace for securities. The exchange evolved from a meeting of 24 men under a buttonwood tree in 1792 on what is now Wall Street in New York City. It was formally constituted as the New York Stock and Exchange Board in 1817. The present name was adopted in 1863. Membership, limited to 1,366 since 1953, is obtained by purchasing (since 1868) a seat from an existing member.

Greater commercial activity in the United States after the War of 1812 and speculation in railroad stocks in the 1830s increased demand for capital and stimulated trading at the exchange. After the Civil War, the exchange provided the capital for the accelerating industrialization of the United States.

After the Panic of 1837, when many investors suffered heavy losses, the exchange began to demand that companies disclose to the public information about their finances as a condition of offering stock. The Stock Market Crash of 1929, which signaled the start of the Great Depression, led to investigation by the federal government and regulation by the Securities and Exchange Commission.

To be listed on the NYSE, a corporation must have aggregate pretax earnings of $6,500,000 over the previous three years and at least 1,100,000 shares of stock outstanding, give common shareholders voting rights, and publish periodic financial statements. A shift from fractional to decimal pricing occurred in 2001.

New York Sun, daily newspaper published from 1833 to 1950 in New York City, long one of the most influential of American newspapers. The *Sun* was the first successful penny daily newspaper in the United States.

The *New York Sun* was founded by a New York City printer, Benjamin H. Day, as a four-page half-tabloid sheet. Its reports of police-court activities and its witty treatment of news made it a success, and only the *Sun* and the *New York Herald* survived from a crowd of 30 or more new penny papers. In 1868 Charles A. Dana purchased the *Sun* and became its editor, a post he retained until his death 29 years later. He introduced a clear style of journalism, carefully retained the humorous touch that was the paper's early hallmark, and occasionally used a sensational approach to scandalous news. Under his guidance the *Sun* became increasingly conservative in its editorial stance, but within eight years the paper's circulation had tripled, reaching 130,000.

In 1887 the *Sun* introduced an immediately successful evening edition. The morning *Sun* and the *Evening Sun* were sold to Frank A. Munsey in 1916, and the morning edition was merged with Munsey's *New York Press.* In 1920 Munsey closed the morning *Sun,* and the *Evening Sun* was renamed simply *The Sun*. Munsey bought the *New York Globe* and merged it into *The Sun* in order to give it a membership in the Associated Press. The *Sun* continued to publish until 1950, when it was sold to the Scripps-Howard group and was merged into the *New York World-Telegram*.

New York Times, The, morning daily newspaper published in New York City, long the newspaper of record in the United States and one of the world's great newspapers. Its strength is in its editorial excellence; it has never been the largest newspaper in terms of circulation.

The *Times* was established in 1851 as a penny paper that would avoid sensationalism and report the news in a restrained and objective fashion. It enjoyed early success as its editors set a pattern for the future by appealing to a cultured, intellectual readership instead of a mass audience. But its high moral tone was no asset in the heated competition of other papers for readers in New York City. Despite price increases, The *Times* was losing $1,000 a week when Adolph Simon Ochs bought it in 1896.

Ochs built the *Times* into an internationally respected daily. Aided by an editor he hired away from the *New York Sun,* Carr Van Anda, Ochs placed greater stress than ever on full reporting of the news of the day, maintained and emphasized existing good coverage of international news, eliminated fiction from the paper, added a Sunday magazine section, and reduced the paper's newsstand price back to a penny. The paper's imaginative and risky exploitation of all available resources to report every aspect of the sinking of the *Titanic* in April 1912 greatly enhanced its prestige. In its coverage of two world wars the *Times* continued to enhance its reputation for excellence in world news.

In 1971 the *Times* became the centre of controversy when it published a series of reports based on the "Pentagon Papers," a secret government study of U.S. involvement in the Vietnam War that had been covertly given to the *Times* by government officials. The U.S. Supreme Court found that the publication was protected by the freedom-of-the-press clause in the First Amendment of the U.S. Constitution. Later in the 1970s the paper, under Adolph Ochs's grandson, Arthur Ochs

Sulzberger, introduced sweeping changes in the organization of the newspaper and its staff and brought out a national edition transmitted by satellite to regional printing plants.

New York University, private institution of higher learning that includes 13 schools, colleges, and divisions at five major centres in the borough of Manhattan in New York City. It was founded in 1831 as the University of the City of New York. Its school of law was established in 1835 and the school of medicine in 1841. A graduate school of pedagogy was added in 1890, becoming an important centre for the teaching of education. The university's present name was adopted in 1894.

New York University now consists of an undergraduate college of arts and sciences and a graduate school of arts and sciences; a school of business offering both undergraduate and graduate programs; a graduate school of public service (administration); a school of education, including health, nursing, and the arts; a school of medicine; a postgraduate medical school; a college of dentistry; a law school; a school of social work; a school of the arts, with training in the performing and visual arts; and a school of continuing education. The university's Gallatin School of Individualized Study was organized in 1972 to provide opportunities for earning degrees through innovative study programs.

New York World, daily newspaper published in New York City from 1860 to 1931, a colourful and vocal influence in American journalism in its various manifestations under different owners.

It was established in 1860 as a penny paper with a basically religious orientation. It supported U.S. President Abraham Lincoln's prosecution of the American Civil War and his other policies, but it lost money, was sold to a consortium of New York City Democrats, and turned abruptly on Lincoln after the Emancipation Proclamation of Jan. 1, 1863. The paper was shut down by federal authorities for two days in 1864 for publishing a fabricated report indicating that the North would draft 400,000 more men for the Union armies. In 1868 the paper published a statistical and historical annual, the *World Almanac,* which long survived the *World* itself.

In 1883 the *World* was purchased by Joseph Pulitzer (1847–1911) and became increasingly flamboyant, particularly its Sunday edition under the editorship of Arthur Brisbane. The *World* played a major role in whipping up the jingoistic spirit that led the United States into the Spanish-American War. The paper's bombast was tempered somewhat after Brisbane moved on and Pulitzer died and was succeeded by his son Joseph Pulitzer II.

The *World* was known for its numerous outstanding reporters, columnists, editors, and cartoonists. By 1930 the paper's circulation had declined after a price increase, and heavy losses induced young Pulitzer to sell the paper to the Scripps-Howard chain. In 1931 the *World* was combined with the *New York Evening Telegram* (founded 1867) to become the *New York World-Telegram.* (The latter lasted until 1966; another merger creation, the *New York World-Journal-Tribune,* lasted less than a year, closing in 1967.)

New York Zoological Park: *see* Bronx Zoo.

New Yorker, The, American weekly magazine, famous for its varied literary fare and humour. The founder, Harold Ross, published the first issue on Feb. 21, 1925, and was the magazine's editor until his death in December 1951. *The New Yorker*'s initial focus was on New York City's amusements and social and cultural life, but the magazine gradually acquired a broader scope that encompassed literature, current affairs, and other topics. *The New Yorker* became renowned for its short fiction, essays, foreign reportage, and probing biographical studies, as well as its comic drawings and its detailed reviews of cinema, books, theatre, and other arts. The magazine offered a blend of reportage and commentary, short stories and poetry, reviews, and humour to a sophisticated, well-educated, liberal audience.

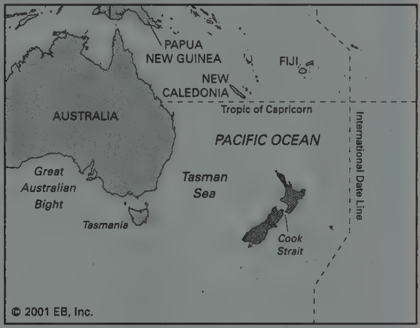
The New Yorker's contributors have included such well-known literary figures as S.J. Perelman, Robert Benchley, Ogden Nash, Wolcott Gibbs, E.B. White, John O'Hara, Edmund Wilson, J.D. Salinger, John Updike, Rebecca West, Dorothy Parker, and Pauline Kael. Among its great cartoonists have been Charles Addams, Helen Hokinson, George Price, James Thurber (a writer as well), Roz Chast, and Rea Irvin, who was the magazine's first art director and the creator of Eustace Tilley, the early American dandy who appeared on the cover of the first issue and on annual covers thereafter.

In 1985 *The New Yorker* was sold to the publisher Samuel I. Newhouse, Jr., this being the first time in its history that the magazine's ownership had changed hands. William Shawn was the magazine's editor in chief from 1952 to 1987, when he was succeeded by Robert Gottlieb, formerly a book editor and executive at Alfred A. Knopf publishers. In 1992 a Briton, Tina Brown, formerly editor of *Vanity Fair,* replaced Gottlieb, and she was succeeded, in 1998, by David Remnick, a staff writer at the magazine.

New Zealand, Maori AOTEAROA, an island nation in the South Pacific Ocean lying about 1,000 miles (1,600 km) southeast of Australia. New Zealand has two main islands—the North and South, separated by the 20-mile- (32-kilometre-) wide Cook Strait—and a number of small islands. The capital is Wellington. Area 104,454 square miles (270,534 square km). Pop. (2000 est.) 3,835,000.

A brief treatment of New Zealand follows. For full treatment, *see* MACROPAEDIA: New Zealand.

For current history and for statistics on society and economy, *see* BRITANNICA BOOK OF THE YEAR.



New Zealand

The land. North Island and South Island are both bisected by mountains in the south and by ranges of hills in the north. The North Island is about 18 percent mountainous, and the South Island is 70 percent mountainous. The Southern Alps, a 300-mile- (480-kilometre-) long chain of folded mountains in the western part of South Island, contain New Zealand's highest point, Mount Cook (12,349 feet [3,764 m]), and 22 other peaks are above 10,000 feet (3,000 m). Pastoral conditions created by the rain-shadow effect of the Southern Alps enable large-scale sheep ranches to produce much of New Zealand's fine wools, particularly from Merino sheep. The hills in the eastern part of South Island seldom exceed 6,000 feet (1,800 m) in elevation and descend to the Canterbury Plains; relief is also lower in the northern hill country. The North Island, much less precipitous than the South, has a central region consisting of the Volcanic Plateau and its surrounding hill country, where sheep and dairy farming are important activities. Parts of the plateau are forested, and there are some subtropical forests on the North Auckland Peninsula.

Most of New Zealand's rivers are short and swift-flowing and are important for hydroelectric-power production; the longest is the Waikato (264 miles [425 km]) in the North Island. The soils are mostly clays and are generally poor for agricultural use, though pockets of fertile alluvial soils are found in many valley bottoms. New Zealand is subject to frequent earthquakes and active volcanism.

Rainfall is fairly reliable and abundant, ranging generally from 25 to 60 inches (635 to 1,525 mm) annually. Mean annual temperatures at sea level vary from 59° F (15° C) in the far north to 48° F (9° C) in the far south. The average seasonal and diurnal temperature range is about 18° F (10° C).

New Zealand's forests, once covering some two-thirds of the country, have shrunk to less than one-third, although reforestation efforts have been undertaken. Lizards, frogs, and bats are the only indigenous land animals; red deer, Australian opossum, rabbits, and various domestic animals have been introduced by European settlers. There is a great variety of birdlife, including the flightless kiwi and weka. Many species of fish (tuna, snapper, cod, and flounder) are found off the coast.

Minerals are not of great economic importance in New Zealand, although coal, iron sands, and gold are found in commercial quantities. Renewable energy resources (hydroelectricity and geothermal power in particular) have played a major part in New Zealand's economic development.

The people. The principal ethnic element of New Zealand's population (about four-fifths) is of European origin (mostly British); Maori, the indigenous Polynesian inhabitants, constitute about one-seventh, while Pacific Islanders, Chinese, and Indians constitute the remainder. English and Maori are the official languages. Anglicans are the largest religious group, followed by Roman Catholics and Presbyterians, although more than one-fourth of the population does not claim any religious affiliation.

New Zealand's population is growing at a relatively low annual rate. Birth and death rates are moderate, health standards are excellent, and life expectancy is relatively high at 78 years for females and 75 for males. Five-sixths of the population lives in urban areas, and most migration within the country takes place between urban areas. Christchurch is the largest city on the South Island. On the more populous North Island, the largest cities include Manukau, Auckland, and Wellington.

The economy. New Zealand has a developed market economy largely based on agriculture, small-scale industries, and services. Economic growth has been kept low by dependence on imported fuels and capital and consumer goods. The gross national product (GNP) per capita is within the range of those of the developed countries of the world.

Agriculture accounts for approximately 5 percent of the gross domestic product (GDP) and employs less than 10 percent of the work force. Farming is highly scientific, and the marketing of butter, cheese, meat, wool, apples, pears, and certain other agricultural commodities is controlled by various boards. Agricultural commodities are New Zealand's chief exports. Pastures cover about half of the total land area, but arable land constitutes only about 2 percent.

Sheep raising dominates agriculture and is highly productive; the nation's sheep population (nearly 50 million) vastly exceeds the number of people. Cattle are also important. Meat, wool, butter, and cheese are largely exported.

The production of wheat meets domestic demand. Barley, corn (maize), peas, and potatoes are grown mainly for domestic consumption, while Chinese gooseberries (kiwi fruit), apples, and pears are produced for export. Forestry is an important source of foreign exchange, particularly the export of coniferous sawed logs, timber, and wood pulp.

There has been much growth in the fishing industry, spurred largely by increases in finfish exports. In 1978 New Zealand claimed an economic zone that extends up to 200 nautical miles (370 km) offshore.

Mining accounts for a tiny percentage of the GDP. Much of the natural gas produced by New Zealand is used by power stations to generate electricity. Crude oil is available from several fields in the Taranaki Peninsula. More than three million tons of coal are also mined annually, and small quantities are exported.

Manufacturing accounts for a shrinking one-fifth of the GDP and employs a slightly smaller proportion of the workforce. Industries tend to be small-scale and produce chiefly for the domestic market. Costs of production are usually much higher than those in other industrialized countries. Electricity is generated mainly by hydroelectric stations, but there are also several large geothermal plants, as well as conventional thermal generating stations.

Government and social conditions. New Zealand is an independent, democratic state within the Commonwealth. It has no formal written constitution. Ceremonial executive power is vested in the British monarch, who is represented in New Zealand by a governor-general. Legislative power is exercised by a unicameral House of Representatives (Parliament), the members of which are elected to terms of three years. The party holding the majority of seats forms the government. Executive power is vested in the policy-making cabinet headed by the prime minister, who is also the leader of the majority party. The governor-general is appointed to a five-year term. Among other ceremonial duties, the governor-general must give royal assent to bills passed by Parliament before they officially become law. The two major political parties are the National Party and the Labour Party, though there are several smaller parties. New Zealand's legal code includes certain statutes passed by the British Parliament before 1947 and usually follows the precedents of English law. The Court of Appeal is the highest appeal court in the country.

Social services account for more than one-third of the total government expenditures. New Zealand's comprehensive welfare system provides benefits for sickness, maternity, old age, disability, widowhood, orphanhood, unemployment, and emergencies. Hospitalization in public institutions is free. Health facilities are well staffed and accessible. Most of the country's housing has been built since 1955. State agencies provide limited financial assistance toward home purchases or subsidized rental accommodation for those with low incomes.

The country's literacy rate is nearly 100 percent. Education is compulsory between the ages of 6 and 16. Following six years of primary school, students attend secondary schools that offer a broad general academic education. Higher education is offered at state institutions.

Newspapers maintain high standards of reporting and comprehensive coverage. Television and radio are supervised by the state-supported Television New Zealand Ltd. and Radio New Zealand Ltd., respectively. A wide range of programming is offered, much of it produced locally.

Cultural life. The cultural milieu of New Zealand is predominantly European, although a revival of the Maori people's distinct artistic and cultural traditions is taking place; in addition, a number of immigrant Pacific Islanders continue their own traditional practices. Maori artistic expression, except for decorative design, was completely oral before the arrival of Europeans, and a great deal has been lost. New songs and chants are being written in Maori, however, as well as some poetry and prose.

New Zealand's artists and writers have evolved from explaining the unique history of the country, as exemplified by the work of Katherine Mansfield, to creating works of personal analysis and introspection. The works of Janet Frame are probably best known to world audiences. Government funding is necessary to support the opera and ballet companies; there is, however, a lively amateur dramatic tradition throughout the country. The national orchestra is completely supported by the government. The film industry has achieved modest international recognition. Sports are the main leisure-time occupation, with widespread participation in most major sports, particularly rugby football, track and field, and horse racing. New Zealand boats won the America's Cup yachting race in 1995 and 2000.

History. Polynesian occupation of New Zealand dates to at least AD 1000 and probably two or three centuries earlier. During the late Polynesian period of the 18th century, an estimated 100,000 to 200,000 Maori inhabited the main islands.

Prime ministers of New Zealand*

	party	term
Henry Sewell		1856
William Fox (*1st time*)		1856
Edward William Stafford (*1st time*)		1856–61
William Fox (*2nd time*)		1861–62
Alfred Domett		1862–63
Frederick Whitaker (*1st time*)		1863–64
Frederick Aloysius Weld		1864–65
Edward William Stafford (*2nd time*)		1865–69
William Fox (*3rd time*)		1869–72
Edward William Stafford (*3rd time*)		1872
George Marsden Waterhouse		1872–73
William Fox (*4th time*)		1873
Julius Vogel (from 1875, Sir Julius Vogel) (*1st time*)		1873–75
Daniel Pollen		1875–76
Sir Julius Vogel (*2nd time*)		1876
Harry Atkinson (*1st time*)		1876–77
Sir George Grey		1877–79
John Hall		1879–82
Frederick Whitaker (*2nd time*)		1882–83
Harry Atkinson (*2nd time*)		1883–84
Robert Stout (from 1886, Sir Robert Stout)		1884–87
Harry Atkinson (from 1888, Sir Harry Atkinson) (*3rd time*)		1887–90
John Ballance	Liberal	1890–93
Richard John Seddon	Liberal	1893–1906
Joseph Ward (from 1911, Sir Joseph Ward) (*1st time*)	Liberal	1906–12
William Ferguson Massey	Reform	1912–25
Joseph Gordon Coates	Reform	1925–28
Sir Joseph Ward (*2nd time*)	United	1928–30
George William Forbes	Reform–United	1930–35
Michael Joseph Savage	Labour	1935–40
Peter Fraser	Labour	1940–49
Sidney Holland	National	1949–57
Walter Nash	Labour	1957–60
Keith Jacka Holyoake	National	1960–72
John Marshall	National	1972
Norman E. Kirk	Labour	1972–74
Wallace Edward Rowling	Labour	1974–75
Robert Muldoon	National	1975–84
David Lange	Labour	1984–89
Geoffrey Palmer	Labour	1989–90
Mike Moore	Labour	1990
Jim Bolger	National	1990–97
Jennifer Shipley	National	1997–99
Helen Clark	Labour	1999–

*The titles premier and first minister were variously applied to each of the principal ministers until 1869, when premier became customary. Although the title prime minister was first used formally in the Schedule of the Civil List Act of 1873, no one used the title officially until Richard John Seddon, beginning in 1893.

Abel Janszoon Tasman, a Dutch sailor, commanded an expedition that sighted the coast of Westland in December 1642. His attempt to land on the South Island provoked a clash with the Maori, however. In 1769–70 Captain James Cook circumnavigated and charted the two main islands. Cook's initial contact with the Maori was also violent, but later voyages and contacts proved more harmonious.

Early European settlement of New Zealand was an offshoot of Australian enterprise in whaling and other activities: Australian companies set up small whaling settlements around the coasts of both islands. From 1839 to 1841 New Zealand was part of the colony of New South Wales. In 1840 the Maori ceded the sovereignty of New Zealand to Britain in exchange for protection and guaranteed possession of their lands. Intermittent fighting with the Maori went on, however, until the colonists finally subdued them in 1847. In 1852 the New Zealand Constitution Act divided the colony into six provinces and established its government.

Relations between settlers and the Maori deteriorated as the Maori became reluctant to sell prime land. In 1860 troops were used to dislodge Maori from land sold under questionable circumstances; war broke out and continued for most of the decade. Eventually British forces, militia, and Maori allied to the government defeated the tribes opposed to selling land.

The discovery of gold in the mid-19th century brought prosperity and more European settlers to the colony. Economic growth on the North Island was impeded, however, because of the Maori war. In the early 1880s the development of refrigerated ships made it possible for farmers to ship butter, cheese, and meat to Great Britain, thus inaugurating an agriculturally based economy.

From 1891 to 1912 the Liberal Party, for most of this period under Richard John Seddon as prime minister, introduced social security (1898), encouraged labour unions (1892–96), and introduced successful land policies. In 1912 the Liberals were unseated by the Reform Party led by William Ferguson Massey, who remained prime minister until 1925. During the 1920s the Reform administration set up a system of export-marketing agencies in which authority was shared by producer and state. These laid the foundations of a cooperative marketing structure for New Zealand's dairy and other products. New Zealand supported Great Britain in both world wars, supplying troops, wool, and food. The country's participation in World War I was a boon to its export trade but was costly in lives. New Zealand's entrance into World War II began with the sending of troops to the European theatre in 1939. After 1941, however, New Zealand was threatened directly by Japan and became involved in the war in the Pacific.

In 1907 New Zealand was given dominion status in the British Empire; it was granted autonomy in 1931 by the Statute of Westminster, but it did not formally accept the statute until 1947. The National Party has controlled New Zealand's government much of the time since independence, although the Labour Party has formed several governments. Since Great Britain joined the European Economic Community in the early 1970s, New Zealand has had to expand its export markets and diversify its economy. It has also become more independent in its foreign relations.

New Zealand, Church of the Province of, an independent Anglican church that developed from missionary work begun in the 19th century. The first missionaries arrived in New Zealand from Australia in 1814. The work flourished, and in 1841 George Augustus Selwyn (1809–78) was appointed the first bishop of New Zealand, where he served until 1867. The church grew as white settlers moved to the country, and it also gained converts among the native Maori population. In 1857 it adopted its own constitution and became an independent church.

Although other denominations also established missions in New Zealand, the Anglican church remained the largest church. It consists of one province divided into several dioceses. In June 1990 in Dunedin, N.Z., Penelope Jamieson became the first female Anglican bishop to head a diocese. The seat of the primate is in Christchurch.

New Zealand Company (1838–58), British joint-stock company responsible for much of the early settlement of New Zealand; it attempted to colonize in accordance with the theories of Edward Gibbon Wakefield (*q.v.*). Formed in the summer of 1838 after a parent New Zealand Association failed to receive a royal charter to proceed with the settlement of the still independent islands, the company sent a land purchase expedition to New Zealand in 1839. In 1840 it founded the settlements of Wellington and Nelson and, in 1841, through a subsidiary organization (the Plymouth Company), the settlement of New Plymouth.

While the advance group was buying land, Britain annexed New Zealand (May 1840) on terms that necessitated a review of the company's land purchases from the Maori (*see* Waitangi, Treaty of). From 1840 to 1845 many of its transactions were ruled invalid. Immigrants who had heeded the company's propaganda found that there was actually little land to be had when they arrived. While the company had finally received a royal charter to continue its work (1841), it was in serious financial difficulty. The massacre in 1843 of its officials and the 1844–47 Bay of Islands War exacerbated the company's plight. In 1858 it was dissolved.

New Zealand Labour Party, political party established in 1916 in a merger of various socialist and trades-union groups, including the Unified Labour Party (founded 1910) and the Social Democratic Party (founded in 1913). The party grew steadily so that by the 1930–35 term it had become the official parliamentary opposition; and in 1935 it gained 53 seats, a clear majority, and formed the first Labour government, with Michael Joseph Savage as prime minister. It remained in office continuously until 1949 (under Prime Minister Peter Fraser from 1940) and enacted various pieces of welfare legislation, including social security, price and trade regulations, compulsory unionism, Maori protection, and other reforms but embracing only very limited socialization (of banks and broadcasting). Ideologically the Labour Party's distance from its rival, the National Party, became narrow and vague. In the next 35 years Labour was in power in 1957–60, 1972–75, and 1984–90.

New Zealand literature, the body of literatures, both oral and written, produced in New Zealand.

A brief treatment of the literature of New Zealand follows. For full treatment, *see* MACROPAEDIA: Australia and New Zealand, Literatures of.

Maori habitation of New Zealand began some 1,000 years before settlement by Europeans. Like other Polynesian peoples, the Maori had an oral tradition that included war chants, laments, love poems, prayers, and a well-developed mythology. The tribal meeting ground was (and continues to be) the site of much oratory, a Maori practice that combines text with aspects of performance. Maori legend also brought the past into the present, making the events described contemporary. When some New Zealand scholars began to fear that the Maori culture would eventually be lost, they attempted to record as much Maori legend as they could. Many types of songs and song-chants have been distinguished; they include laments, love songs, gossip songs, songs of courtship or praise, songs for children, and songs of greeting and farewell. There are also chants for a variety of occasions. Between the 1940s, when Maori writers began to publish works in English, and the 1970s, few writers knew much of the Maori language. Since that time, many writers who identify themselves with Maori culture have established a presence in New Zealand literary history.

The first permanent colony in New Zealand was established in 1840, but modern discussion of New Zealand literature has generally discounted works produced in the 19th century as the output of Britishers abroad. Much of the early writing was, understandably, derivative, and the most informative 19th-century writings are autobiographical narratives of pioneer experiences, such as Lady Mary Anne Barker's *Station Life in New Zealand* (1870) and Frederick Maning's *Old New Zealand* (1863).

The country's first writer of brilliance, Katherine Mansfield, though living and working abroad for most of her life, set many of her short stories—including those collected in *Bliss* (1920) and *The Garden Party* (1922)—in the idealized New Zealand of her childhood. Among her contemporaries and near-contemporaries, the novelists Jane Mander, William Satchell, John A. Lee, Robin Hyde, and John Mulgan should be noted.

The first outstanding New Zealand poet was Blanche Edith Baughan. She was followed in the 1930s by such poets as A.R.D. Fairburn, R.A.K. Mason, Allen Curnow, and Denis Glover. Frank Sargeson, noted for his three-volume autobiography and his novels, also began publishing stories in the 1930s.

In the 1950s a number of now internationally known writers including Janet Frame and Sylvia Ashton-Warner came to the fore. Other writers of note included the novelists Maurice Shadbolt, Maurice Gee, Bill Pearson, David Ballantyne, and Ronald Hugh Morrieson and the vigorous, eclectic poet James K. Baxter, who became something of a cult hero.

Literary styles of the late 20th century tended to reflect international trends, with poetry reflecting surrealist, modernist, and feminist strains. Theatre, in particular, flourished—with notable plays by Bruce Mason, Mervyn Thompson, Roger Hall, and poet Vincent O'Sullivan—and there was considerable crossing of genres among New Zealand writers.

New Zealand National Party, political party founded in 1936 in the merger of non-Labour groups, most notably the United Party and the Reform Party, two parties that had been in coalition since 1931.

The Reform Party, the full name of which was the New Zealand Political Reform League, was a conservative organization that held control of the national government from 1912 to 1928. The United Party, formed in 1927, was the successor to the Liberal Party, dating to the 1890s and formally established in 1905. The new United Party was surprisingly successful in the elections of 1928 and formed a government, under Joseph Ward. A United-Reform coalition government was established in 1931, only to lose disastrously to the New Zealand Labour Party in the 1935 elections. Leaders of the right-wing parties deemed that the only way to revive conservative hopes was to unite their various groups, which separately had been dissipating their strength. The New Zealand National Party was thus born in 1936. The road back was slow, and not until 1949 did it win back the government. For the next 35 years the New Zealand National Party governed continuously except for the periods 1957–60, 1972–75, and 1984–90.

New Zealand Political Reform League, byname REFORM PARTY, conservative political party formed from various local and sectional organizations that took power in 1912, following a general election in 1911, and held control of the government until 1928. The Reform Party first acted as a united group in 1905, but it was not formally constituted and organized along party lines until after the 1911 election.

Based primarily on urban business interests and the small farmers of the North Island dairy industry, the Reform Party won the 1911 election by a promise to transform agricultural leasehold property into freehold on terms that would enable farmers to reap a significant profit from the sale of their land. It also benefited from its opposition to growing labour union defiance of New Zealand's anti-strike Industrial Conciliation and Arbitration Act (1894).

Led by W.F. Massey, the party's leader and New Zealand's premier from 1912 until his death in 1925, the Reform Party dealt violently with the strikes of 1912–13. But it was mortally weakened during the depression of the late 1920s, when its business and agrarian wings turned against one another. The Reform Party returned to power in coalition with the United Party (1931–35) but was formally dissolved in 1936. Its remnant entered the new National Party.

New Zealand red pine: *see* rimu.

New Zealand short-tailed bat (*Mystacina tuberculata*), small bat that is the sole species in the family Mystacinidae. It is about 6.5 cm (2.5 inches) long and has a short 1.8-centimetre (0.7-inch) tail. Its fur is grayish brown and thicker than the fur of other bats. Close to the body the wing membranes are leathery, and the wings can be furled tightly within them. *M. tuberculata,* the most terrestrial bat, is very agile when on the ground. In its forest habitat it may roost in hollow trees, caves, or crevices, and it sometimes digs tunnels in rotten wood. The diet of this species includes fruit, nectar, pollen, and insects. The young are born with their eyes open.

Newar, people of mixed descent who comprise about half the population of the Kāthmāndu Valley in Nepal. They speak a language belonging to the Tibeto-Burman family, but their culture has been strongly influenced by Indian religious and social institutions. The Newar population of Nepal is estimated to be about 540,000.

Most of the Newar are Hindus, but some practice an Indian form of Buddhism. There are about 70 castes, Buddhist as well as Hindu, covering approximately the same spectrum as the caste system of India; they include the Brahman, Kshatriya, Vaisya, and Sudra *varṇa*s as well as numerous groups of untouchables.

The Newar have a wide range of occupations. Many are farmers; others are prominent in the retail trades; and some occupy high political and administrative posts. They have traditionally been noted as architects and artisans, the builders of the famous temples and shrines of Kāthmāndu. From the 10th to the 16th century painting and sculpture flourished among the Newar, along with crafts such as pottery making, papermaking, wood carving, and metallurgy. Each of the crafts has traditionally been the specialty of a particular caste.

Newark, city, New Castle county, northern Delaware, U.S. It lies just west-southwest of Wilmington. The community developed in the late 1680s around the New Worke Quaker meeting-house, which served as an early crossroads meeting place for travelers. Nearby Cooch's Bridge on Christina Creek was the scene (Sept. 3, 1777) of the only Revolutionary War battle fought in the state. An early industrial enterprise in the locality was a paper mill built before 1798 on White Clay Creek. Newark's industries now include the manufacture of vulcanized fibre, concrete products, processed foods, and the assembly of automobiles. Newark is the seat of the University of Delaware (founded 1743 in New London, Pa., and subsequently transferred to Newark in 1765). Inc. town, 1887; city, 1951. Pop. (2000) 28,547.

Newark, city and port of entry, northeastern New Jersey, U.S. It lies on the west bank of the Passaic River and Newark Bay, 8 miles (13 km) west of lower Manhattan. Puritans migrating from Connecticut founded Newark in 1666 on land purchased from local Indians. The settlement, first named Pesayak Towne and later New Milford, was probably renamed for the home of the Reverend Abraham Pierson, who went there from Newark-on-Trent, Eng. Another version holds that the name was of biblical significance (New Ark). Newark became the seat of Essex county (1682) and was chartered as a township in 1693.

After the Revolutionary War Newark became (*c.* 1790) noted for leather tanning and shoe manufacturing, which profited greatly by the inventiveness of Seth Boyden, who developed a process for making patent leather (1818) and who was also credited as the first producer of malleable cast iron (1826). Newark's other industrial pioneers included the Reverend Hannibal Goodwin, who patented a flexible film for motion pictures (1888), and Edward Weston, who invented electrical measuring instruments (1888).

The city's proximity to New York City places it within the nation's most highly industrialized and populous area. Newark is the largest city in the state and is a leading industrial centre. Its manufactures are highly diversified and include electronic equipment, leather goods, chemicals, textiles, industrial machinery, and foodstuffs. Printing, publishing, and the insurance business are also significant. Newark is a transportation centre and a major East Coast distributing point. Newark International Airport is one of the world's busiest, since it serves both Newark and the New York City area. The Port of Newark, started in 1914, is now leased and operated by the Port of New York Authority.

From the 1950s through the '70s there was an outward movement of population from Newark that fundamentally altered its racial composition, a change that accelerated after the city was wracked by black rioting in 1967. The movement of whites to the suburbs raised the proportion of blacks in the city from 17 percent in 1950 to more than 50 percent by the 1980s. In 1970 blacks obtained some political power when the city's first black mayor, Kenneth A. Gibson, was elected.

Located in Newark are the New Jersey Institute of Technology (1881), the Newark campus of Rutgers University, a branch of Seton Hall University (Roman Catholic, 1856), Essex County College (1968), and New Jersey College of Medicine and Dentistry. Near the city centre is Military Park, used as a drill ground in colonial times and now the site of a bronze group of figures, "The Wars of America," by Gutzon Borglum. Branch Brook, a county park, is noted for its Japanese cherry trees. In front of the county courthouse, designed by Cass Gilbert, is a seated statue of Abraham Lincoln, also by Borglum. Historic buildings include Trinity Cathedral (1743), used as a hospital during the Revolutionary War; House of Prayer, with its two-centuries-old stone rectory, Plume House (1710); and the old First Presbyterian Church (1791).

Notable Newark residents have included Mary Mapes Dodge, author of *Hans Brinker, or the Silver Skates* (1865), and Edmund Clarence Stedman, poet; Stephen Crane, author of *The Red Badge of Courage* (1895), was a native son, as was Aaron Burr. Adjacent to the Newark Museum, a general museum, is the Ballantine House, a restored Victorian mansion. Inc. city, 1836. Pop. (2000) city, 273,546; Newark PMSA, 2,032,989.

Newark, city, seat (1808) of Licking county, central Ohio, U.S. It lies at the junctions of the North and South forks of the Licking River and of Raccoon Creek, 30 miles (48 km) east of Columbus. Indian earthworks in the local Mound Builders, Wright Earthworks, and Octagon state memorials date from pre-Columbian settlement in the locality. Laid out in 1802, the community was named for the New Jersey hometown of the first settlers, led by General William C. Schenck. Newark prospered as an agricultural trading centre, and development was spurred by its location near the Ohio and Erie Canal system begun (1825) at Licking Summit, 4 miles (6 km) south, and by the arrival of the first railroad (1852).

The modern city's economy is well diversified and is based on agriculture (dairying, livestock, grain, and fruit) and industry (including the manufacture of glass fibre and aluminum, truck axles and transmissions, lighting equipment, containers, and plastics). The Newark campus of Ohio State University opened in 1957, and Central Ohio Technical College in 1971. Points of historic interest include Buckingham House (1815), Licking County Museum, and the Museum of Ohio Indian Art. Nearby are Buckeye Lake State Park, Dawes Arboretum, the Flint Ridge State Memorial (a prehistoric Indian flint quarry), Dillon Dam and Reservoir, and the Ohio Canal Lock. Granville, 5 miles (8 km) west, is the seat of Denison University (1831). Inc. town, 1826; city, 1860. Pop. (2000) 46,279.

Newark and Sherwood, district, county of Nottinghamshire, central England. It occupies an area of 255 square miles (662 square km) in the east-central part of the county. Newark and Sherwood district extends from the sandy uplands (about 300 feet [90 m] in elevation) in the west to the fertile, wide valley of the River Trent, centred on the town of Newark-on-Trent in the east. The infertile uplands, an outcrop of the Pennines, support heath, limited agriculture, and what remains of the fabled Sherwood Forest; originally an oak forest, much of Sherwood Forest has been replanted in pine.

Coal production has great potential in the district. In the 1960s mining operations in the Nottinghamshire coalfield were extended eastward to Ollerton and Bilsthorpe, near Sherwood Forest. A vast coal reserve was discovered in the late 1970s in the Trent Valley north of Newark-on-Trent. Agriculture is the principle economic activity in the valley; wheat, barley, sugar beets, and dairy cattle are raised. Newark-on-Trent, a manufacturing centre of ball and roller bearings and other machinery, is the district seat.

The cathedral (1884) at Southwell, a parish (town) 10 miles (16 km) west of Newark-on-Trent, incorporates late Norman, Early English, and Decorated Gothic architectural styles. Pop. (2001) 106,287.

Newark-on-Trent, also called NEWARK, town, Newark district, county of Nottinghamshire, England. It lies along the River Trent, at the crossing of the Roman Fosse Way with the modern Great North Road (A1).

The earliest known occupation of the site was in Anglo-Saxon times. In 1055 the town was granted to the bishops of Lincoln, in whose hands it remained until 1549. Bishop Alexander built a castle and bridge over the Trent there (1123–35), the castle being replaced by a stone building about 1173. Much of the town was destroyed in the English Civil Wars of the mid-17th century. In the Middle Ages, Newark had a flourishing cloth industry. It is now a small engineering centre, with many agricultural industries.

The parish Church of St. Mary Magdalene, one of England's finest, has architecture dating from the Norman period. It has a tower and spire 246 feet (75 m) high. Kelham Hall houses the district headquarters. Pop. (1991) 35,129.

Newberg, city, Yamhill county, northwestern Oregon, U.S. It lies in the Willamette River valley, just southwest of Portland. Founded in 1869 as the first Quaker settlement in the Pacific Northwest, it was named by one of the settlers for his German birthplace. The city is now the trading, processing, and shipping centre for an area producing lumber, fruit, nuts, and paper and wood products. It is the seat of George Fox College, established in 1885 as Friends Pacific Academy; the future American president Herbert Hoover was in the first graduating class of 1888. Minthorn House, where Hoover lived with his uncle, has been restored. The Champoeg State Park, where settlers organized the first effective government (1843) in the future state, is nearby. Inc. 1893. Pop. (2000) 18,064.

Newbery Medal, annual award given to the author of the most distinguished American children's book of the previous year. It was established by Frederic G. Melcher, of the R.R. Bowker Publishing Company, and named for John Newbery, the 18th-century English publisher who was among the first to publish books exclusively for children. The first award was given in 1922. It is presented at the annual conference of the American Library Association along with the Caldecott Medal, an award to an artist for the best illustrations for a children's book.

Newbolt, Sir Henry (John) (b. June 6, 1862, Bilston, Staffordshire, Eng.—d. April 19, 1938, London), English poet, best-known for his patriotic and nautical verse.

Newbolt was educated at Clifton Theological College and at Corpus Christi College, Oxford. He was admitted to the bar at Lincoln's Inn in 1887 and practiced law until 1899. The appearance of his ballads, *Admirals All* (1897), which included the stirring "Drake's Drum," created his literary reputation. These were followed by other volumes collected in *Poems: New and Old* (1912; rev. ed. 1919). During World War I he was comptroller of wireless and cables and was later commissioned to complete Great Britain's official naval history of the war. He also edited various anthologies of verse, which reveal his catholic and progressive taste in poetry. He was knighted in 1915 and appointed a Companion of Honour in 1922.

Newburgh, city, Orange county, southeastern New York, U.S. It lies on the west bank of the Hudson River (opposite Beacon), 58 miles (93 km) north of New York City. First settled by Germans from the Palatinate in 1709, it became a parish in 1752 and was named for Newburgh, Scot. It served as General George Washington's final headquarters (1782–83) and was a key American command post in the strategic Hudson Valley during the Revolutionary War. It was there that Washington renounced the idea of a kingship and officially disbanded the Continental Army. Hasbrouck House, Washington's headquarters, is now a state historical site and museum. Nearby are the New Windsor Cantonment (a reconstructed winter camp of the Continental Army) and the preserved headquarters (1754) of General Henry Knox.

Jonathan Hasbrouck House, Newburgh, N.Y.

Milt and Joan Mann from CameraMann

Newburgh's early growth was influenced by its position as a river port; it shared in the 19th-century whaling boom and was a ferry point for coal shipped from Pennsylvania to New England. Its industries include shipbuilding and the manufacture of textiles, clothing, aluminum products, and machinery. The city serves as the trade-distribution centre for the surrounding dairy and fruit region, and nearby oil-tank farms contribute to the economy. Mount Saint Mary College was established (1930) in Newburgh. Inc. village, 1800; city, 1865. Pop. (2000) 28,259.

Newburn, industrial community, Newcastle upon Tyne district, metropolitan area of Tyne and Wear, England. It lies on the western boundary of the metropolitan complex of Newcastle upon Tyne. A residential and manufacturing district, it has a large industrial estate. The Anglo-Scottish Battle of Newburn was fought there in 1640. The Church of St. Michael and All Angels dates from 1190. Pop. (1991) 42,897.

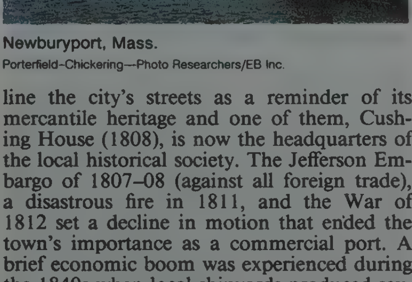
Newbury, town, Newbury district, county of Berkshire, England. The town lies along the River Kennet, on the Kennet and Avon Canal. Much evidence of Roman occupation has been found on the site.

During the English Civil Wars two important battles occurred at Newbury: on Sept. 20, 1643, 6,000 men fell in battle when the day was won by Parliamentary forces; on Oct. 27, 1644, the Royalists overcame their Parliamentary opponents and were able to relieve the local Donnington Castle. In 1795, Newbury's suburb of Speenhamland gave its name to a system of parish relief designed to supplement the wages of the poor.

Newbury was a centre of the textile trade prior to the English Civil Wars. Now, light engineering, flour milling, woodworking, and the manufacture of light aircraft are carried on there. One of the best racecourses in England lies east of the town. Pop. (1991) 33,273.

Newbury, district, county of Berkshire, England. The district occupies an area of 272 square miles (705 square km). It extends westward from the district of Reading along both sides of the River Kennet and edges into the Berkshire Downs on the north and the Hampshire Downs on the south; both downs are composed of chalk and rise to elevations of between 600 to 800 feet (185 to 245 m). The downs have occasional clumps of beech, and cereal grains (especially barley) are grown there. The Kennet River valley itself is devoted to pastureland upon which dairy cattle and the locally bred Berkshire pig are commonplace. Pop. (1998 est.) 144,200.

Newburyport, city, one of the seats of Essex county (with Salem and Lawrence), northeastern Massachusetts, U.S. It lies at the mouth of the Merrimack River, 35 miles (56 km) north-northeast of Boston. Settled in 1635 (as part of Newbury), its location attracted early fishing, shipbuilding, and craft industries and led to its incorporation as a separate town in 1764. Its sheltered harbour was home port for a large merchant fleet that brought wealth to the town in the years prior to the American Revolutionary War. Stately Federal-style houses (built by shipowners and sea captains) line the city's streets as a reminder of its mercantile heritage and one of them, Cushing House (1808), is now the headquarters of the local historical society. The Jefferson Embargo of 1807–08 (against all foreign trade), a disastrous fire in 1811, and the War of 1812 set a decline in motion that ended the town's importance as a commercial port. A brief economic boom was experienced during the 1840s when local shipyards produced several famous clipper ships under the direction of Donald McKay. After 1850 the city's production of textiles, shoes, silverware, and rum was significant. Tourism and the manufacture of electrical machinery, leather, and clothing are now the economic mainstays.



Newburyport, Mass.

A statue in Brown's Park honours the abolitionist William Lloyd Garrison, a native of Newburyport. Salisbury Beach State Reservation and Parker River National Wildlife Refuge are nearby. Inc. city, 1851. Pop. (2000) 17,189.

Newcastle, city and port, New South Wales, Australia. It lies at the mouth of the Hunter River, 104 miles (168 km) by rail northeast of Sydney.

Newcastle originated as the small Coal Harbour Penal Settlement in 1801 and developed as an outlet for coal (from the Newcastle-Cessnock field) and for farm produce of the fertile hinterland. The city's iron and steel industries, established in 1915 by the Broken Hill Proprietary Company, Ltd. (BHP), now rival its coal trade. Diversified industrialization followed, including metallurgy, engineering, shipbuilding, mineral sands mining (rutile and zircon), and major textiles. Proclaimed a municipality in 1859, Newcastle became a city in 1885. Its port facilities (based on North Harbour, the Basin, and Port Waratah) include a floating dock. The University of Newcastle (formerly Newcastle University College) was established in 1965. Newcastle's War Memorial Cultural Centre opened in 1958. The city was struck by a moderate-sized earthquake in 1989 that damaged some buildings. Pop. (2001 prelim.) 470,610.

Newcastle, town, seat (1786) of Northumberland county, New Brunswick, Canada. It lies 89 miles (143 km) northwest of Moncton. A port of entry opposite Chatham, near the mouth of the Miramichi River, it was founded in 1785 and was probably named for Thomas Pelham Holmes, Duke of Newcastle and British prime minister. The town developed with the lumber and allied trades, especially pulp and creosote. Newcastle's town hall, Old Manse Library, and The Enclosure (a park and historic site) were gifts from Lord Beaverbrook (William Maxwell Aitken), publisher and financier, who in the 1880s spent his boyhood in the town and chose his title to honour Beaver Brook Station, a settlement 9 miles (14 km) north. Inc. 1899. Pop. (2001) 1,228.

Newcastle, Irish AN CAISLEÁN NUA, town, Down district (established 1973), formerly in County Down, Northern Ireland. It lies along Dundrum Bay, at the foot of Slieve Donard (2,796 feet [852 m]), which is the highest peak in the Mourne Mountains. The town is a popular seaside resort and tourist centre for exploring the adjacent mountains. Nearby Tollymore Forest Park (1,200 acres [486 hectares]) is a government forestry estate and includes 135 species of trees. Light engineering products are made in the town. The new castle, from which the town takes its name, was a Magennis (MacGinnis) stronghold, built in 1588. Pop. (1991) 7,214.

Newcastle, town, northwestern KwaZulu/Natal province, South Africa. It lies at the foot of the Drakensberg mountains. The fourth British settlement in Natal, it was founded in 1864 as a regional trade centre. Fighting occurred in the vicinity during both the First Boer War (1881) and the South African War (1899–1902). Newcastle has long been known for its coal mining and steel production. The town is on the main road and rail lines between Durban and Johannesburg. Pop. (1991) town 38,767; urban agglom. 212,777.

Newcastle (-under-Lyme), Thomas Pelham-Holles, 1st Duke of, Duke of Newcastle-upon-Tyne, Marquess of Clare, Earl of Clare, Viscount Haughton, Baron Pelham of Laughton, Baron Pelham of Stanmer, original name Thomas Pelham (b. July 21, 1693—d. Nov. 17, 1768, London, Eng.), prime minister of Great Britain from 1754 to 1756 and from 1757 to 1762. Through his control of government patronage, he wielded enormous political influence during the reigns of the kings George I and George II.

Pelham-Holles inherited the barony of Pelham of Laughton from his father in 1712 (having assumed the name Pelham-Holles in 1711). By the time he came of age in 1714, he had become one of the wealthiest Whig landowners in England, with holdings in 12 counties and a rental income of nearly £40,000 a year. He helped bring about the succession of King George I (reigned 1714–27) and as a reward was given the title Duke of Newcastle-upon-Tyne in 1715. In 1724 Robert Walpole, the chief minister, made him secretary of state, a post he held for 30 years.

Newcastle gained even more power when his brother, Henry Pelham, became prime minister in 1743. On Pelham's death in March 1754, Newcastle was made prime minister, but England's setbacks early in the opening months of the Seven Years' War (1756–63) with France led to his resignation in October 1756. He was then created Duke of Newcastle-under-Lyme. Eight months later he again became prime minister in an uneasy coalition with his former enemy William Pitt (later 1st Earl of Chatham), who became secretary of state. While Newcastle procured parliamentary majorities in support of their ministry and handled matters of patronage, Pitt directed the war and turned initial defeat into a brilliant victory. In May 1762 Newcastle resigned and was replaced by John Stuart, 3rd Earl of Bute, favourite of young King George III. Newcastle died without issue, and the dukedom devolved on a nephew, Henry Finnes Clinton.

Newcastle was passionately devoted to the Hanoverian succession, to the cause of the Whigs, and to the game of politics for its own sake. Since party organizations hardly existed in the England of his time, the only means of giving a government cohesion and stability were the systematic management of elections and the distribution of patronage to secure parliamentary support for a particular ministry. Newcastle won a unique reputation for his skill and patience in securing a voting majority in the House of Commons by distributing posts, sinecures, and pensions. The key to his powers of patronage was his long and unbroken tenure of office, which put at his disposal the rich resources of the crown. He thus became an almost indispensable manager in all the ministries of his time.

Newcastle (-upon-Tyne), William Cavendish, 1st Duke of, also called (from 1620) Viscount Mansfield, Baron Ogle of Bothal, and (from 1628) Earl of Newcastle-on-Tyne, Baron Cavendish of Bolsover, and (from 1643) Marquess of Newcastle-on-Tyne (b. *c.* 1593—d. Dec. 25, 1676, Welbeck, Nottinghamshire, Eng.), Royalist commander during the English Civil Wars and a noted patron of poets, dramatists, and other writers.

The son of Sir Charles Cavendish, he attended St. John's College, Cambridge, and through inheritances and royal favour became wealthy. He was created Viscount Mansfield in 1620 and Earl of Newcastle-on-Tyne in 1628 and during his lifetime would become the patron of Ben Jonson, James Shirley, Sir William Davenant, John Dryden, Thomas Shadwell, and Richard Flecknoe, and of Thomas Hobbes, Pierre Gassendi, and René Descartes.

When Charles I declared open war in 1642, Newcastle was given the command of the four northern English counties; he advanced into Yorkshire in November, raised the siege of York, and compelled Lord Fairfax to retire. Subsequently his plans were checked by Sir Thomas Fairfax's recapture of Leeds in January 1643, and he retired to York. He escorted the queen, who returned from abroad in February, to York and thence to Oxford, and subsequently captured Wakefield, Rotherham, and Sheffield, but his successes were once more taken from him by the Fairfaxes, whom he subsequently defeated at Adwalton Moor on June 30, thereby obtaining possession of all Yorkshire except Hull and Wressel Castle. He then advanced into Lincolnshire to attack the eastern association, taking Gainsborough and Lincoln.

Newcastle returned to besiege Hull, and the force which he had left in Lincolnshire was defeated at Winceby by Oliver Cromwell on Oct. 11, 1643, which caused the loss of the whole county. On Oct. 27, 1643, he was created marquess. Next year his position was further threatened by the advance of the Scots. He retreated to York, where the three armies of the Scots, Lord Fairfax, and the Earl of Manchester surrounded him. The Royalist commander Prince Rupert raised the siege on July 1 but the next day threw away his success by engaging the three armies in battle, contrary to Newcastle's desire, at Marston Moor. After this disaster Newcastle announced his intention of abandoning the cause and quitting England. He resided at Hamburg from July 1644 to February 1645 and in April moved to Paris. He left in 1648 for Rotterdam to join Prince Charles in command of the navy, which had revolted, and finally settled at Antwerp. In April 1650 he was appointed a member of Charles II's privy council, and, in opposition to Edward Hyde, Earl of Clarendon, he advocated the agreement with the Scots.

At the Restoration, Newcastle returned to England and regained the greater part of his estates, though burdened with debts. He was reinstated in the offices he had filled under Charles I; was invested in 1661 with the Garter; and was advanced to a dukedom on March 16, 1665. He retired, however, from public life. He wrote various treatises and several comedies and with Sir John Dryden's assistance translated Molière's *L'Étourdi* as *Sir Martin Mar-All* (1688).

When his son Henry died in 1691, the title Duke of Newcastle became extinct.

Newcastle disease, also called Avian Pneumoencephalitis, a serious viral disease of birds caused by a paramyxovirus and marked by respiratory and nervous system problems. Some adult birds recover, although mortality rates are high in tropical and subtropical regions. Young chickens are especially susceptible and rarely survive. Symptoms are variable in turkeys and almost absent in ducks. There is no effective treatment. Vaccines are available and are given repeatedly for best protection. Humans can become infected by handling sick birds but usually develop only a temporary conjunctivitis (inflammation of the mucous membrane lining the inner surface of the eyelid).

Newcastle-under-Lyme, town and borough (district), administrative and historic county of Staffordshire, England. It borders the city of Stoke-on-Trent and occupies the northwestern corner of Staffordshire. Newcastle-under-Lyme takes its name from the new castle erected about 1145 by Ranulf de Gernons, the earl of Chester, in the proximity of the Lyme Forest. The castle became obsolete in Tudor times. The town received its first royal charter of incorporation in 1173. The borough, which is partly urban or suburban and partly rural, includes the towns of Chesterton, Clayton, Keele, Kidsgrove, Knutton, Silverdale, and Wolstanton. Local industries include brick and tile making, electronics, and engineering. The University College of North Staffordshire (1949) became the University of Keele in 1962. Area 81 square miles (211 square km). Pop. (1991) town, 73,731; (1998 est.) borough, 123,300.

Newcastle upon Tyne, city and metropolitan borough, metropolitan county of Tyne and Wear, historic county of Northumberland, northeastern England. It lies on the north bank of the River Tyne 8 miles (13 km) from the North Sea.

The settlement dates from the Roman period, when a fort was built on a site close to the present Tyne Bridge. The district and its name derive from a Norman castle built in 1080 by Robert II, the eldest son of William the Conqueror. In the 12th century the town became important as a fortress settlement because of its key position in the frontier defenses guarding the east coast route from Scotland. In 1172–77 Robert's castle was replaced by a massive stone keep (still standing) that was used to guard the bridge across the Tyne, and walls were built to enclose a small site northwest of the castle. The protection afforded by the fortress attracted religious and commercial bodies, and the resulting town rapidly expanded. The inhabitants gained municipal freedom and privileges granted in numerous charters, and the town became a thriving commercial centre. The wool trade was especially important, and in 1353 Newcastle became a staple (wool-manufacturing) town. By the late Middle Ages it had a thriving cloth industry.

In the following centuries Newcastle's growth continued steadily. In the 16th century locally mined coal, destined for the growing London market, surpassed wool as the town's principal export. (London's dependence on seaborne coal from Newcastle gave rise to the sarcastic phrase "carrying coals to Newcastle," which conveyed the essence of an unnecessary journey.) By 1800 Newcastle had become an important industrial and financial centre (the first banking houses dating from 1755), with expanding ironworking and glassmaking industries. The River Tyne became a major focus for shipbuilding, and Newcastle's shipyards were long among the largest ship-repairing centres in the world. Although the latter activity had declined by the late 20th century, the associated marine and heavy engineering industries remain important to Newcastle, which plays an important role in servicing Britain's offshore oil and gas fields. By the late 20th century, however, coal mining had ceased in Newcastle. The present economy rests mainly on the city's function as a major service and financial centre. Newcastle is the commercial centre of the Tyne and Wear metropolitan area and of northeastern England.

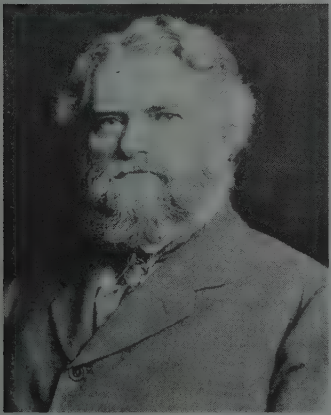
Municipal, commercial, and retail functions are located within the area of the medieval town, between the Tyne and the Town Moor. Outside the town walls, population increase since 1800 has resulted in the growth of many middle-class suburbs—Gosforth and Jesmond in the north, Walker and Heaton in the east, and Denton and Kenton in the west. The present city and metropolitan borough also embrace several former distinct towns. Six principal road and rail bridges link Newcastle with Gateshead on the south bank of the river—the most famous being the Tyne Bridge (1928), part of a major British road link. The rail link between London and Edinburgh also crosses the Tyne at Newcastle (the High Level Bridge, 1844–49). The electrically operated Swing Bridge (1865–76), one of the greatest engineering achievements of its time, is on the site of Roman and medieval bridges. The Cathedral Church of St. Nicholas dates from the 14th century, although another church occupied the site in 1123. The Guildhall (rebuilt 1655–58) stands on the Sandhill, the old city centre. The best-preserved portions of the old town walls lie between Westgate Road and Gallowgate, close to the ruins of the medieval Black Friars' priory.

Newcastle is an important education centre. The University of Newcastle upon Tyne was founded in 1937 as King's College by the merging of Armstrong College and the College of Medicine, both of which were attached to the University of Durham. The links with Durham remained until 1963, when King's College was granted a separate charter and became the present university. Further education is also provided by the Municipal College of Technology, Rutherford College of Technology, and a college of education. The Royal Grammar School, founded during the reign of Henry VIII (1509–47), was incorporated in 1600, and Dame Allan's School was endowed in 1705. Important Roman and other archaeological finds are housed by the Museum of Antiquities (belonging to the university) and the Society of Antiquities. The industrial history of the region is displayed in the Museum of Science and Technology. Collections of several natural history societies are preserved in the Hancock Museum. Both the Laing Art Gallery and Museum and the Hatton Gallery have permanent collections of paintings. Area 44 square miles (113 square km). Pop. (1998 est.) 276,100.

Newchwang (China): *see* Ying-k'ou.

Newcomb, Simon (b. March 12, 1835, Wallace, Nova Scotia—d. July 11, 1909, Washington, D.C.), Canadian-born American astronomer and mathematician who prepared ephemerides—tables of computed places of celestial bodies over a period of time—and tables of astronomical constants.

Life. Newcomb displayed his aptitude for working with figures at an early age. His father, an itinerant country schoolteacher, taught him to count at the age of four, and before he was five he was spending several hours a day making calculations in addition and multiplication; before he was seven he had finished the arithmetic book, including the extraction of cube roots.



Newcomb

By courtesy of the University of Chicago; photograph, Yerkes Observatory, Williams Bay, Wis.

Newcomb had little or no formal education. At the age of 16 he was apprenticed to a quack herb doctor in Salisbury, N.B. After two or three years he ran away to join his widowed father who had settled in the United States, in Maryland. In the libraries at Washington, D.C., Simon found the first full opportunity to indulge his intellectual curiosity. After avidly exploring many technical fields he concluded that his principal talent lay in mathematics. He was especially attracted to the *American Ephemeris and Nautical Almanac,* an annual handbook for astronomers, containing predicted positions in the sky of the principal celestial objects and other astronomical phenomena. He thereupon applied for employment in the American Nautical Almanac Office, then at Cambridge, Mass., and became a computer there in 1857. He also enrolled in the Lawrence Scientific School of Harvard University, receiving a degree in 1858. In 1861 he applied for and received a commission in the corps of professors of mathematics in the United States Navy and was assigned to the United States Naval Observatory at Washington, where he worked for more than 10 years determining the positions of celestial objects with the meridian instruments and for two years with a then new 26-inch refractor telescope.

In 1877 Newcomb was put in charge of the American Nautical Almanac Office, then in Washington, where almost at once he commenced the great work that he had had in his mind for some years and that was to occupy the greater part of the rest of his life: the calculation of the motions of the bodies in the solar system. Reaching the compulsory retirement age for captains in 1897, he later received the then unusual distinction of retirement with the rank of rear admiral.

In 1884 Newcomb had obtained the additional appointment of professor of mathematics and astronomy, which he held until 1893, at Johns Hopkins University, Baltimore, continuing, however, to live in Washington. For many years he was editor of the *American Journal of Mathematics.* He was one of the founders of the American Astronomical Society and was its first president (1899–1905). Newcomb received numerous honorary degrees and was awarded the highest scientific prizes of his day. He was elected a member of the National Academy of Sciences in 1869, serving as home secretary, 1881–83; vice president, 1883–89; and foreign secretary, 1903 until his death.

Accomplishments. Newcomb's most important work appeared in the *Astronomical Papers Prepared for the Use of the American Ephemeris and Nautical Almanac,* a series of memoirs that he founded in 1879 with the object of giving "a systematic determination of the constants of astronomy from the best existing data, a reinvestigation of the theories of the celestial motions, and the preparation of tables, formulae, and precepts for the construction of ephemerides, and for other applications of the same results." Of 36 articles filling approximately 4,500 quarto pages in the first nine volumes, he was the sole or principal author of 25. Among them were his tables of the Sun, Mercury, Venus, Mars, Uranus, and Neptune, along with tables of Jupiter and Saturn that were devised by George W. Hill, another American astronomer. These tables were used throughout most of the world for calculating daily positions of the objects from 1901 to 1959, and even afterward for the Sun, Mercury, Venus, and Mars. This series of *Papers* is remarkable for its sustained high quality. Hardly anything in them has proved to be incorrect, and at mid-20th century they were still worthy of the attention of any student of celestial motions.

Possibly Newcomb's most far-reaching contribution was his inauguration, jointly with A.M.W. Downing, then superintendent of the British Nautical Almanac Office, of a worldwide unified system of astronomical constants, which was later to lead to the outstandingly successful scheme of international collaboration among the principal almanac makers of the world that survived two World Wars with increasing vigour. Newcomb and Downing were impressed by the "confusion which pervaded the whole system of exact astronomy, arising from the diversity of the fundamental data made use of by the astronomers of foreign countries and various institutions in their work." A conference of the directors of the national ephemerides of the United States, Great Britain, France, and Germany, was held in Paris in May 1896. It resolved that beginning with 1901 a certain set of constants, substantially Newcomb's, should be used by all the ephemerides. The decision even included some work of Newcomb's that was not to be finished for several years. A similar conference, held at Paris in 1950, decided unanimously that the system of constants adopted in 1896 was still preferable to any other for practical use. (G.M.Ce.)

BIBLIOGRAPHY. Newcomb's major astronomical works include *Popular Astronomy* (1878, reissued 1910), *The Stars* (1901), *Astronomy for Everybody: A Popular Exposition of the Wonders of the Heavens* (1902, reissued 1942), and *A Compendium of Spherical Astronomy . . .* (1906, reprinted 1960). An autobiography, *The Reminiscences of an Astronomer,* was published in 1903. Raymond Clare Archibald, "Simon Newcomb, 1835–1909: Bibliography of His Life and Work," *Memoirs of the National Academy of Sciences,* 17:19–69 (1924), includes more than 500 titles.

Newcomen, Thomas (b. 1663, Dartmouth, Devon, Eng.—d. Aug. 5, 1729, London), British engineer and inventor of the atmospheric steam engine, a precursor of James Watt's engine.

As an ironmonger at Dartmouth, Newcomen became aware of the high cost of using the power of horses to pump water out of the Cornish tin mines. With his assistant John Calley (or Cawley), a plumber, he experimented for more than 10 years with a steam pump. It was superior to the crude pump of Thomas Savery. In Newcomen's engine the intensity of pressure was not limited by the pressure of the steam. Instead, atmospheric pressure pushed the piston down after the condensation of steam had created a vacuum in the cylinder.

As Savery had obtained a broad patent for his pump in 1698, Newcomen could not patent his engine. Therefore, he entered into partnership with Savery. The first recorded Newcomen engine was erected near Dudley Castle, Staffordshire, in 1712.

Newcomen invented the internal-condensing jet for obtaining a vacuum in the cylinder and an automatic valve gear. By using steam at atmospheric pressure, he kept within the working limits of his materials. For a number of years Newcomen's engine was used in the draining of mines and in raising water to power waterwheels.

newel, also called NEWEL-POST, upright post rising at the foot of a stairway, at its landings, or at its top. These posts usually serve as anchors for handrails. Often the stringboards, which cover and connect the ends of the steps, are framed into the newels. Made of the same substance as the stairway itself—wood, stone, or metal—the newel may be simple and functional, as in most contemporary examples, or highly ornamental, as in the Elizabethan or Jacobean styles.

Originally, a newel was the central post of a winding or circular stairway. If such a stairway has no central post, it is said to be of hollow-newel construction. In Gothic architecture a post used to support a vaulted-arch roof was sometimes called a newel.

Newfoundland, breed of working dog developed on the island of Newfoundland, possibly from crosses between native dogs and the Great Pyrenees dogs taken to North America by Basque fishermen in the 17th century.

Newfoundland
Sally Anne Thompson—EB Inc.

Noted for rescuing persons from the sea, the Newfoundland is a huge, characteristically gentle and patient dog standing 26 to 28 inches (66 to 71 cm) and weighing 110 to 150 pounds (50 to 68 kg). Powerful hindquarters, a large lung capacity, large webbed feet, and a heavy, oily coat contribute to the dog's ability to swim and to withstand cold waters. In addition to rescue work, the Newfoundland has served as a watchdog and companion and as a draft animal. The typical Newfoundland is solid black; the Landseer Newfoundland, named after Sir Edwin Landseer, the artist who painted it, is usually black and white.

Newfoundland and Labrador, one of the four Atlantic Provinces of Canada, extending into the North Atlantic Ocean and constituting the easternmost portion of the North American continent. The Strait of Belle Isle separates the island of Newfoundland to the south from mainland Labrador, which is bounded by Quebec to the west and south and constitutes nearly three-quarters of the province's total area. Newfoundland has more than 10,000 miles (16,000 km) of wildly jagged coastline with some of the world's finest and most extensive fishing grounds, the Grand Banks. The position of Newfoundland gives it strategic importance in transportation and communication between North America and Europe. The capital is St. John's. Area: island of Newfoundland, 43,008 square miles (111,390 square km); province, 156,649 square miles (405,720 square km). Pop. (2001) 512,930.

A brief treatment of Newfoundland and Labrador follows. For full treatment, *see* Canada: Newfoundland and Labrador.

The original inhabitants were Indians and Inuit. Archaeological excavation in the northern part of the island of Newfoundland has revealed Viking ruins dating from about AD 1000, demonstrating that the Vikings were the earliest Europeans to reach the area. The island's official discovery by Europeans, however, was in 1497 by the Italian explorer John Cabot, who claimed it for England.

Traditionally, the British regarded Newfoundland's fisheries as a preserve of the mother country and discouraged colonial settlement of the island. Thus, Newfoundland developed separately from the rest of Canada, and it was not until 1824 that a settled colony with a resident governor and council was finally acknowledged by Great Britain. In 1832 local agitation led to a popularly elected assembly. By the end of the 19th century a working class composed mainly of Irish Roman Catholics and a middle class of Protestant merchants and fishermen had developed in Newfoundland. New radical social policies in the colony were heralded by the formation of the People's Party by Edward Morris in 1907 and the Fishermen's Protective Union by William Coaker in 1908.

In 1927 Labrador became part of the colony after lengthy negotiations with Canada. In the 1930s Newfoundland's already struggling economy was overwhelmed by the Great Depression, and a commission appointed by the United Kingdom took over the government in order to straighten out the financial situation. In 1949 Newfoundland entered the Canadian union as a province. It was renamed Newfoundland and Labrador in 2001.

Newfoundland island and Labrador are separate physiographic regions. The island is geologically part of the Appalachian chain of North America, while Labrador is part of the Canadian Shield. In general, the province has cold but not severe winters (with the exception of northern Labrador, which is subarctic) and warm to cool summers. It is hit by numerous midlatitude storms, however, that move across Canada and up the Atlantic seaboard, and there are frequent, dense fogs over the Grand Banks and along the south and southeastern portion of the coast.

Much of the province is forested, with the exceptions of the tundra region of northern Labrador, the barren reaches at higher elevations, and some coastal regions. The principal trees are such conifers as balsam fir and black spruce. In most parts of the province, but particularly on the island, the conifers are mixed with deciduous species such as paper and yellow birches and with a wide variety of hardwood shrubs. The best stands of forest occur in areas of deep and well-drained soils such as the eastern slope of the Long Range Mountains in Labrador. Large mammals include moose, caribou, black bears, polar bears, and several species of seal. In the northern coniferous forests and in the tundra region, there are numerous small fur-bearing animals, and large seabird colonies inhabit the islands and coastal areas. Whales, now protected, are commonly seen in the summer.

Newfoundland and Labrador's people are an extremely homogeneous group. Virtually all of them are of British and Irish origin, and most of the remainder are of French extraction. The three largest religious denominations are Roman Catholic, Anglican, and the United Church of Canada.

Fishing in the Grand Banks, mainly for cod, was virtually the only economic activity in Newfoundland until the beginning of the 20th century. The exploitation of western Labrador's vast iron reserves has made mining the major industry. Forestry also arose beginning in the late 19th century. Newfoundland's fisheries, although surpassed by mining and forestry as sources of provincial wealth, remain the largest employers and continue to constitute the main economic base for the coastal villages and towns. Traditionally, fishing was inshore, and the fish were prepared for the market by small, family-run facilities. Today the catch is taken in offshore waters by modern trawlers and is fresh-frozen in large plants located along the coast. By the late 20th century, however, stocks of northern cod stock had become so depleted that the province's economy was severely affected.

A narrow-gauge railway was built during the 1880s from St. John's to Channel-Port aux Basques, but that railway has been abandoned. The province now has a single rail line that carries freight from Labrador to the Gulf of St. Lawrence. Newfoundland is well connected by roads, but most of Labrador is still without them. The island is linked to mainland Canada by car and passenger ferries. Several airlines serve the province.

The enormous hydroelectric-power resources of the province have been of great importance to its industrial development. Churchill Falls (Labrador) is the site of one of the world's greatest hydroelectric developments, supplying power to Quebec and indirectly to the northeastern United States.

The constitution of Newfoundland and Labrador is based on the British North America Act of 1867. It provides for a lieutenant governor, appointed by Canada's governor-general and representing the crown, and a unicameral assembly elected by universal adult suffrage; the leader of the majority party becomes premier and selects the executive council from the assembly. Local government has been slow to evolve. St. John's first municipal government was elected in 1888, and the next town council was not created until 1938.

Newfoundland and Labrador's isolation helped perpetuate sectarianism in its schools. In 1969 the Canadian federal government consolidated and integrated the province's school districts. Compulsory primary and secondary education is free in the public schools to grade 11. Nondenominational vocational, technical, and trade schools are also operated by the provincial government. The Memorial University of Newfoundland in St. John's, founded 1925, has become one of Canada's larger institutions of higher education.

As a result of the province's comparative isolation, 17th-century West Country speech and other British dialects are still preserved there. An immense body of folk music and folk tales also exists that has been preserved by storytellers and bards.

Newhall, Nancy, *née* WYNNE (b. May 9, 1908, Lynn, Mass., U.S.—d. July 7, 1974, Jackson, Wyo.), American photography critic, conservationist, and editor who was an important contributor to the development of the photograph book as an art form.

She attended Smith College and was a member of the Art Students League of New York. Her career began in 1943, when she became acting curator of the photography department at the Museum of Modern Art, New York City, substituting for her husband, Beaumont Newhall, the photography historian and founder of the department, while he was in military service.

Among Newhall's 22 books are *Time in New England* (1950), with photographs by Paul Strand, and the biography *Ansel Adams* (1963). Her long collaboration with Adams produced the landmark classic of conservationism *This Is the American Earth,* published by the Sierra Club in 1961 in the "oversize" format that she helped to pioneer. It is considered her most important work.

Newham, outer borough of London. It is bordered to the east by the River Roding and Barking Creek, to the south by the River Thames, and to the west by the River Lea. The northern edge of the borough is formed, in part, by the Wanstead Flats. Nearly all of Newham lies within the historic county of Essex.

The area grew extensively as 19th-century industrial London expanded, resulting in poor social and housing conditions, especially in the southwestern section. Much of the older housing was replaced in the mid-20th century. The Royal Docks along the Thames, now closed to shipping, are retained as the centrepiece of a mixed-use development. Sugar-refining, chemical, and other bulk industries are located along the banks of the Thames. The Thames Barrier, a flood-control device, stretches across the river to Greenwich.

Newham is traversed by the North Circular Road and other major routes; a foot tunnel and ferry link it with Woolwich, south of the Thames. Area 14 square miles (36 square km). Pop. (2001) 243,737.

Newhaven, town ("parish"), Lewes district, county of East Sussex, England, at the mouth of the River Ouse. "New" haven developed after the great storm of 1570, when the course of the lower Ouse shifted westward from its former outlet at Seaford. The port is the English terminus of a cross-Channel ferry service to Dieppe, France. There is some light industry, boatbuilding, and tourist trade. Pop. (1981) 9,834.

Newhouse FAMILY, family that built the second largest publishing empire in the United States in the second half of the 20th century.

The family's fortunes began with Samuel Irving Newhouse (b. May 24, 1895, New York, N.Y., U.S.—d. Aug. 29, 1979, New York City), who was born Solomon Neuhaus and was later known as S.I. Newhouse. He was working as a clerk for Judge Herman Lazarus in Bayonne, N.J., when Lazarus took over a failing newspaper, the *Bayonne Times.* Lazarus asked Newhouse, then 17, to take care of the paper. Newhouse cut costs while working for more advertising and wider circulation, and within one year the newspaper was making a profit.

In the early 1920s he began purchasing floundering newspapers and using the same techniques to make them profitable that had worked on the *Bayonne Times*. He bought the *Staten Island Advance* in 1922, and in 1924 he incorporated the Staten Island Advance Company, which became the basis of his publishing empire. With the profits he made from the *Advance,* he bought other small, undistinguished, unprofitable newspapers in New York and New Jersey and turned them around. In 1949 he renamed his company Advance Publications Inc.

Newhouse became a major force in American newspaper publishing in the 1950s with his purchase of the *Portland Oregonian* (1950), the *St. Louis Globe-Democrat* (1955), and several papers in Southern cities. In 1959 he acquired Condé Nast Publications, which printed such magazines as *Vogue, Glamour,* and *House & Garden*. With his purchase (1962) of the Times-Picayune Publishing Company, which printed both of the major newspapers in New Orleans, Newhouse owned more papers than any other American publisher. In 1967 he bought the *Cleveland Plain Dealer* for $54,000,000, and in 1976 he paid the record-breaking sum of $305,000,000 for Booth Newspapers, which published eight Michigan newspapers and *Parade* magazine. Though he paid close attention to his newspapers' profitability, Newhouse did not impose any editorial policies on his papers; local editors were free to express their own political views.

By the time of his death in 1979, Newhouse owned the third largest newspaper chain in the United States, with a total circulation of more than 3,000,000. Besides 31 newspapers, he also owned 7 magazines, 5 radio stations, 6 television stations, and 15 cable television systems. His philanthropies included a $15,000,000 donation to Syracuse University to establish the Newhouse School of Public Communications.

Upon his death the business was managed by two sons, Samuel I. Newhouse, Jr. (b. 1928), and Donald E. Newhouse (b. 1930), who greatly expanded the family holdings. Under their leadership, Advance Publications purchased Random House (1980) and several other book publishers and became one of the largest American magazine publishers with such titles as *The New Yorker, Vanity Fair, Gentleman's Quarterly, Vogue, Mademoiselle, Glamour, Bride's, Self,* and *Gourmet.*

Newlands, John Alexander Reina (b. Nov. 26, 1837, London, Eng.—d. July 29, 1898, London), British chemist whose "law of octaves" noted a pattern in the atomic structure of elements with similar chemical properties and contributed in a significant way to the development of the periodic law.

Newlands studied at the Royal College of Chemistry, London, fought as a volunteer under Giuseppe Garibaldi for Italian unification (1860), and later worked as an industrial chemist. In 1864 he published his concept of the periodicity of the chemical elements, which he had arranged in order of atomic weight. He pointed out that every eighth element in this grouping shared a resemblance and suggested an analogy with the intervals of the musical scale. The "law of octaves," thus enunciated, was controversial at first but later was recognized as an important generalization in modern chemical theory. Newlands collected his various papers in *On the Discovery of the Periodic Law* (1884).

Newman, mining town, northwestern Western Australia. It lies near Mount Newman, the highest peak (3,455 feet [1,053 m]) in the Ophthalmia Range. Both the town and the mountain were named for Aubrey Woodward Newman, who died while exploring the region in 1896. Newman was constructed during 1967–69 by The Mount Newman Mining Company Proprietary Ltd. as the residential and service centre for the iron-ore-mining development at nearby Mount Whaleback, one of the largest such projects in the world. In 1979 an iron-ore-beneficiation plant was completed there, and by the 1980s about 20,000,000 tons of ore were being exported annually by rail through Port Hedland to the northwest. The state capital, Perth, lies about 735 miles (1,184 km) by road to the southwest. Pop. (1991) 5,627.

Newman, Arnold, in full ARNOLD ABNER NEWMAN (b. March 3, 1918, New York, N.Y., U.S.), American photographer who specialized in portraits of well-known people posed in settings associated with their work. This approach, known as "environmental portraiture," greatly influenced portrait photography in the 20th century.

Newman studied art at the the University of Miami, Fla., in 1936–38 and then took a job as an assistant in the photography studio of a Miami department store. He had become the manager of a portrait studio by 1939, and in 1941 he had his first major exhibition, a joint show (with his old friend and mentor Ben Rose) in New York City. In the early 1940s, during his visits to New York City, Newman began making portraits of well-known painters and other artists, usually posing them in their own studios. From 1946 he ran his own photography studio in New York City, and he gradually broadened his subject matter to include famous people of all types, including writers, composers, political leaders, scientists, and business magnates. Among his best-known portraits are those of Max Ernst, Alfred Stieglitz and Georgia O'Keefe, Igor Stravinsky, Alfried Krupp, Pablo Picasso, and Jean Cocteau.

The 76 photographic portraits of eminent Britons that Newman made for the National Portrait Gallery in London were published in the book *The Great British* (1979). Many other portraits are collected in the books *One Mind's Eye* (1974), *Faces USA* (1978), *Artists: Portraits from Four Decades* (1980), *Arnold Newman: Five Decades* (1986), and *Arnold Newman's Americans* (1992).

Newman, Barnett, original name BARUCH NEWMAN (b. Jan. 29, 1905, New York, N.Y., U.S.—d. July 3, 1970, New York City), American painter whose large, austerely reductionist canvases influenced the colour-field painters of the 1960s.

The son of Polish immigrants, Newman studied at New York City's Art Students League (1922–26) and at the City College of New York, from which he graduated in 1927. He worked in his father's clothing business in the 1930s and gradually began painting full-time. With the painters William Baziotes, Robert Motherwell, and Mark Rothko, he cofounded the school called "Subject of the Artist" (1948), which held open sessions and lectures for other artists.

© 1970 Arnold Newman

Newman evolved a style of mystical abstraction in the 1940s and achieved a breakthrough with the canvas "Onement I" (1948), in which a single stripe of orange vertically bisects a field of dark red. This austerely geometric style became his trademark. His paintings, many of which are quite large, typically consist of grand, empty fields of saturated colour inflected with one or more vertical stripes of other colours. Newman's first one-man show, held in New York City in 1950, aroused hostility and incomprehension, but by the late 1950s and '60s his work had influenced Ad Reinhardt, Clyfford Still, and such younger artists as Frank Stella and Larry Poons. Newman's series of 14 paintings called "Stations of the Cross," exhibited at the Solomon R. Guggenheim Museum, New York City, in 1966, fully established his reputation.

Newman, John Henry (b. Feb. 21, 1801, London, Eng.—d. Aug. 11, 1890, Birmingham, Warwick), influential churchman and man of letters of the 19th century, who led the Oxford Movement in the Church of England and later became a cardinal-deacon in the Roman Catholic church. His eloquent books, notably *Parochial and Plain Sermons* (1834–42), *Lectures on the Prophetical Office of the Church* (1837), and *University Sermons* (1843), revived emphasis on the dogmatic authority of the church and urged reforms of the Church of England after the pattern of the original "catholic," or universal, church of the first five centuries AD. By 1845 he came to view the Roman Catholic church as the true modern development from the original body.

Early life and education. Newman was born in London in 1801. After pursuing his education in an evangelical home and at Trinity College, Oxford, he was made a fellow of Oriel College, Oxford, in 1822, vice principal of Alban Hall in 1825, and vicar of St. Mary's, Oxford, in 1828. Under the influence of the clergyman John Keble and Richard Hurrell Froude, Newman became a convinced high churchman (one of those who emphasized the Anglican church's continuation of the ancient Christian tradition, particularly as regards the episcopate, priesthood, and sacraments).

Association with the Oxford Movement. When the Oxford Movement began Newman was its effective organizer and intellectual leader, supplying the most acute thought produced by it. A High Church movement within the Church of England, the Oxford Movement was started at Oxford in 1833 with the object of stressing the Catholic elements in the English religious tradition and of reforming the Church of England. Newman's editing of the *Tracts for the Times* and his contributing of 24 tracts among them were less significant for the influence of the movement than his books, especially the *Lectures on the Prophetical Office of the Church* (1837), the classic statement of the Tractarian doctrine of authority; the *University Sermons* (1843), similarly classical for the theory of religious belief; and above all his *Parochial and Plain Sermons* (1834–42), which in their published form took the principles of the movement, in their best expression, into the country at large.

In 1838 and 1839 Newman was beginning to exercise far-reaching influence in the Church of England. His stress upon the dogmatic authority of the church was felt to be a much-needed reemphasis in a new liberal age. He seemed decisively to know what he stood for and where he was going, and in the quality of his personal devotion his followers found a man who practiced what he preached. Moreover, he had been endowed with the gift of writing sensitive and sometimes magical prose.

Gernsheim Collection, Harry Ransom Humanities Research Center, The University of Texas at Austin

Newman was contending that the Church of England represented true catholicity and that the test of this catholicity (as against Rome upon the one side and what he termed "the popular Protestants" upon the other) lay in the teaching of the ancient and undivided church of the Fathers. From 1834 onward this middle way was beginning to be attacked on the ground that it undervalued the Reformation; and when in 1838–39 Newman and Keble published Froude's *Remains,* in which the Reformation was violently denounced, moderate men began to suspect their leader. Their worst fears were confirmed in 1841 by Newman's *Tract 90,* which, in reconciling the Thirty-nine Articles with the teaching of the ancient and undivided church, appeared to some to assert that the articles were not incompatible with the doctrines of the Council of Trent; and Newman's extreme disciple, W.G. Ward, claimed that this was indeed the consequence. Bishop Richard Bagot of Oxford requested that the tracts be suspended; and in the distress of the consequent denunciations Newman increasingly withdrew into isolation, his confidence in himself shattered and his belief in the catholicity of the English church weakening. He moved out of Oxford to his chapelry of Littlemore, where he gathered a few of his intimate disciples and established a quasi-monastery.

Conversion to Roman Catholicism. Newman resigned St. Mary's, Oxford, on Sept. 18, 1843, and preached his last Anglican sermon ("The Parting of Friends") in Littlemore Church a week later. He delayed long, because his intellectual integrity found an obstacle in the historical contrast between the early church and the modern Roman Catholic church. Meditating upon the idea of development, a word then much discussed in connection with biological evolution, he applied the law of historical development to Christian society and tried to show (to himself as much as to others) that the early and undivided church had developed rightly into the modern Roman Catholic church and that the Protestant churches represented a break in this development, both in doctrine and in devotion. These meditations removed the obstacle, and on Oct. 9, 1845, he was received at Littlemore into the Roman Catholic church, publishing a few weeks later his *Essay on the Development of Christian Doctrine.*

Newman went to Rome to be ordained to the priesthood and after some uncertainties founded the Oratory at Birmingham in 1848. He was suspect among the more rigorous Roman Catholic clergy because of the quasi-liberal spirit that he seemed to have brought with him; and therefore, though in fact he was no liberal in any normal sense of the word, his early career as a Roman Catholic priest was marked by a series of frustrations. In 1852–53 he was convicted of libeling the apostate former Dominican priest Achilli. He was summoned to Ireland to be the first rector of the new Catholic university in Dublin, but the task was, under the circumstances, impossible, and the only useful result was his lectures on the *Idea of a University* (1852). His role as editor of the Roman Catholic monthly, the *Rambler,* and in the efforts of Lord Acton to encourage critical scholarship among Catholics, rendered him further suspect and caused a breach with H.E. Manning, who was soon to be the new archbishop of Westminster. One of Newman's articles ("On Consulting the Faithful in Matters of Doctrine") was reported to Rome on suspicion of heresy. He attempted to found a Catholic hostel at Oxford but was thwarted by the opposition of Manning.

Apologia pro Vita Sua. From the sense of frustration engendered by these experiences Newman was delivered in 1864 by an unwarranted attack from Charles Kingsley upon his moral teaching. Kingsley in effect challenged him to justify the honesty of his life as an Anglican. And though he treated Kingsley more severely than some thought justified, the resulting history of his religious opinions, *Apologia pro Vita Sua* (1864; "A Defense of His Life"), was read and approved far beyond the limits of the Roman Catholic church, and by its fairness, candour, interest, and the beauty of some passages, it recaptured the almost national status that he had once held.

Though the *Apologia* was not liked by Manning and those who thought as he did because it seemed to show the quasi-liberal spirit that they feared, it assured Newman's stature in the Roman Catholic church. In 1870 he expressed opposition to a definition of papal infallibility, though himself a believer in the doctrine. In the same year, he published his most important book of theology since 1845, *An Essay in Aid of a Grammar of Assent* (commonly known as *The Grammar of Assent*), which contained a further consideration of the nature of faith and an attempt to show how faith can possess certainty when it rises out of evidence that can never be more than probable. In 1879 Pope Leo XIII made him cardinal-deacon of St. George in Velabro. He died at Birmingham in 1890 and is buried (with his closest friend, Ambrose St. John) at Rednal, the rest house of the Oratory.

Mind and character. Newman's portraits show a face of sensitivity and aesthetic delicacy. He was a poet—most famous are his contributions in the *Lyra Apostolica* of his Anglican days, including the hymn "Lead, kindly light," written in 1833 when he was becalmed in the strait between Sardinia and Corsica, and *The Dream of Gerontius* (1865), based upon the requiem offices and including such well-known hymns as "Praise to the holiest in the height" and "Firmly I believe and truly." He was always conscious of the limitations of prose and aware of the necessity for parable and analogy, and logical theologians sometimes found him elusive or thought him muddled.

But his was a mind of penetration and power, trained upon Aristotle, David Hume, Bishop Joseph Butler, and Richard Whately, and his superficial contempt for logic and dialectic blinded some readers into the error of thinking his mind illogical. His intellectual defect was rather that of oversubtlety; he enjoyed the niceties of argumentation, was inclined to be captivated by the twists of his own ingenuity, and had a habit of using the reductio ad absurdum in dangerous places. Newman's mind at its best is probably to be found in parts of the *Parochial and Plain Sermons* or the *University Sermons,* at its worst in the *Essay on Ecclesiastical Miracles* of 1843.

His sensitive nature, though it made him lovable to his few intimates, made him prickly and resentful of public criticism, and his distresses under the suspicions of his opponents, whether Anglicans defending the Reformation or ultramontanes (exponents of centralized papal power) attacking his Roman theology, weakened his confidence and prevented him from becoming the leader that he was otherwise so well equipped to be. Nevertheless, as the effective creator of the Oxford Movement, he helped to transform the Church of England; and as the upholder of a theory of doctrinal development he helped Catholic theology to become more reconciled to the findings of the new critical scholarship, while in England the *Apologia* was important in helping to break down the cruder prejudices of the English against Catholic priests. In both the Catholic church and the Church of England his influence has been momentous. (W.O.C.)

BIBLIOGRAPHY. The most important works by Newman have been reprinted, a few of them often; but, as Newman was in the habit of making substantial alterations when reediting, their text history needs care: see J. Rickaby, *Index to the Works of John Henry Cardinal Newman* (1914).

Many of his letters as an Anglican were edited by Anne Mozley, *Letters and Correspondence of J.H. Newman During His Life in the English Church,* new ed., 2 vol. (1898); the *Correspondence of John Henry Newman with John Keble and Others 1839–1845* was edited at the Birmingham Oratory (1917). See also *Cardinal Newman and William Froude, F.R.S.: A Correspondence,* ed. by G.H. Harper (1933). C.S. Dessain (ed.), Ian Ker, Thomas Gornall, Edward E. Kelly, and V.F. Blehl (assoc. eds.), *Letters and Diaries of John Henry Cardinal Newman,* 31 vol. (1961–77), is definitive. The best edition of the *Apologia* is by M.J. Svaglic, *Apologia pro Vita Sua* (1967). The official biography is W.P. Ward, *The Life of John Henry Cardinal Newman, Based on His Private Journals and Correspondence,* 2 vol. (1912, reissued 1927); less critical, but well based on the archives and very readable, is M. Trevor, *Newman,* 2 vol. (1962–63); a short modern life is C.S. Dessain, *John Henry Newman* (1966).

For Newman's thought and philosophical theology, see M. Nedoncelle, *La philosophie religieuse de John Henry Newman* (1946); for theology in general, J.H. Walgrave, *Newman: le développement du dogme* (1957; *Newman the Theologian,* 1960), and C.S. Dessain, *Newman's Spiritual Themes* (1977); for the idea of development and its background, O. Chadwick, *From Bossuet to Newman* (1957); for Newman and education, A.D. Culler, *The Imperial Intellect* (1955); and F. McGrath, *Newman's University: Idea and Reality* (1951).

Newman, Paul (b. Jan. 26, 1925, Cleveland, Ohio, U.S.), American film actor whose career has spanned more than four decades.

The son of a Catholic mother and Jewish father, Newman was a navy radio operator in World War II and enrolled at Ohio's Kenyon College upon his discharge (B.A., 1949).

Paul Newman, 1965
The Kobal Collection

He went to New York City in 1953 and soon began appearing in roles on Broadway. On the basis of his first play, *Picnic* (1953), Newman signed a film contract with Warner Bros. and in 1954 made a disastrous screen debut in the biblical epic *The Silver Chalice,* which Newman himself later described as "the worst picture of the decade." He fared better with two well-received performances in live television dramas (*Our Town* [1955] and *Bang the Drum Slowly* [1956]) and secured his future in films with his impressive portrayal of boxer Rocky Graziano in *Somebody Up There Likes Me* (1956). He captured his first Academy Award nomination for his performance in *Cat on a Hot Tin Roof* (1958).

In 1961 Newman essayed the role which perhaps best defines his screen persona, that of pool shark "Fast" Eddie Felson in *The Hustler.* Earning him another Oscar nomination, *The Hustler* was the first in a series of 1960s films, which included *Cool Hand Luke* (1967), in which Newman portrayed antiheroic protagonists.

Two popular films teamed Newman with costar Robert Redford and director George Roy Hill, both films featuring the Newman-Redford duo as a pair of charming outlaws. Newman's performance in the comic western *Butch Cassidy and the Sundance Kid* (1969) was hailed as his best work in comedy to date. In 1973 Newman and Redford portrayed Depression-era conmen in *The Sting,* a film that won that year's Oscar for best picture and matched *Butch Cassidy*'s box office success.

Newman's success afforded him the luxury of being eclectic in his choice of material, starring in some films that were box office failures but became cult favourites. Newman maintained his star status by appearing in such popular films as *The Towering Inferno* (1974), *Slap Shot* (1977), and two films for which he received Oscar nominations, *Absence of Malice* (1981) and *The Verdict* (1982).

After six Academy Award nominations and one career achievement Oscar, Newman finally won a best actor statuette for his work in director Martin Scorsese's *The Color of Money* (1986), the sequel to *The Hustler.* At the age of 70, he was nominated yet again for his depiction of an out-of-work construction worker in director Robert Benton's *Nobody's Fool* (1994). He also worked with Benton on the detective thriller *Twilight* (1998), proving his rank among the cinema's most enduring leading men.

Newmarket, town, Forest Heath district, administrative and historic county of Suffolk, England. It lies 70 miles (110 km) north of London. It is the home of the Jockey Club and has been celebrated for its horse races from the time of James I (reigned 1603–25); it is also known for the training of racehorses. Charles I instituted the first cup race there in 1634. Two of the five English classic races are held there in the spring—the Two Thousand Guineas and the One Thousand Guineas—and in the autumn two of the most popular handicap races, the Cesarewitch and the Cambridgeshire. Newmarket is the site of a great annual sale of bloodstock and possesses a unique Equine Research Centre. In 1967 the National Stud (a breeding centre for English horses) was opened there. There are two racecourses on Newmarket Heath: the Rowley Mile course, used in the spring and autumn, and the July course, used in the summer. The Rowley Mile intersects the Devil's Ditch, or Devil's Dyke, an earthwork thought to have been built by the East Anglians as a defense against the Mercians about the 6th century AD. The area is covered by chalk downland, with its unique flora and fauna. Northwest of Newmarket in Cambridgeshire is Wicken Fen, a nature reserve belonging to the National Trust, that is a surviving part of the now largely drained Fens. Pop. (1991) 16,498.

Newport, town, Isle of Wight unitary authority, historic county of Hampshire, England. It lies near the centre of the diamond-shaped island at the head of the River Medina's estuary, 5 miles (8 km) from its mouth at Cowes. Newport was probably the Roman settlement of Medina, but there is no trace of Saxon or Jute settlement. The first charter was granted between 1177 and 1184, and the borough was incorporated in 1608. Newport early superseded nearby Carisbrooke as the island's capital because of its facilities for trade. It remains the island's agricultural and administrative centre. Parkhurst, a major British maximum-security prison, stands on the outskirts. Pop. (1991) 20,574.

Newport, city, seat (1796; with Alexandria) of Campbell county, Kentucky, U.S. It adjoins Covington and lies opposite Cincinnati, Ohio, on the Ohio River near the mouth of the Licking River. The first settlement (about 1790) was named for Christopher Newport, commander of the first ship to reach Jamestown, Va., in 1607. An antislavery newspaper was published in Newport in the 1850s. The city experienced its greatest growth in the 1880s and '90s with an influx of German settlers and the completion of bridges to Cincinnati. Newport was the scene of a seven-year (1921–28) strike by steelworkers. Steel remains important, although services are now a major part of the economy. Other industries include printing and food processing. The Newport Aquarium opened in 1999. Inc. village, 1795; city, 1835. Pop. (2000) 17,048.

Newport, city, Newport county, southeastern Rhode Island, U.S. It occupies the southern end of Rhode (Aquidneck) Island in Narragansett Bay (there bridged to Jamestown). From the harbour on the west, the city rises up a gentle hillside to a low plateau.

Newport was founded in 1639 by a group of religious refugees from Massachusetts who had settled at the northern end of the island and founded the present town of Portsmouth. Following a schism in that settlement, a group led by William Coddington moved to the southern end of the island and established Newport, which, because of its excellent harbour, soon became one of the most flourishing seaports in colonial North America. Until the 20th century the two towns shared a government. Its early merchants prospered in the triangular trade of rum, molasses, and slaves between New England, Africa, and the West Indies. Printing in Rhode Island was begun at Newport in 1727 by James Franklin, an older brother of Benjamin. In 1758 James Franklin, Jr., established the *Newport Mercury,* which is still published as a weekly newspaper. The British occupation of Newport (1776–79) during the U.S. War of Independence resulted in the flight of merchants to the mainland.

After the American Civil War, largely because of a temperate climate and scenic location, Newport developed as an opulent summer resort with palatial summer mansions such as The Breakers, built (1895) in Italian Renaissance style for Cornelius Vanderbilt (grandson of the first Cornelius Vanderbilt).

Newport was one of Rhode Island's five original capital cities; Providence became sole capital in 1900. Many colonial buildings survive, including the Friends Meeting House (1699); the Old Colony House (1739); Trinity Church (1725–26); Touro Synagogue (1763), the oldest in America, founded by Spanish and Portuguese Jews; the Redwood Library and Athenaeum (1747); and the Artillery Company of Newport (chartered 1741) Military Museum. The old section of Newport, known as The Point, on the harbour front, has homes of colonial merchants, including Hunter House (1748), now restored as a museum. In Touro Park is the Old Stone Mill, a circular stone tower that is probably one of the oldest European-built edifices in the United States.

The International Tennis Hall of Fame and Museum (founded 1954) is in the Newport Casino (1880). Salve Regina University was established in 1947. Newport long has been known as a centre of yachting and has held many of the America's Cup yacht races. The Museum of Yachting is located in Fort Adams State Park. The city hosted the Newport Jazz Festival from 1954 until 1971, when it was moved to New York City. A festival of classical music is held annually in Newport in July, and a revived jazz festival occurs in August.

Newport was incorporated as a city in 1784 and resumed the town form of government in 1787, but in 1853 it was reincorporated as a city. Despite some closings in the 1970s, a major employer continues to be the U.S. Navy, with several facilities including the Naval Education and Training Center, Naval War College, Surface Warfare Officers School Command, Naval Justice School, and Naval Undersea Warfare Center. Services and tourism are also principal components of the city's economy. Pop. (2000) 26,475.

Newport, Welsh CASNEWYDD, town, industrial seaport, and county borough, historic county of Monmouthshire (Sir Fynwy), Wales.

The town is located at the mouth of the River Usk where it enters the River Severn estuary. A medieval borough with a castle (now in ruins) dating from about 1126, the town of Newport enjoyed commercial privileges conferred by various charters, such as that of 1385. Its present importance, however, dates from the 19th-century industrialization of the neighbouring coalfield. In 1839 Newport was the scene of some of the popular uprisings known as the Chartist riots, bullet marks from which are still visible in the pillars of the Westgate Hotel. The coal trade that brought considerable prosperity to the port up to 1913 has since ceased, and the town's industry has diversified to include steel and aluminum processing, papermaking, engineering, and chemicals. The port's imports include timber, tea, and automobiles. Newport is one of the most important metallurgical centres in Britain, with an immense steelworks at Llanwern, east of the town. Erected in 1906, a Transporter bridge

245 feet (75 metres) high spans the river near the docks, and a road bridge built in 1964 was the first cable cantilever bridge in Britain.

Newport county borough covers an area of industrial and residential development and open countryside around the town of Newport. Its main historical fame lies in the town of Caerleon ("City of the Legions"). From the 4th century BC to AD 75 the place was a stronghold of the Silures, the tribe that controlled what later became Monmouthshire. When the Romans conquered the Silures, Caerleon became the site of Isca Silurum, chief fortress of the Roman 2nd Augustan Legion. An amphitheatre built in the town in AD 80 later became known as King Arthur's Round Table. The present county borough has been dominated by the port of Newport since the 19th century, and that town continues to employ the bulk of the surrounding population. Agriculture remains a strong tradition to the east and west of the town, however, where a few small market villages remain. The county borough has excellent rail and motorway connections with London, southeastern England, the Midlands, and northern England, as well as with other parts of southern Wales. Area county borough, 74 square miles (191 square km). Pop. (1991) town, 115,522; (1998 est.) county borough, 139,200.

Newport Beach, city, Orange county, southern California, U.S. It lies along Newport Bay (Pacific inlet), south of Long Beach. Captain S.S. Dunnels sailed into the bay in 1865 looking for "new port" facilities; he developed Newport Landing, which in 1873 became a lumber terminal. Known as McFaddens Landing and Port Orange, it was laid out in 1892 as Newport. It developed around yachting, sport fishing, and beach activities and as a residential community for commuters to Los Angeles and Long Beach. There has been light industrial development, mainly aerospace electronics. Encompassing Lido Isle, Balboa Island and Peninsula, and Corona Del Mar, the city has extensive marina facilities. The University of California, Irvine, is immediately northeast. The Newport Harbor Art Museum displays modern American art. Inc. 1906. Pop. (2000) 70,032.

Newport News, independent city and port of entry, southeastern Virginia, U.S. It lies on the north side of Hampton Roads (harbour) and the mouth of the James River. With Portsmouth, Hampton, and Norfolk, it constitutes the Port of Hampton Roads (*q.v.*). The site was settled by Daniel Gookin (1621), who brought 50 colonists from Ireland. The origin of the place-name is obscure but is traditionally associated with Captain Christopher Newport, commander of five expeditions to Jamestown during 1606–12, and Sir William Newce, who arrived from Ireland in 1621.

Development began after 1870, when the site was chosen as a coal-shipping port for the Chesapeake and Ohio Railway. It was laid out in 1882, and by 1886 its prosperity was assured when the Newport News Shipbuilding and Dry Dock Company was founded there. One of the largest and most complete shipyards in the world, it has produced the luxury liners *America* and *United States,* the aircraft carriers *Forrestal* and *Enterprise,* and nuclear-powered submarines designed for firing guided missiles. Newport News was also an important supply and embarkation port in both world wars. In 1952 the city was made independent of Warwick county, in which it was located. That same year Warwick county was incorporated as the city of Warwick, and in 1958 Newport News and Warwick merged as the city of Newport News.

In addition to its port facilities, which can handle huge tonnages of coal, ore, bulk liquids, and general cargo, Newport News has diversified manufactures (textiles, paper, aeronautical and electronic equipment, and petroleum products). The city's Mariners' Museum (1930) has collections of ship models and a library. Also in Newport News are the Virginia War Museum, with exhibits from a Nazi concentration camp and the Berlin Wall; the Virginia Living Museum, with an aquarium and a planetarium; and Christopher Newport University (1960). Inc. 1896. Pop. (2000) city, 180,150; Norfolk–Virginia Beach–Newport News MSA, 1,569,541.

Newquay, town on the Atlantic coast, Restormel borough, administrative and historic county of Cornwall, England. The town is almost entirely a modern seaside resort, having grown since the mid-19th century from a small fishing village. It stands on cliffs overlooking sandy beaches and is sheltered from the Atlantic by Towan Head. The climate is equable, and tropical plants grow in the Trenance (valley). The small harbour is now used only by local fishing and pleasure boats. Newquay has become one of the most crowded tourist resorts on the Cornish coast. Pop. (1991) 17,390.

Beach at Newquay, Cornwall

Eric Carle—Shostal

Newry, Irish AN TLÚR, town and seat, Newry and Mourne district (established 1973), formerly in County Down, Northern Ireland. It lies along the River Clanrye and Newry Canal, near Carlingford Lough (inlet of the sea) and the Mourne Mountains. The town developed around a Cistercian abbey founded on the Clanrye by St. Malachy about 1144 and was granted a charter in 1157. The Irish name of the town, Iubhar Cinn Trágha, means "the yew tree at the head of the Strand," and it is alleged that the original yew, the symbol of immortality, was planted by St. Patrick. Because of its position in a gap of the hills, Newry was often attacked from the 13th to the 17th century; it was burned by the English king James II's forces in 1689. St. Patrick's Church, founded in Newry in 1578, was the first Protestant church to be built in Ireland. Newry is the seat of the Roman Catholic bishop of Dromore, and the Cathedral of Saints Patrick and Colman was completed in 1825. The town's industries include spinning and weaving of linen and cotton, the manufacture of waterproof clothing, food processing, and granite quarrying. Pop. (1991) 21,633.

Newry and Mourne, district, Northern Ireland. Formerly astride Counties Armagh and Down, Newry and Mourne was established as a district in 1973. It is bordered by the districts of Armagh and Banbridge to the north and Down to the northeast, by the Irish Sea to the east, and by the Irish Republic to the south and west. The Newry Canal, built in 1730–41 and the first major canal in the British Isles, flows between Lough (lake) Neagh and Carlingford Lough (inlet of the sea) and divides the district in two, with low mountains on the east and west.

Some potatoes, oats, and livestock are produced in the area, and, although limestone and granite are quarried in the Mourne Mountains, many of the wooded slopes have been preserved for recreation. Newry town is the administrative seat of the district and is connected to the Irish Sea at Carlingford Lough by the Newry Canal. Area 344 square miles (890 square km). Pop. (1991) 82,288.

news agency, also called PRESS AGENCY, PRESS ASSOCIATION, WIRE SERVICE, or NEWS SERVICE, organization that gathers, writes, and distributes news from around a nation or the world to newspapers, periodicals, radio and television broadcasters, government agencies, and other users. It does not publish news itself but supplies news to its subscribers, who, by sharing costs, obtain services they could not otherwise afford. All of the mass media depend upon the agencies for the bulk of the news, even including those few that have extensive news-gathering resources of their own.

The news agency has a variety of forms. In some large cities, newspapers and radio and television stations have joined forces to obtain routine coverage of news about the police, courts, government offices, and the like. National agencies have extended the area of such coverage by gathering and distributing stock-market quotations, sports results, and election reports. A few agencies have extended their service to include worldwide news. The service has grown to include news interpretation, special columns, news photographs, audiotape recordings for radio broadcast, and often videotape or motion-picture film for television news reports. Major agencies also are presences on the Internet. Many agencies are cooperatives. Under this form of organization, individual members provide news from their own circulation areas to an agency pool for general use. In major news centres the national and worldwide agencies have their own reporters to cover important events, and they maintain offices to facilitate distribution of their service.

The major press associations in the United States have expanded their service to include entertainment features, and some feature syndicates provide straight news coverage as a part of their service. The Newspaper Enterprise Association distributes both news and features in the United States.

Despite the plethora of news services, most news printed and broadcast throughout the world comes from only a few major agencies, such as the Associated Press in the United States, Reuters in Great Britain, and Agence France-Presse in France. Only these and a few others have the financial resources to station experienced reporters in all areas of the world where news develops regularly or to send them wherever news develops unexpectedly.

The world agencies have established a variety of relationships with other agencies and with individual news media. Most of them purchase the news services of national or local agencies to supplement news gathered by their own staff representatives at key points. Reuters, like the Agence France-Presse, supplies a worldwide news file to be distributed by some national agencies along with their domestic news reports. The American services more often contract to deliver their service directly to individual users abroad.

News agencies in communist countries had close ties to their national governments. Each major communist country had its own national news service, and each news service was officially controlled. Tass, the Soviet news agency, was the principal source of world news for the Soviet Union and its allies. China's Hsinhua, or New China News Agency, was the largest remaining news agency in a communist country by the late 20th century.

Most other countries have one or more national news agencies. Some depend on a common service, such as the Arab News Agency, which provides news for several states in the Middle East. Others are national newspaper cooperatives, such as the Ritzaus Bureau of Denmark, founded in 1866, which has a well-developed teleprinter network. A few, like the Agenzia Nazionale Stampa Associata of Italy, have expanded coverage abroad in limited degree to supplement their domestic service but still depend on Reuters and Agence France-Presse for much of their foreign news. Germany since 1949 has built Deutsche-Presse Agentur into one of the more important news agencies in Europe, including extensive exchange with other national services. In Canada the Canadian Press is a cooperative news agency with headquarters in Toronto. The oldest and largest news agency operating exclusively in Britain is the Press Association, founded by provincial newspapers on a cooperative basis in 1868. It began active work on Feb. 5, 1870, when the postal service took over the private telegraph companies that had previously supplied the provincial papers with news. It supplies news to all the London daily and Sunday newspapers, provincial papers, and trade journals and other periodicals.

The ability to transmit news rapidly has greatly increased during the 20th century. Radioteleprinters that make possible fast automatic transmission of news messages link all major areas. Picture transmission by radio and high-fidelity wires is well developed. From the major agencies, teletypesetter service, pioneered by the Associated Press in 1951, is available to newspapers wishing to have computerized typesetting done directly from news-service transmissions.

For brief coverage of the major world news agencies, *see* Agence France-Presse; Associated Press; Kyōdō; Press Trust of India; Reuters; Tass; United Press International. For treatment of newspaper feature syndicates, *see* newspaper syndicate.

newscast, radio or television summary of news events read by a newscaster or produced with a combination of reading and audio tape for radio or a combination of reading and film or video tape for television. It ranges from the one-minute dateline radio summary (usually a reading of five or six brief news items, each preceded by the city, state, or country in which it occurred) to the 15-minute newscast (usually divided into three groups: international, national, and local) to the 30-minute or one-hour newscast (generally longer items, integrating international, national, and local news and grouped according to related events) or even to an all-news format.

The newscast had a slow and difficult start in the U.S. in the 1920s in the form of infrequent readings of headlines and front-page stories from the late editions of newspapers. That start eventually led to a series of battles, beginning in 1933, between the radio stations on the one hand and, on the other, the major American newspapers and the three news-service agencies that sustained them—the Associated Press, the United Press, and the International News Service. The most significant outgrowth of the conflict, after two years, was the formation by the networks of their own news-gathering organizations. Public interest in news increased significantly with the events that led to World War II, and the networks' news organizations gave the first proof of their potential during that period.

The television newscast began in 1953 as a televised version of the radio form, with elements adopted from the theatre newsreel. In fact, the staffs of television's newscasts were drawn largely from newsreel organizations. The increasing frequency and popularity of newscasts led to controversies by the end of the 1960s involving their objectivity. The Federal Communications Commission code (1941) governing broadcasters reads, ". . . the broadcaster cannot be an advocate," and the code (1939) of the National Association of Broadcasters says, "Since the number of broadcasting channels is limited, news broadcasts shall not be editorial . . . ." Broadcasters were said by some to have violated these regulations, especially in newscasts.

Consult the INDEX *first*

Newsday, evening daily tabloid newspaper published in Long Island, N.Y., to serve residents of suburban Nassau and Suffolk counties, east of New York City.

It was established in 1940, as residential suburbs began to expand. Its founders were Harry Guggenheim and Alicia Patterson, daughter of publisher Joseph Medill Patterson. They set a liberal-independent policy for *Newsday,* which specialized in reporting serious local news, sometimes using teams of investigative reporters. The paper moved into new plants several times between 1947 and 1979, when it settled in Melville, Long Island, and began making the shift to computerized typesetting and other technological innovations.

In 1953 *Newsday* won a Pulitzer Prize for "disinterested and meritorious public service" and earned two more Pulitzer awards in later years. It is part of the Times Mirror Company group, which also publishes the *Los Angeles Times.*

newsletter, informal publication, often simple in format and crisp in style, that provides special information for a defined audience. Newsletters are ordinarily but not always issued regularly. They offer varieties of personal journalism and seldom carry advertising.

Forerunners of modern newsletters were the "corantos"—single-page collections of news items from foreign journals. They were circulated by the Dutch early in the 17th century, and English and French translations were published in Amsterdam. In the English American colonies, the *Boston News-letter*—credited also as the first American newspaper—appeared in 1704.

Roger W. Babson of Massachusetts introduced an investment advisory letter in 1904, and the *Whaley-Eaton Report* began in 1918. Circulation of modern newsletters varies from the modest numbers of free letters of small voluntary organizations to the hundreds of thousands achieved by subscription newsletters like *The Kiplinger Washington Letter*, begun in 1923 by Willard M. Kiplinger. Typical of many is the weekly *Latin American Reports*, started in London in 1967. Common topics covered in newsletters include business and the professions, energy, health, safety, and travel. Corporations often issue newsletters for internal communication; nonprofit organizations issue them for their members.

The wide availability of the typewriter, of cold type, and of fast and economical offset printing that reproduces camera-ready text and art contributed to the rapid growth of newsletters in the 20th century, especially in the 1960s and 1970s. The use of direct mail and the development of specialized mailing lists proved important for subscription letters. Word-processing systems and electronic delivery were applied to expedite production and improve timeliness.

By the late 20th century more than 100,000 different newsletters were issued in the United States. The Newsletter Association of America was founded in New York City in 1977; renamed the Newsletter Association in 1982, it organized a chapter in London in 1983.

Newsletters enjoy the economy of publishing for a limited and defined market. They often offer inside information, advice, and forecasts.

The Newsletter on Newsletters began in 1964. *Publishing Newsletters* (1982), by Howard Penn Hudson, illustrates a variety of designs and includes a glossary.

newspaper, publication usually issued daily, weekly, or at other regular times that provides news, views, features, and other information of public interest and that often carries advertising.

A brief treatment of newspapers follows. For full treatment, *see* MACROPAEDIA: Publishing.

Forerunners of the modern newspaper include the *Acta diurna* ("daily acts") of ancient Rome—posted announcements of political and social events—and manuscript newsletters circulated in the late Middle Ages by various international traders, among them the Fugger family of Augsburg.

In England the printed news book or news pamphlet usually related a single topical event such as a battle, disaster, or public celebration. The earliest known example is an eyewitness account of the English victory over the Scots at the Battle of Flodden (1513). Other forerunners include the town crier and ballads and broadsides.

In the first two decades of the 17th century, more or less regular papers printed from movable type appeared in Germany, Italy, and the Netherlands. The Dutch "corantos" ("currents of news"), which strung together items extracted from foreign journals, became the sources for English and French translations published in Amsterdam as early as 1620. Rudimentary newspapers appeared in many European countries in the 17th century, and broadsheets with social news were published in Japan in the Tokugawa period (1603–1867).

The first English corantos appeared in London in 1621. By the 1640s the news book had taken the form of a newspaper—the title page being dropped. The first English daily was *The Daily Courant* (1702–35). Not until 1771 did Parliament formally concede journalists the right to report its proceedings. *The Times,* which became a model for high quality and later led in mechanical innovation, was founded by John Walter in 1785, and *The Observer* was founded in 1791.

The Thirty Years' War (1618–48) set back incipient newspapers in Germany, and censorship in various forms was general throughout Europe. Sweden passed the first law guaranteeing freedom of the press in 1766.

In France the first daily, *Journal de Paris,* was started in 1771, and the *Journal des Débats* (1789), published until World War II, was founded as a daily to report on sessions of the National Assembly. Papers multiplied during the Revolution and decreased sharply after it.

The first newspaper in the United States, *Publick Occurrences Both Forreign and Domestick* (Boston, September 1690), was suppressed by the colonial governor after one issue. In 1704 the *Boston News-letter* began publication as a weekly issued by the postmaster. The *Boston Gazette* (1719) was printed by James Franklin, Benjamin Franklin's brother. Independent newspaper publishing in the English colonies is considered to have begun with James Franklin's *New-England Courant* (1721). Freedom of the press was advanced in a landmark case in 1735 when John Peter Zenger, a New York City newspaper publisher, was acquitted of libel on the defense that his political criticism was based on fact. Press freedom in the United States was further secured by the First Amendment to the U.S. Constitution (1791). Most of the press of the new republic proved fiercely partisan in the political struggles between the Federalists and Jeffersonian Republicans.

Circulation in the low thousands was common for papers at the beginning of the 19th century. Rising circulations were made possible by technological advances in mechanical typesetting, in high-speed printing (rotary press), in communications (telegraph and telephone), and in transport (railway). Led by papers in Great Britain and the United States, newspapers broadened their appeal and reduced prices. *The Times,* for example, increased circulation from 5,000 in 1815 (price seven pence) to 50,000 by the mid-19th century (five pence). In the United States, Benjamin Day established the *Sun* in New York City (1833) as the first successful penny paper. Two years later James Gordon Bennett began the *New York Herald.* He shaped many of the directions of modern journalism, including comprehensive coverage and an emphasis on entertainment. Horace Greeley, who crusaded for women's rights and against slavery, founded the independent *New York Tribune* (1841). Another independent, though less flamboyant, paper, *The New York Times,* appeared 10 years later. By the mid-19th century, there were 400 dailies and 3,000 weekly papers in the United States.

What became the Associated Press was organized (1848) by New York publishers as a cooperative news-gathering enterprise, and in London Paul J. Reuter began his foreign news service for the press (1858). Competition in New York City between Joseph Pulitzer, who owned the *World* from 1883, and William Randolph Hearst (*Journal,* 1895) led to excesses of lurid and sensationalized news, called yellow journalism (*q.v.*), and reactions against it in the late 1890s. In western Europe many papers became primarily organs of political and literary opinion.

In 1896 Alfred Harmsworth (Lord Northcliffe) launched the London *Daily Mail* as a national paper. Priced low to increase circulation, it was deliberately based on a plan for earning most of the revenues from advertising. He also introduced the first tabloid (*Daily Mirror,* 1903)—about half the size of a standard paper (15 × 23 inches [38 × 58 cm]). The first American tabloid was the *New York Daily News* (1919), started by Joseph Medill Patterson and devoted to sex and sensationalism. Early in the 20th century, the number of American papers reached a peak (more than 2,000 dailies and 14,000 weeklies). They declined in number thereafter, though total circulation rose. During the 1920s and '30s competition for circulation continued, and the wide use of syndicated columnists and ready-to-use features, comic strips, crossword puzzles, and other amusements developed.

A dozen large chains later came to control more than half of the American dailies. The first American chain was organized by Edward W. Scripps in the 1890s. A pattern of consolidation and merger was seen worldwide, especially in the second half of the 20th century.

Dissatisfaction with established papers, notably among younger readers, led to the rise in the second half of the 20th century of a diverse "underground," or alternative, press. The *Village Voice* in New York City began publishing in 1955. The alternative press, sometimes strident and irreverent, was forthright in seeking fresh approaches. Various special-interest groups, among them trade, ethnic, and religious interests, are also served by papers edited expressly for them.

Asia had more than 2,500 dailies in the late 20th century and Europe more than 2,600. There were some 2,200 in North America, South America had more than 760, and Africa fewer than 160.

Most of the news distributed internationally is provided by only four agencies, all in Western countries: Reuters, the Associated Press, United Press International, and Agence France-Presse.

newspaper syndicate, also called PRESS SYNDICATE, or FEATURE SYNDICATE, agency that sells to newspapers and other media special writing and artwork, often written by a noted journalist or eminent authority or drawn by a well-known cartoonist, that cannot be classified as spot coverage of the news. Its fundamental service is to spread the cost of expensive features among as many newspapers (subscribers) as possible. Press syndicates sell the exclusive rights to a feature to one subscriber in each territory, in contrast to the wire news services (*see* news agency), which offer their reports to all papers in a given area. Some syndicates specialize in such entertainment features as comic strips, cartoons, columns of oddities or humour, and serialized novels. Typical syndicated features are columns of advice on child rearing, health, running a household, gardening, and such games as bridge.

Syndicates came into being in the United States at the end of the Civil War. Individual features, however, had been syndicated as early as 1768 in the *Journal of Occurrences,* which was circulated by a group of "Boston patriots." The syndicate filled a need among rural or small-town weekly and daily papers for material that would help them compete with big-city papers. Three syndicates were in operation in 1865, supplying miscellaneous feature news items and short stories. In 1870 Tillotson & Son, publishers in Bolton, Eng., began to supply some British papers with serialized fiction. By 1881 Henry Villard, a reporter for the Associated Press (AP), had founded his own syndicate in Washington, D.C., and was soon sending material to the Cincinnati *Commercial,* the *Chicago Tribune,* and the *New York Herald.* About 1884, Charles A. Dana of the *New York Sun* formed a syndicate to sell short stories by Bret Harte and Henry James. Samuel S. McClure launched a similar venture in the same year. He first offered fiction and secured the rights to several stories by Rudyard Kipling. He also helped to introduce the stories of Sir Arthur Conan Doyle and others into the United States. The features offered at that time were mostly literary material and pictures. An important change came in 1896, however, when the big New York City Sunday newspapers began to produce and publish comic pages. In 1907 the comic strip was introduced in daily papers. This form of art gradually changed the whole character of the business and made it more profitable. The strips were shipped in matrix form to the subscribers for simultaneous publication. Originally, they were truly "comics" in that they were intended to make readers laugh, but later many became continued stories with no humour. When Bud Fisher's "Mutt and Jeff" was first bought and published in England in 1920, many British readers scoffed at the idea. It proved successful, and British editors later originated many strips in competition with the American products. By the late 1950s American comic strips were being translated into several languages and sold all over the world.

Many writers, photographers, and graphic artists syndicate their own materials. Some newspapers with especially strong resources syndicate their own coverage, including news, to papers outside their own communities. Examples include the *New York Times,* with major resources in every news department, and the defunct *Chicago Daily News,* which was known for its foreign coverage. Papers sometimes syndicate as a team with another newspaper—*e.g.,* the *Los Angeles Times–Washington Post* syndicate.

newsreel, short motion picture of current events introduced in England about 1897 by the Frenchman Charles Pathé. Newsreels were shown regularly, first in music halls between entertainment acts and later between the featured films in motion-picture theatres. Because spot news was expensive to shoot, newsreels covered expected events, such as parades, inaugurations, sport contests, bathing beauty contests, and residual news, such as floods.

Among the best-known early newsreel series were the *Pathé-Journal* (1908), shown first in England and France, and the *Pathé Weekly* (1912), produced for American audiences. *The March of Time* (1935), produced in the United States by Time, Inc., illustrated the influence of the documentary film by combining filmed news with interpretive interviews and dramatizations. With the rising popularity of television news reports, documentaries, and specials, the number of newsreels declined markedly. By the late 1950s the last of the American weeklies, Fox Movietone News, had gone out of business.

Newsweek, weekly newsmagazine published in New York City, one of the highly influential "big three" of American newsweeklies. It was founded in 1933 by Thomas J.C. Martyn, a former foreign-news editor of *Time,* as *News-Week.* It borrowed the general format of *Time* (founded 1923), as did Raymond Moley's *Today* magazine—with which *News-Week* merged in 1937, removing the hyphen from its name. The early *Newsweek* offered a rather drab survey of the week's news with signed columns of analysis. After World War II it grew livelier, and even more so after its purchase in 1961 by *Washington Post* publisher Philip L. Graham. It has a strong reputation for accurate, brisk, and vivid reporting of news events and for the care it exercises to report objectively. Like *Time,* it presents all the news in terse summary form, organized by departments and giving careful attention to the arts and sciences, business, religion, and sports.

newt, also called EFT, any of more than 40 species and 10 genera of salamanders constituting the widely distributed family Salamandridae of the order Caudata. They are called newts when aquatic and have moist skin, but are called efts when terrestrial and have rough skin. The name newt is derived from the expression "an eft," which became "a neft" and the letter "f" was transformed by popular usage to a "w."

The newt's body is long and slender, and its tail is flattened laterally (higher than wide). Different species of newts live either on land or in water, but all return to ponds or streams to breed, usually in spring. The fertilized eggs usually hatch in three to five weeks' time, and the aquatic larvae metamorphose into adults in late summer or early fall. Most young newts lead a completely terrestrial life, but when two to four years old they begin their annual or permanent return to the ponds. Newts eat earthworms, insects, snails, and other small animals.

In Great Britain newts are represented by

Warty newt (*Triturus cristatus*)

Toni Angermayer

three species of the genus *Triturus,* members of which are sometimes called tritons. The most common British newt is the smooth newt, *T. vulgaris,* a spotted form that also occurs widely throughout Europe. The largest European newt is the warty newt, *T. cristatus,* which grows to approximately 17 cm (7 inches). The California newt, *Taricha torosa,* found in humid regions of western North America, grows to about 15 cm in length. A common species of eastern North America is the red eft, *Notophthalmus viridescens.* The red eft lives on land for two or three years before becoming permanently aquatic. As it does so it turns from bright red to dull green with a row of red spots on the sides. The Japanese newt, *Cynops pyrrhogaster,* is frequently kept as a pet, surviving for several years in captivity. Newts are also found in the Middle East, Iran, and large areas in China and adjacent regions.

Newton, city, seat of Jasper county, central Iowa, U.S. It lies 30 miles (48 km) east of Des Moines. It was settled in 1846 as the county seat and was named for John Newton, Revolutionary War soldier. The railroad arrived in the 1860s and the community developed as a lumber-milling and agricultural trading centre. In 1898 the washing machine industry began there with the manufacture of ratchet-slat washers. Newton was where Frederick L. Maytag invented a "hand power" washing machine (1907) and his motor-driven washer (1911), which revolutionized the industry. The manufacture of automatic laundry appliances is now the economic mainstay, and the Jasper County Historical Museum exhibits the progress of the laundry industry. The city's other products include farm and road-building machinery, advertising specialties, and dairy foods (notably blue cheese). Inc. 1857. Pop. (1992 est.) 14,786.

Newton, city, seat (1872) of Harvey county, central Kansas, U.S. Founded in 1871 and named for Newton, Mass., it was a railhead for the Chisholm Trail cattle drives from 1871 to 1873. In the 1870s Russian Mennonite settlers began raising Turkey Red hard winter wheat brought from their homeland, and this variety became Kansas' principal agricultural product. Newton is now a trading and shipping centre for the surrounding wheat-growing area. There are railroad maintenance shops, food-processing and grain-milling plants, and factories making mobile homes. Bethel College (1887) in North Newton is the oldest Mennonite college in the nation; the Kauffman Museum on its campus features collections of antique automobiles and pioneer relics. Inc. 1872. Pop. (1992 est.) 16,613.

Newton, city, Middlesex county, eastern Massachusetts, U.S. It lies along the Charles River just west of Boston. Settled in 1639, it was part of Cambridge until separately incorporated as New Towne in 1688. Adopting its present name in 1691, it developed early milling and forge industries at the upper and lower falls of the Charles River. Suburban growth was stimulated by completion of the Boston and Worcester Railroad in 1834. Despite population increases, a sprawling, hilly setting has helped to sustain a semirural atmosphere (13 individual "villages," 8 of which have "Newton" in their names). Industry is limited by zoning laws.

The city is noted for its educational institutions, being the home of Andover Newton Theological School (1808) and several junior colleges (including Lasell [1851], Mount Ida [1899], and Aquinas [1961]). Chestnut Hill is the site of Boston College (1863) and Pine Manor College (1911). Inc. city, 1873. Pop. (1992 est.) 82,126.

newton, the absolute unit of force in the metre-kilogram-second (MKS) system of physical units. It is defined as that force necessary to provide a mass of one kilogram with an acceleration of one metre per second per second. One newton is equal to a force of 100,000 dynes in the centimetre-gram-second (CGS) system, or a force of about 0.2248 pound in the foot-pound-second (English, or customary) system. The newton was named for Sir Isaac Newton, whose second law of motion describes the changes that a force can produce in the motion of a body.

Newton, Alfred (b. June 11, 1829, Geneva, Switz.—d. June 7, 1907, Cambridge, Cambridgeshire, Eng.), British zoologist, one of the foremost ornithologists of his day.

Newton studied at Magdalene College, Cambridge, and from 1854 to 1863, as a holder of the Drury Travelling Fellowship, visited Lapland, Iceland, the West Indies, North America, and Spitsbergen, in the Arctic Ocean, on ornithological expeditions. In 1866 he became the first professor of zoology and comparative anatomy at the University of Cambridge, where few of the faculty or students were acquainted with zoology. Newton held the position for the remainder of his life, continually stimulating the growth of zoology as a distinct discipline. He was instrumental in securing passage of the first acts of Parliament for the protection of birds. He edited the ornithological journal *Ibis* (1865–70) and *The Zoological Record* (1870–72). Of his books, probably the most important is *A Dictionary of Birds* (1893–96), which grew from numerous articles on birds that he contributed to the 9th edition of *Encyclopædia Britannica.* His article "Ornithology" as amended in the 11th edition is still considered a valuable source of information on the history of ornithology and bird classification.

Newton, Sir Charles Thomas (b. Sept. 16, 1816, Bredwardine, Herefordshire, Eng.—d. Nov. 28, 1894, Margate, Kent), British archaeologist who excavated sites in southwestern Turkey and disinterred the remains of one of the seven wonders of the ancient world, the Mausoleum of Halicarnassus (at present-day Bodrum, Turkey). He also helped to establish systematic methods for archaeology and, as the first keeper (curator) of Greek and Roman antiquities at the British Museum, London, greatly enriched its collection by making outstanding acquisitions.

An assistant in the museum's Department of Antiquities (1840–52), Newton was sent to the Aegean as vice consul at Mytilene, on Lesbos, with the charge of looking after the museum's interests in Anatolia. In 1852 and 1855 he secured a series of inscriptions from the island of Calymnos. In 1856–57 he excavated the remains of the mausoleum and later unearthed the ground plan of Cnidus. Along with the chief remains from Halicarnassus, he brought to the museum the bronze Delphian serpent from Istanbul, a sculpture of the Greek goddess Demeter, the colossal lion from Cnidus, and statues from the road to Didyma (Branchidae). While serving as curator at the British Museum, he was also professor of archaeology at University College, London (1880–88), and did much to promote Hellenic studies in Britain. Knighted in 1887, he published, jointly with R.P. Pullan, his assistant at Cnidus, *A History of Discoveries at Halicarnassus, Cnidus, and Branchidae,* 2 vol. (1862–63).

Newton, Sir Isaac (b. Dec. 25, 1642 [Jan. 4, 1643, New Style], Woolsthorpe, Lincolnshire, Eng.—d. March 20 [March 31], 1727, London), English physicist and mathematician who invented the infinitesimal calculus, laid the foundations of modern physical optics, and formulated three laws of motion that became basic principles of modern physics and led to his theory of universal gravitation. He is regarded as one of the greatest scientists of all time.

A brief treatment of Sir Isaac Newton follows. For full treatment, *see* MACROPAEDIA: Newton.

Newton received a bachelor's degree at Trinity College, Cambridge, in 1665. During the next two years while the university was closed because of plague, Newton returned home, where he thought deeply about how certain natural phenomena might be explained and formulated the bases of his first major discoveries. He returned in 1667 as a fellow to Trinity College, where he became Lucasian professor of mathematics in 1669.

In 1666 Newton discovered the nature of white light by passing a beam of sunlight through a prism. He invented the calculus about 1669 but did not formally publish his ideas until 35 years later. He built the first reflecting telescope in 1668. Newton's most famous publication, *Philosophiae Naturalis Principia Mathematica* (1687; *Mathematical Principles of Natural Philosophy*), contains his work on the laws of motion, the theory of tides, and the theory of gravitation. His laws of motion laid the basis for classical mechanics, and the theory of gravity was particularly important in working out the motions of the planets. The *Principia* has been called one of the most important works of science ever written. In another book, *Opticks* (1704), Newton described his theory of light as well as the calculus and other mathematical researches.

Newton served as warden of the Royal Mint from 1696 and became president of the Royal Society in 1703, holding this office until his death. In 1705 he became the first British scientist ever to receive a knighthood for his researches.

Newton Abbot, town ("parish"), Teignbridge district, county of Devon, England. It lies near the head of the Teign Estuary. Bradley Manor (15th century) is now a National Trust property, while the Jacobean Forde House (1610) was visited by William, prince of Orange, the successful 17th-century contender for the English throne, who first read his famous declaration to the people of England at Newton Abbot market cross. The town is a busy service centre. Its industries include light engineering, food processing, and publishing. Pop. (1981) 20,979.

Newtonian transformations (physics): *see* Galilean transformations.

Newton's law of gravitation, statement that any particle of matter in the universe attracts any other with a force varying directly as the product of the masses and inversely as the square of the distance between them. In symbols, the magnitude of the attractive force F is equal to G (the gravitational constant, a number the size of which depends on the system of units used and which is a universal constant) multiplied by the product of the masses (m_1 and m_2) and divided by the square of the distance R: $F = G(m_1m_2)/R^2$. Isaac Newton put forward the law in 1687 and used it to explain the observed motions of the planets and their moons, which had been reduced to mathematical form by Johannes Kepler early in the 17th century.

Newton's laws of motion, relations between the forces acting on a body and the motion of the body, which, although formulated for the first time in usable form by Isaac Newton, had been discovered experimentally by Galileo about four years before Newton was born. The laws cover only the overall motion of a body; *i.e.,* the motion of its centre of mass. This concept is equivalent to assuming that the body is a particle with a definite mass but no size.

Strictly speaking, the laws are valid only for motions relative to a reference frame (coordinate system) attached to the fixed stars. Such a reference frame is known as a Newtonian, Galilean, or an inertial frame. Because the Earth rotates, a reference frame attached to the Earth is not inertial, and in some cases this rotation must be considered when applying Newton's laws. In most applications, however, the Earth's rotation can be neglected.

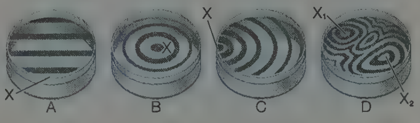
Newton's first law states that, if a body is at rest or moving at a constant speed in a straight line, it will remain at rest or keep moving in a straight line at constant speed unless it is acted upon by a force. This postulate is known as the law of inertia, and it is basically a description of one of the properties of a force: its ability to change rest into motion or motion into rest or one kind of motion into another kind. Before Galileo's time it was thought that bodies could move only as long as a force acted on them and that in the absence of forces they would remain at rest. Those who sought to find the forces that kept the planets moving failed to realize that no force was necessary to keep them moving at a practically uniform rate in their orbits; gravitational force, of which they had no conception, only changes the direction of motion.

Newton's second law is a quantitative description of the changes that a force can produce in the motion of a body. It states that the time rate of change of the velocity (directed speed), or acceleration, α, is directly proportional to the force F and inversely proportional to the mass m of the body; *i.e.,* $a = F/m$ or $F = ma$; the larger the force, the larger the acceleration (rate of change of velocity); the larger the mass, the smaller the acceleration. Both force and acceleration have direction as well as magnitude and are represented in calculations by vectors (arrows) having lengths proportional to their magnitudes. The acceleration produced by a force is in the same direction as the force; if several forces act on a body, it is their resultant (sum), obtained by adding the vectors tail-to-tip, that produces the acceleration.

The second law is the most important, and from it all of the basic equations of dynamics can be derived by procedures developed in the calculus. A simple case is a freely falling body. Neglecting air resistance, the only force acting on the body is its weight acting down, and it produces a downward acceleration equal to the acceleration of gravity, symbolized as g, which has an average value of 9.8 metres (32.2 feet) per second per second near the surface of the Earth.

Newton's third law states that the actions of two bodies upon each other are always equal and directly opposite; *i.e.,* reaction is always equal and opposite to action. The proposition seems obvious for two bodies in direct contact; the downward force of a book on a table is equal to the upward force of the table on the book. It is also true for gravitational forces; a flying airplane pulls up on the Earth with the same force that the Earth pulls down on the airplane. The third law is important in statics (bodies at rest) because it permits the separation of complex structures and machines into simple units that can be analyzed individually with the least number of unknown forces. At the connections between the units, the force in one member is equal and opposite to the force in the other member. The third law may not hold for electromagnetic forces when the bodies are far apart.

Newton's rings, in optics, a series of concentric light- and dark-coloured bands observed between two pieces of glass when one is convex and rests on its convex side on another piece having a flat surface. Thus, a layer of air exists between them. The phenomenon is caused by the interference of light waves; *i.e.,* the superimposing of trains of waves so that when their crests coincide, the light brightens; but when trough and crest meet, the light is destroyed. Light waves reflected from both top and bottom surfaces of the air film between the two pieces of glass interfere. The rings are named after the English 17th-century physicist Sir Isaac Newton, who first investigated them quantitatively.



Interference patterns formed with test surfaces

The principle is often used in testing the uniformity of a polished surface by studying the interference pattern the surface makes when placed in contact with a perfectly flat glass surface. The figure shows contour patterns formed by various surfaces under test. In the figure, A is produced by a flat surface with point of contact at X. In B and C the test surface is slightly convex, the points of contact indicated by X in each case. An irregular surface may give an interference pattern shown in D, with two points of contact X_1 and X_2.

Newtown, Welsh DRENEWYDD, "new town," Powys county, historic county of Montgomeryshire, Wales, located on the River Severn 15 miles (24 km) southwest of Welshpool. In 1967 Newtown was designated the second new town in Wales in an effort to create additional employment opportunities and check persisting rural depopulation. The town's original charter dates from 1280. To the southwest of town are the remains of a Norman motte-and-bailey castle, and the parliament hall of the medieval Welsh leader Owen Glendower was moved to Newtown in 1885. Gradual urban renewal during the 1970s resulted in a considerable mixture of old and new. The 16th-century town hall was torn down and replaced with a new Georgian-style hall. Other new structures include a county library headquarters, a police centre, and residential and industrial estates. A variety of light industries have been introduced to supplement the traditional textile mills and sawmills. Pop. (1991) 10,548.

Newtown Saint Boswells, village, Scottish Borders council area, historic county of Roxburghshire, Scotland, lying in the Tweed basin southeast of Edinburgh on the Edinburgh-Newcastle road. Before 1929 its population consisted mainly of railway employees. Since then its main function has changed to local governmental administration, and it has important livestock sales and a campus of Borders College. Nearby Dryburgh Abbey, founded in 1150 for the Premonstratensian order, has the tombs of Sir Walter Scott and Earl Haig (Field Marshal Douglas Haig). Pop. (1991) 1,108.

Newtownabbey, Irish BAILE NA MAINISTREACH, town and district (established 1973), formerly in County Antrim, Northern Ireland. The town of Newtownabbey was formed in 1958 by the amalgamation of seven villages, and it is a residential continuation of the city of Belfast on the shores of Belfast Lough (inlet of the sea). Newtownabbey is surrounded by modern industrial estates, manufacturing tires, telephones, textiles, and light engineering products, as well as new housing complexes.

Newtownabbey district has an area of 58 sq mi (150 sq km) and borders the districts of Larne and Carrickfergus to the east, Ballymena to the north, Antrim to the west, and Belfast to the south. The southern slopes of the Antrim Mountains extend into the northern and eastern parts of the district, but most of Newtownabbey consists of flat to undulating lowland. The district's light agricultural activity is centred around the administrative seat of Ballyclare, located in a wide valley 7 mi (11 km) north of Newtownabbey town. Pop. (1991) town, 57,103; (1998 est.) district, 79,600.

Newtownards, town and seat, Ards district (established 1973), formerly in County Down, Northern Ireland, at the northern end of Strangford Lough (inlet of the sea), just east of Belfast. It was founded by Sir Hugh Montgomery in 1608 at the site of a ruined Dominican friary (established 1244 by Walter de Burgh, earl of Ulster). It is now a manufacturing centre, with linen, hosiery, and engineering industries. Pop. (1991) 24,301.

Nexø, Martin Andersen (b. June 26, 1869, Copenhagen—d. June 1, 1954, Dresden, E. Ger.), writer who was the first Danish proletarian novelist championing social revolution, thus doing much to raise social consciousness in Denmark and throughout Europe.

Nexø came from an extremely poor family in the slums of Copenhagen but spent most of his childhood on the island of Bornholm, where he worked as a shepherd and later as a shoemaker's apprentice. He thus came to know the extreme deprivation suffered by the proletariat. With the help of a patron, he was later able to go to school; after finishing he worked as a teacher in a Grundtvigian folk school until 1901, when he was able to support himself by his writing.

Nexø's two major novels became known throughout the world. The first, *Pelle erobreren,* 4 vol. (1906–10; *Pelle the Conqueror,* 4 vol., 1913–16), tells of Pelle's development as the son of a farm labourer to become a worker in Copenhagen and a militant labour leader. The second novel, *Ditte mennskebarn,* 5 vol. (1917–21; *Ditte, Daughter of Man,* 3 vol., 1920–22) depicts the life of a poor, courageous, and loving girl and woman for whom there is no escape from oppression. A third novel, *Midt i en Jærntid* (1929; *In God's Land,* 1933), is critical of wealthy farmers during the period of agricultural inflation brought about by World War I. Nexø was a great admirer of the Soviet revolutionary experiment; he became a Communist after World War I and travelled to the Soviet Union a number of times. *Mod dagningen* (1923; "Toward the Dawn") gives his impressions of the Soviet Union. His memoirs appeared as *Erindringer,* 2 vol. (1932–39; first part: *Under the Open Sky,* 1938). In 1945 Nexø published a sequel to *Pelle, Morten hin Røde,* 2 vol. (1945; "Morten the Red"), in which Morten is the revolutionary and Pelle is shown as having turned bourgeois, like many of the labour leaders in the West. Nexø left Denmark in 1949, after the signing of the North Atlantic Pact, and settled in the German Democratic Republic, where he remained for the rest of his life.

nexum, in very early Roman law, a type of formal contract involving the loan of money under such oppressive conditions that it might result in the debtor's complete subjection to the creditor. The transaction was accomplished by means of a ritual employing scales and copper, the traditional symbols of transfer of property. The procedure was discontinued in the late 4th century BC, when the so-called Lex Poetelia released all those who were *nexi* (*i.e.,* insolvent debtors held in bondage by their creditors).

Ney, Michel, DUC (duke) D'ELCHINGEN, PRINCE DE LA MOSKOWA (b. Jan. 10, 1769, Sarrelouis, Fr.—d. Dec. 7, 1815, Paris), one of the best known of Napoleon's marshals (from 1804), who pledged his allegiance to the restored Bourbon monarchy when Napoleon abdicated in 1814. Upon Napoleon's return in 1815, Ney rejoined him and commanded the Old Guard at the Battle of Waterloo. Under

Ney, lithograph by François Le Villain, early 19th century, after a portrait by Maurin
H. Roger-Viollet

the monarchy, again restored, he was charged with treason, for which he was condemned and shot by a firing squad.

Military service. Ney was the son of a barrel cooper and blacksmith. Apprenticed to a local lawyer, he ran away in 1788 to join a hussar regiment. His opportunity came with the revolutionary wars, in which he fought from the early engagements at Valmy and Jemappes in 1792 to the final battle of the First Republic at Hohenlinden in 1800.

The early campaigns revealed two contrasting features of Ney's character: his great courage under fire and his strong aversion to promotion. Willing to hurl himself into battle at critical moments to inspire his troops by his personal example, he was unwilling to accept higher rank, and when his name was put forward he protested to his military and political superiors. In every instance he was overruled: it was as general of a division that he fought in Victor Moreau's Army of the Rhine at Hohenlinden.

A year before that battle, Napoleon, under whom Ney had never served, had emerged as master of France. In May 1801, Ney was summoned to be presented to the First Consul at the Tuileries, where Napoleon and Joséphine had surrounded themselves with the ceremony and splendour of a court. The Army of the Rhine had been disbanded, and Ney had bought a modest farm in Lorraine. His first encounter with Bonaparte was formal and unremarkable, for the First Consul, regarding Moreau as a military rival and political opponent, viewed the close associates of that general with suspicion. Joséphine, however, took him up and found him a wife, Aglaé Auguié, one of her maids of honour and daughter of a high civil servant. They were married in the chapel of the Auguié château near Versailles. Ney, with his influential new connections, became, at 33, part of the social and military world of the Consulate.

When peace with England broke down and Bonaparte was assembling armies along the Channel coast, Ney asked for employment and was given command of the VI Army Corps. Early in 1804, when police uncovered a plot by émigré Royalists to kidnap or murder Napoleon and restore the Bourbons to the throne, Ney's republican friend, General Moreau, was said to be involved, and with other alleged conspirators was put on public trial. Napoleon commuted Moreau's two-year sentence for banishment. On May 19, 1804, the day after Napoleon had had himself proclaimed hereditary emperor of the French, he revived the ancient military rank of marshal, and 14 generals, including Ney, were gazetted marshals of the empire.

When Napoleon led his armies in swift marches into the heart of the Continent, after a new European coalition of Russia, Austria, and England had been formed against France, the first victory was won by Ney at Elchingen in October 1805—for which he was created duke of Elchingen in 1808—and less than two months later Napoleon defeated the Russo-Austrian armies at Austerlitz. Ney was active in the defeat of Prussia at Jena in 1806 and of the Russians at Eylau and Friedland in 1807. When he was sent to Spain in 1808, his fame for personal bravery remained undimmed, but at the same time he was also known as a touchy and temperamental commander whom the general staff found difficult to fit into a tactical pattern. His impulsiveness sometimes verged on insubordination when his orders did not come from the Emperor himself. Since Napoleon directed the Spanish operations by remote control, Ney quarrelled with all those set above him, and, early in 1811, he was sent home in near disgrace.

The Russian campaign of 1812 reestablished his position. On the morning after the somewhat inconclusive battle at Borodino, Napoleon made him prince de la Moskowa. On the retreat from Moscow, Ney was in command of the rear guard, a position in which he was exposed to Russian artillery fire and to numerous Cossack attacks. He rose to heights of courage, resourcefulness, and inspired improvisation that seemed miraculous to the men he led. "He is the bravest of the brave," said Napoleon when Ney, for weeks given up as lost, joined the main body of the frozen and shrunken Grand Army.

In the European campaigns of 1813, Ney had to fight against former friends. Moreau had returned from exile in the U.S. to serve as Tsar Alexander I's military adviser and was killed by a French cannonball outside Dresden. Ney had the mortification of being defeated at Dennewitz by the crown prince of Sweden, Charles XIV John, who as Jean Bernadotte had served as a sergeant in the revolutionary armies, as had Ney. At Leipzig, Ney was wounded and had to be sent home. The defeated army fought its way back across Germany into France, where, deaf to all appeals for peace, Napoleon launched a new campaign. Ney, commanding in eastern France, organized the kind of partisan warfare he had learned in the revolutionary wars.

Ney's political shift. Napoleon concentrated his remaining forces at Fontainebleau to fight the allies in Paris, but Ney, speaking for himself and other marshals, told him that the army would not march. "The army will obey *me*," said Napoleon. "Sire," replied the Bravest of the Brave, "the army will obey its generals." Napoleon was forced to abdicate. Ney retained his rank and titles and took an oath of fidelity to the Bourbon dynasty.

On March 1, 1815, Napoleon reappeared in France. Ney, ordered to take command in the district of Besançon, told the King "that man deserves to be brought back to Paris in an iron cage." Ney, however, found that the population in his military district was intensely hostile to the Bourbons. Therefore, after receiving messages from Napoleon, he announced his decision to join the Emperor and was deliriously cheered by his soldiers and the populace. The King fled from Paris, and Napoleon reentered the Tuileries. Ney spent the period mostly in disgruntled retirement at his country estate. He saw little of Napoleon until three days before Waterloo, when he was summoned and asked to serve. He was put in charge of the left wing against the English, Napoleon taking the right wing against the Prussians, whom he defeated at Ligny. Ney fought the English in the drawn battle of Quatre-Bras. His conduct at Waterloo has remained a matter of controversy. When at nightfall the French fled from the field, Ney, his face blackened by smoke and holding a broken sword in his hand, shouted to a colleague: "If they catch us now, they'll hang us," a remark of prophetic accuracy.

Trial and death. After the second return of the Bourbons, Ney made a halfhearted attempt to flee the country, but was recognized and arrested in a remote corner of southwestern France. First put before a court-martial, he refused to recognize its competence and insisted on his right as a peer to be tried by the upper chamber. As he had expected, he was sentenced to death in one of the most divisive trials in French history. In December 1815, a firing squad in the Luxembourg Gardens ended what his soldiers had always regarded as a charmed life.

Ney was a soldier's soldier, wholly without political ambition or judgment. He was at his greatest in the campaigns for France's natural frontiers at the beginning and end of his career, but out of his depth in Napoleon's intricate strategy for the domination of Europe. He showed little interest in external distinctions or social success. The dignity with which he met his death effaced the memory of his political vagaries and made him, in an epic age, the most heroic figure of his time.

(Ha.K.)

BIBLIOGRAPHY. Andrew H. Atteridge, *The Bravest of the Brave* (1912); John B. Morton, *Marshal Ney* (1958); and Harold Kurtz, *The Trial of Marshal Ney His Last Years and Death* (1957), are the principal biographies, containing full-length bibliographies. Ney's second son published the *Mémoires du maréchal Ney* (1833; Eng. trans., 2 vol., 1833), but this work takes the story only up to 1805. The Duke of Wellington's attitude toward the captured and imprisoned Ney is amply documented in his *Supplementary Dispatches . . .* (1858–72), especially vol. 11; a vivid account of Ney's trial before the upper chamber in 1815 occurs in the *Personal Recollections of the Late Duc de Broglie, 1785–1820,* 2 vol. (1887). During his trial a number of English partisans were intent on liberating Ney in an action that misfired. Their exploits are described in Giovanni Costigan, *Sir Robert Wilson* (1932); Ian Bruce, *Lavalette Bruce* (1953); and Harold Kurtz (*op. cit.*).

Neyagawa, city, Ōsaka Urban Prefecture (*fu*), Honshu, Japan, in the northern part of the Kōchi-gawa (Kōchi River) plain. Many ancient relics attest to prehistoric settlement in the area. With the construction of a railway line to Ōsaka in 1910, Neyagawa grew as a residential suburb. The few large-scale factories produce metal products, transportation equipment, and textiles. Pop. (1983 est.) 258,907.

A list of the abbreviations used
in the MICROPAEDIA *will be found*
at the end of this volume

Neyman, Jerzy (b. April 16, 1894, Bendery, Russia—d. Aug. 5, 1981, Oakland, Calif., U.S.), Russian-U.S. mathematician and statistician who helped to establish the statistical theory of hypothesis testing. Neyman was a principal founder of modern theoretical statistics. In 1968 he was awarded the prestigious National Medal of Science.

After serving as a lecturer at the Institute of Technology, Kharkov, in the Ukraine, from 1917 to 1921, Neyman was appointed statistician of the Institute of Agriculture at Bydgoszcz, Pol. In 1923 he became a lecturer at the College of Agriculture, Warsaw, and joined the faculty of the University of Warsaw in 1928. He served on the staff of University College, London, from 1934 to 1938, and then emigrated to the United States, where he joined the faculty of the University of California at Berkeley, becoming chairman of a new department of statistics in 1955. There he built, with the help of a growing number of statisticians and mathematicians who studied under him, what became known as a leading world centre for mathematical statistics. A highly successful series of symposia on probability and statistics were carried out under his guidance.

Neyman's work in mathematical statistics, which includes theories of estimation and of testing hypotheses, has found wide application in genetics, medical diagnosis, astronomy, meteorology, and agricultural experimentation. He was noted especially for combining theory and its applications in his thinking.

Neyshābūr, also spelled NĪSHĀPŪR, town, northeastern Iran. Neyshābūr is situated 46 miles (74 km) west of Meshed. The town, which has shifted its position repeatedly in historical times, lies at an elevation of 3,980 feet (1,213 m) in a wide, well-watered, and fertile plain at the southern foot of the Bīnālūd Mountains. The surrounding area produces cereals and cotton, and the town's industries include agricultural marketing and the manufacture of carpets and pottery. Neyshābūr is linked by road and railway with Tehrān and Meshed.

Neyshābūr derived its name from its alleged founder, the Sāsānian king Shāpūr I (d. 272). It was once one of the four great cities of the region of Khorāsān and was important in the 5th century as the residence of the Sāsānian king Yazdegerd II (reigned 438–457). By the time the Arabs came to Khorāsān in the mid-7th century, however, it had become insignificant. Under the Ṭāhirid dynasty (821–873), the city flourished again, and it rose to importance under the Sāmānid dynasty (ended 999). Toghrïl Beg, the first Seljuq ruler, made Neyshābūr his residence in 1037, but it declined in the 12th century and in the 13th twice suffered earthquakes as well as the Mongol invasion.

A few miles east of the town is the Qadamgāh (1643), a fine domed mausoleum. American excavations in 1934–40 disclosed rich remains of both the Seljuq and pre-Seljuq periods in the locality. Near the mosque of the Imāmzādeh Maḥroq, 4 miles (6 km) southeast of Neyshābūr, is the tomb of the 12th-century astronomer-poet Omar Khayyam. The grave of the poet and mystic Farīd od-Dīn ʿAṭṭār also lies nearby. Pop. (1991) 135,681.

Nez Percé, Sahaptian-speaking North American Indian people centring on the lower Snake River and such tributaries as the Salmon and Clearwater rivers in what is now central Idaho and adjacent areas of Oregon and Washington. They were the largest, most powerful, and best known of the Sahaptin (*q.v.*) and were called by various names by other peoples; the French name, Nez Percé ("Pierced Nose"), referred to the wearing of nose pendants, though the fashion does not seem to have been widespread among them.

Their culture was primarily that of the Plateau culture area and more specifically that of the Sahaptin tribes. As one of the easternmost groups, however, they were influenced by the Plains Indians living just east of the Rockies. Typical of the Plateau, their domestic life traditionally centred on small villages located on streams having abundant salmon, which, dried, formed their main source of food. They also sought a variety of game, berries, and roots. Their dwellings were communal lodges, A-framed and mat-covered, varying in size but sometimes housing as many as 30 families.

After acquiring horses early in the 18th century, however, Nez Percé life began to change dramatically, at least among some groups. They were able to mount expeditions for bison hunts and to trade with peoples beyond the Rockies. Always somewhat warlike, they now became more so, adopting many war honours, war dances, and horse tactics imitative of the custom of the Plains; the Plains tepee was also used. The Nez Percé built up one of the largest horse herds on the continent and were almost unique among American Indians in learning selective breeding. As this enrichment and expansionism led to more tribal or intervillage consultation, they tended to dominate negotiations with other tribes.

The arrival of whites gradually changed their life. Just six years after the explorers Meriwether Lewis and William Clark visited the Nez Percé in 1805, fur traders and trappers began penetrating the area, followed later by missionaries. By the 1840s white settlers were moving through on the Oregon Trail, leading in 1855 to a treaty with the United States that created a large Nez Percé reservation, encompassing most of their traditional land. The discovery of gold on the Salmon and Clearwater rivers in 1860, however, and the influx of thousands of miners and then settlers, led U.S. commissioners in 1863 to force renegotiation of the treaty, fraudulently reducing the size of the reservation by three-fourths; subsequent invasions of homesteaders reduced the area even more. Many Nez Percé, perhaps a majority, had never accepted either the old treaty or the new, and hostile actions and raids by both whites and Indians finally evolved into the Nez Percé War of 1877. For five months a small band of 250 Nez Percé warriors, under the leadership of Chief Joseph, held off a U.S. force of 5,000 troops led by General O.O. Howard, who tracked them through Idaho, Yellowstone Park, and Montana before they surrendered to General Nelson A. Miles on October 5. In the campaign, Chief Joseph lost 239 persons, including women and children, and the United States lost 266. The tribe was then assigned to malarial country in Oklahoma rather than being returned to the Northwest as promised. (*See also* Joseph, Chief.)

Looking Glass, Nez Percé chief who fought under Chief Joseph in the Nez Percé War of 1877

Smithsonian Institution, National Anthropological Archives Photo No. 2963-A

In the late 20th century some 1,500 Nez Percé still remained on the Nez Percé Reservation in Idaho, but most had left to join the general U.S. population, largely as small landowners or labourers.

Nezahualcóyotl, also spelled NETZAHUALCÓYOTL, municipality northeast of Mexico City, México *estado* ("state"), central Mexico. Situated at the northeastern end of the Valle de México just outside of Mexico City, Nezahualcóyotl has become Mexico's third largest locality (after the Federal District and Guadalajara). Settlement began shortly after 1900, when Lake Texcoco was reduced in size and large areas of land were uncovered along the southern shore. Although the marshy land was initially inhospitable because of periodic flooding in the summer and strong winds in the winter and spring, it became more attractive to potential colonists after the creation of new population divisions was prohibited within the Federal District, in 1946. In that same year the government built Xochiaca Dam to the north to provide flood protection in the Lake Texcoco Zone and authorized the sale of parcels of land there at very low prices. Thousands of people were attracted, but problems soon arose, as the lots were sold without provision for public services and private efforts to contract for needed services were not satisfactory. In 1958, as the population of the new colonies nearby grew rapidly and conflicts between buyers and sellers intensified, the government passed legislation requiring that any new land sales must include service arrangements. A municipal administration was solidified in 1963, when the localities of Chimalhuacan, La Pas, Texcoco, Ecatepec, and Atenco were agglomerated into the municipality of Nezahualcóyotl, with its headquarters in Ciudad de Nezahualcóyotl. The municipality is connected by highway to Mexico City, sharing several urban and suburban bus lines, and its economy is heavily dependent on the city. Pop. (1990) 1,255,456.

Neẓāmī, in full ELYĀS YŪSOF NEẒĀMĪ GANJAVĪ, NEẒĀMĪ also spelled NIẒĀMĪ (b. *c.* 1141, Ganja, Seljuq empire [now Gyandzha, Azerbaijan]—d. 1209, Ganja), greatest romantic epic poet in Persian literature, who brought a colloquial and realistic style to the Persian epic.

Little is known of Neẓāmī's life. Orphaned at a young age, he spent his entire life in Ganja, leaving only once to meet the ruling prince. Although he enjoyed the patronage of a number of rulers and princes, he was distinguished by his simple life and straightforward character.

Only a handful of his *qaṣīdah*s ("odes") and *ghazal*s ("lyrics") have survived; his reputation rests on his great *Khamseh* ("The Quintuplet"), a pentalogy of poems written in *mas̄navī* verse form (rhymed couplets) and totaling 30,000 couplets. Drawing inspiration from the Persian epic poets Ferdowsī and Sanāʾī, he proved himself the first great dramatic poet of Persian literature. The first poem in the pentology is the didactic poem *Makhzan al-asrār* (*The Treasury of Mysteries*), the second the romantic epic *Khosrow o-Shīrīn* ("Khosrow and Shīrīn"). The third is his rendition of a well-known story in Islāmic folklore, *Leyli o-Mejnūn* (*The Story of Leyla and Majnun*). The fourth poem, *Haft paykar* (*The Seven Beauties*), is considered his masterwork. The final poem in the pentalogy is the *Sikandar* or *Eskandar-nāmeh* ("Book of Alexander the Great"; Eng. trans. of part I, *The Sikander Nama*), a philosophical portrait of Alexander.

Neẓāmī is admired in Persian-speaking lands for his originality and clarity of style, though his love of language for its own sake and of philosophical and scientific learning makes his work difficult for the average reader.

Neziqin (Hebrew: "Damages"), the fourth of the six major divisions, or orders (*sedarim*), of the Mishna (codification of Jewish oral laws), which was given its final form early in the 3rd century AD by Judah ha-Nasi. *Neziqin* deals principally with legally adjudicated damages and financial questions. The 10 tractates (treatises) of *Neziqin* are: *Bava qamma* ("First Gate"), *Bava metziʿa* ("Middle Gate"), *Bava batra* ("Last Gate"), *Sanhedrin* (the supreme executive and legislative body), *Makkot* ("Stripes"), *Shevuʿot* ("Oaths"), *ʿEduyyot* ("Testimonies"), *ʿAvoda zara* ("Idolatry"), *Avot* ("Fathers"), and *Horayot* ("Decisions"). Both the Palestinian and the Babylonian Talmud have Gemara (critical commentaries) on all the tractates, with the exception of *Avot* and *ʿEduyyot*.

Ngada, also called ROKKA, or ROKANESE, tribe inhabiting the south coast of Flores, one of the Lesser Sunda Islands, in Indonesia. They live around the Inerie volcano and inland on the Badjava plateau. Primarily of Proto-Malay stock, they speak a Malayo-Polynesian language of the Ambon-Timor group, and numbered 35,000–40,000 in 1954. Claiming they migrated from Java, the Ngada were formerly hunters. Today they practice both wet (learned from the Dutch) and dry cultivation of rice and also grow corn (maize), millet, and vegetables. Ngada villages are composed of wooden pile houses, organized according to clan territories; land is portioned out to clan members. Descent is patrilineal and matrilineal; the oldest child receives the family inheritance. Marriage is strictly clan endogamous, and although sibling marriage is forbidden, marriage between cousins is encouraged. After marriage, the husband belongs to his wife's clan until full bridewealth is paid. Identified by a common ancestor and a geographic location, clans traditionally acted also as political units until the Dutch instituted the office of *radja.* Originally the Ngada recognized a high god (Déva) and his female component (Nitu), but since 1920 missionaries have worked among the Ngada, and today many Ngada are Roman Catholics.

Ngami, Lake, shallow lake at the southwest corner of the 4,000-square-mile (10,400-square-kilometre) Okavango Swamp in northwestern Botswana. The swamp and the lake are fed by the Okavango River, which loses most of its flow through evaporation in the marshes. Lake Ngami is 3,057 feet (932 m) above sea level. When the explorer David Livingstone first sighted it in 1849, he estimated it to be more than 170 miles (275 km) in circumference, but by 1950 it had become a sea of grass, and during a severe drought in 1965–66 it dried up completely. Because thousands of cattle belonging to the local inhabitants were dependent on the lake for water, the drought caused much hardship. Abundant rains since then have again filled the lake, although it is much smaller than it was when Livingstone first saw it. It is rich in birdlife and contains barbel fish, which are able to survive in mud for months while the lake is dry. Lake Ngami has no natural outlet; if it became filled, the Kunyere and Nghabe valleys would be submerged, and any excess water would be deflected into the Boteti (Botletle) River.

Ngaoundéré, also spelled N'GAOUNDÉRÉ, or N'GAUNDÉRÉ, town, north-central Cameroon, on the Adamawa Plateau. It is the northern terminus of the Trans-Cameroon Railway to Yaoundé and Douala and lies on the major north-south road from Garoua to Bertoua and Yaoundé; by these routes it exports livestock and peanuts (groundnuts) to southern Cameroon. Local development projects focus on animal husbandry. The town's industries include dairying, slaughtering, preparation of hides and skins, perfume manufacture, and cotton ginning. Major bauxite deposits are exploited to the south. Tourism is significant, encouraged by large game reserves to the northeast and northwest. A hospital, an airport, and customs and meteorological stations serve the town.

Ngaoundéré is important as a traditional Fulani capital. It was founded in the first half of the 19th century as a part of the kingdom of Adamawa by the Fulani emir Modibbo Adama. Pop. (1987) 78,210.

Ngasaunggyan, Battle of (1277), Mongol defeat of Burmese troops that led to the demise of the Pagan dynasty of Myanmar (Burma). After unifying China, the Mongol ruler Kublai Khan sent envoys to neighbouring kingdoms, obliging them to accept Mongol vassalage. The Pagan king Narathihapate (reigned 1254–87) shunned the first Mongol embassy and massacred the members of the second. Confident of victory because of recent Burmese conquests of the territory up to Nanchao, Narathihapate advanced boldly into Yunnan in 1277, accompanied by scores of elephants and soldiers. He met the Mongol troops at Ngasaunggyan, where he was decisively defeated. Thereafter Burmese opposition disintegrated. The border fortresses near Bhamo fell in 1283, thus opening the Irrawaddy River valley to invasion. Narathihapate fled southward to Bassein, where he decided to submit to Mongol vassalage, but he was assassinated by his son in 1287. The Mongols, in full control as far south as Pagan, installed a puppet in Myanmar in 1289, thus extinguishing the power of the Pagan dynasty.

Ngata, Sir Apirana Turupa (b. July 3, 1874, Kawaka, N.Z.—d. July 14, 1950, Waiomatatini), political and cultural leader of the Maori community in New Zealand. He was a major force behind the improvement of government policy toward the Maori in the early 20th century.

Earning his law degree in 1897, Ngata became the first Maori graduate of a New Zealand university and worked briefly as a lawyer before becoming active in the nationalist Young Maori Party. In 1905 he began his 39-year term of office in Parliament, representing the eastern Maori constituency. He was knighted in 1927, and he served as minister of native affairs from 1928 to 1934.

In 1931 Ngata inaugurated his Maori land-development plan, which improved the quality of his people's agriculture and expanded the amount of Maori land under cultivation. His efforts to improve educational opportunities for the Maori included the founding of the Maori Purposes Fund to finance school construction.

Deeply committed to the preservation of the Maori culture, Ngata helped to found the Maori Board of Ethnological Research and served as its chairman from 1928 to 1934. His contributions to Polynesian anthropology included a nine-year term as president of the Polynesian society and his *Nga Moteatea* (1929), largely a collection of songs and chants of the various Maori tribes.

A list of the abbreviations used in the MICROPAEDIA *will be found at the end of this volume*

Ngbandi, also spelled GBANDI, also called MOGWANDI, a people of the upper Ubangi (Oubangui) River in southern Central African Republic and northern Zaire. Ngbandi speak a language of the Adamawa-Eastern subgroup of the Niger-Congo family that is related to that of neighbouring Banda and Baya. "Ngbandi" is a term preferred by Belgian ethnographers, while the French include these people with such "Ubangian" peoples as the Banziri, Nzakara, Sango, and Yakoma. The Ngbandi came from what are now the southern regions of The Sudan, converging upon and assimilating a number of small groups in their present lands. Ngbandi of the Bandia clan conquered Azande areas in the 18th century, creating a series of states; they assimilated Azande culture and language and are now indistinguishable from that group.

Rural Ngbandi grow corn (maize), cassava, peanuts (groundnuts), sweet potatoes, lima beans, peppers, pineapples, papayas, and tobacco. Traditionally, men have hunted, fished, and cleared land for cultivation, while women have gathered wild foods and done the hoeing, planting, and harvesting. Rural-urban migration of able-bodied men and women in search of work has been steadily increasing with the growth of the money economy.

The Ngbandi traditionally lived in compact villages consisting of a single row of dwellings. They have been mainly patrilineal, though there have been circumstances in which a man might reside with his maternal uncle. Ngbandi chiefs have acted as arbiters and priests of the ancestral cult central to traditional social life. Polygamy is practiced but has been on the decline for many years.

The Ngbandi were once renowned warriors, and their craftsmen produced lances and knives of high quality that were traded with many neighbouring groups; these are now prized by collectors of African art. Ngbandi also produced elegant curved-neck harps reminiscent of those of their ancestral peoples living in Chad and the southern part of The Sudan.

Ngo Dinh Diem (b. Jan. 3, 1901, Quang Binh province, northern Vietnam—d. Nov. 2, 1963, Cho Lon, South Vietnam), Vietnamese political leader who served as president, with dictatorial powers, of South Vietnam from 1955 until his assassination.

Diem was born into one of Vietnam's noble families. His ancestors in the 17th century had been among the first Vietnamese converts to Roman Catholicism. He was on friendly terms with the Vietnamese imperial family in his youth, and in 1933 he served as the emperor Bao Dai's minister of the interior, but he resigned that same year in frustration at French unwillingness to countenance his legislative reforms. Relinquishing his titles and decorations, he spent the next 12 years living quietly in Hue. In 1945 Diem was captured by the forces of the Communist leader Ho Chi Minh, who invited him to join his independent government in the North, hoping that Diem's presence would win Catholic support. But Diem rejected the proposal and went into self-imposed exile, living abroad for most of the next decade.

In 1954 Diem returned at Bao Dai's request to serve as prime minister of a U.S.-backed government in South Vietnam. After defeating Bao Dai in a government-controlled referendum in October 1955, he ousted the emperor and made himself president of the newly declared Republic of Vietnam (South Vietnam). Diem refused to carry out the Geneva Accords, which had called for free elections to be held throughout Vietnam in 1956 in order to establish a national government. With the south torn by dissident groups and political factions, Diem established an autocratic regime that was staffed at the highest levels by members of his own family. With U.S. military and economic aid, he was able to resettle hundreds of thousands of refugees from North Vietnam in the south, but his own Catholicism and the preference he showed for fellow Roman Catholics made him unacceptable to Buddhists, who were an overwhelming majority in South Vietnam. Diem never fulfilled his promise of land reforms, and during his rule, Communist influence and appeal grew among southerners as the Communist-inspired National Liberation Front, or Viet Cong, launched an increasingly intense guerrilla war against his government. The military tactics Diem used against the insurgency were heavy-handed and ineffective and only served to deepen his government's unpopularity and isolation.

Diem's imprisoning and killing of hundreds of Buddhists, who he alleged were abetting Communist insurgents, finally persuaded the United States to withdraw its support from him. Diem's generals assassinated him during a coup d'état.

Ngo Quyen (b. 897?—d. 944), Vietnamese liberator, known for his military tactics, who founded the first enduring Vietnamese dynasty and laid the foundation for an independent Vietnamese kingdom, which he called Nam Viet.

Ngo Quyen was prefect, under Chinese domination, of Giao Chau province in the valley of the Red River in what is now northern Vietnam. In 938–939 he defeated the Chinese at the Bach Dang River north of modern Haiphong and declared an autonomous kingdom. He established his capital on the Red River at Co Loa, believed to have been the capital of Vietnam's legendary Au Lac dynasty. Ngo Quyen could maintain only a tenuous control over his domain because feudal lords, known as *su quan,* refused to cooperate with his centralized authority. They tried to wrest power from Ngo Quyen, who barely managed to save the throne for his successors.

Ngo Quyen's military tactics, used to expel the Chinese in 939, were imitated by later generals in the course of Vietnamese history. His reign marked a turning point for Vietnam. Although China attacked repeatedly in the centuries to come, the kingdom of Nam Viet remained autonomous until the French seized control in the 19th century.

Ngo Quyen's immediate heirs proved unable to maintain a unified state. After his death in 944, Duong-Binh Vuong Tam-Kha usurped the throne for a brief time—until Ngo Quyen's two sons, Ngo Nam-Tan Vuong Xuong-Van and Ngo Thien-Sach Vuong Xuong-Ngap, finally established a joint rule, which lasted until the collapse of the Ngo dynasty in 954.

Ngo Van Chieu, also called NGO MINH CHIEU (b. 1878, Binh Tay, Vietnam—d. 1926?, Tay Ninh), founder of the Vietnamese religious sect Cao Dai (*q.v.*).

Ngo Van Chieu graduated from a provincial college in My Tho and entered the French colonial immigration service, where he served until 1902. In 1919, during a séance, he received what he conceived to be a revelation calling him to a religious mission. After a period of study and meditation, he announced the formation of Cao Dai (literally meaning "High Tower," a Taoist epithet for the supreme deity). Cao Dai was formally established in 1926 by Le Van Trung, a former government official, who became its leader, or "pope." Cao Dai contains elements of Confucianism, Taoism, Buddhism, and Roman Catholicism.

Ngonde (people): *see* Nyakyusa.

Ngoni, also called ANGONI, ABANGONI, MANGONI, and WANGONI, approximately 12 groups of people of the Nguni (*q.v.*) branch of Bantu-speaking peoples that are scattered throughout eastern Africa. Their dispersal was due to the rise of the Zulu empire early in the 19th century, during which many refugee bands moved away from Zululand. One Ngoni chief, Zwangendaba, led his party to Lake Tanganyika; the descendants of his group, the Ngoni cluster proper, are located in northern Malaŵi, in Zambia, and in southern Tanzania. Another group found its way to Mozambique.

Each Ngoni group formed a small independent state with a central administration based on patrilineal succession. It raided its weaker neighbours, and when the fertility of its own cultivated area was exhausted, the group moved elsewhere.

The superior Ngoni military organization, based, like that of the Zulu, on universal conscription into age-set regiments, enabled them to capture many of the people whose lands they seized or pillaged. Some captives were sold as slaves to Arabs, but many were assimilated into the tribe, some achieving high rank in the army and administration. Despite losses from warfare, the population increased greatly, leading eventually to splits in the state and the dispersal of rival segments.

Internally, each state, at least among Zwangendaba's people, was divided into several such segments, many of which were under the nominal leadership of queens.

The settlement pattern was characterized by large, compact villages surrounding a central cattle pen. Villages were built quite close to one another and might contain 2,000 or 3,000 inhabitants. A belt of empty land surrounded the settled area, separating it from the territories of the tribes raided by the Ngoni.

At the end of the 19th century, Portuguese, British, and German forces invaded the areas in which the Ngoni had been unchallenged for 50 years, and by 1910 all Ngoni had come under colonial control.

Ngorongoro Crater, extinct volcanic crater (caldera) in the Great Rift Valley, northern Tanzania. It lies 75 miles (120 km) west of the town of Arusha. The crater measures between 10 and 12 miles (16 and 19 km) across and has an area of 102 square miles (265 square km). Its rim rises to 7,500 feet (2,286 m), while its floor is 2,000 feet (600 m) below the rim. The crater is thought to have formed about 2,500,000 years ago from a large active volcano whose cone collapsed inward after a major eruption, leaving the present extremely large caldera as its chief remnant. The crater is home to a great array of African wildlife, including elephant, rhinoceros, lion, buffalo, zebra, reedbuck, and Thomson's gazelle. Flamingos frequent shallow Lake Magadi, a soda lake on the crater's floor. The local Masai people also graze their livestock in the crater.

Valley floor of the Ngorongoro Crater

Lynn McLaren—Photo Researchers, Inc.

The Ngorongoro Crater became part of Serengeti National Park in 1951 but was made a separate conservation area in 1959. It is the focus of one of Africa's major wildlife conservation areas and has an overwhelming "crater-of-the-Moon" appearance.

Ngoy, former kingdom on the Atlantic coast of Central Africa, just north of the Congo (Zaire) River, in an area that is now part of southern Cabinda (an exclave of Angola) and western Zaire. It was founded by Bantu-speaking people about the 15th century. The domestic and foreign slave trade rapidly became a major feature of the economy, with the port of Cabinda serving as the locus of foreign trade. When the Portuguese built a fort in Cabinda in 1783, Ngoy allied with neighbouring Kakongo and with the French to destroy it. Exporting slaves gradually brought wealth and power to the Ngoy nobility at the expense of the king, who was rendered ineffectual. The kingdom finally disintegrated into petty principalities after the nobles failed to elect a new king in the 1830s.

Ngozi, town, north-central Burundi. It is a market centre located at an elevation of about 5,740 feet (1,750 m). The surrounding area supports cattle raising and the growing of coffee, bananas, cassava, sweet potatoes, beans, and corn (maize). Other important activities in the region include the mining of cassiterite (a tin ore) and the processing of tea. There is a government hospital in Ngozi, as well as places of worship for Roman Catholics, Protestants, and Muslims. A road to the south links Ngozi with Gitega town, Burundi's second-largest town and a centre of trade and important services. Pop. (1990) town, 14,511.

Ngubane, Jordan Kush, Kush also spelled KHUSH (b. Nov. 15, 1917, Ladysmith, Natal [now KwaZulu/Natal], S.Af.—d. 1985), Zulu novelist, scholar, and editor for the South African publications *Ilanga lase Natal* ("The Natal Sun," Durban), *Bantu World* (Johannesburg), and *Inkundla ya Bantu* ("Bantu Forum," Verulam).

Ngubane took his degree at Adams College, near Durban. Because of increasing pressures, he moved his family in 1962 to Swaziland, where he farmed a modest property and did occasional writing. In 1969 he went to the United States on a Ford Foundation grant to teach at Howard University, Washington, D.C. He returned in the spring of 1980 to his Zulu homeland to accept a cabinet post as minister of information.

Ngubane worked closely with the Zulu chief Albert Lutuli during the latter's busiest period, from 1940 until he was awarded the Nobel Prize for Peace (1960).

Ngubane's one Zulu-language novel, *Uvalo Lwezinhlonzi* (1957; "His Frowns Struck Terror"), was popular when it appeared and was even a required school text before being banned from 1962 to 1967. His nonfictional works include *An African Explains Apartheid* (1963) and *Conflict of Minds* (1979). In 1979 he published a long study analyzing similarities and differences between the racial problems in the United States and in South Africa. He also published some poetry and short fiction. In 1974 Ngubane published his only English-language novel, *Ushaba: The Hurtle to Blood River;* he referred to the book as a "Zulu

Umlando," which he defined as "a story of ideas in action." "The narrator or *umlandi* is a witness of history," he wrote, and "as a rule, his authority rests on the fact that he was present at the critical moment when history took a new turn.... He deals with idea-forms, the subjective-moulds in which events are first cast."

Consult the INDEX *first*

Ngugi wa Thiong'o, original name JAMES THIONG'O NGUGI (b. Jan. 5, 1938, Limuru, Kenya), East Africa's leading novelist, whose popular *Weep Not, Child* (1964) was the first major novel in English by an East African. As he became sensitized to the effects of colonialism in Africa, he adopted his traditional name and wrote in the Bantu language of Kenya's Kikuyu people.

Ngugi received bachelor's degrees from Makerere University, Kampala, Uganda, in 1963 and from Leeds University, Yorkshire, Eng., in 1964. After doing graduate work at Leeds, he served as a lecturer in English at University College, Nairobi, Kenya, and as a visiting professor of English at Northwestern University, Evanston, Ill., U.S. From 1972 to 1977 he was senior lecturer and chairman of the department of literature at the University of Nairobi.

The prizewinning *Weep Not, Child* is the story of a Kikuyu family drawn into the struggle for Kenyan independence during the state of emergency and the Mau Mau rebellion. *A Grain of Wheat* (1967), generally held to be artistically more mature, focuses on the many social, moral, and racial issues of the struggle for independence and its aftermath. A third novel, *The River Between* (1965), which was actually written before the others, tells of lovers kept apart by the conflict between Christianity and traditional ways and beliefs and suggests that efforts to reunite a culturally divided community by means of Western education are doomed to failure. *Petals of Blood* (1977) deals with social and economic problems in East Africa after independence, particularly the continued exploitation of peasants and workers by foreign business interests and a greedy indigenous bourgeoisie. In a novel written in Kikuyu and English versions, *Caitaani Mutharaba-ini* (1980; *Devil on the Cross*), Ngugi presents these ideas in an allegorical form. Written in a manner meant to recall traditional ballad singers, the novel is a partly realistic, partly fantastical account of a meeting between the Devil and various villains who exploit the poor.

The Black Hermit (1968; produced 1962) was the first of several plays, of which *The Trial of Dedan Kimathi* (1976; produced 1974), cowritten with Micere Githae Mugo, is considered by some critics to be his best. He was also coauthor, with Ngugi wa Mirii, of a play first written in Kikuyu, *Ngaahika Ndeenda* (1977; *I Will Marry When I Want*), the performance of which led to his detention for a year without trial by the Kenyan government. (His book *Detained: A Writer's Prison Diary*, which was published in 1981, describes his ordeal.) The play attacks capitalism, religious hypocrisy, and corruption among the new economic elite of Kenya. *Matigari ma Njiruungi* (1986; *Matigari*) is a novel in the same vein.

Ngugi presented his ideas on literature, culture, and politics in numerous essays and lectures, which were collected in *Homecoming* (1972), *Writers in Politics* (1981), *Barrel of a Pen* (1983), and *Moving the Centre* (1993). In *Decolonising the Mind: The Politics of Language in African Literature* (1986), Ngugi argued for African-language literature as the only authentic voice for Africans and stated his own intention of writing only in Kikuyu or Kiswahili from that point on. Such works earned him a reputation as one of Africa's most articulate social critics.

Nguni, cluster of related Bantu-speaking ethnic groups living in South Africa, Swaziland, and Zimbabwe, whose ancestors inhabited a broad band of upland territory extending from the Great Fish River, in what is now Eastern Cape province, northward to Kosi Bay, near the border of KwaZulu/Natal and Mozambique, that paralleled the Indian Ocean. Although the people of this zone originally spoke a Bantu language in common, with only subtle and gradual linguistic variations, distinct (and mostly mutually unintelligible) Bantu languages developed during the late 19th and early 20th centuries—*e.g.,* Xhosa, Zulu, and Swazi. The Nguni languages are unique among Bantu languages in that they have imploded "clicking" phonemes. These sounds were absorbed into the language through the Ngunis' intermarriage with the area's earlier Khoisan-speaking peoples, whose languages were characterized by such click sounds.

At the start of the 19th century the Nguni were divided into a number of political entities. Each had its own chief, who was drawn from any of a number of recognized chiefly lineages that had both political and ritual powers. These groups included the Ndlambe, Gcaleka, Thembu, Mpondo, Mpondomise, Bhaca, Hlubi, Mtethwa, and Zulu. The people dwelling in these polities cultivated millet and kept a large number of cattle, which had both a subsistence role and a social role in Nguni society. There was a distinct division of labour: women were associated with hoe cultivation and men with cattle husbandry. The Nguni followed patterns of patrilineal descent and virilocal residence and practiced exogamous marriage, with wives obtained legally through the transfer of cattle as bridewealth (*lobola*).

The Nguni way of life changed greatly during the 19th century. One of the major factors was the Mfecane ("The "Crushing"), a period of wars and resettlement begun in the 1820s by Shaka, king of the Zulu. Shaka created an expansive Zulu state that waged war on neighbouring peoples, causing them to be incorporated into the Zulu state or to flee as refugees. These refugees, copying the new military discipline and the strategy developed by Shaka, were able to conquer other African peoples and to establish new states throughout southern and central Africa. These included the Ndebele state in southwestern Zimbabwe, under Mzilikazi; the Gaza state in southern Mozambique, under Soshangane; the Swazi state in Swaziland, under the Dlhamini family; and a cluster of Ngoni states in Tanzania, Zambia, and Malaŵi, under the successors of the Ngoni leader Zwangendaba.

Another major event, less cataclysmic yet more far-reaching in its impact, was the gradual undermining of Nguni society by expanding European power. A series of wars were fought between the southern Nguni peoples and the Europeans in the Cape of Good Hope. In piecemeal fashion the southern Nguni were conquered, their lands occupied, and their cattle seized, thus forcing large numbers of Nguni men to become migrant labourers throughout southern Africa. This process, gradual at first, accelerated sharply in the period after 1886, when large gold deposits were discovered in the Witwatersrand.

The process of industrialization sparked by the gold mines has continued throughout the 20th century, requiring large numbers of workers. In this capacity, the Nguni speakers have become one of the main underpinnings of the economy and are found as urban people throughout South Africa, rather than exclusively in the areas from which they had originally derived.

Despite the urbanization of the Nguni, the South African government, through much of the 20th century, attempted to maintain "traditional" Nguni cultural institutions and chiefs in rural areas under its system of apartheid and separate black states. Many contemporary Nguni-speaking peoples, however, were born in urban areas and have little connection with the rural areas of their ancestors. In consequence of this development, Nguni may best be considered as a linguistic term, with its cultural associations largely eroded.

Nguru, town, northwestern Yobe state, northern Nigeria, near the Hadejia River, a seasonal tributary of the Komadugu Yobe River, which flows into Lake Chad. Precisely when the town was founded is unknown, but by the early 16th century it had been incorporated into the Bornu kingdom (*see* Kanem-Bornu) of the Kanuri people and was the seat of the *galadima,* the Bornu governor of the western provinces. Nguru's location in the disputed area between the Hausa states and Bornu led it to be temporarily occupied by the forces of Muḥammad Kisoki, the Hausa king (1509–65) of Kano, 150 miles (240 km) west-southwest. Nguru was also the site about 1561 of the major victory by Kebbi, a Hausa state to the west, over Bornu; but Bornu succeeded in regaining the town shortly thereafter. Nguru once again became the seat of the *galadima* about 1808, when Fulani warriors almost destroyed the town in their victorious jihad, or holy war.

Since the arrival of the railroad in 1929, Nguru has become one of Nigeria's major collecting points for gum arabic, and it also ships peanuts (groundnuts), cotton, meat, hides, and skins by rail to Lagos. A modern abattoir and refrigeration plant was built there in the 1960s to process the cattle and goats pastured during the dry season in the Hadejia valley. The town serves as the chief trade centre (sorghum, millet, peanuts, cowpeas, cotton) for the nearby predominantly Muslim Kanuri, Bede (Bedde), and Manga peoples. Nguru is the northeastern terminus of the railway branch from Zaria and Kano. It is also served by a local highway that connects it with the main highway network at Damaturu, to the southeast. Pop. (1991 est.) 87,660.

Nguyen DYNASTY (1802–1945), the last Vietnamese dynasty, which was founded and dominated by the powerful Nguyen family. The Nguyen family emerged into prominence in the 16th century, when Vietnam was under the Le dynasty (*see* Later Le dynasty).

After Mac Dang Dung usurped the Vietnamese throne in 1527, Nguyen Kim fought to restore a Le emperor in 1533, leaving the Mac family in power in the northern section of the country. Members of the Nguyen family acted as mayors of the palace to the weak Le rulers, but by the mid-16th century this role passed to the Trinh family (*q.v.*), and Nguyen power became associated with the southernmost sections of the Vietnamese state. Longstanding rivalry between the Nguyen and the Trinh became open warfare in 1620, with hostilities continuing intermittently until 1673. By that date both families accepted a de facto division of the Vietnamese state.

Although never accorded royal status by the Chinese, the Nguyen ruled over southern Vietnam in an essentially independent fashion. During the 17th and 18th centuries the Nguyen encouraged Vietnamese settlement into lands formerly occupied by the Chams and the Cambodians. Much of the settlement of Cham and Cambodian lands, however, was done by Chinese refugees fleeing the collapse of the Ming dynasty. The Chinese were actively courted by the Nguyen, who were in desperate need of manpower in order to resist the encroachment of their northern rivals, the Trinh, and to expand their territorial base southward. Cho-lon, Bien Hoa, and many other towns in the Mekong River delta and along the southern coast were founded at this time on the sites of Chinese emporia (*phô*).

Nguyen power in southern Vietnam was challenged and nearly eclipsed by the revolt of the Tay Son brothers (*q.v.*) that broke out in 1771. A young prince, Nguyen Anh, survived to lead an eventual recovery of Nguyen territory and finally to become the emperor Gia Long (*q.v.*), who ruled over the whole of Vietnam from 1802 and was the founder of the Nguyen dynasty.

Modeling their administration after that of the Chinese Ch'ing dynasty (1644–1911), the Nguyen, particularly after Gia Long's death in 1820, followed a conservative policy that opposed foreign missionary activity in Vietnam. The French, partly as a result of this antimissionary policy, invaded Vietnam in 1858, initially landing at Tourane (Da Nang), and then establishing a base at Saigon. They forced the emperor Tu Duc (*q.v.*), then facing revolts elsewhere, to cede the three eastern provinces of southern Vietnam, called Cochinchina (*q.v.*) by the French, to France in 1862. Five years later the French gained control of all Cochinchina. French control over the whole of Vietnam was established following invasions in 1883–85, and Vietnam's ancient vassalage relationship with China was ended. The Nguyen dynasty was, however, retained in Hue with nominal control over central Vietnam, called Annam (*q.v.*) by the French, and over northern Vietnam, called Tonkin (*q.v.*). Cochinchina, in contrast, had the status of a colony. The French continued to dominate the throne until 1945, when the last emperor, Bao Dai (*q.v.*), abdicated, following the Vietnamese Nationalist forces' proclamation of independence. Bao Dai served as chief of state from 1949 until he was deposed by Ngo Dinh Diem in a national referendum in 1955.

Nguyen Bun Dao (Vietnamese emperor): *see* Khai Dinh.

Nguyen Cao Ky (b. Sept. 8, 1930, Son Tay, northern Vietnam), South Vietnamese military and political leader known for his flamboyant manner and militant policies.

A member of the French forces that opposed the Vietnamese liberation movement, Ky joined the South Vietnamese Air Force after the nation was partitioned in 1954. He attracted much attention because of his vehement anticommunism, as well as his bravado, and was highly favoured by U.S. advisers in Vietnam. As a result he was named commander of South Vietnam's air force after the 1963 overthrow of the Ngo Dinh Diem government. With U.S. aid, Ky soon built up a fighting force of 10,000 men.

In June 1965 Ky, together with Major General Nguyen Van Thieu and General Duong Van Minh, led a military coup in unseating the government of Premier Phan Huy Quat. As the head of that triumvirate, Ky provoked widespread opposition to his authoritarian policies. In 1967 the top military leaders reached an agreement by which Thieu would run for president and Ky for vice president of a new regime. Unhappy with his new position, Ky became an outspoken critic of Thieu's administration. In 1971 he attempted to oppose Thieu for the presidency but was forced to remove himself as a candidate and returned to the air force. Upon the fall of South Vietnam in April 1975, Ky fled to the United States.

After coming to the United States Ky made tours, lecturing at several universities and promoting his book, *Twenty Years and Twenty Days,* published in 1976.

Nguyen Du, in full NGUYEN-DU THANH-HIEN, pseudonym TO NHU (b. 1765, Tien Dien, Vietnam—d. Aug. 10, 1820, Hue), best-loved poet of the Vietnamese and creator of the epic poem *Kim van Kieu,* written in *chu-nom* (southern characters). He is considered by some to be the father of Vietnamese literature.

Nguyen Du passed the mandarin examinations at the age of 19 and succeeded to a modest military post under the Le dynasty. He served the Le rulers, as his family had done for generations, until their dynasty fell in 1787. Nguyen Du was for a period associated with efforts to restore the Le to power, but, unable to achieve this goal, he withdrew to the mountains of Hong Linh near his native village. When in 1802 the new Nguyen ruler Gia Long succeeded in uniting the country and called Nguyen Du to court, he reluctantly obeyed and subsequently held many official posts.

While serving in Quang Binh in northern Vietnam in 1813, he attained the rank of Column of the Empire and was subsequently appointed head of a delegation to Peking. During this mission he translated a Chinese novel, dating from the Ming period, into Vietnamese poetry as *Kim van Kieu* (English translation by Huynh Sanh Thong, *The Tale of Kieu: The Classic Vietnamese Verse Novel*; 1973). As an exploration of the Buddhist doctrine of karmic retribution for individual sins, his poem expresses his personal suffering and deep humanism. He also wrote "Words of a Young Hat Seller," a shorter poem in a lighter vein; *Chieu hon* ("Address to the Dead"); and many other poems in Chinese rather than Vietnamese.

Nguyen Du was assigned to two other ambassadorial missions to Peking; before he was able to depart on the last one, however, he died of a long illness for which he stoically refused treatment.

Nguyen Hue (Vietnamese revolutionary leader): *see* Tay Son brothers.

Nguyen Huu Tho (b. July 10, 1910, Cho Lon, southern Vietnam—d. Dec. 24, 1996, Ho Chi Minh City, Vietnam), chairman of the National Liberation Front (NLF), the South Vietnamese political organization formed in 1960 in opposition to the U.S.-backed Saigon government.

The son of a rubber-plantation manager who was later killed during the First Indochina War (1946–54), Nguyen Huu Tho studied law in Paris in the 1930s. Returning to Saigon, he set up practice, remaining politically inactive until 1949, when he led student demonstrations against the French; he also organized protests in 1950 against the patrolling of the southern Vietnamese coast by U.S. warships. He was imprisoned and won popular acclaim for his prolonged hunger strike in protest of the war.

After the Geneva Agreements had divided Vietnam into northern and southern zones in 1954, Tho cooperated with the southern regime of Ngo Dinh Diem until he was arrested for advocating nationwide elections on reunification. Except for a short interval in 1958, Tho remained in prison from 1954 to 1961, when he escaped with the aid of some of his anti-Diem followers. These men, who had recently formed the National Liberation Front, made Tho, a noncommunist, provisional and then full-time chairman of the NLF.

Tho essentially served as a figurehead leader, while real power in the NLF was held by its military arm, the Viet Cong, and by veteran communists who reported directly to the North Vietnamese leadership. Tho helped attract a wide spectrum of South Vietnamese supporters to the NLF. In June 1969 the NLF established a Provisional Revolutionary Government (PRG) with Huynh Tan Phat as president and Nguyen Huu Tho as chairman of its advisory council. The PRG, in effect, became the government of South Vietnam in April 1975, when the Saigon government's troops surrendered to the North Vietnamese and PRG forces. Tho was made a vice president of Vietnam in 1976, a post he held until 1980, when he became acting president. In 1981 Tho was made vice president of the Council of State, as well as chairman of the Standing Committee of the National Assembly.

Nguyen Khanh (b. 1927), military and political leader who participated in a successful coup d'état against the South Vietnamese dictator, President Ngo Dinh Diem, in 1963 and served briefly as president of South Vietnam in 1964.

Khanh served in the French colonial army until 1954 and rose through the ranks of the Vietnamese army to become chief of staff to General Duong Van Minh. He joined Minh and other high military officials in assassinating Diem on Nov. 1, 1963, and led a countercoup against Minh in 1964. Khanh administered the government of South Vietnam in January–October 1964. His regime was undermined by several coups; he himself resigned once. After General Nguyen Cao Ky took control of the government in February 1965, Khanh was named roving ambassador but was, in effect, exiled to the United States.

Nguyen Tri Phuong (b. 1806, near Saigon [now Ho Chi Minh City], Vietnam—d. Nov. 20, 1873, Hanoi), general dedicated to protecting Vietnam from European influence and military conquest by France. He was a conservative and a close adviser to the emperor Tu Duc (reigned 1847–83).

The son of a provincial administrator, Nguyen Tri Phuong entered the military service and distinguished himself by repelling the Siamese invasion of Chau Doc, on the Cambodian border, and recapturing Ha Tien. At the death of General Truong Minh Giang in 1841, Nguyen Tri Phuong was named as his successor and became viceroy of lower Cochinchina (modern southern Vietnam).

Nguyen Tri Phuong linked himself to the monarchy by arranging the marriage of one of his daughters to Tu Duc, becoming one of the most powerful ministers at the court of Hue. Together, he and Tu Duc kept Vietnam closed to the West but, in refusing to adopt Western technology, left the country backward and vulnerable to conquest by the French.

Nguyen Tri Phuong delayed French conquest by his defense against Admiral Charles Rigault de Genouilly at Tourane (now Da Nang) in 1859, but he was decisively beaten in 1861 by Admiral Léonard Charner at Chi Hoa, near Saigon (now Ho Chi Minh City), and France was ceded several southern provinces. His final defeat in 1873 occurred in the defense of the Hanoi citadel. Taken prisoner, he availed himself of a traditional Vietnamese means of political and moral protest by tear-ing at his bandages and starving himself to death.

Nguyen Truong To (b. 1828, Nghe An province, Vietnam—d. 1871), an early advocate of modernization and political reform in Vietnam who was among the first Vietnamese to travel abroad and to realize the adjustments his country needed in order to survive.

A convert to Roman Catholicism, Nguyen Truong To traveled with French priests to Italy and France; upon his return to Vietnam in the 1860s, he was received by Emperor Tu Duc, to whom he advocated modernization. In 1866 Tu Duc sent him back to Europe as an official emissary to purchase equipment and to engage Western specialists for the introduction of modern technology into Vietnam. The project, however, was never realized because the French conquest of southern Vietnam in 1867 persuaded the emperor, on the advice of his mandarins, to pursue a policy of isolation from the West.

Nguyen Truong To advocated stringent political and economic reforms, fighting the conservative elements at court. He urged a reduction in the number of officials and an increase in their responsibilities and salaries in order to fight corruption. He also advocated political cooperation with all foreign powers on the basis of equality to prevent any single power from gaining ascendancy. His other suggestions included governmental, social, and educational reforms, the use of Western technological knowledge and scientific equipment in order to exploit the natural resources of the country, and the elimination of Chinese characters in Vietnamese writing. Nguyen Truong To's repeated demands brought severe reprisals from the court. Vietnam's leaders refused to listen to his reasoning and tried in vain to keep the modern world out of the country.

Nguyen Van Thieu (b. April 5, 1923, Tri Thuy, Ninh Thuan province, Vietnam), president of the Republic of Vietnam (South Vietnam) from 1967 until the republic fell to the forces of North Vietnam in 1975.

The son of a small landowner, Thieu joined the communist-oriented Viet Minh in 1945 but later fought for the French colonial regime against the Viet Minh. In 1954 he was put in charge of the Vietnamese National Military Academy and, after 1956, continued to serve under the regime of Ngo Dinh Diem in South Vietnam.

Thieu played an important part in a successful coup against Diem in 1963. In 1965 he became chief of state in a military government headed by Premier Nguyen Cao Ky. In 1967 he was elected president under a new constitution promulgated in that year. He was reelected without opposition in 1971.

Thieu's emergence coincided with the beginning of major U.S. intervention in the war against the Viet Cong insurgents and North Vietnam. Despite criticism of the authoritarian nature of his regime, he retained the support of the United States throughout the administrations of the U.S. presidents Lyndon B. Johnson and Richard M. Nixon. He continued to consolidate his power after the peace agreements of 1973 (in which his government was a somewhat reluctant participant) and the withdrawal of U.S. troops from South Vietnam.

Communist gains in South Vietnam's northern provinces early in 1975 prompted Thieu to recall troops to defend the capital city, Saigon (now Ho Chi Minh City). Badly managed, the retreat turned into a rout, allowing communist forces to surround the capital. After resisting for several days, Thieu was persuaded that his resignation might permit a negotiated settlement of the war. On April 21, 1975, in a speech denouncing the United States, he resigned in favour of his vice president, Tran Van Huong, and shortly afterward left the country. He went first to Taiwan and later to England, taking up residence in Surrey.

Nguyen Van Thinh (d. Nov. 10, 1946, Saigon [now Ho Chi Minh City], Vietnam), Vietnamese statesman who in 1946 served briefly as president of a French-controlled government of Cochinchina (southern Vietnam).

Thinh was a French citizen—a privilege granted to select Vietnamese nationals during the French rule of Vietnam. After World War II he helped plan an allegedly free Vietnamese republic created by the French in early 1946. Thinh's official title was president of the provisional government of the Republic of Cochinchina, but the republic was actually controlled by the French. Feeling dishonoured by his ineffectual role, Thinh committed suicide.

Nguyen Vinh Thuy (Vietnamese emperor): *see* Bao Dai.

Ngwenyama: *see* Sobhuza II.

Nha Trang, port city, southeastern Vietnam. The city lies at the mouth of the Cai River, 256 miles (412 km) northeast of Ho Chi Minh City (formerly Saigon). Its history is known as far back as the 3rd century AD, when, as part of the independent land of Kauthara, a Champa kingdom, it acknowledged the suzerainty of Funan. In 1653 it was incorporated into the territory of the Nguyen lords of southern Vietnam and after 1802 into the kingdom of Vietnam. After 1862 Nha Trang was acquired by the French, who in 1895 established there the Pasteur Institute for research in tropical diseases. In 1912 the Saigon-Hanoi railway reached the town.

Nha Trang is a fishing port that has oil-storage facilities. It also has a fine, sandy beach, and under the French it became a seaside resort. On the north bank of the Cai River, opposite Nha Trang, is the village of Thon Cu Lao, behind which, on a granite knoll, sits Po Nagar ("Lady of the City"), a well-preserved cluster of four Cham shrines dedicated to Śiva and erected or rebuilt between the 7th and 12th century. Nha Trang is the site of the University of Fishery and Marine Products. Pop. (1989) 213,460.

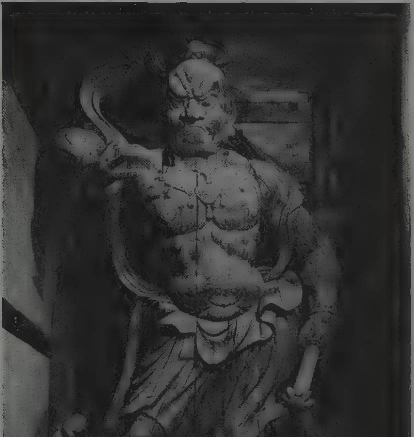
Ni-ō (Japanese: "Two Kings"), in Japanese Buddhist mythology, protector of the Buddhist faith, who makes a dual appearance as the guardian on either side of temple gateways. The guardian on the right side is called Kongō ("Thunderbolt"), or Kongō-rikishi; he holds a thunderbolt, with which he destroys evil, and is associated with the bodhisattva ("Buddha-to-be") Vajrapāṇi. The guardian on the left side of the gateway is called Misshaku, or Misshaku-rikishi. The two are depicted as gigantic figures, either heavily armoured or with naked chests and flowing scarves, as seen in the superbly spirited 13th-century guardians of the Tōdai Temple at Nara, Japan.



Ni-ō at the south gate of the Tōdai Temple, Nara, Japan; wood sculpture by Unkei, 1203

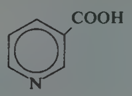
Asuka-en

Ni Tsan, Pinyin NI ZAN, original name NI YÜN-LIN (b. 1301, Wu-hsi, Kiangsu province, China—d. 1374), one of the group of Chinese painters later known as the Four Great Masters of the Yüan dynasty (1206–1368).

Although Ni Tsan was born to wealth, he declined to serve the foreign Mongol dynasty of the Yüan and instead lived a life of retirement and cultivated the scholarly arts (of poetry, painting, and calligraphy), collected artistic works of the past, and associated with those of a similar temperament. He was characterized by his contemporaries as particularly quiet and fastidious, and many of those qualities are found in his paintings. He was much imitated by later painters, and therefore originals by him are difficult to authenticate. Generally it may be said that his paintings, usually landscapes, are spare in elements and are in ink monochrome only and that great areas of the paper are left untouched. There is often a rustic hut, without any further suggestion of human presence, a few trees and other scant indications of plant life, and elemental landforms with a sombre quiet throughout.

The art of Ni Tsan and his peers in the Yüan dynasty was opposed to the preceding standards of the Southern Sung academy, whose art immediately appealed to the eyes through obvious displays of virtuoso brushwork and a convincing pictorial reality. Ni Tsan's new style demanded concentrated viewing before the larger and, in fact, more complex plays of ink could be perceived. Toward the end of his life Ni Tsan is said to have distributed all his possessions among his friends and adopted the life of a Taoist recluse, wandering and painting in his mature style. After the restoration of Chinese rule under the Ming dynasty in 1368, he returned to urban life.

niacin, also called NICOTINIC ACID, or VITAMIN B_3, water-soluble vitamin of the B complex; it is also called the pellagra-preventive vitamin, or vitamin PP, because an adequate amount in the diet prevents pellagra, a chronic disease characterized by skin lesions, gastrointestinal disturbance, and nervous symptoms. Niacin is interchangeable in metabolism with its amide, niacinamide (nicotinamide). Like vitamin B_1 (thiamine) and vitamin B_2 (riboflavin), it is a coenzyme involved in the metabolism of carbohydrates and acts to catalyze the oxidation of sugar derivatives and other substances.



Niacin

Niacin, which was identified as a pellagra preventive in 1937, is widely distributed among plants and animals. Lean meat is generally a good source. Approximately 10 to 20 milligrams per day (1 milligram = 0.001 gram) of nicotinic acid is required by humans. In the intestinal tract, the amino acid tryptophan can be converted to niacin by bacterial action and thus can serve as a source for part of the niacin required by the animal.

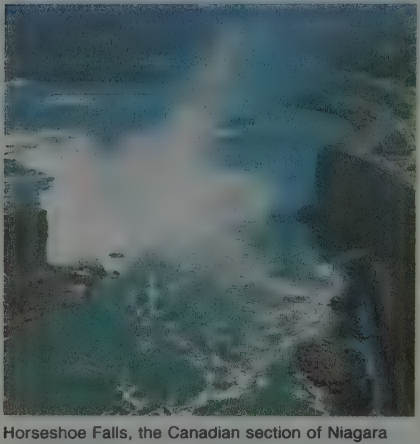
This explains scientists' early observation that the protein in such foods as eggs and milk, both poor sources of niacin, can nevertheless prevent or cure pellagra in humans.

Niacin is one of the most stable vitamins, resisting most cooking and preserving processes. It is prepared commercially from β-picoline or from quinoline, which are both obtainable from coal tar.

Niagara (Ontario, Canada): *see* Niagara-on-the-Lake.

Niagara Escarpment, also called LAKE RIDGE, ridge in North America that extends (with breaks) for more than 650 miles (1,050 km) from the Door Peninsula, in eastern Wisconsin, U.S., through the Manitoulin Islands, Ontario, Can., in northern Lake Huron, southward across the Bruce Peninsula, and then eastward around the southwestern end of Lake Ontario. It marks a portion of the shoreline (molded by glaciation and water erosion) of an ancient sea. The ridge crosses the Canadian–United States boundary at Niagara Falls and terminates just east of Rochester, N.Y. Its forested crest, sloping steeply toward the north, stands from 250 to 1,000 feet (75 to 300 m) above the surrounding lowlands. Several rivers, notably the Niagara, have cut gorges through the scarp, leaving recessed cataracts, including the famous Niagara Falls. Such cities as Rochester have grown up adjacent to cataracts (Genesee Falls), taking advantage of the cheap power supply. The escarpment also shelters the intensive Niagara fruit belt along the southern shore of Lake Ontario.

Niagara Falls, cataract on the Niagara River in northeastern North America, one of the continent's most famous spectacles. The falls lie on the border between Ontario, Can., and New York state, U.S. For many decades the falls were an attraction for honeymooners and for such stunts as walking over the falls on a tightrope or going over them in a barrel. Increasingly, however, the appeal of the site has become its beauty and uniqueness as a physical phenomenon.



Horseshoe Falls, the Canadian section of Niagara Falls, Ontario
ISTC

The falls are in two principal parts, separated by Goat Island. The larger division, adjoining the left, or Canadian, bank, is Horseshoe Falls; its height is 185 feet (56 m), and the length of its curving crest line is about 2,200 feet (670 m). The American Falls, adjoining the right bank, are 190 feet (58 m) high and 1,060 feet (320 m) across.

The shaping of the Niagara gorge downriver and the maintenance of the falls as a cataract depend upon peculiar geologic conditions. The rock strata from the Silurian Period (438 to 408 million years ago) in the Niagara gorge are nearly horizontal, dipping southward only about 20 feet per mile (almost 4 m per km). An upper layer of hard dolomite is underlain by softer layers of shale. Water exerts hydrostatic pressure and slowly dissolves the dolomite after infiltrating joints caused by glaciation and subsequent uplift. Dolomite blocks fall away as water from above also infiltrates and erodes the shale. The disposition of the rock strata provides the conditions for keeping the water constantly falling vertically from an overhanging ledge during a long period of recession (movement upstream).

The water flowing over the falls is free of sediment, and its clearness contributes to the beauty of the cataract. In recognition of the importance of the waterfall as a great natural spectacle, the province of Ontario and the state of New York retained or acquired title to the adjacent lands and converted them into public parks.

In recent years the very large diversion of water above the falls for power purposes has lessened the rate of erosion. Elaborate control works upstream from the falls have maintained an even distribution of flow across both the U.S. and Canadian cataracts, and the curtains of the waterfalls have been maintained. A large part of the great river above the falls is diverted and disappears into four great tunnels for use in the power plants downstream. Owing to concern over the possibility of major rockfalls, water was diverted from the American Falls in 1969, and some cementing of the bedrock was done; an extensive boring and sampling program was also carried out. River flow was returned to the American Falls in November of that year, and it was decided that safety measures for the viewing public should be implemented and that measures to stem natural processes were both too expensive and undesirable.

Excellent views of the falls are obtained from Queen Victoria Park on the Canadian side; from Prospect Point of the U.S. side at the edge of the American Falls; and from Rainbow Bridge, which spans the Niagara gorge about 1,000 feet (300 m) downstream from Prospect Point. Visitors may cross from the U.S. shore to Goat Island by footbridge and may take an elevator to the foot of the falls and visit the Cave of the Winds behind the curtain of falling water. The Horseshoe Falls, which carry about 90 percent of the river's discharge, receded upstream at an average rate of about 5.5 feet (1.7 m) per year in 1842–1905. Thereafter control works and diversion of water decreased the erosion.

Niagara Falls, city, regional municipality of Niagara, southeastern Ontario, Canada. It lies on the left bank of the Niagara River, opposite Niagara Falls, N.Y. Development of the city, which was named Elgin in 1853, began with the completion in 1855 of the first suspension bridge across the Niagara gorge. The city was renamed Clifton in 1856 and received its present name in 1881. In 1963 it merged with Stamford Township, increasing its area 12-fold. The city's importance is due largely to the cataract, which is a major source of electrical power for Ontario and is one of the nation's most popular tourist attractions. Now connected to Niagara Falls, N.Y., by three bridges, including the Rainbow and Whirlpool Rapids bridges, the city is also a customs port and industrial centre. Manufactures include electrochemicals, fertilizers, abrasives and refractories, silverware, cereals, machinery, sporting equipment, paper goods, and food products. Queen Victoria Park stretches along the bank of the river above and below the falls and includes the Oakes Garden Theatre. Inc. 1904. Pop. (1991) city, 75,399; St. Catherines–Niagara metropolitan area, 364,552.

Niagara Falls, city and port of entry, Niagara county, western New York, U.S. It lies at the great falls of the Niagara River, opposite the city of Niagara Falls, Ont. The British built Fort Schlosser there in 1761, and in 1805 Augustus Porter established a grist mill and a settlement called Manchester. Both the settlement and the fort were burned during the War of 1812, but development of the surrounding farmlands continued; the villages of Manchester, Suspension Bridge, and Clarksville (later to merge into Niagara Falls) grew up along the river. The Niagara River's hydroelectric potential began to be developed in 1881, and, with the formation of the Niagara Falls Power Company in 1886, the industrial future of the city was assured. Its hydroelectric plants supply power to much of New York state and to the city's electrochemical, electrometallurgical, and aerospace industries. Other economically important manufactures include paper, abrasives, flour, machinery, and electrical equipment.

The Niagara Reservation State Park (established 1885) includes Prospect Park (site of the Schoellkopf Geological Museum with exhibits on the history and formation of the falls) and areas along the river, including Luna, Goat, and other smaller islands. Tourism is a major economic factor, with millions of visitors coming to view the falls each year. Rainbow Bridge, which was completed in 1941 to replace the Falls View Bridge that collapsed in 1938, is one of several that cross the river downstream from the falls. Niagara County Community College was founded in the city in 1962, and Niagara University (1856) is situated just outside the city limits. Tuscarora Indian Reservation is 9 miles (14 km) northeast. Inc. city, 1892. Pop. (1990) city, 61,840; Niagara Falls PMSA, 220,756.

Niagara Frontier, recreation and heavy-industrial area in western New York, U.S., extending mainly along the Niagara River between Lakes Ontario and Erie and lying in the counties of Erie and Niagara and part of Cattaraugus. The recreational area sometimes includes the Canadian side of the river, while the industrial region includes metropolitan Buffalo, which encompasses Niagara Falls, Tonawanda–North Tonawanda, Lackawanna, and Lockport.

The focus of the recreation region is the Niagara Reservation State Park, established in 1885 at Niagara Falls. It is New York's oldest state park, and it includes an observation tower, elevators that descend into the gorge at the base of the American Falls, and boat trips into the turbulent waters at the base of the Horseshoe Falls. Fort Niagara State Park, at the mouth of the Niagara River on Lake Ontario, includes old Fort Niagara, built by the French in 1725–26 on the site of the Indian town Ongniaahra—whence Niagara. A few miles to the east lies the Four Mile Creek Annex to the park, devoted largely to camping. Whirlpool State Park is located at the Lower Rapids 3 miles (5 km) north of the falls; and Devil's Hole State Park at the Lower Gorge overlooks the end of the Lower Rapids. Buckhorn Island State Park is a wildlife sanctuary at the north end of Grand Island, south of the falls. Big Six Mile Creek Boat Basin is on the west side of the island, and Beaver Island State Park is a recreational area at its southern tip. Evangola State Park, near Farnham on the south shore of Lake Erie, has a broad sandy beach. Overlooking the river near Lewiston is the Earl W. Brydges Artpark (1974), dedicated to the performing arts. The whole area is overseen by the Niagara Frontier State Park and Recreation Commission (created in 1883 as the State Reservation at Niagara).

Robert Moses State Parkway, formerly Niagara Parkway, links the Grand Island parks with Niagara Falls, Fort Niagara, and Lake Ontario. The Grand Island South Parkway and West River Parkway combine to form a scenic route around the island and provide a connection with the New York State Thruway, Robert Moses State Parkway, Beaver Island and Buckhorn Island state parks, and Buffalo.

Niagara Movement (1905–10), organization of black intellectuals led by W.E.B. Du Bois and calling for full political, civil, and social rights for black Americans. This stance stood in notable contrast to the accommodation philosophy proposed by Booker T. Washington in the Atlanta Compromise of 1895. The Niagara Movement was the forerunner of the National Association for the Advancement of Colored People (NAACP). In the summer of 1905, 29 prominent blacks, including Du Bois, met secretly at Niagara Falls, Ont., and drew up a manifesto calling for full civil liberties, abolition of racial discrimination, and recognition of human brotherhood. Subsequent annual meetings were held in such symbolic locations as Harpers Ferry, W.Va., and Boston's Faneuil Hall.

Despite the establishment of 30 branches and the achievement of a few scattered civil-rights victories at the local level, the group suffered from organizational weakness and lack of funds as well as a permanent headquarters or staff, and it never was able to attract mass support. After the Springfield (Ill.) Race Riot of 1908, however, white liberals joined with the nucleus of Niagara "militants" and founded the NAACP the following year. The Niagara Movement disbanded in 1910, with the leadership of Du Bois forming the main continuity between the two organizations.

Niagara-on-the-Lake, also called NIAGARA, town, regional municipality of Niagara, southeastern Ontario, Canada. It lies on the southern shore of Lake Ontario, at the mouth of the Niagara River, 22 miles (35 km) below the falls. The town was established in 1792, when it was chosen as the first capital of Upper Canada and named Newark by Lieutenant Governor John G. Simcoe. Because of the town's location opposite a U.S. arsenal, the capital was moved to Toronto in 1796, and Newark's name was subsequently changed to Niagara-on-the-Lake. The town is a summer resort and a centre of a fruit-growing region. Industries include canning, yacht building, and basket weaving. Fort George, which was built in the late 1790s and played an important role in the War of 1812, and Navy Hall are popular tourist attractions. Pop. (1991) 12,945.

Niagara River, river that is the drainage outlet for the four upper Great Lakes (Superior, Michigan, Huron, and Erie), having an aggregate basin area of some 260,000 square miles (673,000 square km). Flowing in a northerly direction from Lake Erie to Lake Ontario, a distance of about 35 miles (56 km), the Niagara constitutes part of the boundary between the United States and Canada, separating New York state from the province of Ontario. The relatively high flow and steep descent (about 326 feet [99 m]) of the river combine to make it one of the best sources of hydroelectric power in North America. About halfway along the river's course lies Niagara Falls, one of the major scenic spectacles of the continent. U.S. and Canadian cities of the same name stand on either bank of the river.

From its head at Lake Erie, the river flows through a single channel for about 5 miles (8 km). It is then divided into two channels by Strawberry and Grand islands, the eastern, or U.S., channel running for about 15 miles (24 km), the western, or Canadian, for about 12 miles. At the foot of Grand Island the two merge again about 3 miles (5 km) above Niagara Falls. From Lake Erie to the upper rapids the river descends about 10 feet (3 m), whereas in the short rapids it falls 50 feet (15 m) before pouring over the falls.

Below the falls and extending for 7 miles (11 km) is the Niagara Gorge. The stretch of 2.25 miles (3.6 km) from Horseshoe Falls is known as the Maid of the Mist Pool. It has a descent of only 5 feet (1.5 m) and is navigable by excursion boats. Beyond this, the gorge descends another 93 feet (28 m), flowing northwestward first through the narrow Whirlpool Rapids for 1 mile (1.6 km) to the Whirlpool. There the gorge makes a 90° bend to the northeast for 2 miles (3 km) and turns north for another 1.5 miles (2.5 km) to the foot of the Niagara Escarpment at Lewiston, New York. In its final 7 miles, the river flows across a lake plain to Lake Ontario.

The river came into existence late in the Pleistocene Epoch, more than 10,000 years ago, when the margin of a great continental ice sheet melted back and exposed the escarpment of Niagaran dolomite rock, allowing the discharge from the Lake Erie Basin to pour over it. Recession of the falls created the Niagara Gorge, the age of which, when calculated by dividing its length by the average rate of recession of the falls in recent time, is about 7,000 years. Other considerations led some geologists to estimate an age as great as 25,000 years. Determinations of the age of the last glacial ice advance in the area suggest, however, that the Niagara River is about 12,000 years old.

The river is navigable from Lake Erie to the upper rapids. Waterborne traffic along the Niagara passes through the upper single channel and the U.S. channel and enters the New York State Barge Canal at Tonawanda, New York. That canal, with a minimum depth of 12 feet (4 m), connects with the Hudson River and has branches that connect with Lake Champlain and Lake Ontario. The Black Rock Canal, from Buffalo Harbor to a point a few miles down the Niagara River, extends the navigation period locally through a greater part of the winter, when the river itself becomes jammed with Lake Erie ice. The principal shipping between Lakes Erie and Ontario, however, passes through the Welland Canal, an important link in the Great Lakes-St. Lawrence Seaway.

Canada and the United States agreed, in a treaty signed in 1950, to reserve sufficient amounts of water for flow over Niagara Falls to preserve their scenic value. All water in excess of a certain amount, estimated to average about 130,000 cubic feet (3,600 cubic metres) per second, was made available for diversion for power generation, to be divided equally between the United States and Canada. This power is developed by public-authority power-plant installations on both sides of the gorge. Two large power plants situated at the end of the gorge, one near Lewiston, N.Y., and one at Queenston, Ont., receive water diverted from the river above the falls and carried to them by tunnels and canals. The electrical power is used by nearby electrochemical industries and is also sent to various cities for other uses.

Niagaran Series, second of the three major divisions of Silurian rocks and time (438 to 408 million years ago) in North America. It was named for exposures studied in Niagara county, N.Y. The characteristic exposures for the series are found in the gorge of the Niagara River below Niagara Falls; the gorge is rimmed by a resistant dolomite formation, the Lockport Dolomite, below which fossiliferous shales and thin limestones comprise the remainder of Niagaran rocks in the area. West of the Cincinnati Arch, Niagaran strata are largely calcareous, very widespread, and often attain a considerable thickness. In the Niagaran dolomites of Indiana, Illinois, and Wisconsin, fossil coral reefs are frequently encountered, some of which are about 10 km (6 miles) in diameter and attain a thickness of about 300 m (1,000 feet).

Niah Cave, site of significant archaeological evidence concerning prehistoric man's existence in Southeast Asia, located in Sarawak on the island of Borneo, East Malaysia, 10 miles (16 km) inland from the South China Sea. The Niah Cave provides examples of early Pleistocene man's habitat in Sarawak and was the site of almost continuous human dwelling until the 19th century. The cave was first described to Westerners in 1864 by Alfred Russel Wallace, the originator, along with Charles Darwin, of the theory of natural selection. Although a Sarawak civil servant visited the cave seven years later, only in the 20th century, following its purchase by the Sarawak Museum, was the importance of the site revealed.

The Niah Cave itself is massive, with five openings, or mouths. The main cave is called the painted cave because of red hematite wall and ceiling paintings. Its mouth is about 300 feet (90 m) high by 600 feet (180 m) wide. While other sections of the cave are dark, moist, and inhabited by millions of bats and swiftlets, the painted cave is dry, well lit, and favourable for human dwelling. The first archaeological digging, by Tom Harrisson in 1954, uncovered considerable evidence of past human habitations. The earliest flakes and chopper tools date from about 40,000 BC. The most important discovery at Niah was the remains of a skeleton of an adolescent male, about 38,000 BC, the earliest *Homo sapiens* remains found in the Far East to that time; these bones are of particular interest because this individual lived at the same time as Solo man of Java, the Rhodesioids of Africa, and the classic Neanderthals of Europe—all *Homo sapiens,* but of far less modern looking and gracile (slender) type. Other discoveries include the burial place "boats of the dead."

Consult the INDEX *first*

nialamide, synthetic drug of the monoamine-oxidase inhibitor type, used to treat mental depression. Like other monoamine-oxidase inhibitor drugs, nialamide prevents the enzymatic breakdown of norepinephrine, the brain-neurotransmitter substance concerned with emotional stimulation. Nialamide is administered orally. The onset of action is delayed, the effects of the drug developing slowly over the first two weeks of therapy. As with other monoamine-oxidase inhibitor drugs, liver damage is a possible side effect.

Niam-Niam (people): *see* Azande.

Niamey, city, capital of Niger. Located along the Niger River in the southwest corner of the republic, it originated as an agricultural village of Maouri, Zerma, and Fulani people. It was established as the capital of Niger colony in 1926, and after World War II it grew rapidly. Today it is occupied by Yoruba and Hausa traders, merchants, officials, and craftsmen from Nigeria, Benin, and Togo, as well as from other parts of Niger. The city, which lies mainly on the left (north) bank of the river,

The National Assembly building in Niamey, Niger

Victor Englebert—De Wys Inc.

has expanded onto the right bank since the construction of the Kennedy Bridge in 1970.

There is some industry, but most people work in the service sector. Niamey is the site of the University of Niamey (1971; university status 1973), the National School of Administration (1963), the national museum, and research institutes for geology and minerals, human sciences, oral tradition, tropical forestry, tropical agriculture, and veterinary studies. There is an international airport, and roads link Niamey with Atlantic ports in Benin and Nigeria. Pop. (1994 est.) 420,000.

Niane, Djibril Tamsir (b. Jan. 9, 1932, Conakry, Guinea), African historian, playwright, and short-story writer.

After his secondary education in Dakar, Senegal, Niane graduated in history in 1959 from the University of Bordeaux in France. He taught in Conakry and at the Institut Polytechnique before joining the Basic Institute of Black Africa in Dakar.

Niane's first scholarly work, *Recherches sur l'empire du Mali* (1959; "Studies of the Empire of Mali"), was followed by *Histoire de l'Afrique occidentale* (1961; "History of Western Africa"), coauthored with Jean Suret-Canale. His novel *Soundjata ou l'épopée mandingue* (1960; *Sundiata: An Epic of Old Mali*) is a highly successful re-creation of the life and times of the illustrious 13th-century founder of the Mali empire, recounted in the voice of a tribal storyteller. His other works include a collection of short stories, *Mery* (1975), and two historical plays, *Sikasso* and *Chaka.*

Niani, village, northeastern Guinea. It lies on the left bank of the Sankarani River (a tributary of the Niger). A former administrative centre of Kangaba (a small state subservient to the old Ghana empire), it was named the capital of the new empire of Mali by its Mandingo (Malinke) founder, King Sundiata Keita (Mari Djata; reigned *c.* 1230–55). Niani remained the capital of the Muslim Mandingo empire for 300 years; it reached its zenith as Mali's political, commercial, and caravan centre (gold, salt, kola nuts, slaves) in the reign of Mansa Mūsā (1307–32). Raids by Songhai cavalrymen in the early 15th century marked the beginning of Niani's gradual decline. The site of the medieval Malian capital was not confirmed until excavations were made in the mid-1960s around present-day Niani, which lies in a valley irrigated for rice and occasionally mined for alluvial gold.

Niantic, Algonquian-speaking woodland Indians of southern New England. The Eastern Niantic lived on the western coast of what is now Rhode Island and on the neighbouring coast of Connecticut. The Western Niantic lived on the seacoast from Niantic Bay, just west of New London, to the Connecticut River. Once one tribe, they were apparently split by the migration of the Pequot into their area.

The Western Niantic were nearly destroyed by the Pequot War (1637), and remnants joined the Mohegans. The Eastern Niantic remained neutral during King Philip's War (1675–76), and at its close many of the defeated Narraganset Indians and their allies settled among them. Thereafter the combined tribes were called Narraganset (*q.v.*).

Niarchos, Stavros Spyros (b. July 3, 1909, Athens, Greece—d. April 15, 1996, Zürich, Switz.), Greek shipping magnate and art collector.

In 1929 Niarchos graduated from the University of Athens in law and began working in his uncle's flour mill. Recognizing the great transportation expense in importing Argentine wheat, Niarchos convinced his family that it would save money if it owned its own ships. Six freighters were bought for $120,000 during the Great Depression, and in 1939 Niarchos branched off to form his own firm, Niarchos Group, in which he owned two tankers and five other vessels.

While Niarchos served in the Greek navy during World War II, the Allied forces leased his ships, six of which were subsequently sunk in combat. Niarchos used the resulting $2,000,000 of insurance money as capital to expand his fleet and, in particular, to buy oil tankers. His philosophy was to buy and build big, and many of his supertankers set world records in size and carrying capacity. For many years he owned the largest private fleet in the world, some of his keenest competitors being his brother-in-law, Aristotle Onassis, and his father-in-law, Stavros Livanos. At its height his shipping company, Niarchos Ltd., operated more than 80 tankers, though Niarchos later sold off most of this fleet.

Niarchos also earned a reputation as an art investor and collector. In 1957 he purchased the French Impressionist art collection of the American actor Edward G. Robinson for more than $2,500,000. Although he owned homes in New York, London, Paris, and Athens, he spent much of his time on the Mediterranean Sea aboard his yacht *Creole.*

Niari River, tributary of the Kouilou River in southern Congo. Its headwaters rise in the Batéké Plateau northwest of Brazzaville. It runs south to Galobondo, west to Loudima, and northwest to Makabana, where it joins the Louessé River to form the Kouilou River. The Niari basin attracted extensive settlement after World War II, spurred by the construction of the Brazzaville–Pointe-Noire railway through the Niari valley. The basin is rich in copper, lead, and zinc deposits. It also has some of the most fertile soil in the Congo and has therefore been selected as the site for a number of agricultural research stations and experimental farms. The name Niari is sometimes extended to include the Kouilou River (*q.v.*) as well as the Niari proper.

Nias, Indonesian PULAU NIAS, island and *kabupaten* (regency), Sumatera Utara *provinsi* (province), Indonesia. It is the largest island in a chain paralleling the western coast of Sumatra. With an area of 1,842 square miles (4,772 square km), it has a topography much like that of western Sumatra but without volcanoes. The highest elevation is 2,907 feet (886 m). Nias' coasts are rocky or sandy and without any ports, and ships must anchor offshore of Guningsitoli on the eastern coast and Telukdalem on the south.

Most of the people are animists, belong to the early (Proto-) Malay stock, and speak dialects of a distinct branch of the Austronesian (Malayo-Polynesian) language family. Some are Christian and Muslim converts. Megalithic monuments and wooden sculptures honouring the dead or representing fertility are common throughout the island. In northern Nias, villages are small and located on hilltops, each enclosing a stone-paved rectangle. Larger villages in southern Nias may include a bathing pool. Houses are built on piles, the chief's house being particularly large with a high roof and massive carved pillars and beams. Pop. (1990) 567,318.

Niatross (foaled 1977), American harness racehorse (Standardbred), one of the greatest pacers in history, who in his two-year racing career set records for American career winnings ($2,019,212) and, in the second year, a record for one-year winnings for a horse of any breed ($1,414,313). Both records later were surpassed.

Sired by Albatross and foaled by Niagara Dream, Niatross was owned by Elsie Berger, Clint Galbraith, and Lou Guida and trained and driven by Galbraith.

As a two-year-old Niatross won all 13 starts, set a two-year-old winnings record of $604,900, and was named Horse of the Year, as he was again in 1980. As a three-year-old, Niatross won 24 of 26 races and captured the Pacing Triple Crown by winning the William H. Cane Futurity, the Messenger Stake, and the Little Brown Jug. In his career of 39 races, Niatross won 37. He set world marks for pacers in the mile (1:52$^{1}/_{5}$ sec), for harness racers in the mile (1:49$^{1}/_{5}$ sec), and for a three-year-old in the mile (1:49$^{1}/_{5}$ sec). He was syndicated for a record $8,000,000 in 1980 and put to stud in 1981.

Niaux, cave at Ariège, France, that is famous for its carefully drawn wall paintings in a black-outlined style typical of the classical Magdalenian period of Paleolithic art. This period is estimated to have lasted from approximately 15,000 to 10,000 BC. Niaux is one of a series of Pyrenean grottoes displaying the most stylistically homogenous cave painting known.

Like most caves, Niaux is divided into a number of distinct areas, among them the Salon Noir, which contains panels showing bison and horses drawn in outline. A few of the animals' features, such as a horse's jaw, are also indicated, and the figures are typically shaded in a cross-hatched manner. There are also depictions of fish, oxen, some variety of cat, and a beast tentatively identified as a rhinoceros. Other areas of the cave include the so-called Rotunda and the Reseau René Clastres, an inaccessible gallery discovered in 1970 that contains five paintings.

Nibelungenlied (German: "Song of the Nibelungs"), Middle High German epic poem written about 1200 by an unknown Austrian from the Danube region. It is preserved in three main 13th-century manuscripts, A (now in Munich), **B** (St. Gall), and C (Donaueschingen); modern scholarship regards **B** as the most trustworthy. An early Middle High German title of the work is *Der Nibelunge Not* ("The Nibelung Distress"), from the last line of the poem. The superscription on one of the manuscripts from the early 14th century is "The Book of Kriemhild."

The story has a long history and, as a result, contains a number of disparate elements. For example, the word Nibelung itself presents difficulties. In the first part of the poem, it appears as the name of Siegfried's lands and peoples and his treasure, but, throughout the second, it is an alternate name for the Burgundians.

The poem's content falls into two parts. It begins with two cantos (*aventiuren*) that introduce, respectively, Kriemhild, a Burgundian princess of Worms, and Siegfried, a prince from the lower Rhine. Siegfried is determined to woo Kriemhild despite his parents' warning. When he arrives in Worms, he is identified by Hagen, a henchman of Kriemhild's brother King Gunther. Hagen then recounts Siegfried's former heroic deeds, including the acquisition of a treasure. When war is declared by the Danes and Saxons, Siegfried offers to lead the Burgundians and distinguishes himself in battle. Upon his return, he meets Kriemhild for the first time, and their affections develop during his residence at court.

At this point a new element is introduced. News reaches the court that a queen of outstanding strength and beauty may be won only by a man capable of matching her athletic prowess. Gunther decides to woo Brunhild with the aid of Siegfried, to whom he promises the hand of Kriemhild if successful. Siegfried leads the expedition to Brunhild's abode, where he presents himself as Gunther's vassal. In the ensuing contests, Gunther goes through the motions of deeds actually performed by Siegfried in a cloak of invisibility. When Brunhild is defeated, she accepts Gunther as her husband. Siegfried and Kriemhild are then married as promised, but Brunhild remains suspicious and dissatisfied. Soon the two queens quarrel; Brunhild ridicules Kriemhild for marrying a vassal, and Kriemhild reveals Siegfried's and Gunther's deception.

Now Hagen becomes a prominent figure as he sides with Brunhild and takes the initiative in plotting vengeance. He wins Kriemhild's confidence and learns Siegfried's one vulnerable spot and then strikes the fatal blow.

During these events, Brunhild drops almost unnoticed out of the story, and the death of Siegfried does not appear to be so much vengeance on her part as an execution by Hagen, who is suspicious of Siegfried's growing power. Siegfried's funeral is conducted with great ceremony, and the grief-stricken Kriemhild remains at Worms, though for a long time estranged from Gunther and Hagen. Later they are reconciled in order to make use of Siegfried's treasure, which is brought to Worms. Kriemhild begins to distribute it, but Hagen, fearing that her influence will grow, sinks the treasure in the Rhine.

The second part of the poem is much simpler in structure and deals basically with the conflict between Hagen and Kriemhild and her vengeance against the Burgundians. Etzel (Attila), king of the Huns, asks the hand of Kriemhild, who accepts, seeing the possibilities of vengeance in such a union. After many years, she persuades Etzel to invite her brothers and Hagen to his court. Though Hagen is wary, they all go to Etzel's court, where general combat and complete carnage ensues. Kriemhild has Gunther killed and then, with Siegfried's sword, she slays the bound and defenseless Hagen, who to the last has refused to reveal where Siegfried's treasure is hidden. Kriemhild in turn is slain by a knight named Hildebrand, who is outraged at the atrocities that she has just committed.

In the *Nibelungenlied* some elements of great antiquity are discernible. The story of Brunhild appears in Old Norse literature. The brief references to the heroic deeds of Siegfried allude to several ancient stories, many of which are preserved in the Scandinavian *Poetic Edda* (*see* Edda), *Völsunga saga,* and *Thidriks saga,* in which Siegfried is called Sigurd. The entire second part of the story, the fall of the Burgundians, appears in an older Eddaic poem, *Atlakvida* ("Lay of Atli"; *see* Atli, Lay of). Yet the *Nibelungenlied* does not appear to be a mere joining of individual stories but, rather, an integration of component elements into a meaningful whole.

It is the second part of the poem that suggests the title "The Book of Kriemhild." The destruction of the Burgundians (Nibelungen) is her deliberate purpose. The climax of the first part, the death of her husband, Siegfried, prepares the ground for the story of her vengeance. Furthermore, Kriemhild is the first person introduced in the story, which ends with her death; and all through the story predominating attention is paid to Hagen. This concentration on Kriemhild and on the enmity between her and Hagen would seem to suggest that it was the poet's intention to stress the theme of Kriemhild's vengeance.

The *Nibelungenlied* was written at a time in medieval German literature when the current emphasis was on the "courtly" virtues of moderation and refinement of taste and behaviour. The *Nibelungenlied,* with its displays of violent emotion and its uncompromising emphasis on vengeance and honour, by contrast looks back to an earlier period and bears the mark of a different origin—the heroic literature of the Teutonic peoples at the time of their great migrations. The poem's basic subject matter also goes back to that period, for it is probable that the story of the destruction of the Burgundians was originally inspired by the overthrow of the Burgundian kingdom at Worms by the Huns in AD 437, and the story of Brunhild and Siegfried may have been inspired by events in the history of the Merovingian dynasty of the Franks in about AD 600. Much of the heroic quality of the original stories has remained in the poem, particularly in the author's conception of Hagen as the relentless protector of King Gunther's honour.

Probably no literary work has given more to Germanic arts than the *Nibelungenlied.* Many variations and adaptations appeared in later centuries. The most significant modern adaptation is Richard Wagner's famous opera cycle *Der Ring des Nibelungen* (1853–74).

Nicaea (Turkey): *see* İznik.

Nicaea, Council of (325), the first ecumenical council of the Christian church, meeting in ancient Nicaea (now İznik, Tur.). It was called by the emperor Constantine I, an unbaptized catechumen, or neophyte, who presided over the opening session and took part in the discussions. He hoped a general council of the church would solve the problem created in the Eastern church by Arianism, a heresy first proposed by Arius of Alexandria that affirmed that Christ is not divine but a created being. Pope Sylvester I did not attend the council but was represented by legates.

The council condemned Arius and, with reluctance on the part of some, incorporated the nonscriptural word *homoousios* ("of one substance") into a creed (the Nicene Creed) to signify the absolute equality of the Son with the Father. The emperor then exiled Arius, an act that, while manifesting a solidarity of church and state, underscored the importance of secular patronage in ecclesiastical affairs.

The council also attempted but failed to establish a uniform date for Easter. But it issued decrees on many other matters, including the proper method of consecrating bishops, a condemnation of lending money at interest by clerics, and a refusal to allow bishops, priests, and deacons to move from one church to another. Socrates Scholasticus, a 5th-century Byzantine historian, said that the council intended to make a canon enforcing celibacy of the clergy, but it failed to do so when some objected. It also confirmed the primacy of Alexandria and Jerusalem over other sees in their respective areas.

Nicaea, Council of (787), the seventh ecumenical council of the Christian church, meeting in Nicaea (now İznik, Tur.). It attempted to resolve the Iconoclastic Controversy, initiated in 726 when Emperor Leo III issued a decree against the worship of icons. The council declared that icons deserved reverence and veneration but not adoration. Convoked by the patriarch Tarasius, the council was attended by delegates of Pope Adrian I, and the pope confirmed the decrees of the council. Its authority was challenged in France as late as the 11th century, however, partly because certain doctrinal phrases had been incorrectly translated. But Rome's original verdict was eventually accepted, and the second Council of Nicaea was accepted as the seventh ecumenical council.

Nicaea, empire of, independent principality of the fragmented Byzantine Empire, founded in 1204 by Theodore I Lascaris (1208–22); it served as a political and cultural centre from which a restored Byzantium arose in the mid-13th century under Michael VIII Palaeologus.

Theodore fled to Anatolia with other Byzantine leaders after the Latin crusaders' conquest of Constantinople in 1204, establishing himself at Nicaea (now İznik, Tur.), 40 miles (64 km) to the southeast. Crowned emperor in 1208, Theodore gradually acquired control over much of western Anatolia. He and his successors sponsored a revival of Greek studies at their capital.

The next Nicaean emperor was John Vatatzes, who sought to retake Constantinople before his rivals Theodore Angelus, despot of Epirus, or John Asen II of Bulgaria (1218–41). He defeated Theodore at Klokotnitsa (in Bulgaria) in 1230. Between 1240 and 1250 he negotiated with the Western emperor Frederick II (1220–50) for help in reconquering Constantinople, but nothing came of the pact.

Theodore II Lascaris (1254–58) and John IV Lascaris (1258–61) maintained Nicaean strength against the invading Mongols during their brief reigns. In 1261 a Nicaean general, Michael Palaeologus, retook Constantinople and, as Michael VIII, founded the last dynasty of the Byzantine emperors.

Nicaragua, officially REPUBLIC OF NICARAGUA, Spanish REPÚBLICA DE NICARAGUA, largest country of Central America, covering an area of 50,464 square miles (130,700 square km). The capital is Managua. Nicaragua's maximum length from north to south is about 275 miles (440 km), and its maximum width from east to west is about 280 miles (450 km). It is bordered by Honduras on the north, the Caribbean Sea on the east, Costa Rica on the south, and the Pacific Ocean on the west. The population in 2002 was estimated to be 5,024,000.

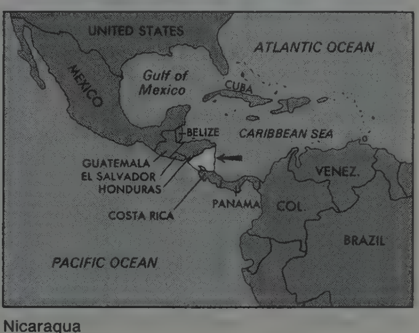
A brief treatment of Nicaragua follows. For full treatment, *see* MACROPAEDIA: Central America.

For current history and for statistics on society and economy, *see* BRITANNICA BOOK OF THE YEAR.

The land. The western half of Nicaragua has highly dissected and thickly forested mountain ranges that alternate with basins and fertile valleys. To the west and south of this central mountain core there is a discontinuous belt of some 40 dormant and active volcanoes that stretches northwest-southeast, parallel to the Pacific coast. A basin region, including Lake Nicaragua (3,156 square miles [8,157 square km]) and the smaller Lake Managua (400 square miles [1,035 square km]), lies in the southwest interior of Nicaragua, east of the volcanic belt. The Pacific lowlands are to the west of the volcanic belt.

In the eastern half of the country the terrain gradually descends toward the Caribbean coast, where a fringe marshland area is called the Mosquito Coast. The Coco River (485 miles [780 km] long), with a drainage basin of 2,240 square miles (5,800 square km), forms most of the boundary with Honduras. The San Juan River links Lake Nicaragua to the Caribbean Sea and forms much of the southern boundary with Costa Rica. Seismic activity is frequent in Nicaragua, occasionally resulting in devastating earthquakes.

The climate of Nicaragua is tropical, with a dry (January–mid-May) and a wet (mid-May–December) season. It is slightly cooler and much wetter in the east than in the west. The Pacific side of the country has a mean annual temperature of 81° F (27° C), and annual precipitation is about 75 inches (1,900 mm); the corresponding figures for eastern Nicaragua are 79° F (26° C) and as much as 150 inches (3,800 mm) of rainfall. Tropical forests cover



Nicaragua

more than one-third of the total land area. The eastern lowlands are generally covered with savanna vegetation, except on the Mosquito Coast, where tropical rain forest prevails. The fauna includes puma, jaguar, various monkeys, anteater, crocodile, peccary, and various snakes and turtles.

The people. More than three-fourths of Nicaragua's people are mestizos, a product of the racial mixture of Europeans (mostly Spanish) and American Indians. Of the original American Indian population, the Sumo, Miskito (Mosquito), and Rama peoples occupy the basins of the northeastern rivers and other areas along the Caribbean Sea. The west coast has a small number of Monimbo and Subtiaba Indian peoples. Black Creoles live in the Caribbean lowland. Spanish is the official language, but there is widespread familiarity with English. Nearly nine-tenths of the population is Roman Catholic.

Nicaragua has a young population; almost half its people are under 15 years of age. The birth rate is one of the highest in Central America, while the death rate is only slightly above average and declining. Since the 1950s there has also been a considerable decline in the relatively high rate of infant mortality. The country has one of the highest estimated annual rates of population growth in Central and Latin America.

The economy. Nicaragua has a developing market economy based largely on agriculture, light industries, and trade. The gross national product (GNP) had a negative real growth rate from the mid-1970s largely because of political and economic instability. The GNP per capita is low by Central American standards.

Agriculture accounts for about one-fourth of the GNP but employs as much as two-fifths of the work force. Corn (maize), sorghum, and beans are the chief staples and are harvested twice a year. Coffee, cotton, bananas, and sugar are produced primarily for export. Nicaragua's known mineral resources include large reserves of gold, copper, and silver. Significant quantities of gold and silver are produced in eastern Nicaragua.

Industries—mostly processing domestic raw materials—account for one-fifth of the GNP and employ about one-tenth of the work force. Products include refined sugar, petroleum products, chemicals, cigarettes, leather goods, textiles, cement, and plastics. Nicaragua's electricity is generated principally from imported fuels; one-fourth also comes from hydroelectric sources and another one-fourth is generated by nuclear fuels.

Nicaragua's principal exports include coffee, cotton, beef, bananas, and gold. Imports consist of primary and intermediate goods for industry, mineral fuels, capital goods for industry, and transport equipment. Canada, Germany, the Soviet Union, Cuba, and Japan are its main trading partners.

Government and social conditions. Following the overthrow of the Somoza regime, Nicaragua was ruled from 1979 to 1985 by a junta drawn from the FSLN; Sandinista National Liberation Front (Frente Sandinista de Liberación Nacional). Executive and legislative authority was centred in the Government of National Reconstruction, which received legislative advice from a Council of State. Presidential and legislative elections were held in 1984, and a new administration, still largely dominated by the FSLN, replaced the junta government in 1985. The Sandinista administration lost the historic free election held in 1990, but Sandinistas retained enough seats in the National Assembly, which has 92 members, to prevent constitutional changes by the new administration.

Health services were vastly improved under the Sandinista government after decades of neglect. Diseases such as enteritis, tuberculosis, tetanus, and typhoid fever, however, are still common. There is a shortage of trained medical personnel, and health-care facilities are poorly equipped. Life expectancy is about 61 years for males and 63 years for females.

Education is free and compulsory between the ages of 6 and 13 years. About three-fourths of school-age children attend primary school, but only a small percentage of these advance to secondary school.

Nicaragua has several daily newspapers, including *La Prensa,* one of the largest. The government imposed censorship on the nation's news media throughout much of the 1980s. There are two major television stations and numerous radio stations.

History. Nicaragua's earliest Indian inhabitants migrated from South America and settled on the western coast at a remote but undetermined date. Waves of Indian migrants from Mexico and Mesoamerica began entering Nicaragua in the 10th century AD. The Spanish pacification of these peoples in the 16th century AD was relatively easy owing to the conversion to Christianity of one of the leading tribes.

Christopher Columbus landed in eastern Nicaragua in 1502. The first European settlements, Granada and León (both in the western interior), date from the early 1520s and were established by the Spanish explorer and soldier Hernández de Córdoba. During the colonial period an intense rivalry developed between these two cities. León, as the provincial capital, developed into a liberal intellectual centre, whereas Granada developed as an agricultural centre, with a conservative landed aristocracy. British buccaneers established settlements on the Caribbean coast in the 17th and 18th centuries. These settlements led to Britain's claim to the Mosquito Coast as a protectorate (1740–86). The cities of León and Granada continued to be hostile to each other during the area's struggle for independence from Spain in the early 1800s.

In 1826 Nicaragua became a state within the United Provinces of Central America, but it left the federation in 1838. The British seized the small Caribbean port of San Juan del Norte in 1848 and held it until 1860. During the 1850s, Cornelius Vanderbilt's steamship company transported prospectors bound for the California gold fields from the Atlantic to the Pacific by steamship on the San Juan River and Lake Nicaragua. William Walker, a filibuster from Tennessee, managed to establish himself as president of Nicaragua in 1856. He was routed a year later, however, by the efforts of the five Central American republics and Vanderbilt's steamship company.

For about a century after the nation reached independence in 1838, Nicaragua's politics were dominated by the competition for power between the Liberals, who were centred in the city of León, and the Conservatives, who were centred in that of Granada. These two sides shifted the capital back and forth between their respective cities until a compromise was reached in 1857 under which Managua, which lay equidistant between the rival cities, was made the capital.

Conservatives headed the government for most of the second half of the 19th century, but in 1893 the Liberals gained the presidency and proceeded to persecute the Conservatives just as the latter had previously persecuted them. The Liberals held power until 1909, at which time pressure from the United States led to the installation of a Conservative government. To back up its support of the new government, the United States sent a small detachment of marines into the country. The withdrawal of the marine detachment in 1925 was followed by the eruption of a new civil war between the Liberals and the Conservatives, and in response the United States sent several thousand marines in to suppress a Liberal-led insurrection in 1927. Two successive U.S.-supervised elections resulted in the election of Liberal presidents in 1928 and 1932, respectively. The marines withdrew from Nicaragua in 1933 after having carefully trained the Nicaraguan National Guard to keep order in the country.

In 1934 the head of the National Guard, Anastasio Somoza García, instigated the assassination of the preeminent remaining Liberal rebel leader, César Augusto Sandino, and in 1936 Somoza ran for the presidency without opposition. Somoza ruled Nicaragua with an iron hand for 20 years, and, though considerable economic development took place during that time, the benefits were inequitably distributed in favour of the Somoza family and its supporters. Somoza was assassinated in 1956 and was succeeded by one of his sons, Luis Somoza Debayle, who ruled until his own death in 1967. He was succeeded by his brother, Anastasio Somoza Debayle. Meanwhile, a guerrilla movement opposed to the rule of the Somozas and known as Sandinistas (after César Augusto Sandino) had been founded in 1962.

An earthquake devastated Managua in 1972, killing 6,000 people and leaving another 300,000 homeless. Opposition to the Somoza regime intensified after the government diverted international aid from the earthquake's victims to enrich the Somoza family instead. The Sandinistas then joined forces with liberal and middle-class opponents of the government, and a widespread popular insurrection overwhelmed the National Guard and overthrew Somoza in 1979.

The Sandinista-dominated government expropriated the vast property holdings of the Somoza family; nationalized banks, insurance companies, and mineral and forest resources; and generally instituted greater government participation in the economy. It also curtailed civil liberties and cultivated closer ties with the Soviet Union and Cuba.

The United States suspended foreign aid to Nicaragua in 1981 and in 1982 began to actively attempt to destabilize Nicaragua's economy by funding antigovernment rebels and initiating various covert activities. These efforts were successful and, though Nicaragua had made considerable progress in improving social services by 1985, economic woes increased. The Sandinista government lost the national elections in February 1990; thereafter many economic activities such as export industries and mining were returned to private control, and public participation in the economy increased.

Nicaragua, Lake, Spanish LAGO DE NICARAGUA, the largest of several freshwater lakes in southwestern Nicaragua and the dominant physical feature of the country; it is also the largest lake in Central America. Its aboriginal name was Cocibolca, meaning "sweet sea"; the Spanish called it Mar Dulce; its present name is said to have been derived from that of Nicarao, an Indian chief whose people lived on the lake shores. Oval in shape, the lake has an area of 3,149 square miles (8,157 square km), is 110 miles (177 km) in length, and has an average width of 36 miles (58 km). About 60 feet (18 m) deep in the centre, its waters reach a depth of 200 feet (60 m) to the southeast of its largest island, Ometepe. Its surface is 95 feet (29 m) above sea level.

It is believed that Lake Nicaragua, together with Lake Managua to the northwest, originally formed part of an ocean bay that, as a result of volcanic eruption, became an inland basin containing the two lakes, which are linked by the Tipitapa River. The ocean fish thus trapped adapted themselves as the water gradually turned from saltwater to freshwater. Lake Nicaragua is the only freshwater lake containing oceanic animal life, including sharks, swordfish, and tarpon.

More than 40 rivers drain into the lake, the largest being the Tipitapa River. The San Juan River (Río San Juan) drains out of the lake, following a 112-mile course that runs from the southeastern shore of the lake through a densely forested region to empty into the Caribbean Sea. For part of its course, the San Juan forms the boundary between Nicaragua and Costa Rica. To the southwest, the lake is separated from the Pacific Ocean by a narrow land corridor—the Rivas Isthmus—which is 12 mi wide.

Contrary to popular belief, the lake is tideless, although there is a daily fluctuation in the water level caused by east winds blowing up the San Juan Valley. The water level also falls during the dry season, December to April, and rises during the rainy season, May to October. There are several currents in the lake; the principal one runs from southeast to northeast on the surface, while beneath it a deeper current flows in the opposite direction. Surface water temperature usually remains at 75° F (24° C), and bottom temperature at 60° F (16° C). Due to the chemical composition of the volcanic rocks forming parts of the lake's bed and shores, the lake waters contain high proportions of dissolved magnesium and potassium salts.

There are over 400 islands in the lake, of which 300 are within 5 mi of the city of Granada on the northwest lake shore. Most of the islands are covered with a rich growth of vegetation, which includes tropical fruit trees. Some of the islands are inhabited. Ometepe, which, as mentioned, is the largest island, is 16 mi long and 8 mi wide. It is formed of what originally were two separate volcanoes—Concepción, which is 5,282 ft high and last erupted in 1983, and Madera, which is 4,015 ft high. Lava from bygone eruptions forms a bridge between them, called the Tistian Isthmus. (A third volcano associated with the lake is Mombacho, 4,413 ft high, which stands on the western shore.) Ometepe Island is the preeminent site in Nicaragua for pre-Columbian examples of statuary, ceramics, and other archaeological remains, some of which, it is believed, represent vestiges of ancient South American, as well as North American, civilizations. Coffee, cacao, corn (maize), bananas, and fruit are grown on the island as well as a little cotton and tobacco.

The lake is a traditional means of communication between the cities of the west coast of Nicaragua and those in the south and east of the country. Steamships have operated on the lake since 1882. Lake steamers based at Granada visit small lakeside towns, such as San Jorge and La Virgen on the west shore; Cárdenas and San Carlos on the southern shore; San Ubaldo, Puerto Díaz, San Miguelito, and El Morrito on the eastern shore.

In previous centuries, piratical raids from the Caribbean were sometimes made on the lakeside towns, until the building of fortifications in the 17th century on the San Juan River blocked the pirates' ingress. From the time of the ending of Spanish rule in the 1820s, the possibility of constructing a transoceanic canal from the Atlantic to the Pacific, which would run up the San Juan River, cross the lake, and be completed by a channel dug through the Rivas Isthmus, has been mooted. After the discovery of gold in California in 1848, Cornelius Vanderbilt, the New York millionaire, developed the Vanderbilt Road—a route over which gold prospectors from New York were transported up the river and over the lake, completing the final few miles to the Pacific by stage coach in order to take ship for San Francisco in California. The arrangement revived interest—which lasted for many years—in the possibilities of a transoceanic canal. After the completion of the Panama Canal in 1914, interest in the project once more subsided. Since 1916, however, by the provisions of the Bryan-Chamorro Treaty concluded between Nicaragua and the United States, the United States has had the exclusive right to build such a canal.

Nicaro, city, Holguín province, eastern Cuba. It is situated on the Bahía (bay) de Levisa, a nearly landlocked arm of the Atlantic Ocean, at the base of the Lengua de Pájara peninsula. Nicaro is Cuba's major centre for the refining of nickel and cobalt from nickel oxide, which is mined nearby in the foothills of the Sierra del Cristal. Other economic activities include motor repairing and the processing of dairy products; the city is also the home port of a small fishing fleet. Nicaro is connected by road with other coastal cities, and there is an airport on the peninsula southeast of the city. The area was the scene of major fighting in 1958 during Fidel Castro's revolt against the regime of Fulgencio Batista. Pop. (latest est.) 9,506.

Niccoli, Niccolò (b. *c.* 1364, Florence—d. Feb. 3, 1437, Florence), wealthy Renaissance Humanist from Florence whose collections of ancient art objects and library of manuscripts of classical works helped to shape a taste for the antique in 15th-century Italy.

Niccoli was one of the chief figures in the company of learned men who gathered around Cosimo de' Medici, and his intellectual quarrels with other noted Humanists created a sensation in the learned world at the time. Niccoli's chief services to classical literature consisted in his copying and collating ancient manuscripts, correcting the texts, introducing divisions into chapters, and making tables of contents. Many of the most valuable manuscripts in the Laurentian Library in Florence are by his hand, among them those of Lucretius and of 12 comedies of Plautus. Niccoli's private library was the largest and best in Florence, and he also possessed a small but significant collection of ancient works of art, coins and medals. He was also an accomplished calligrapher whose slightly inclined *antica corsiva* script influenced the development of italic type.

niccolite, an ore mineral of nickel, nickel arsenide (NiAs). It is commonly found associated with other nickel arsenides and sulfides, as in the Natsume nickel deposits, Japan; Andreas-Berg, Ger.; Sudbury, Ont.; and Silver Cliff, Colo. Niccolite is classified in a group of sulfide minerals that exhibit a characteristic hexagonal structure. The name, a derivative of the German word *Kupfernickel,* is a reference to subterranean imps (*Nickel*) who teased miners. For detailed physical properties, *see* sulfide mineral (table).

Niccolò dell'Arca, also called Niccolo da Bari (fl. *c.* 1460–94), early Renaissance Italian sculptor famed for his expressionistic use of northern Gothic realism in combination with true compositional principles of Renaissance art. Niccolò takes his name from the tomb (*arca* in Italian) of St. Dominic in the church of S. Domenico, Bologna, where he made the canopy and most of the freestanding figures (1469–94). His masterpiece is the passionately dramatic lamentation over the dead Christ (six figures; 1463, S. Maria della Vita, Bologna). Another terra-cotta sculpture group of the Madonna and saints (1478) is above the main entrance of the Palazzo Comunale in Bologna.

Niccolo di Giovanni di Massio: *see* Gentile da Fabriano.

Nice, seaport city, Mediterranean tourist centre, and capital of Alpes-Maritimes *département,* Provence-Alpes-Côte-d'Azur region, southeastern France. The city is located on the Baie (bay) des Anges, 20 mi (32 km) from the Italian border. Sheltered by beautiful hills, Nice has a pleasant climate and is the leading resort city of the Côte d'Azur, or French Riviera.

Founded by the Phocaeans of Marseille (a colony of Greek mariners) around 350 BC, the city was probably named in honour of a victory (*nikē* in Greek) over a neighbouring colony. Conquered by the Romans during the 1st century AD, it became a busy trading station. The town was held by the counts of Provence during the 10th century, and in 1388 passed under the protection of the counts of Savoy, who held it until 1860, although it was captured and occupied several times by the French during the 17th and 18th centuries. Nice was ceded to France by the Treaty of Turin (1860), after which a referendum ratified the decision. The Paillon River, now partly built over, separates the new town to the west from the old town, the harbour, and the commercial district to the east. The old town, with narrow winding streets, stands at the western base of a granite hill known as Le Château, although the castle that used to crown it was destroyed in 1706. The harbour, begun in 1750 and extended after 1870, is used by commercial vessels (imports include cereals and vegetable oils), fishing craft, and pleasure boats. There is also a regular passenger service to Corsica. The most striking part of the new town is the famous Promenade des Anglais, which originated in 1822 as a path along the shore built by the English colony. It stretches 2.5 mi (4 km) along the waterfront, and consists of two wide carriageways separated by flower beds and palm trees.

The Musée Jules Chéret des Beaux-Arts and the Musée Masséna have collections of early Italian paintings and works by 19th-century and contemporary artists. A memorial to the painter Marc Chagall has been built to house a collection of biblical paintings donated by the artist in 1966. A mile northeast of the city centre is the ancient episcopal town of Cimiez, which contains the majestic ruins of a Roman amphitheatre. Nearby stands a 17th-century villa housing an archaeological museum and a collection of more than 40 paintings and drawings by the French artist Henri Matisse.

Tourism is the leading commercial activity of the town, both in summer and winter. Numerous festivities are organized every year, the most important being the Carnival of Nice, which was first held in 1873. Nice has excellent road, rail, and sea communications; the airport is one of the most important in France. Industries include food processing, olive oil works, distilleries, and manufacture of perfumes. Newer technologies recently established include electronics and precision machinery. A flower and fresh-fruit market was established in 1963. Nice is also a growing cultural centre. A university with faculties of law, science, and letters was established in 1965; the Centre Universitaire Méditerranéen (founded 1933; first director, the French poet Paul Valéry) holds conferences on contemporary problems and language studies; and an international art school was established in 1970. Pop. (1999) 343,123.

Niceforo, Alfredo (b. Jan. 23, 1876, Castiglione di Sicilia, Catania, Italy—d. March 2, 1960, Rome), Italian sociologist, criminologist, and statistician who posited the theory that every person has a "deep ego" of antisocial, subconscious impulses that represent a throwback to precivilized existence. Accompanying this ego, and attempting to keep its latent delinquency in check, according to his concept, is a "superior ego" formed by man's social interaction. This theory, which he published in 1902, bears some resemblance to the discoveries of psychoanalysis that were being made about the same time.

Niceforo taught criminology in Lausanne (Switzerland), Brussels, and elsewhere and statistics at the universities of Naples and Rome (from 1931). Initially he was influenced by the Italian criminologist Cesare Lombroso (1835–1909), who had theorized the existence of a criminal type, identifiable by certain physical features. Niceforo came to believe, however, that crime could be understood only through a thorough investigation—biological, psychological, and sociological—of the normal human being.

One of the first empirical social scientists in Italy, he applied statistics to the problem of finding regularities in social behaviour. Out of these studies came his theory that persons in all societies exhibit certain constant features, which he called residues, one of which was diversity among individuals. He also discerned in every society the stratification of people into social hierarchies and their collection into a mass, observable especially in religious and national ideological systems.

In elaborating his theory of man's dual ego, he maintained that the deep ego often successfully evades the attempts of the superior ego to control it. This view is detailed in his *L' "io" profondo e le sue maschere* (1949; "The Deep Ego and Its Masks").

Nicene Creed, also called NICENO-CONSTANTINOPOLITAN CREED, a Christian statement of faith that is the only ecumenical creed because it is accepted as authoritative by the Roman Catholic, Eastern Orthodox, Anglican, and major Protestant churches. The Apostles' and Athanasian creeds are accepted by some but not all of these churches.

Until the early 20th century, it was universally assumed that the Niceno-Constantinopolitan Creed (the more accurate term) was an enlarged version of the Creed of Nicaea, which was promulgated at the Council of Nicaea (325). It was further assumed that this enlargement had been carried out at the Council of Constantinople (381) with the object of bringing the Creed of Nicaea up to date in regard to heresies about the Incarnation and the Holy Spirit that had risen since the Council of Nicaea.

Additional discoveries of documents in the 20th century, however, indicated that the situation was more complex, and the actual development of the Niceno-Constantinopolitan Creed has been the subject of scholarly dispute. Most likely it was issued by the Council of Constantinople even though this fact was first explicitly stated at the Council of Chalcedon in 451. It was probably based on a baptismal creed already in existence, but it was an independent document and not an enlargement of the Creed of Nicaea.

The so-called *Filioque* clause (Latin *filioque,* "and from the son"), inserted after the words "the Holy Spirit . . . who proceedeth from the Father," was gradually introduced as part of the creed in the Western Church, beginning in the 6th century. It was probably finally accepted by the papacy in the 11th century. It has been retained by the Roman Catholic, Anglican, and Protestant churches. The Eastern churches have always rejected it because they consider it theological error and an unauthorized addition to a venerable document.

The Nicene Creed was originally written in Greek. Its principal liturgical use is in the Eucharist in the West and in both Baptism and the Eucharist in the East. A modern English version of the text is as follows:

We believe in one God,
the Father, the Almighty,
maker of heaven and earth,
of all that is seen and unseen.
We believe in one Lord, Jesus Christ,
the only Son of God,
eternally begotten of the Father,
God from God, Light from Light,
true God from true God,
begotten, not made, one in Being with the Father.
Through him all things were made.
For us men and for our salvation
he came down from heaven:
by the power of the Holy Spirit
he was born of the Virgin Mary, and became man.
For our sake he was crucified under Pontius Pilate;
he suffered, died, and was buried.
On the third day he rose again
in fulfillment of the Scriptures;
he ascended into heaven
and is seated on the right hand of the Father.
He will come again in glory
to judge the living and the dead,
and his kingdom will have no end.
We believe in the Holy Spirit, the Lord, the giver of life,
who proceeds from the Father and the Son.
With the Father and the Son he is worshipped and glorified.
He has spoken through the Prophets.
We believe in one holy catholic and apostolic Church.
We acknowledge one baptism for the forgiveness of sins.
We look for the resurrection of the dead,
and the life of the world to come. Amen.

Nicephorus, name of rulers grouped below by country and patriarchate and indicated by the symbol •.

BYZANTINE EMPIRE

•**Nicephorus I** (b. Seleucia—d. July 26, 811, Bulgaria), Byzantine emperor from 802 who late in his reign alienated his subjects with his extremely heavy taxation and frequent confiscations of property.

Nicephorus became a high financial official under the empress Irene, and, when a revolution deposed Irene in 802, he was proclaimed emperor. In the following year he crushed a rebellion by Bardanes Turcus, a rival candidate for the throne, and in 808 he put down a similar revolt led by Arsaber.

Nicephorus I, coin, 9th century; in the British Museum
Peter Clayton

When Nicephorus withheld the tribute that Irene had agreed to pay the Baghdad caliph Hārūn ar-Rashīd, war followed, and Arab forces defeated the Byzantine emperor at Crasus in Phrygia (805). In 806 Hārūn ar-Rashīd invaded Asia Minor with more than 135,000 men and captured Heraclea, Tyana, and other places. Nicephorus was forced to agree to pay a yearly tribute of 30,000 gold pieces.

Although Nicephorus' religious policy was Orthodox rather than Iconoclast (*e.g.,* he permitted the veneration of images), he exercised strong control over the church, even going so far as to sponsor the convocation of a synod (809) that declared the emperor exempt from ecclesiastical laws.

During Nicephorus' reign Venice, Istria, and the Dalmatian coast were in dispute between Byzantium and the empire of Charlemagne until 810. Then a tentative agreement was reached, under which the disputed areas were to be returned to Byzantium in exchange for Byzantine recognition of Charlemagne's title of emperor. The details were worked out two years later during the reign of Nicephorus' successor, his son-in-law Michael I.

In 807–809, Nicephorus I conducted campaigns against the Bulgars, who were harassing Byzantium's northern frontiers. In 811 he invaded Bulgaria, rejecting the Bulgar khan Krum's repeated offers for peace. The Bulgars, however, managed to trap the Byzantines in a mountain defile, where they killed Nicephorus together with most of his army. Krum had Nicephorus' skull lined with silver and used it as a drinking cup.

•**Nicephorus II** PHOCAS (b. 912, Cappadocia—d. Dec. 10/11, 969, Constantinople), Byzantine emperor (963–969), whose military achievements against the Muslim Arabs contributed to the resurgence of Byzantine power in the 10th century.

Nicephorus II Phocas, coin, 10th century; in the British Museum

Early life. Nicephorus Phocas was the son of Bardas Phocas, an important Byzantine general in Anatolia, on the borders of the empire. He quickly embraced a military career of arms and as a young patrician distinguished himself at his father's side in a war against the Ḥamdānid Arabs in the East. In 954–955 the emperor Constantine VII Porphyrogenitus named him commander in chief of the armies of the East, to replace the aging Bardas. Nicephorus proceeded to restructure the army to reinforce discipline and improve recruiting. At this point he probably wrote the treatises on military tactics that are attributed to him, although proof is lacking.

The emperor Romanus II named him commander of a wartime expedition to liberate Crete (which had been controlled by the Arabs ever since 826), at great cost to Aegean populations and international commerce. This enterprise mobilized the entire Byzantine fleet and close to 24,000 men. Nicephorus gained the island with the capture of Chandax, now Iráklion, on March 7, 961. In a general massacre, the inhumanity of which revealed his fierce nature, he broke all Arab resistance. Aided by the monks, among whom was Athanasius, his spiritual director and founder of the Greek Orthodox monastery on Mt. Athos, Nicephorus achieved the reconsolidation of Christianity. He then returned to Constantinople with ‘Abd al-‘Azīz, the last *amīr* of Crete, as his captive. This exploit, sung by the poet Theodosius the

Deacon, realized the Byzantine dream (after dozens had failed to liberate Crete) of imperial mastery of the eastern Mediterranean. Later, as emperor, Nicephorus could state proudly that he controlled the seas. By that time, however, he had recovered Cilicia and the island of Cyprus and had captured other Muslim naval bases.

At the beginning of 962, Nicephorus attacked the Arabs of Cilicia and Syria, capturing more than 60 fortresses. After the death of Romanus II on March 15, 963, the situation in the capital changed. The Emperor's will had left a eunuch, Joseph Bringas, in charge of the affairs of state and the 20-year-old empress, Theophano, as acting regent for the legitimate emperors, Basil and Constantine, aged six and three, respectively. These circumstances do not seem to have tempted Nicephorus.

Rise to power. In spite of his great popularity, there was no indication that Nicephorus—whose physical appearance was reportedly not very agreeable and who seemed destined under the influence of Athanasius the Athonite to embrace the monastic life—would end up seducing and being seduced by the young and beautiful empress. If such a plan existed at the time (and there is reason to believe it did) it was probably the brainchild of the ambitious Theophano, who was unhappy with Bringas' government. The people of Constantinople, aroused by Basil the chamberlain, revolted against Bringas, and the imperial army, through the intermediation of John Tzimisces, Nicephorus' faithful lieutenant, "obliged" the soldier to accept the crown at Caesarea on July 3, 963, and to march against Constantinople. On Aug. 16, 963, Nicephorus was crowned in the Hagia Sophia by the patriarch Polyeuctus, and on September 20 he celebrated his marriage to Theophano.

Smitten with the young woman and influenced by his brother Leo Phocas, whose self-interested machinations (he was accused of speculating on the price of wheat) stirred up the discontent of the people of Constantinople, Nicephorus gradually became taciturn and suspicious even of his best advisers, who, one after another, were removed from office. As emperor, Nicephorus continued his exploits against the Arabs until finally, abandoned by all, he retired to the fortified palace of Boukoleion, which he had built for his personal safety. During a night in December 969, he was killed there by former friends, guided by Tzimisces and advised by Theophano.

The contradictions in Nicephorus' life and character also marked his domestic politics. His government evoked unanimous discontent: the hostility of the people to the new fiscal charges and coinage debasement required by military needs; the exasperation of ecclesiastical authorities over decisions against enrichment of the monasteries; the remonstrances of his spiritual director, Athanasius, against his private life; and the apprehensions of Theophano that her children would be ousted through the machinations of Leo Phocas. These all created a climate of intrigue, which resulted in Nicephorus' assassination and brought John Tzimisces to the throne.

Military achievements. The failure of Nicephorus' domestic policies did not cast a shadow on his military achievement, which made his reign one of the Byzantine Empire's most glorious. In the words of C. Schlumberger, his most exhaustive biographer, he inaugurated the Byzantine era in the East. In fact, though known primarily for his exploits against the infidel, Nicephorus also carried the imperial frontier beyond the Euphrates to Syria. Nor did he neglect the other imperial frontiers in the conception of Byzantine grandeur. To counteract the Bulgar menace he spurred Russian intervention in the Danubian area, a policy that was not without danger for Byzantium, especially after his death. Also, to stop expansionist plans of the Germanic sovereign Otto I, who was re-creating the Carolingian heritage, Nicephorus opposed Otto's title of emperor, while trying with more or less success to consolidate the Byzantine presence in Italy. Nicephorus II's policies, seen in their entirety, indicate that his purpose was to assure Byzantium of its place as international arbiter, which he accomplished through the use of arms.

Reputation. Phocas was indeed a Nicephorus (Bringer of Victory) for the empire. The Byzantines surnamed him Kallinikos, artisan of good victories; the Arabs called him Nikfour, the Saracen hammer. His death caused joy in the Muslim world and shook Christianity. His legend was quickly nourished with stories of his exploits and tragic death. Byzantine and even Bulgar poets were inspired by his exploits, and posterity has kept his memory alive: he is celebrated in the epic poetry of the frontier; the church beatified him (an *acolouthie* was composed in his honour); and the monks of Mt. Athos still venerate as their benefactor and founder Nicephorus, emperor and martyr. His life was summed up in the phrase inscribed on his sarcophagus: "You conquered all but a woman." (H.Ah.)

BIBLIOGRAPHY. C. Schlumberger, *Un Empereur byzantin au Xᵉ siècle: Nicéphore Phocas* (1890), is a comprehensive biography. The same author's *L'Épopée byzantine à la fin du Xᵉ siècle,* 3 vol. (1896–1905); and A.A. Vasiliev, *Byzance et les Arabes,* vol. 2, *La Dynastie macédonienne* (1968), are useful for Nicephorus Phocas' career in the East. Also of interest is H. Gregoire, "The Amorians and the Macedonians, 842–1025," in *The Cambridge Medieval History,* new ed., vol. 4, pt. 1, pp. 147–156 (1966).

•**Nicephorus III** BOTANEIATES (fl. late 11th century), Byzantine emperor (1078–81) whose use of Turkish support in acquiring and holding the throne tightened the grip of the Seljuq Turks on Anatolia.

Nicephorus, who belonged to the military aristocracy of Asia Minor and who was related to the powerful Phocas family, became commander of the Anatolian theme (administrative district). When discontent against the government of Michael VII Ducas led to rioting in Constantinople, Nicephorus was proclaimed emperor (Jan. 7, 1078) by his supporters there. With some support from Suleiman, the Seljuq ruler in Anatolia, Nicephorus was acclaimed emperor by his troops at Nicaea (in northwestern Anatolia) and entered Constantinople three months later. His imperial claim was ratified by the aristocracy and clergy, who had already deposed Michael VII. Nicephorus III defeated a rival claimant to the throne, Nicephorus Bryennius, the empire's commander in Albania; he also defeated a later pretender, Nicephorus Basilacius, who succeeded Bryennius in Albania.

Nicephorus III Botaneiates, detail of a manuscript; in the Bibliothèque Nationale, Paris (Ms. Coislin 79)
By courtesy of the Bibliotheque Nationale, Paris

After the death of Nicephorus' wife, he married Mary, the wife of the deposed but still living Michael VII, naming Michael's son Constantine as his successor but then later deciding on one of his own nephews instead. He relegated Constantine's fianceé, a daughter of the Norman leader Robert Guiscard, to a convent. Nicephorus' action provided an excuse for Guiscard's later successful attacks against the empire.

In 1080 another usurper, Nicephorus Melissenus, appeared in Asia Minor and also sought Turkish assistance. As a result of such constant internal strife, with one faction or another requesting aid from the Turks, most of Asia Minor was lost to Byzantium and became incorporated in the Seljuq Sultanate of Rūm, centred on Iconium (modern Konya, Tur.). Unable either to save the empire from disintegration or to maintain his own position as ruler, Nicephorus abdicated on April 4, 1081, and entered the Peribleptos monastery in Constantinople.

PATRIARCHATE

•**Nicephorus I,** SAINT, Greek NIKEPHOROS (b. *c.* 758, Constantinople—d. June 2, 829, near Chalcedon, Bithynia, Asia Minor; feast day March 13), Greek Orthodox theologian, historian, and patriarch of Constantinople (806–815) whose chronicles of Byzantine history and writings in defense of Byzantine veneration of icons provide data otherwise unavailable on early Christian thought and practice.

Although his conservatively Orthodox family had suffered at the hands of iconoclast (image-destroying) regimes during the Isaurian dynasty (717–820), Nicephorus succeeded to the imperial secretariat and represented the emperor Constantine VI as imperial commissioner to the second Council of Nicaea (787), which approved the use of liturgical icons. After having retired for a number of years into monastic seclusion, he was called to be director of Constantinople's refuge centre for the poor soon after the accession of the empress Irene (ruled 797–802).

Though still a layman, he was nominated patriarch of Constantinople in 806. That move stirred the opposition of zealous monks of the Stoudion monastery who attacked his unconventional succession to the patriarchate, his compromising stand on an adulterous marriage at court, and his generally conciliatory position on theology. Later, however, his repudiation of the iconoclastic policies of the Isaurian emperor Leo V the Armenian won the monks' respect.

Subsequently, in 815, an iconoclastic synod at Constantinople deposed and exiled Nicephorus to a monastic retreat near Chalcedon; thenceforth, he produced a series of influential anti-iconoclastic tracts and Byzantine chronicles. His theological arguments achieved a measure of toleration from the emperor Michael II (ruled 820–829). Chief among his theological works was his *Apologeticus major* (817, "Major Apology"), an exhaustive treatise on the legitimacy of icon veneration. Nicephorus succeeded in neutralizing his theological adversaries and contributed to the eventual vindication of the use of icons by the mid-9th century.

Two of his historical works became universally popular: *Breviarium Nicephori* ("Nicephorus' Short History"), which narrated events during Byzantine reigns from 602 to 769 and is significant for material on the founding of Bulgarian settlements; and chronological tables, which listed civil and ecclesiastical offices from the time of Adam to the year 829. Both works circulated in the West through the Roman Anastasius the Librarian's late 9th-century Latin compilation of the *Chronologia tripartita* ("Tripartite Chronicle").

Nicephorus Bryennius: *see* Bryennius, Nicephorus.

Nicephorus Callistus Xanthopoulos (b. *c.* 1256—d. *c.* 1335), Byzantine historian and litterateur whose stylistic prose and poetry exemplify the developing Byzantine Humanism of the 13th and 14th centuries, and whose 23-volume *Ecclesiasticae historiae* ("Church History") constitutes a significant documentary source for material on primitive Christianity, its doctrinal controversies and Christological heresies, and for hagiographical, liturgical, and legendary texts from Byzantine culture.

One of the clerics attached to Constantinople's basilica of Hagia Sophia (Greek: Holy Wisdom), Nicephorus was trained in the florid, rhetorical style of Renaissance Byzantine historiography; he taught rhetoric and theology and in his later years became a monk. Using the basilica's manuscript library, he compiled his major work, an 18-volume "Church History," from the origins of Christianity to the execution of the emperor-tyrant Phocas in 610; an appendix of 5 volumes continued the chronicle, summarizing events until the death of Emperor Leo VI the Wise (912). Taking as a point of departure several celebrated ecclesiastical histories, including those of the 6th-century Byzantine Evagrius Scholasticus and the 4th-century Eusebius of Caesarea, integrated with accounts of an anonymous 10th-century text, Nicephorus paraphrased a chronicle the value of which must be determined by the quality of the individual sources used. In the manner of Byzantine Humanism, the "History," written in an affected style that often impedes textual clarity, was dedicated to the emperor Andronicus II Palaeologus (1282–1328) and contributed to that monarch's nationalist movement exalting Greek culture and Orthodoxy above Latin Christianity. The 16th-century Latin translation, however, served to support the argument for the use of religious images in controversies involving certain Protestant iconoclasts.

Among Nicephorus' other works are commentaries on the writings of the outstanding patristic Greek theologian, Gregory of Nazianzus; treatises on the annual cycle of Byzantine worship, with annotations on Lenten and Easter hymnody; original liturgical orations in prose and poetry; rigid Byzantine verse forms cataloging emperors, patriarchs, and other dignitaries; and, as an exception, secular themes in verse and rhetorical forms.

Nicetas OF REMESIANA (fl. early 5th century), Greek bishop, theologian, and composer of liturgical verse, whose missionary activity and writings effected the Christianization of the Serbian Slavic regions and cultivated a Latin culture among the barbarians in the lower Danube Valley.

After becoming bishop of Remesiana (later the Serbian village of Bela Palanka, near the town of Niš) *c.* 366, Nicetas twice visited Paulinus, who was bishop of Nola, in Campania (near Naples), a fellow missionary, the foremost Latin literary figure of his age, and the primary source for knowledge of Nicetas' life and pastoral activity. Scholarship, having laboriously reconstructed substantial portions of Nicetas' theological tracts, has furnished sufficient evidence to identify his principal doctrinal work, the *Competentibus ad baptismum instructionis libelli sex* ("Six Books of Instructions for Baptismal Candidates"). The lengthy excerpts from this catechetical series, particularly "On the Meaning of Faith," "On the Power of the Holy Spirit," and the "Commentary on the Apostolic-Nicene Creed," indicate that Nicetas stressed the orthodox position in Trinitarian doctrine consonant with the leading 4th-century theologian Cyril of Jerusalem. Accordingly, Nicetas opposed any attribution of a created nature—either to the Son, contrary to the Arians, or to the Holy Spirit, as against the Macedonians. Moreover, these documents contain, apparently for the first time in early Christian literature, the term communion of saints, in reference to the belief in a mystical bond uniting both the living and the dead in a confirmed hope and love. This expression henceforth played a central role in formulations of the Christian creed.

Other patristic writers, including the 5th-century church historian Gennadius of Marseilles, credit Nicetas with promoting Latin sacred music among his newly converted primitive Serbians for use during their eucharistic worship with its vigil from Saturday evening to Sunday morning. He wrote a rationale for such practice and reputedly composed a number of liturgical hymns, among which some 20th-century scholars identify the major Latin Christian acclamation chant of thanksgiving, the "Te Deum laudamus" (Latin: "God, We Praise You").

Nicetas STETHATOS (b. *c.* 1000—d. *c.* 1080), Byzantine mystic, theologian, and outspoken polemist who played the principal theoretical role in the 11th-century Greek Orthodox–Latin church controversy concluding in the definitive schism of 1054.

A monk of the Stoudion monastery in Constantinople (now Istanbul), Nicetas allied himself *c.* 1020 with his spiritual tutor, Symeon the New Theologian, whose biographer and apologist he became when Symeon was attacked for his system of contemplative prayer. In his biography of Symeon, Nicetas integrated his own views on the inner experience of beatifying illumination that derived from a monastic prayer discipline involving both body and spirit, known as Hesychasm (*q.v.*). Furthering this tradition he wrote a treatise and several commentaries on ascetical practices.

In the 11th-century conflict between the Greek and Latin churches, Nicetas served as theologian-polemist to Constantinople's patriarch Michael Cerularius, who, during 1053–54, disputed sharply with the papal legate Cardinal Humbert of Silva Candida. Nicetas criticized Western doctrine on the manner of relating the Holy Spirit to the divinity, on the claims of papal supremacy, on mandatory clerical celibacy, and on the use of unleavened bread in Roman eucharistic worship.

niche, in architecture, decorative recess set into a wall for the purpose of displaying a statue, vase, font, or other object. Niches were used extensively in both interior and exterior walls by the architects of ancient Rome. A fine extant example of such use is found at the Roman Temple of Diana at Nîmes, Fr.

Gothic examples of the decorative recess are ubiquitous, including niches in such medieval structures as the English cathedrals of Wells and Peterborough. Later architects, especially those of the Italian Renaissance and the classic revival of 17th- and 18th-century Europe, all made use of the niche. Semicircular niches are often featured, many having shell-like fluting at the apex.

niche, in ecology, the smallest unit of a habitat that is occupied by an organism. Habitat niche refers to the physical space occupied by the organism; ecological niche refers to the role it plays in the community of organisms found in the habitat. The activities of an organism and its relationships to other organisms are determined by its particular structure, physiology, and behaviour. Two organisms that occupy similar niches but that are native to different geographical areas are termed ecological equivalents.

Nichinan, city, Miyazaki Prefecture (*ken*), Kyushu, Japan, facing the Pacific Ocean. Japanese (Obi) cedar has been cultivated in the area since the early 19th century and forms the basis of the city's shipbuilding, timber, paper, and pulp industries. Nichinan's two ports—Aburatsu and Oodotsu—are the main centres for coastal fishing (bonito, yellowtail, tuna) in southern Kyushu. Agricultural products include sweet potatoes, barley, and tobacco. The city is bordered (north) by low, rounded hills, and its picturesque seacoast is part of Nichinan-kaigan Quasi-national Park. Pop. (1995) 47,596.

Nichiren, original name ZENNICHI, also called ZENSHŌBŌ RENCHŌ, posthumous name RISSHŌ DAISHI (b. March 30, 1222, Kominato, Japan—d. Nov. 14, 1282, Ikegami), militant Japanese Buddhist prophet who contributed significantly to the adaptation of Buddhism to the Japanese mentality and who remains one of the most controversial and influential figures in Japanese Buddhist history. After an exhaustive study of the various forms of Buddhism, he concluded (in 1253) that the *Lotus Sūtra* teaching was the only true doctrine suitable for his age and predicted calamity for Japan if all other sects were not banished. He wrote his systematic work, *Kaimokushō* (1272), while in exile for his radical teachings.

Early years and spiritual quest. Nichiren, the son of a fisherman, was born in the village of Kominato, on the Pacific coast of the present Bōsō Peninsula in eastern Japan. When he was 11 years old, he entered the Buddhist monastery of Kiyosumi-dera, near Kominato, and after four years of novitiate received the Buddhist orders. Buddhism in Japan had become more and more doctrinally confused, and the identity of the various sects was based more on institutional aspects than on doctrinal tenets. Though the monastery of Kiyosumi-dera officially belonged to the Tendai sect (which was centred on the *Lotus Sūtra* text and realization of the universal Buddha-nature), the doctrine practiced there was a mixture of different Buddhist schools; it had a strong emphasis on Shingon, an esoteric school that emphasized an elaborate symbolic ritual as a means of arousing an immediate sense of the all-pervading presence of the Buddha.

The young monk was too intense and too sincere in his quest for the true doctrine of the Buddha to be satisfied with such prevailing confusion of doctrine. Soon his central spiritual problem was to find, through the maze of scriptures and doctrines, the authentic teaching the historical Buddha, Gautama (Śākyamuni), had preached for the salvation of mankind. So he undertook a thorough study of all the major Buddhist schools existing in Japan.

In 1233 he went to Kamakura, where he studied Amidism—a pietistic school that stressed salvation through the invocation of Amida (Amitābha), the Buddha of infinite compassion—under the guidance of a renowned master. After having persuaded himself that Amidism was not the true Buddhist doctrine, he passed to the study of Zen Buddhism, which had become popular in Kamakura and Kyōto. He then went to Mount Hiei, the cradle of Japanese Tendai Buddhism, where he found the original purity of the Tendai doctrine corrupted by the introduction and acceptance of other doctrines, especially Amidism and esoteric Buddhism. To eliminate any possible doubts, Nichiren decided to spend some time at Mount Kōya, the centre of esoteric Buddhism, and also in Nara, Japan's ancient capital, where he studied the Ritsu sect, which emphasized strict monastic discipline and ordination.

By 1253, 20 years after his quest had begun, Nichiren had reached his final conclusion: the true Buddhism was to be found in the *Lotus Sūtra,* and all other Buddhist doctrines were only temporary and provisional steps used by the historical Buddha as a pedagogical method to lead men to the full and final doctrine contained in the *Lotus Sūtra.* Moreover, the Buddha himself had decreed that this doctrine was to be preached to men during the age of *mappō* (the "latter law")—the last, degenerate period after his death, the present age—and that a teacher would then appear to preach this true and final doctrine.

Nichiren's doctrine. In the spring of 1253, Nichiren returned to Kiyosumi-dera, where he proclaimed his faith before his old master and his fellow monks, adding that all other forms of Buddhism were to be banished, for they were false and were misleading the people. Neither the monks of Kiyosumi-dera nor the feudal lord of the region accepted his doctrine, and their angry reaction was such that he had to escape to save his life.

Expelled from his monastery, Nichiren lived in a little hut in Kamakura and spent his days preaching his doctrine at the busiest crossroads of the city. His constant attacks against all other sects of Buddhism attracted an ever-increasing hostility and finally open persecution from Buddhist institutions and from the authorities. The country was at the time afflicted by epidemics, earthquakes, and internal strife. Reflecting on this sad situation, Nichiren is said to have read once again all the Buddhist scriptures and in 1260 published a short tract, *Risshō ankoku ron* ("The Establishment of Righteousness and the Pacification of the Country"), in which he stated that the deplorable state of the country was due to the people's refusal to follow true Buddhism and their support of false sects. The only salvation was for the authorities and the people of Japan to accept Nichiren's doctrine as the national faith and banish all the other sects. If this was not done, Nichiren claimed, the state of the country would become even worse, and Japan would be invaded by a foreign power. The military government in Kamakura reacted to this prophetic admonition by exiling the monk to a deserted place in the Izu-hantō, in the present Shizuoka prefecture, in June 1261. He was pardoned in 1263, but upon his return to Kamakura Nichiren renewed his attacks.

In 1268 an embassy from the Mongols—who had conquered China—arrived in Japan with the demand that the Japanese become a tributary nation to the new Mongol dynasty. Nichiren saw in this event the fulfillment of his prophecy of 1260. Once again he sent copies of his *Risshō ankoku ron* to the authorities and the heads of the major Buddhist institutions, insisting again that if his doctrine was not accepted as the true Buddhism and if the other sects were not banished, Japan would be visited with all manner of calamities.

Exile. Again the authorities and the older Buddhist sects were enraged by the extraordinary audacity of this troublesome monk, and in 1271 Nichiren was arrested and condemned to death. The death penalty was commuted at the last moment, and instead of being executed Nichiren was exiled to the island of Sado, in the Sea of Japan, where in 1272 he wrote his systematic work *Kaimokushō* ("The Opening of the Eyes").

According to Nichiren's account and the belief of his adherents, he was saved from execution by a miraculous intervention that struck the sword from the executioner's hand. While the fiery monk was in exile, a second and a third Mongol embassy arrived, threatening an invasion if Japan persisted in its refusal to become a vassal nation. Nichiren's prophecy and the pressure of his influential friends in Kamakura moved the government, and an edict of pardon was issued in the spring of 1274. In May Nichiren arrived in Kamakura, where he met with high government officials and reiterated his stern requests. Though this time the authorities treated him with deference and respect, they still refused to comply with his demands.

Full of indignation, Nichiren left Kamakura in June and with a small number of disciples retired to a solitary place on Mount Minobu, in the present Yamanashi prefecture. There he spent his last years instructing his followers and writing. Among the main works of this period are the "Selection of the Time," a synthetic exposition of his philosophy of history, and "In Recompense of Indebtedness," in which a good life is seen as one of practical gratitude toward one's parents, all creatures, one's sovereign, and the Buddha.

The hardships and persecutions endured for so many years began to take their toll, and Nichiren's state of health grew worse and worse. His final illness was probably a cancer of the intestinal tract. In the fall of 1282 he left his hermitage at Minobu and took residence in the mansion of one of his disciples in the district of Ikegami (in what is now Tokyo), where he died.

Assessment. Nichiren is perhaps the most controversial figure in the history of Japanese Buddhism. Incapable of accepting any compromise, he described himself as a most intractable character. Yet letters he wrote to his disciples and friends reveal how loving, understanding, and even delicate he could be. He dearly loved Japan and wanted it to fulfill its mission of being the chosen country of Buddhism, from which Buddha's salvation was to spread to the entire world. His Buddhism was typically Japanese in the sense that it could not be confined to mere speculation or even to individual salvation but had to be concerned with the salvation of society and temporal institutions—hence, the importance he gave to the right understanding of history and human affairs. The continuing vitality of the religious system he founded in the 13th century is attested by the fact that many of the modern Buddhist sects now flourishing in Japan are, in various degrees, based on Nichiren's doctrines. (P.P. del C.)

BIBLIOGRAPHY. Masaharu Anesaki, *Nichiren, the Buddhist Prophet* (1916, reissued 1966).

Nichiren Buddhism, school of Japanese Buddhism named after its founder, the 13th-century militant prophet and saint Nichiren. It is one of the largest schools of Japanese Buddhism; in 1977 the total membership of its numerous subsects was reported to be approximately 30,600,000.

Nichiren believed that the quintessence of the Buddha's teachings was contained in the *Lotus Sūtra* (Sanskrit: *Saddharmapuṇḍarīka-sūtra;* "The Scripture of the Lotus of the Good Law"). According to him, the other sects then existing in Japan misunderstood the truth, and he vehemently denounced them and the government that supported them. He blamed the social unrest of the period on the erroneous religious beliefs of the nation and proclaimed that the salvation of the Japanese nation depended on devotion to the truth contained in the *Lotus Sūtra.* He came to conceive of himself as the bodhisattva ("buddha-to-be") Jōgyō, who was destined to suffer for proclaiming the truth in an era of darkness, an identification apparently verified by the severe persecution he suffered.

Nichiren taught that the historical Buddha Śākyamuni was identical with the original, eternal Buddha and that, inasmuch as all men partake of the Buddha-nature, all men are manifestations of the eternal. He devised three ways of expressing this concept, known as the *sandai-hihō* ("three great secret laws [or mysteries]"). The first, the *honzon,* is the chief object of worship in Nichiren temples and is a ritual drawing showing the name of the *Lotus Sūtra* surrounded by the names of divinities mentioned in the sutra (words of the Buddha). The second great mystery is the *daimoku,* the "title" of the sutra; and Nichiren instituted the devotional practice of chanting the phrase *namu Myōhō renge-kyō* ("salutation to the *Lotus Sūtra*"). The third mystery relates to the *kaidan,* or place of ordination, which is sacred and belongs to the "Lotus of the Good Law."

After Nichiren's death the school split into various subsects, most notably Nichiren-shū (Nichiren Sect) and Nichiren-shō-shū (True Nichiren Sect). The former, which still controls the main temple, the Kuon-ji, founded by Nichiren at Mount Minobu (Yamanashi prefecture), maintained a dominant position among Nichiren Buddhists until the years following World War II, when it was eclipsed by the Nichiren-shō-shū, whose phenomenal growth stemmed from its lay organization, the Sōka-gakkai.

Nichiren-shō-shū traces its line of succession back to one of Nichiren's six disciples, Nikkō, who, according to documents held by the sect, was the prophet's chosen successor. The temple he established in 1290 at the foot of Mount Fuji, Daiseki-ji, is still the sect's headquarters. Nichiren-shō-shū differs from the other Nichiren sects in its elevation of the founder, Nichiren, to a rank higher even than that of the historical Buddha.

Among its rival Nichiren sects, Nichiren-shō-shū had only minor influence until the emergence of the Sōka-gakkai lay organization brought it into its present dominant position in Japanese politics. The sect has established branches outside Japan. In the United States the lay organization equivalent to the Sōka-gakkai is called Nichiren-shō-shū of America.

Nicholas, name of rulers grouped below by country, papacy, or patriarchate and indicated by the symbol ●.

Foreign-language equivalents:

Greek	Nicolaos, or Nikolaos
Latin	Nicolaus
Montenegrin	Nikola
Russian	Nikolay, or Nikolai

Montenegro

●**Nicholas I,** Montenegrin in full NIKOLA PETROVIĆ (b. Oct. 7 [Sept. 25, old style], 1841, Njegoš, Montenegro—d. March 2, 1921, Antibes, Fr.), prince (1860–1910) and then king (1910–18) of Montenegro, who transformed his small principality into a sovereign European nation.

Heir presumptive to his uncle Danilo II, who was childless, Nicholas came to the throne in August 1860 after Danilo's assassination. Educated abroad in Paris and Trieste, he was throughout his reign faced with the difficult task of popularizing Western ways. A strong prince and an outstanding leader, he fought the Turks in 1862 and again in 1876, when he conducted a brilliant campaign. At the Congress of Berlin (1878), Montenegro was doubled in size, with an outlet to the Adriatic, and recognized as a sovereign state. Alexander II of Russia, whose friendship with Nicholas dated back to a state visit to St. Petersburg in 1868, supplied him regularly with money and arms and at one point favoured his candidacy for the Serbian throne. A clever diplomat, Nicholas strengthened his dynastic connections through the marriages of his daughters: Elena married (1896) the future king of Italy, Victor Emmanuel III; Zorka married Peter Karageorgević (1883) but died before he became king of Serbia; two other daughters married Russian grand dukes. In Balkan politics Nicholas conspired, sometimes with, and sometimes against, Serbian rulers, to create a South Slav state.

Styling himself "Royal Highness" (December 1900), Nicholas became more despotic until he was forced to grant a constitution in 1905. Political dissension, nevertheless, continued, culminating in the Cetinje bomb plot against him (1907). On Aug. 28, 1910, Nicholas declared himself king. Hoping to gain prestige through the addition of new territories, he joined in the Balkan War of 1912–13 against Turkey; but his territorial acquisitions were disappointing. In World War I he supported Serbia against Austria-Hungary. Defeated, he concluded a separate peace in January 1916 and then went into exile in Italy. When the victorious Serbs entered Montenegro after the defeat of Austria-Hungary, Nicholas and his dynasty were formally deposed by a national assembly (Nov. 26, 1918), and Montenegro was joined to Serbia, later to become part of the Kingdom of the Serbs, Croats, and Slovenes (Yugoslavia).

Papacy

●**Nicholas I,** SAINT, byname NICHOLAS THE GREAT (b. *c.* 819–822, Rome—d. Nov. 13, 867, Rome; feast day November 13), pope from 858 to 867, master theorist of papal power, considered to have been the most forceful of the early medieval pontiffs, whose pontificate was the most important of the Carolingian period and prepared the way for the 11th-century reform popes.

He had served in the Curia for almost 15 years before his election in April 858 as Pope Benedict III's successor. His reign was marked by three historically significant contests.

Nicholas supported the patriarch St. Ignatius of Constantinople, who was uncanonically replaced by the scholar Photius after the Byzantine emperor Michael III had unjustly humiliated and deposed him. To investigate this state of affairs, Nicholas dispatched legates to Constantinople, but when they confirmed judgment against Ignatius in 861, he disavowed them. After receiving word from the exiled Ignatius in 862, Nicholas, having studied the case, favoured Ignatius and excommunicated Photius (863), who counterdeposed the Pope in 867. Nicholas did not live to learn of this act or of its extreme culmination: the Photian Schism, a split between the Eastern and Western churches.

Nicholas' second great struggle was with King Lothair of Lorraine, who wanted to divorce his wife, Theutberga, on false charges of incest. Theutberga appealed to Nicholas, while a synod at Aachen in April 862 gave Lothair permission to remarry. At a synod at Metz, in 863, Lothair obtained confirmation of the Aachen decision, probably through bribery, from Nicholas' legates, archbishops Günther of Cologne and Theutgaud of Trier (Trèves). When these legates arrived in Rome with the libellous decree of Metz, Nicholas, treating Lothair as his ecclesiastical subject, quashed the whole proceedings against Theutberga and, creating a precedent, deposed the archbishops.

The third great ecclesiastical affair of Nicholas' pontificate involved the deposition in 862 of Bishop Rothad II of Soissons by Archbishop Hincmar of Reims, a classic example of the right of bishops to appeal to Rome against their metropolitans. Nicholas, a strict upholder of Rome's primacy of jurisdiction, ordered an examination that led to Rothad's restoration in 865 by using, probably for the first time, the False Decretals, a 9th-century collection of revolutionary but partially forged documents that, in part, maintained bishops' independence against the encroachments of archbishops who were attempting to extend their power.

For Nicholas, the Roman see, having power by divine commission, was the head and the epitome of the Catholic Church. Consistently urging the supremacy of Rome, he fully endorsed the papal inheritance of sacerdotal and royal functions as conferred by Christ on St. Peter and the delegation of temporal power to the emperor for the protection of the church. He reacted against Carolingian domination in ecclesiastical matters and claimed the right to legislate for the whole of Christendom. Thus, his teaching contained the rudiments of papal theocracy and helped to found Roman supremacy over the Western sees by declaring that what the pope decides, all must observe. M. Maitland's English translation of J. Roy's *St. Nicholas I* was published in 1901, followed by E. Perels' *Papst Nikolaus I und Anastasius Bibliothekarius* in 1920.

●**Nicholas II,** original name GERARD OF BURGUNDY, French GÉRARD DE BOURGOGNE (b. Lorraine—d. Aug. 27, 1061, Florence), pope from 1058 to 1061, a major figure in the Gregorian reform.

He was bishop of Florence when he was elected, *c.* December 1058 at Siena, Italy, to succeed Pope Stephen X (IX), in opposition to Antipope Benedict X, who had been chosen by the anti-reformist Roman aristocracy. In January 1059 Benedict was expelled from the papacy.

At the Lateran Council of April 1059, a milestone in papal history, Nicholas promulgated his famous bull on papal elections (April 13); he did so in reaction to the disorders that interrupted his own election. He assigned the leading part in elections to the seven cardinal bishops (*i.e.,* those who had the predominant position among the higher clergy), who were to choose a suitable candidate and then summon the other cardinals. The remaining clergy and the people were to acclaim the choice, and the imperial role was dismissed. Nicholas' legate, sent to notify the German court of the election decree, was refused an audience, and an imperialist version of the decree was circulated. At a synod of 1061, the German bishops declared Nicholas' decree void and quashed all his acts, signifying the ruptured alliance between Germany and Rome and launching the contest between empire and papacy.

Nicholas' relations with the Normans, firmly entrenched in southern Italy, were friendly, however. By the Treaty of Melfi (Aug. 23, 1059) he invested Robert Guiscard as duke of Apulia, Calabria, and Sicily (with papal suzerainty over these lands) and Richard of Aversa as prince of Capua, in return for allegiance. A. Clavel's *Pape Nicholas II: son oeuvre disciplinaire* ("Pope Nicholas II: His Disciplinarian Work") was published in 1906.

●**Nicholas III,** original name GIOVANNI GAETANO ORSINI (b. *c.* 1225, Rome—d. Aug. 22, 1280, Soriano nel Cimino, near Viterbo, Papal States), pope from 1277 to 1280.

Of noble birth, he was made cardinal in 1244 by Pope Innocent IV and protector of the Franciscans in 1261 by Pope Urban IV. After a colourful and celebrated service in the Curia, he was elected pope on Nov. 25, 1277, and initiated an administrative reform of the Papal States.

In matters of the church, Nicholas issued the important bull of 1279, temporarily settling the Franciscan struggle over the interpretation of perfect poverty that had split the order into two factions, the Conventuals and the Spirituals. His bull revoked the concessions concerning the use of money made by Pope Innocent IV and clarified Innocent's ruling that all possessions of the order, except those reserved by the donors, belonged to the papacy.

Nicholas successfully continued Pope Gregory X's policy of restraining the ambitious Sicilian king Charles I of Anjou and did not renew Charles's positions as imperial vicar of Tuscany and senator of Rome, an office Nicholas prevented from ever again being filled by a foreign ruler. He induced the German king Rudolf I to acknowledge that the Italian province of the Romagna (though it was not incorporated until much later) belonged to the church. Anxious to maintain a balance of power between Rudolf and Charles, who had invaded Italy and who was supported by the ruling Florentine party, Nicholas sent his nephew Cardinal Malebranca to Florence in 1279 on a mission that resulted in a reorganization of that government.

In May 1280 he arranged a treaty to terminate the claims of the sovereign dynasties—the Habsburgs and the Angevins—for the possession of Sicily. His early death ruined his plans to reorganize the Holy Roman Empire and led to a renewal of Angevin-French influence on the papacy under his successor, Pope Martin IV. Nicholas was a political realist; he accepted the idea that every cardinal was the agent of a political interest, and he exalted his own family, the Orsini, who acquired increasing influence in church policy and administration.

●**Nicholas IV,** original name GIROLAMO MASCI (b. Sept. 30, 1227, near Ascoli Piceno, Papal States—d. April 4, 1292, Rome), pope from 1288 to 1292, the first Franciscan pontiff.

He joined the Franciscans when young and became their minister for Dalmatia. In 1272

Pope Gregory X sent him to Constantinople, where he took part in effecting a brief reunion with the Greeks. From 1274 to 1279 he was minister general of the Franciscans, and in 1281 Pope Martin IV made him cardinal bishop of Palestrina, Italy. He was elected on Feb. 22, 1288, to succeed Pope Honorius IV, after the papacy had been vacant for almost 11 months.

Nicholas IV relied heavily on a powerful Italian family, the Colonna, and increased the number of Colonna cardinals. In a bull of 1289 he granted half of the church's revenues and a share in its administration to the College of Cardinals, thereby increasing their importance in church and Papal States affairs. In 1290 he issued a new bull against the Apostolici, various Christian sects that sought to reestablish the life and discipline of the primitive church by a literal observance of continence and poverty.

Like his predecessors popes Nicholas III, Martin IV, and Honorius IV, Nicholas IV strove to keep the balance between the sovereign dynasties of the Habsburgs (the German king Rudolf I) and the Anjous (the Sicilian king Charles I). As feudal overlord of Sicily, Nicholas tried vainly to force the royal house of Aragon to restore Sicily to the Anjous, and in 1291 he ended the conflict between France and the Kingdom of Aragon.

Nicholas was unable to revive the Crusades, and in 1291 the last Christian crusader state, the Palestinian fortress of Acre, fell to the Mamlūk sultan of Egypt. Nicholas' wish to ally the Western powers with the Mongols against the Muslims was given hope through the Il-Khan Arghun of Persia, who sent urgent requests for joint action to Nicholas and kings Philip IV of France and Edward I of England. Although the plan did not materialize, Nicholas sent the celebrated Franciscan missionary Giovanni da Montecorvino to Kublai Khan's court, which led to establishment of the first Roman Catholic Church in China. He also sent missionaries, mostly Franciscans, to the Balkans and the Near East. He did much for Roman architecture and art, especially in restoring the basilicas of S. Giovanni in Laterano and Sta. Maria Maggiore.

•**Nicholas (V),** original name PIETRO RAINALDUCCI, or RAINALLUCCI (b. Corvaro, Rieti, Papal States—d. Oct. 16, 1333, Avignon, Provence), last imperial antipope, whose reign (May 1328 to August 1330) in Rome rivalled the pontificate of Pope John XXII at Avignon.

An assembly of priests and laymen in Rome under the influence of the Holy Roman emperor Louis IV the Bavarian, whom John had excommunicated, elected the Franciscan monk Pietro Rainalducci as the antipope Nicholas V. Having little support, Nicholas' cause proved fruitless. After John excommunicated him in April 1329, Nicholas, having been assured a pardon, renounced at Avignon his illegal claim to the papacy on Aug. 25, 1330. He remained in honourable imprisonment in the papal palace until his death.

•**Nicholas V,** original name TOMMASO PARENTUCELLI (b. Nov. 15, 1397, Sarzana, Republic of Genoa—d. 1455, Rome), influential Renaissance pope (reigned 1447–55) and founder of the Vatican Library. Soon after his election, he brought to an end the schism caused by rivalries between popes and councils. By 1455 he had restored peace to the Papal States and to Italy. He began a program for the rebuilding of many of Rome's architectural wonders, including St. Peter's Church, and became the patron of many artists and scholars. His failure to promote real religious reform, however, helped to bring about the Reformation of the 16th century.

Early life. Parentucelli was born in 1397. His father died when he was nine. Later he studied at Bologna, but for lack of funds had to interrupt his studies there. Then, to earn money, he acted as tutor for two years in two wealthy, cultured Florentine families, and this contact with the early Renaissance coloured all his life. After returning to the university and completing his studies, at the age of 22 he entered the household of Niccolò Albergati, the cardinal-archbishop of Bologna, whom he served devotedly for 20 years, accompanying him on his many diplomatic missions throughout Europe.

Pope Eugenius IV recognized Parentucelli's merit and experience and, on Albergati's death, made him bishop of Bologna (1444), but he was prevented from entering the city by its rebellious inhabitants, who sought independence from papal rule. At the Council of Ferrara–Florence (1438–45), he led the discussions with the Armenians, Copts, and Jacobites that attempted to end their doctrinal differences with the Latin Church, and he later journeyed on missions for the Pope. After his diplomatic success in pacifying the German Electors at the Diet of Frankfurt in 1446, he was created cardinal and only three months later, on March 6, 1447, was elected pope. Thenceforward, his chief aims were, in his words, "without using arms other than those which Christ has given me for my defence, that is to say, His Cross," to work for ecclesiastical and political peace, to reform the church, and to make Rome architecturally and artistically the worthy centre of Christianity.

Diplomacy and church reform. When Nicholas became pope, the remnant of the rebellious Council of Basel (1431–37)—which advocated control of the church through councils rather than through the pope—and its antipope Felix V still challenged Rome. Nicholas, by demanding little and yielding much, brought the schism to an end. He restored peace in the papal states, not by mercenary armies, which he disbanded, but by strategically situated castles entrusted to carefully chosen governors. In Rome he was conciliatory with the nobility and granted concessions to the restive citizens. He allowed the town of Palestrina, destroyed by his predecessor, to be rebuilt; pacified Bologna by granting it virtual independence; won the allegiance of Poland by concessions; and, by promising coronation as Holy Roman emperor to Frederick III, gained the support of Austria. In order to give peace to Italy by preserving the status quo and to organize a crusade against the Turks, he initiated the Peace of Lodi among Venice, Milan, Florence, and Naples and solemnly ratified it on Feb. 25, 1455.

Nicholas helped the church by furthering legislation against the old abuses of simony (buying and selling of church offices) and clerical concubinage and by encouraging bishops to govern their dioceses wisely. In Germany Cardinal Nicholas of Cusa (1401–64), a notable scholar and thinker, and the Franciscan theologian and preacher, Saint John of Capistrano (1386–1456), laboured hard at reform with much success. A wider measure to stimulate piety and restore the papal reputation was the proclamation of the 1450 Jubilee Year. Vast numbers of pilgrims visited Rome, and the project did much good, though it was marred by an outbreak of the plague and a tragedy when 172 people died in a panic-crush on the Ponte Sant'Angelo.

Architectural and Humanistic achievement. Pope Nicholas is best remembered for his influence on the Renaissance in Rome. "Of all Renaissance popes," says Eugène Müntz, a famous curator and art historian, "Nicholas is the one who ventilated the greatest number of architectural ideas: his successors only executed one or another element of his programme." He had plans for building a new St. Peter's Church but was able only to rebuild what was crumbling, to reconstruct the Vatican Palace, and to surround the whole with a wall. The restoration and embellishment of many Roman architectural treasures, such as the senatorial palace on the Capitoline Hill, are credited to him, but he pillaged ancient monuments to quarry materials for his new constructions. At his initiative, Rome became a centre for goldsmiths and silversmiths; he employed French, Belgian, and German tapestry makers; and he commissioned artists of note, among them the great Florentine painter Fra Angelico (1387–1455), to beautify his constructions.

He had the Humanist's passion for books. On his diplomatic missions he sought them out, and as pope he spent vast sums on buying them; he also founded the Vatican Library. His court became a centre for Humanists, some of them more pagan in outlook than Christian; they were employed in copying and translating ancient texts, among them the works of Homer, Herodotus, Thucydides, and many Greek Church Fathers.

His last years were saddened by a plot against his life. Twice he dealt mercifully with the ringleader; the third time, in 1453, he had him and his accomplices executed. Also in 1453, Constantinople, the seat of Eastern Christianity, was captured by the Turkish sultan. Nicholas had ordered a fleet to aid the beleaguered city, but it arrived too late. This was a military reverse of great religious and cultural significance.

Nicholas was a man of gentle character who achieved more by wise concession than others did by force. Of him Vespasiano da Bisticci (1421–98), the biographer of 15th-century luminaries, wrote: "He did not know what avarice was: indeed, if he retained anything of his own, it was simply because no one had asked him for it." His diplomatic efforts on behalf of peace in Italy and elsewhere and his patronage of the arts, especially of literature, restored to the church much of the ancient prestige it had lately lost. His failure to promote sufficiently religious reform, however, was destined to result in the Reformation in the 16th century. (J.Gi.)

PATRIARCHATE

•**Nicholas I,** byname NICHOLAS THE MYSTIC (b. 852, Constantinople—d. May 15, 925), Byzantine patriarch of Constantinople (901–907; 912–925), who contributed measurably to the attempted reunion of the Greek and Roman churches and who fomented the tetragamy controversy, or the question of a fourth marriage for the Eastern Orthodox.

A close associate of the controversial patriarch Photius of Constantinople, Nicholas began his career in the Byzantine civil service but became a monk when Photius was deposed in 886. Named a secretary counsellor (Mysticus) by the emperor Leo VI (886–912), Nicholas was appointed patriarch of Constantinople in 901. Having refused on grounds of religious legality and propriety to grant the Emperor's request for a dispensation to contract a fourth marriage after the death of his third wife, and declining to consult Pope Sergius III in the matter, Nicholas was banished to a monastery outside Constantinople. Recalled either by Leo in the last year of his reign, or by Emperor Alexander (912–913), Nicholas was invited to act as regent for Prince Constantine VII.

Because of his harsh retaliation against patriarch Euthymius, his successor during exile, Nicholas alienated many of the clergy and people, among them Leo's family, creating a rivalry between their respective supporters. During the rule of the emperor Romanus I Lecapenus (920–944), Nicholas was reconciled with Patriarch Euthymius, thus ending the bitter internal struggle within the Eastern Orthodox Church. Nicholas' negotiations with Pope John X (914–928) concerning cooperative union between Eastern and Western Christendom and an agreement over the ecclesiastical law of marriage for the Eastern Church inaugurated a rare period of harmony. In a synod (920) Nicholas issued a decree of union settling the tetragamy question by ordinarily limiting Greek Christians to three marriages but validating the fourth marriage of Leo VI for the good of the state in order to settle the imperial line of succession by a legitimate heir.

Nicholas also engaged in various diplomatic affairs, as is evidenced by his letters on Byzantine–Bulgarian relations and concerning questions of Greek estates in Italy. He is revered as a saint by the Eastern Orthodox Church.

Articles are alphabetized word by word, not letter by letter

• **Nicholas III** (fl. late 11th century), Eastern Orthodox patriarch of Constantinople (1084–1111), theologian and liturgical scholar noted for combatting doctrinal heresy and composing sacramental prayer texts for the Byzantine liturgy. Among Nicholas' liturgical compositions are prayers and responses in the service rituals for baptism, marriage, confession, fasting, and communion.

As emperor Alexis I Comnenus was negotiating with Pope Urban II the possibility of Western help against the Turks, Nicholas was consulted about the state of ecclesiastical relations between Rome and Constantinople. He expressed himself in favour of Church union, provided that the Pope send him an Orthodox confession of faith. He rejected any departure from Greek Orthodox doctrine and practice, including universal papal authority, the Latin concept of the Holy Spirit (*Filioque* question), and the use of unleavened bread in the Communion service. Frequently intervening in monastic affairs, Nicholas strengthened discipline in the community of Mt. Athos (Greece) and probably wrote a monastic Rule (*Typikon*) adapted from the original text of the early Palestinian monastic founder St. Sabas.

In a final theological judgment, Nicholas condemned as heretical the Bogomil leader Basil the Physician and his adherents, an exclusive sect originating in Bulgaria and teaching a form of religious dualism that attributed two sons to the Creator, Christ and Satan. In 1118 the emperor Alexius had Basil burned at the stake.

Russia

• **Nicholas I,** Russian in full NIKOLAY PAVLOVICH (b. July 6 [June 25, old style], 1796, Tsarskoye Selo, near St. Petersburg, Russia—d. March 2 [Feb. 18, O.S.], 1855, St. Petersburg), Russian emperor (1825–55), often considered the personification of classic autocracy; for his reactionary policies, he has been called the emperor who froze Russia for 30 years.

Early life. Nicholas was the son of Grand Duke Paul and Grand Duchess Maria. Some three and a half months after his birth, following the death of Catherine II the Great, Nicholas' father became Emperor Paul I of Russia. Nicholas had three brothers, two of whom, the future emperor Alexander I and Constantine, were 19 and 17 years older than he. It was the third, Michael, his junior by two years, and a sister, Anne, who became his childhood companions and intimate lifelong friends.

Nicholas I, detail of a watercolour by Christina Robertson, 1840; in the collection of Mrs. Merriweather Post, Hillwood, Washington, D.C.

Paul was extremely neurotic, overbearing, and despotic. Yet it is believed that he showed kindness and consideration to his younger children and that, in fact, he loved and cherished them tenderly. He was killed in a palace revolution of 1801, which made Alexander emperor when Nicholas was not quite five years old. Maria, on the contrary, remained formal and cold in her relationship to the children, very much in keeping with her general character. She belonged, apparently, among those human beings who combine numerous conventional virtues with a certain rigidity and lack of warmth. In the words of a competent observer: "The only failing of this extraordinary woman was her being excessively, one may say, exacting of her children and of the people dependent on her."

Education. The future emperor's first guardian and instructor was a Scottish nurse, Jane Lyon, who was appointed by Catherine II to care for the infant and who stayed with Nicholas constantly during the first seven years of his life. From Lyon the young grand duke learned even such things as the Russian alphabet, his first Russian prayers, and his hatred of the Poles (at least he liked later to trace the origin of his bitter antipathy toward that people to the stories told by his nurse about her painful experience in Warsaw in the turbulent year of 1794).

In 1802–03 men replaced women in Nicholas' entourage, and his regular education began. As directed by Gen. Matthew Lamsdorff, it emphasized severe discipline and formalism. The growing grand duke studied French and German as well as Russian, world history, and general geography in French, together with the history and geography of Russia. Religion, drawing, arithmetic, geometry, algebra, and physics were added to the curriculum. Nicholas received instruction also in dancing, music, singing, and horseback riding and was introduced at an early age to the theatre, costume balls, and other court entertainment.

A more advanced curriculum went into effect in 1809, with courses ranging from political economy, logic, moral philosophy, and natural law to strategy. English, Latin, and Greek were added to the language program. Though, on the whole, a belief that Nicholas had not been trained for his role of Russian sovereign is wrong, he did profit little from the instruction, which he found rigid and tedious. He loved only military science, becoming a fine army engineer and expert in several other areas of military knowledge. Moreover, he always remained in his heart a dedicated junior officer.

Circumstances also favoured militarism. Nicholas' education, as well as that of his younger brother, was interrupted and largely terminated by the great struggles against Napoleon in 1812–15. The grand dukes were allowed to join the army in 1814, and, although they saw no actual fighting, they lived through the heady emotions of those momentous years and also enjoyed the opportunities to stay in Paris and other places in western and central Europe. On Nov. 4, 1815, at a state dinner in Berlin, Alexander I and King Frederick William III rose to announce the engagement of Nicholas and Princess Charlotte of Prussia (Alexandra, after she became Orthodox).

The solemn wedding followed some 20 months later, on July 13, 1817. The match represented a dynastic and political arrangement sought by both reigning houses, which had stood together in the decisive years against Napoleon and after that at the Congress of Vienna—the peace settlement following the Napoleonic Wars—and it proved singularly successful. Not only was Nicholas in love with his wife, but he became very closely attached to his father-in-law as well as to his royal brothers, one of whom was later to be his fellow ruler as King Frederick William IV. Beyond that, Nicholas was powerfully attracted by the Prussian court and even more so by the Prussian Army. He felt remarkably happy and at home in his adopted family and country, which for many years he tried to visit as often as he could.

To complete his training, Grand Duke Nicholas was sent on two educational voyages—an extensive tour of Russia that lasted from May to September in 1816 and a journey to England, where the future emperor spent four months late that same year and early in 1817. The Russian trip covered much ground at great speed and was quite superficial, but it has interest for the historian because of the notes that Nicholas, following the instructions of his mother, took on everything seen and heard. The grand duke's observations deal, typically, with appearances rather than with causes and reflect a number of his prejudices, including his bitter dislike of Poles and Jews. Such quick inspection tours later became almost an obsession of the Emperor.

In England, Nicholas stayed mostly in London, although he travelled to a score of other places. While he did attend the opening of the houses of Parliament and in general obtained some knowledge of English politics, his only recorded comments on that score were unfavourable. The future emperor found it much more congenial to examine military and naval centres. His favourite English companion was the Duke of Wellington. Less than a year after his return to Russia and a few months after his marriage, Nicholas was appointed inspector general of the army corps of engineers. In subsequent years he held several other military positions but of secondary significance.

Ascension to the throne. Alexander I's unexpected death in southern Russia on Dec. 1, 1825, led to a dynastic crisis. Because Alexander I had no direct male successor, Constantine was next in line for the throne. But the heir presumptive had married a Polish woman not of royal blood in 1820 and renounced his rights to the crown. Nicholas was thus to become the next ruler of Russia, the entire matter being stated, in 1822, in a manifesto confirmed with Alexander I's signature. But the manifesto remained unpublished, and

Nicholas questioned the legal handling of the whole issue and the reaction in the country, which expected Constantine to succeed Alexander. In any case, Constantine and the Polish kingdom of which he was commander in chief swore allegiance to Nicholas, but Nicholas, the Russian capital, and the Russian Army swore allegiance to Constantine.

It was only after Constantine's unyielding reaffirmation of his position and the resulting lapse of time that Nicholas decided to publish Alexander's manifesto and become emperor of Russia. On Dec. 26, 1825 (Dec. 14, O.S.), when the guard regiments in St. Petersburg were to swear allegiance for the second time in rapid succession, this time to Nicholas, liberal conspirators staged what came to be known as the Decembrist Rebellion. Utilizing their influence in the army, in which many of them were officers, they started a mutiny in several units, which they entreated to defend the rightful interests of Constantine against his usurping brother. Altogether some 3,000 misled rebels marched in military formation to the Senate Square—now the Decembrist Square—in the heart of the capital. Although the rebellion had failed by nightfall, it meant that Nicholas I ascended the throne over the bodies of some of his subjects and in actual combat with the dreaded revolution.

Personality. Nicholas I has come down in history as the classic autocrat, in appearance and manner as much as in behaviour and policy. To quote Andrew Dickson White, a United States diplomat:

> With his height of more than six feet, his head always held high, a slightly aquiline nose, a firm and well-formed mouth under a light moustache, a square chin, an imposing, domineering, set face, noble rather than tender, monumental rather than human, he had something of Apollo and of Jupiter . . . Nicholas was unquestionably the most handsome man in Europe.

Or to refer to Adolphe, marquis de Custine, whose lasting literary fame rests on his denunciation of the Russia of Nicholas I: "Virgil's Neptune . . . one could not be more emperor than he." In short, Nicholas I came to represent autocracy personified: infinitely majestic, determined and powerful, hard as stone, and relentless as fate. Yet, on closer acquaintance, the other side of the Emperor emerged. The detachment and the superior calm of an autocrat, which Nicholas I tried so often and so hard to display, were essentially a false front. The sovereign's insistence on firmness and stern action was based on fear, not on confidence; his determination concealed a state approaching panic, and his courage fed on something akin to despair. Nicholas' violent hatred could concentrate apparently with equal ease on an individual, such as the French king Louis-Philippe; a group, such as the Decembrists; a people, such as the Poles; or a concept, such as revolution. His impulse was always to strike and keep striking until the object of his wrath was destroyed.

Aggressiveness, however, was not the Emperor's only method of coping with the problems of life. He also used regimentation, orderliness, neatness, and precision, an enormous effort to have everything at all times in its proper place. Nicholas I was by nature a drill master and an inspector general; the army remained his love, almost an obsession, from childhood to the end of his life. But, in every other sphere of activity and existence too, the Emperor insisted on minute and precise regulation, with nothing to be left to chance. Position, circumstances, and his own character placed an almost intolerable burden on his shoulders. Still, he managed to carry it for three decades, sustained by his overwhelming sense of duty and devotion to hard work, by his sincere religious convictions, and by his family. His outlook, however, became ever more pessimistic and fatalistic, until in the disaster of the Crimean War the autocrat declared simply: "I shall carry my cross until all my strength is gone." "Thy will be done."

Ideology. Nicholas' views fitted his personality to perfection. In contrast to Alexander I, he had been brought up at the time of wars against Napoleon and of reaction, which he accepted wholeheartedly as his own cause. Eventually the Russian wing of European reaction, represented by Nicholas I and his government, found its ideological expression in the doctrine of so-called Official Nationality.

Formally proclaimed in 1833 by Count Sergey Uvarov, the Emperor's minister of educaton, Official Nationality rested on three principles: Orthodoxy, autocracy, and nationality. Autocracy meant the affirmation and maintenance of the absolute power of the sovereign, which was considered the indispensable foundation of the Russian state; in foreign relations it was transformed into legitimism and a defense of the Vienna settlement. Orthodoxy referred to the official church and its important role in Russia and also to the ultimate source of ethics and ideals that gave meaning to human life and society. Nationality (*narodnost*) described the particular nature of the Russian people, considered as a mighty and dedicated supporter of its dynasty and government. Whereas Alexander I had never quite abandoned dreams of change, Nicholas I was determined to defend the existing order in his motherland, especially autocracy.

Reign. Nicholas I's rule reflected in a striking manner both his character and his principles. The new regime became preeminently one of militarism and bureaucracy. The Emperor surrounded himself with military men, to the extent that late in his reign there were almost no civilians among his immediate assistants. Also, he relied heavily on special emissaries, most of them generals of his suite, who were sent all over Russia on particular assignments to execute immediately the will of the sovereign. Operating outside the regular administrative system, they represented an extension, so to speak, of the monarch's own person. In fact, the entire machinery of government came to be permeated by the military spirit of direct orders, absolute obedience, and precision, at least as far as official reports and appearances were concerned. Corruption and confusion, however, lay immediately behind this facade of discipline and smooth functioning.

In his conduct of state affairs, Nicholas I often bypassed regular channels and generally resented formal deliberation, consultation, or other procedural delay. The importance of the Committee of Ministers, the State Council, and the Senate decreased in the course of his reign. Instead of making full use of them, the Emperor depended more and more on special bureaucratic devices meant to carry out his intentions promptly while remaining under his immediate and complete control. As one favourite method, Nicholas I made extensive use of ad hoc committees that stood outside the usual state machinery. The committees were typically composed of a handful of the most trusted assistants of the Emperor; because these were few in number, the same men in different combinations formed these committees throughout Nicholas' reign. As a rule, the committees carried on their work in secret, adding further complication and confusion to the already cumbersome administration of the empire. The failure of one committee to perform its task merely led to the formation of another. For example, some nine committees tried to deal with the issue of serfdom during Nicholas' reign.

The propensities of the autocrat found expression also in the development and the new role of His Majesty's Own Chancery. Organized originally as a bureau to deal with matters that demanded the sovereign's personal participation and to supervise the execution of the Emperor's orders, it acquired five new departments: in 1826 the Second and the Third, to deal with the codification of law and the newly created corps of gendarmes, respectively; in 1828 the Fourth, to manage the charitable and educational institutions under the jurisdiction of the empress dowager Maria; in 1836 the Fifth, to reform the condition of the state peasants (soon replaced by the new Ministry of State Domains); in 1843 the Sixth, to draw an administrative plan for Transcaucasia.

The departments of the Chancery served Nicholas I as a major means of conducting a personal policy that bypassed the regular state channels. Its Third Department, the political police, acted as the autocrat's main weapon against subversion and revolution and as his principal agency for controlling the behaviour of his subjects and for distributing punishments and rewards among them. Its assigned fields of activity ranged from "all orders and all reports in every case belonging to the higher police" to "reports about all occurrences without exception!" The two successive heads of the Third Department—Count Aleksandr Benckendorff and Prince Aleksey Orlov—probably spent more time with Nicholas than did any of his other assistants; they accompanied him, for instance, on his repeated trips of inspection throughout Russia. During his entire reign the Emperor strove to follow the principle of autocracy—to be a true father of his people concerned with their daily lives, hopes, and fears.

Yet Nicholas I could do little for them beyond the minutiae. Determined to preserve autocracy, afraid to abolish serfdom, and suspicious of all independent initiative and popular participation, the Emperor and his government could not introduce in their country the much-needed basic reforms. In practice as well as in theory they looked backward. Important developments took place only in a few areas in which change would not threaten the fundamental structure of the Russian Empire. Thus Count Mikhail Speransky codified law, and Count Pavel Kiselev changed and improved the lot of the state peasants; but even limited reforms became impossible after 1848.

Final years. Frightened by European revolutions, Nicholas I became completely reactionary. During the last years of the reign the Emperor's once successful foreign policy collapsed, leading to isolation and to the tragedy of the Crimean War. A dauntless champion of legitimism and a virtual hegemony of eastern and central Europe following the revolutions of 1848–49, Nicholas—in part because of his own miscalculations, rigidity, and bluntness—found himself alone fighting the Crescent (the Ottoman Empire), supported by such countries of the Cross as France, Great Britain, and Sardinia.

Although it is unlikely that Nicholas committed suicide, as several historians have claimed, death did come as liberation to the weary and harassed Russian emperor. An ordinary cold picked up in late February 1855 turned into pneumonia, which the once mighty, but now apparently exhausted, organism refused to fight. To the end the autocrat retained lucidity and dignity. His last words to his heir and his family were: "Now I shall ascend to pray for Russia and for you. After Russia, I loved you above everything else in the world. Serve Russia." Nicholas I was survived by his wife, Empress Alexandra, and their six children: Emperor Alexander II, the grand dukes Constantine, Nicholas, and Michael, and the grand duchesses Maria and Olga. Another daughter, Grand Duchess Alexandra, had died in 1844. (N.V.R.)

Early life and reign. Nikolay Aleksandrovich was the eldest son (*tsesarevich*) of the *tsarevich* Aleksandr Aleksandrovich (emperor as Alexander III from 1881) and his consort Maria Fyodorovna (Dagmar of Denmark). Succeeding his father on Nov. 1, 1894, he was crowned in Moscow on May 26, 1896.

Neither by upbringing nor by temperament was Nicholas fitted for the complex tasks that awaited him as autocratic ruler of a vast empire. He had received a military education from his tutor, and his tastes and interests were those of the average young Russian officers of his day. He had few intellectual pretensions but delighted in physical exercise and the trappings of army life: uniforms, insignia, parades. Yet on formal occasions he felt ill at ease. Though he possessed great personal charm, he was timid and shunned close contact with his subjects, preferring the privacy of his family circle. His domestic life was serene. To his wife, Alexandra, whom he had married on Nov. 26, 1894, Nicholas was passionately devoted. She had the strength of character that he lacked, and he fell completely under her sway. Under her influence he sought the advice of spiritualists and faith healers, most notably Rasputin, who eventually acquired great power over the imperial couple.

Nicholas also had other irresponsible favourites, often men of dubious probity who provided him with a distorted picture of Russian life, but one that he found more comforting than that contained in official reports. He distrusted his ministers, mainly because he felt them to be intellectually superior to himself and feared they sought to usurp his sovereign prerogatives. His view of his role as autocrat was childishly simple: he derived his authority from God, to whom alone he was responsible, and it was his sacred duty to preserve his absolute power intact. He lacked, however, the strength of will necessary in one who had such an exalted conception of his task. Nicholas had to wage a continual struggle against himself, suppressing his natural indecisiveness and assuming a mask of self-confident resolution. His dedication to the dogma of autocracy was an inadequate substitute for a constructive policy, which alone could have prolonged the imperial regime.

Soon after his accession Nicholas proclaimed his uncompromising views to liberal deputies from the *Zemstva,* the self-governing local assemblies, in which he dismissed as "senseless dreams" their aspirations to share in the work of government. He met the rising groundswell of popular unrest with intensified police repression. In foreign policy, his naïveté and lighthearted attitude toward international obligations sometimes embarrassed his professional diplomats; for example, he concluded an alliance with the German emperor William II during their meeting at Björkö in July 1905, although Russia was already allied with France, Germany's traditional enemy.

He was the first Russian sovereign to show personal interest in Asia, visiting in 1891, while still *tsesarevich,* India, China, and Japan; later he nominally supervised the construction of the Trans-Siberian Railway. His attempt to maintain and strengthen Russian influence in Korea, where Japan also had a foothold, was partly responsible for the Russo-Japanese War (1904–05). Russia's defeat not only frustrated Nicholas' grandiose dreams of making Russia a great Eurasian power, with China, Tibet, and Persia under its control, but also caused problems at home, where discontent grew into the revolutionary movement of 1905.

Nicholas considered all who opposed him, regardless of their views, as malicious conspirators. Disregarding the advice of his future prime minister Sergey Yulyevich Witte, he refused to make concessions to the constitutionalists until events forced him to yield more than might have been necessary had he been more flexible. On March 3, 1905, he reluctantly agreed to create a national representative assembly, or Duma, with consultative powers, and by the manifesto of October 30 he promised a constitutional regime under which no law was to take effect without the Duma's consent, as well as a democratic franchise and civil liberties. Nicholas, however, cared little for keeping promises extracted from him under duress. He strove to regain his former powers and ensured that in the new "fundamental laws" (May 1906) he was still designated an autocrat. He furthermore patronized an extremist right-wing organization, the Union of the Russian People, which sanctioned terrorist methods and disseminated anti-Semitic propaganda. Witte, whom he blamed for the October manifesto, was soon dismissed, and the first two Dumas were prematurely dissolved as "insubordinate."

Pyotr Arkadyevich Stolypin, who replaced Witte and carried out the coup of June 16, 1907, dissolving the second Duma, was loyal to the dynasty and a capable statesman. But the emperor distrusted him and allowed his position to be undermined by intrigue. Stolypin was one of those who dared to speak out about Rasputin's influence and thereby incurred the displeasure of the empress. In such cases Nicholas generally hesitated but ultimately yielded to Alexandra's pressure. To prevent exposure of the scandalous hold Rasputin had on the imperial family, Nicholas interfered arbitrarily in matters properly within the competence of the Holy Synod, backing reactionary elements against those concerned about the Orthodox Church's prestige.

World War I. After its ambitions in the Far East were checked by Japan, Russia turned its attention to the Balkans. Nicholas sympathized with the national aspirations of the Slavs and was anxious to win control of the Turkish straits but tempered his expansionist inclinations with a sincere desire to preserve peace among the great powers. After the assassination of the Austrian archduke Francis Ferdinand at Sarajevo, he tried hard to avert the impending war by diplomatic action and resisted, until July 30, 1914, the pressure of the military for general, rather than partial, mobilization.

The outbreak of World War I temporarily strengthened the monarchy, but Nicholas did little to maintain his people's confidence. The Duma was slighted, and voluntary patriotic organizations were hampered in their efforts; the gulf between the ruling group and public opinion grew steadily wider. Alexandra turned Nicholas' mind against the popular commander in chief, his father's cousin the grand duke Nicholas, and on Sept. 5, 1915, he dismissed him, assuming supreme command himself. Since he had no experience of war, almost all his ministers protested against this step as likely to impair the army's morale. They were overruled, however, and soon dismissed.

Nicholas II did not, in fact, interfere unduly in operational decisions, but his departure for headquarters had serious political consequences. In his absence, supreme power in effect passed, with his approval and encouragement, to the empress. A grotesque situation resulted: in the midst of a desperate struggle for national survival, competent ministers and officials were dismissed and replaced by worthless nominees of Rasputin. The court was widely suspected of treachery, and antidynastic feeling grew apace. Conservatives plotted Nicholas' deposition in the hope of saving the monarchy. Even the murder of Rasputin failed to dispel Nicholas' illusions: he blindly disregarded this ominous warning, as he did those by other highly placed personages, including members of his own family. His isolation was virtually complete.

Abdication and death. When riots broke out in Petrograd (St. Petersburg) on March 8, 1917, Nicholas instructed the city commandant to take firm measures and sent troops to help restore order. It was too late. The government resigned, and the Duma, supported by the army, called on the emperor to abdicate. At Pskov, on March 15, with fatalistic composure, Nicholas renounced the throne—not, as he had originally intended, in favour of his son, Alexis, but in favour of his brother Michael, who, however, refused the crown.

Nicholas was detained at Tsarskoye Selo by Prince Lvov's provisional government. It was proposed that he and his family be sent to England; but instead, mainly because of the opposition of the Petrograd Soviet, the revolutionary Workers' and Soldiers' Council, they were moved to Tobolsk, in Western Siberia. This step sealed their doom. In April 1918 they were taken to Yekaterinburg in the Urals.

When anti-Bolshevik "White" Russian forces approached the area, the local authorities were ordered to prevent a rescue; and in the night of July 16/17 the prisoners were all slaughtered in the cellar of the house where they had been confined. The bodies were burned, cast into an abandoned mine shaft, and hastily buried elsewhere. A team of Russian scientists located the remains in 1976 but kept the discovery secret until after the collapse of the Soviet Union. By 1994 genetic analyses had positively identified the remains as those of Nicholas, Alexandra, three of their daughters, and four servants. The skeletons of another daughter (probably Maria) and of Alexis were not found. The remains were given a state funeral on July 17, 1998, and reburied in Saint Petersburg in the crypt of the Cathedral of St. Peter and St. Paul. On Aug. 14, 2000, the Russian Orthodox Church canonized the emperor and his family, designating them "passion bearers" (the lowest rank of sainthood) because of the piety they had shown during their final days. (J.L.H.K.)

BIBLIOGRAPHY. Robert K. Massie, *Nicholas and Alexandra* (1967, reissued 1985), is a popular study of life at the imperial court. Reliable general surveys of Nicholas' reign are given by Richard Dennis Charques, *The Twilight of Imperial Russia* (1958, reprinted 1974); and Virginia Cowles, *The Last Tsar* (also published as *The Last Tsar & Tsarina,* 1977). On the last years, Bernard Pares, *The Fall of the Russian Monarchy* (1939; reissued 1988); and George Katkov, *Russia, 1917: The February Revolution* (1967, reprinted 1979), offer differing interpretations; the latter is more favourable to Nicholas.

Nicholas, Russian in full NIKOLAY NIKOLAYEVICH (b. Nov. 18 [Nov. 6, Old Style], 1856, St. Petersburg, Russia—d. Jan. 5, 1929, Antibes, Fr.), Russian grand duke and army officer who served as commander in chief against the Germans and Austro-Hungarians in the first year of World War I and was subsequently (until March 1917) Emperor Nicholas II's viceroy in the Caucasus and commander in chief against the Turks.

The son of the emperor Alexander II's brother, the grand duke Nikolay Nikolayevich "the Elder," Nicholas was educated at the general staff college and commissioned in 1872. He served in the Russo-Turkish War of 1877–78 and as inspector general of cavalry (1895–1905), introducing major reforms in training and equipment. He was made commander of the St. Petersburg military district in 1905 and also was appointed first president of the short-lived imperial committee of national defense.

When World War I began, Emperor Nicholas II abandoned his intention to lead the Russian armies himself and appointed the grand duke Nicholas commander in chief. Despite their early successes, the Russians were outgeneralled by the German chief of staff Erich Ludendorff and eventually were immobilized by munitions shortages. The grand duke is considered to have done as well as possible with the general staff's plans he was obliged to follow.

On Sept. 5 (Aug. 23, Old Style), 1915, the emperor assumed the supreme command. He sent the grand duke to the Caucasus, where he remained until the overthrow of the monarchy in 1917. The emperor's last official act was to appoint the grand duke commander in chief once more; but his appointment was canceled almost immediately by Prince Georgy Y. Lvov, head of the provisional government. Two years later Grand Duke Nicholas sailed from Russia in a British warship. He lived in France until his death, heading an organization that sought to unite all anticommunist Russian émigrés.

Nicholas, SAINT, also called NICHOLAS OF BARI, NICHOLAS OF MYRA, SANTA CLAUS (fl. 4th century, Myra, Lycia, Asia Minor [near modern Finike, Tur.]; feast day December 6), one of the most popular minor saints commemorated in the Eastern and Western churches, and now traditionally associated with the festival of Christmas.

Nicholas' existence is not attested by any historical document, so nothing certain is known of his life except that he was probably bishop of Myra in the 4th century. According to tradition, he was born in the ancient Lycian seaport city of Patara, and, when young, he traveled to Palestine and Egypt. He became bishop of Myra soon after returning to Lycia. He was imprisoned during the Roman emperor Diocletian's persecution of Christians but was released under the rule of Emperor Constantine the Great and attended the first Council (325) of Nicaea. After his death he was buried in his church at Myra, and by the 6th century his shrine there had become well known. In 1087 Italian sailors or merchants stole his alleged remains from Myra and took them to Bari, Italy; this removal greatly increased the saint's popularity in Europe, and Bari became one of the most crowded of all pilgrimage centres. Nicholas' relics remain enshrined in the 11th-century basilica of San Nicola, Bari.

Nicholas' reputation for generosity and kindness gave rise to legends of miracles he performed for the poor and unhappy. He was reputed to have given marriage dowries of gold to three girls whom poverty would otherwise have forced into lives of prostitution, and he restored to life three children who had been chopped up by a butcher and put in a brine tub. In the Middle Ages, devotion to Nicholas extended to all parts of Europe. He became the patron saint of Russia and Greece; of charitable fraternities and guilds; of children, sailors, unmarried girls, merchants, and pawnbrokers; and of such cities as Fribourg, Switz., and Moscow. Thousands of European churches were dedicated to him, one as early as the 6th century, built by the Roman emperor Justinian I, at Constantinople (now Istanbul). Nicholas' miracles were a favourite subject for medieval artists and liturgical plays, and his traditional feast day was the occasion for the ceremonies of the Boy Bishop, a widespread European custom in which a boy was elected bishop and reigned until Holy Innocents' Day (December 28).

After the Reformation, Nicholas' cult disappeared in all the Protestant countries of Europe except Holland, where his legend persisted as Sinterklaas (a Dutch variant of the name Saint Nicholas). Dutch colonists took this tradition with them to New Amsterdam (now New York City) in the American colonies in the 17th century. Sinterklaas was adopted by the country's English-speaking majority under the name Santa Claus, and his legend of a kindly old man was united with old Nordic folktales of a magician who punished naughty children and rewarded good children with presents. The resulting image of Santa Claus in the United States crystallized in the 19th century, and he has ever since remained the patron of the gift-giving festival of Christmas.

Under various guises Saint Nicholas was transformed into a similar benevolent, gift-giving figure in The Netherlands, Belgium, and other northern European countries. In the United Kingdom Santa Claus is known as Father Christmas.

Nicholas OF AUTRECOURT, French NICOLAS D'AUTRECOURT (b. *c.* 1300, Autrecourt, near Verdun, Fr.—d. after 1350, Metz, Lorrain), French philosopher and theologian known principally for developing medieval Skepticism to its extreme logical conclusions, which were condemned as heretical.

Nicholas was an advanced student in liberal arts and philosophy at the Sorbonne faculty of the University of Paris from 1320 to 1327. He became one of the most notable adherents of nominalism, a school of thought holding that only individual objects are real and that universal concepts simply express things as names. Nicholas' chief writings are commentaries on the 12th-century *Sentences* of Peter Lombard, the basic medieval compendium of philosophical theology, and on the *Politics* of Aristotle; nine letters to the Franciscan monk-philosopher Bernard of Arezzo; and an important treatise usually designated by the opening words *Exigit ordo executionis* ("The order of completion requires"). This last contains the 60 theses controverted at Nicholas' heresy trial, convened by Pope Benedict XII at Avignon, in 1340.

Nicholas rejected the traditional Aristotelian objectivism, with its allusions to a single intellect for all men, and proposed that there are only two bases for intellectual certitude: the logical principle of identity, with its correlative principle of contradiction, which states that a thing cannot simultaneously be itself and another; and the immediate evidence of sense data. Consistent with his nominalist doctrine, he denied that any causal relation could be known experientially and taught that the very principle of causality could be reduced to the empirical declaration of the succession of two facts. The consequence of such a concept of causality, he averred, was to reject the possibility of any rational proof for the existence of God and to deny any divine cause in creation. Indeed, he held as more probable that the world had existed from eternity.

Nicholas' nominalism precluded the possibility of knowing anything as a permanent concept and allowed only the conscious experience of an object's sensible qualities. Rejecting Scholastic–Aristotelian philosophy and physics, Nicholas believed that the physical and mental universe is ultimately composed of simple, indivisible particles or atoms. He maintained, however, that his innovative thought did not affect his fidelity to Christian religious tradition, including the moral commandments and belief in a future life. Faith and reason, he taught, operate independently from each other, and one could assent to a religious doctrine that reason might contradict. Because of the fallibility of the senses and the human inclination—even in Aristotle—toward erroneous judgment, evidence and truth are not always identical, and philosophy at best is simply the prevalence of the more probable over the less probable.

The ecclesiastical judges at Nicholas' heresy trial labeled his avowals of Christian belief as mere subterfuge and denounced him. Condemned in 1346 by Pope Clement VI, Nicholas finally was ordered in 1347 to resign his professorship, recant his error, and publicly burn his writings. That he took refuge with Emperor Louis IV the Bavarian is a legend created to form a parallel with the life of William of Ockham, his nominalist precursor. Nicholas became dean of the cathedral at Metz in 1350, after which nothing more is heard of him. His *Exigit* manuscript was discovered by A. Birkenmayer at the Bodleian Library, Oxford, and was published in 1939 by J.R. O'Donnell in *Medieval Studies.*

Nicholas OF CLÉMANGES, original name NICOLAS POILLEVILAIN (b. *c.* 1363, Clémanges, Fr.—d. 1437, Paris), theologian, humanist, and educator who denounced the corruption of institutional Christianity, advocated general ecclesiastical reform, and attempted to mediate the Western Schism (rival claimants to the papacy) during the establishment of the papal residence in Avignon, Fr.

Named rector of the University of Paris in 1393 after acquiring repute as a liberal humanist, Nicholas attempted to resolve the papal schism at the suggestion of his colleagues. In 1397 on the strength of his fame as a Latinist, he became secretary to the antipope Benedict XIII at Avignon, while Pope Boniface IX resided in Rome. Frustrated by the continuation of the schism, Nicholas withdrew his allegiance to Benedict in 1408, when the antipope lost the support of the French. After retiring to a Carthusian monastery near Avignon, he addressed a communication to the Council of Constance in 1414, supporting the theory of conciliarism, or the subordination of the pope to a general council. At the Council of Chartres in 1421, he defended the freedom of the Gallican church, and in 1432 he returned to his teaching career at the College of Navarre.

Reflecting an attitude of sober humanism, transcending the partisan church politics of his day, Nicholas preferred the equanimity of intellectual and moral suasion rather than combative means to influence the contending factions dividing Christendom. He aimed at expressing disputed philosophical and religious questions in pre-Christian classical literary form. His works *De fructu rerum adversarum* ("On the Fruit of Adversities") and *De fructu eremi* ("On the Fruit of Seclusion"), written at the height of the papal crisis in 1408, proposed criteria for settling the schism. In addition to several biblical commentaries he composed the tract *De studio theologico* ("On Theological Study"), in which he criticized the abstractions of medieval scholastic philosophy and urged theologians to a more direct exposition of biblical doctrine.

In his treatise *De lapsu et reparatione justitiae* ("On the Failure and Renewal of Justice") and in companion works (*c.* 1415) discussing the decline of the church and the ravages of simoniacal practices (the selling of religious offices) by ecclesiastical authorities, Nicholas deplored clerical avarice and the abuse of power. The essay *De corrupto ecclesiae statu* ("On the Corrupt State of the Church"), formerly attributed to him, is of dubious authenticity, according to more recent scholarship. His works, including the collection of stylistic letters on controversial issues and several pieces of poetry, were edited by J.M. Lydius (2 vol., 1613) and by A. Coville (1936).

Nicholas OF CUSA, German NIKOLAUS VON CUSA, Latin NICOLAUS CUSANUS (b. 1401, Kues, Trier—d. Aug. 11, 1464, Todi, Papal States), cardinal, mathematician, scholar, experimental scientist, and influential philosopher who stressed the incomplete nature of man's knowledge of God and of the universe.

At the Council of Basel in 1432, he gained recognition for his opposition to the candidate put forward by Pope Eugenius IV for the archbishopric of Trier. To his colleagues at the council he dedicated *De concordantia catholica* (1433; "On Catholic Concordance"), in which he expressed support for the supremacy of the general councils of the church over the authority of the papacy. In the same work he discussed the harmony of the church, drawing a pattern for priestly concord from his knowledge of the order of the heavens. By 1437, however, finding the council unsuccessful in preserving church unity and enacting needed reforms, Nicholas reversed his position and became one of Eugenius' most ardent followers. Ordained a priest about 1440, Cusa was made a cardinal in Brixen (Bressanone), Italy, by Pope Nicholas V and in 1450 was elevated to bishop there. For two years Cusa served as Nicholas' legate to Germany, after which he began to serve full-time as bishop of Brixen.

A model of the "Renaissance man" because of his disciplined and varied learning, Cusa was skilled in theology, mathematics, philosophy, science, and the arts. In *De docta ignorantia* (1440; "On Learned Ignorance") he described the learned man as one who is aware of his own ignorance. In this and other works he typically borrowed symbols from geometry to demonstrate his points, as in his comparison of man's search for truth to the task of converting a square into a circle.

Among Cusa's other interests were diagnostic medicine and applied science. He emphasized knowledge through experimentation and anticipated the work of the astronomer Copernicus by discerning a movement in the universe that did not centre in the Earth, although the Earth contributed to that movement. Cusa's study of plant growth, from which he concluded that plants absorb nourishment from the air, was the first modern formal experiment in biology and the first proof that air has weight. Numerous other developments, including a map of Europe, can also be traced to Cusa. A manuscript collector who recovered a dozen lost comedies by the Roman writer Plautus, he left an extensive library that remains a centre of scholarly activity in the hospital he founded and completed at his birthplace in 1458.

Nicholas OF DAMASCUS (fl. 1st century BC), Greek historian and philosopher whose works included a universal history from the time of the Assyrian empire to his own days.

Nicholas instructed Herod the Great in rhetoric and philosophy, and attracted the notice of Augustus when he accompanied his patron on a visit to Rome. Later, when Herod's conduct aroused the suspicions of Augustus, Nicholas was sent on a mission to bring about a reconciliation. He survived Herod and it was through his influence that the succession was secured for Herod Archelaus. Fragments of his universal history, his autobiography, and his life of Augustus have been preserved, chiefly in the extracts of Constantine Porphyrogenitus.

Nicholas OF FLÜE, SAINT, byname BROTHER KLAUS, German SANKT NIKLAUS VON FLÜE, or BRUDER KLAUS (b. March 21?, 1417, Flüeli, near Sachseln, Obwalden, Switz.—d. March 21, 1487, Ranft; canonized 1947; feast day in Switzerland September 25, elsewhere March 21), hermit, popular saint, and Swiss folk hero. His intervention in a conflict between cantonal factions over the admission of Fribourg and Solothurn to the Swiss Confederation led to the agreement of Stans (Dec. 22, 1481), which forestalled civil war and strengthened the federative bond of the member cantons.

After serving with his cantonal contingent in the war against Zürich (1436–50), Flüe was elected judge and councillor for upper Unterwalden (1448), but in 1467 he left his wife and family and his civil functions to become a hermit. The nature of his intervention at Stans is still disputed; but by his admonitions to moderation, he entered popular Swiss tradition as one of the earliest champions of arbitration as a method for resolving disputes.

Nicholas OF HEREFORD (d. *c.* 1420, Coventry, Warwickshire, Eng.), theological scholar and advocate of the English reform movement within the Roman Church who later recanted his unorthodox views and participated in the repression of other reformers. He collaborated with John Wycliffe on the first complete English translation of the Bible.

Nicholas was ordained in 1370 and later received a doctorate in theology (1382) from Oxford. While at Oxford he was influenced by Wycliffe, founder of an evangelical Christian group called Lollards. Developing the reform theology of Lollardism further through his own preaching, Nicholas denounced clerical luxury and affirmed the right of every Christian to establish his personal belief through meditation on the Scriptures. He and Wycliffe, along with other Lollards, were condemned for their views and called to appear before the Archbishop of Canterbury's court in 1382; when they refused to appear, they were excommunicated.

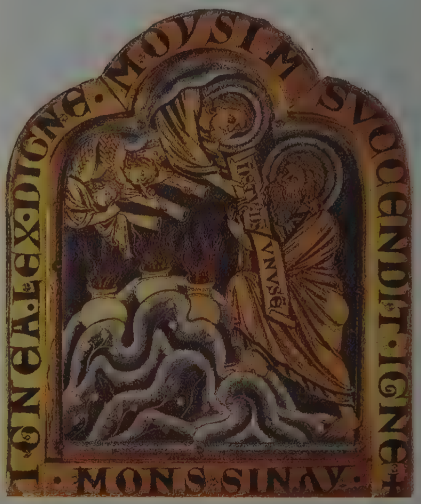
Nicholas immediately appealed his case to Pope Urban VI and went to Rome to plead, but he was again condemned and was sentenced to imprisonment for life. He escaped during a popular uprising against the Pope in June 1385 but was jailed by the Archbishop of Canterbury on his return to England. He was subjected to harsh treatment at Saltwood Castle, Kent (1388–89), and his writings were seized by order of King Richard II. By 1391 he recanted his beliefs, was granted royal protection, and was appointed theological inquisitor of suspected heretics. Chroniclers of the time report that he vigorously disputed his former Lollard colleagues. He was appointed chancellor of Hereford Cathedral (1391), and in 1395 he became chancellor of St. Paul's, London. From 1397 to 1417 he was treasurer at Hereford; shortly before his death he resigned the post and entered a Carthusian monastery.

The most important of Nicholas' literary works—and the only one extant—is the Wycliffe Bible. Nicholas is believed to have been entrusted with the translation of the Old Testament, the major part of which was completed by 1382. His other writings were destroyed by Richard II during Nicholas' captivity at Saltwood Castle, although documents of the period preserve his *Confession of 1382* and other public statements of his beliefs.

Nicholas OF LYRA, Latin NICOLAUS LYRANUS (b. *c.* 1270, Vieille-Lyre, Normandy—d. Oct. 16/23, 1349, Paris), author of the first printed commentary on the Bible and one of the foremost Franciscan theologians and influential exegetes (biblical interpreters) of the Middle Ages.

Becoming a Franciscan *c.* 1300, by 1309 Nicholas was a professor at the Sorbonne, where he taught for many years. From 1319 he headed the Franciscans in France and in 1325 founded the College of Burgundy, Paris. Nicholas' chief work is his monumental 50-volume *Postillae perpetuae in universam S. Scripturam* ("Commentary Notes to the Universal Holy Scripture"), a commentary on the whole Bible that became a leading manual of exegesis. The importance of the *Postillae* lies in its emphasis on a literal, rather than a mystical or an allegorical, interpretation of Scriptures. Some scholars claim that the work had an important influence on Martin Luther.

Nicholas OF VERDUN (fl. *c.* 1150–1210, Flanders), the greatest enamellist and goldsmith of his day and an important figure in the transition from late Romanesque to early Gothic style. He was an itinerant craftsman who travelled to the site of his commission; therefore most of what is known of his life is inferred from his works.



"Moses on Mt. Sinai," champlevé enamel plaque by Nicholas of Verdun, completed 1181; from the Klosterneuburg Altar in the Abbey Church of Klosterneuburg, near Vienna
Erwin Meyer

The altarpiece (1181) of the Abbey Church of Klosterneuburg, Austria, is his best known work and reveals his absolute mastery of metalworking and the technique of champlevé enamelling, in which compartments hollowed out from a metal base are filled with vitreous enamel. The program of scenes on the altar is the most ambitious of its kind in the 12th century and is often considered the most important surviving medieval enamel work. The earlier scenes are done in a mature Romanesque style, but later scenes become progressively more bold and classical.

The reliquary (1205) of SS. Piatus and Nicasius in the Cathedral of Tournai, Belgium, subordinates enamel work to beaten metalwork. Though much-damaged by restoration, it remains a masterful work of early Gothic sculpture, with its slender figures and supple drapery.

The Shrine of the Three Kings in the treasury of Cologne Cathedral is the most important of the Cologne reliquaries attributed to Nicholas. Much of the reliquary is the work of assistants, but the general design and the figures of the prophets are by Nicholas. Powerful and expressive, the prophets have been called the most important metal sculptures of the late 12th century. Two reliquaries attributed to Nicholas, the shrines of St. Anne in Siegburg and of St. Albanus in Saint-Pantaleon, Cologne, have suffered so much by restoration that they no longer reveal the hand of Nicholas except in the overall design.

Nicholls, Gwyn, in full ERITH GWYN NICHOLLS (b. June 1874, Westbury-on-Severn, Gloucester, Eng.—d. March 1939, Wales), one of the greatest rugby players of all time.

Nicholls was captain of Cardiff four times, a club record, beginning in 1892 and was the only Welsh representative on the British team that toured Australia in 1899. Nicholls was also captain of Wales 10 times, leading the team to victory in the legendary match against the New Zealand All Blacks in 1905, and won 24 caps for Wales. After he retired in 1925, Nicholls served on several Cardiff athletic committees and was a selector for the Welsh Rugby Union.

Nichols, John (b. Feb. 2, 1745, London, Eng.—d. Nov. 26, 1826, London), writer, printer, and antiquary who, through numerous volumes of literary anecdotes, made an invaluable contribution to posterity's knowledge of the lives and works of 18th-century men of letters in England.

John Nichols, engraving by Charles Heath after a portrait by J. Jackson
BBC Hulton Picture Library

Apprenticed in 1757 to William Bowyer the younger (known as "the learned printer"), who took him into partnership in 1766, Nichols undertook his first literary work as editor of the works of Jonathan Swift (1775–79). In 1778 Nichols became part manager of the *Gentleman's Magazine* and in 1792 sole managing editor. Of his original work, *Bibliotheca Topographica Britannica* (1780–90) and *The History and Antiquities of the County of Leicester* (1795–1815) are especially valuable. They are the fruit of his own meticulous observation and research. A friend of most of the leading literary figures of his age, he published Samuel Johnson's *Lives of the English Poets,* exercising much editorial influence and supplying a good deal of basic information. His own work as a biographer of the age began with his memoir of Bowyer, expanded into *Biographical and Literary Anecdotes of William Bowyer* (1782). This formed the basis of *Literary Anecdotes of the Eighteenth Century,* 9 vol. (1812–15; completed by his son, John Bowyer Nichols).

Nichols, Mike, original name MICHAEL IGOR PESCHKOWSKY (b. Nov. 6, 1931, Berlin, Ger.), American motion-picture and stage director whose productions focus on the absurdities and horrors of modern life as revealed in personal relationships.

Nichols immigrated with his family to the United States at the age of seven. He attended the University of Chicago (1950–53), studied acting under Lee Strasberg in New York City, and then returned to Chicago, where, with Elaine May, Alan Arkin, Barbara Harris, and Paul Sills, he formed the comic improvisational group The Second City. Nichols and May then traveled nationwide with their social-satire routines, and from 1960 to 1961 they performed on Broadway in *An Evening with Mike Nichols and Elaine May.*

Nichols made his Broadway directorial debut with the highly praised *Barefoot in the Park* (1963) and went on to direct a series of commercially and critically successful Broadway plays, many written by Neil Simon. He won Tony awards for *Barefoot in the Park, Luv* (1964), *The Odd Couple* (1965), *Plaza Suite* (1968), *The Prisoner of 2nd Avenue* (1971), and Tom Stoppard's *The Real Thing* (1984). He also directed *The Gin Game* (1977).

His first film was *Who's Afraid of Virginia Woolf?* (1966), a powerful rendering of the Edward Albee play. This was followed by *The Graduate* (1967), a landmark film about the conflicts of the generation of the 1960s for which he received an Academy Award for best director. Other notable films include *Catch-22* (1970), a macabre look at warfare; *Carnal Knowledge* (1971); *Silkwood* (1983), an examination of the practices of the nuclear power industry; *Postcards from the Edge* (1990); and *Wolf* (1994). His films typically are marked by his cynical commentary on contemporary life, often underlined by humour.

Nicholson, Ben (b. April 10, 1894, Denham, Buckinghamshire, Eng.—d. Feb. 6, 1982, London), English artist whose austere geometric paintings and reliefs were among the most influential abstract works in British art.

The son of the painter Sir William Nicholson, he was largely self-taught and only briefly attended the Slade School of Fine Art (1910–11), London. He traveled extensively in Europe between 1911 and 1914 and in 1917 visited California, keeping a detailed record in sketches of architecture and landscape.

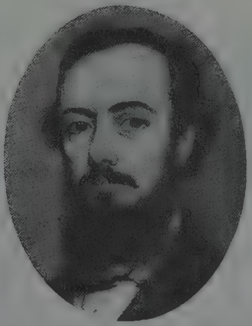
During the 1920s, along with the sculptors Barbara Hepworth (who became his second wife) and Henry Moore, Nicholson was instrumental in introducing continental modernism into England. His first semiabstract still lifes reflected his exposure to Synthetic Cubism in Paris. In 1933 he met the Dutch painter Piet Mondrian, under whose influence his work took on a cooler geometry; typical of this period are his low reliefs of whitewashed circles and rectangles (*e.g.,* "White Relief," 1937–38). He was coeditor with Naum Gabo and J.L. Martin of *Circle,* a manifesto published in 1937 to promote Constructivism in England. His later work showed an increasing concern with texture and with simple, isolated representation through silhouette.

Nicholson, Jack (b. April 22, 1937, Neptune, N.J., U.S.), American motion-picture actor noted for his versatile portrayals of unconventional outsiders.

Nicholson played a string of undistinguished roles in low-budget horror and motorcycle-gang films in the late 1950s and '60s before his performance as the easygoing Southern lawyer companion of the two main characters in *Easy Rider* (1969) brought him nationwide acclaim. He then went on to leading roles in a number of highly successful motion pictures, including *Five Easy Pieces* (1970), *Carnal Knowledge* (1971), *The Last Detail* (1973), *Chinatown* (1974), and *One Flew Over the Cuckoo's Nest* (1975), the last film winning him an Academy Award for best actor.

After a hiatus of several years, he resumed his career. Notable films include *The Shining* (1980), *The Postman Always Rings Twice* (1981), *Prizzi's Honor* (1985), *The Witches of Eastwick* (1987), *Batman* (1989), and *Wolf* (1994). He won an Academy Award for best supporting actor for his performance in *Terms of Endearment* (1983). Nicholson himself directed *Drive, He Said* (1971) and directed and starred in *Goin' South* (1978) and *The Two Jakes* (1990).

Nicholson, John (b. Dec. 11, 1821, Dublin, Ire.—d. Sept. 23, 1857, Delhi [India]), British soldier and administrator who brought relief to Delhi during the Indian Mutiny of 1857.



John Nicholson, detail of a chalk drawing by William Carpenter, 1854; in the National Portrait Gallery, London
By courtesy of the National Portrait Gallery, London

Nicholson became a cadet in the Bengal Army at the age of 17 and fought at Ghaznī during the First Afghan War (1839–42). Subsequently, he held political posts in Kashmir and the Punjab and took part in the Second Sikh War (1848–49).

During the rebellion of 1857 Nicholson was promoted to brigadier general after pacifying the Punjab and led a swift advance on Delhi, which had been seized by rebel forces in May. His arrival in Delhi early in August and his victory at Najafgarh inspired the besieged British troops outside the city; on September 14 he led an attacking column against the Kashmir Gate. The gate was taken, but he was wounded in battle and died shortly thereafter.

Nicholson, Reynold Alleyne (b. Aug. 18, 1868, Keighley, Yorkshire, Eng.—d. Aug. 27, 1945, Chester, Cheshire), English orientalist who exercised a lasting influence on Islāmic studies.

Educated at Aberdeen University and the University of Cambridge, Nicholson was lecturer in Persian (1902–26) and Sir Thomas Adams professor of Arabic (1926–33) at Cambridge. He was a leading scholar in Islāmic literature and mysticism. His *Literary History of the Arabs* (1907) remains a standard work on that subject in English; while his many text editions and translations of Ṣūfī writings, culminating in his eight-volume *Mathnawi of Jalalu'ddin Rumi* (1925–40), eminently advanced the study of Muslim mystics. He combined exact scholarship with notable literary gifts; some of his versions of Arabic and Persian poetry entitle him to be considered a poet in his own right. His profound understanding of Islām and of the Muslim peoples was the more remarkable in that he never traveled outside Europe. A shy and retiring man, he proved himself an inspiring teacher and an original thinker.

Nicholson, Seth Barnes (b. Nov. 12, 1891, Springfield, Ill., U.S.—d. July 2, 1963, Los Angeles, Calif.), American astronomer best known for discovering four satellites of Jupiter: the 9th in 1914 (at Lick Observatory, Mount Hamilton, California), the 10th and 11th in 1938, and the 12th in 1951 (all at Mount Wilson Observatory, Calif.).

Educated at Drake University, Des Moines, Iowa, and at the University of California (Ph.D., 1915), Nicholson was on the Mount Wilson Observatory staff from 1915 to 1957. Of greater astrophysical significance than his satellite discoveries was his investigation of sunspots, especially their magnetic properties and terrestrial effects. With the American astronomer Edison Pettit, he made many thermocouple measurements of stellar and planetary radiation.

Nicholson, William (b. 1753, London, Eng.—d. May 21, 1815, Bloomsbury, London), English chemist, discoverer of the electrolysis of water, which has become a basic process in both chemical research and industry.

Nicholson was at various times a hydraulic engineer, inventor, translator, and scientific publicist. He invented a hydrometer (an instrument for measuring the density of liquids) in 1790. In 1800, after he heard of the invention of the electric battery by the Italian physicist Alessandro Volta, he built one of his own. He then discovered that when leads from the battery are placed in water, the water breaks up into hydrogen and oxygen, which collect separately to form bubbles at the submerged ends of the wires. With this discovery Nicholson became the first man to produce a chemical reaction by electricity.

In 1797 Nicholson founded the *Journal of Natural Philosophy, Chemistry and the Arts,* which was the first independent scientific journal. The success of this periodical inspired the creation of several rival scientific journals in England that eventually drove Nicholson's periodical out of business. Nicholson's *Introduction to Natural Philosophy* (1781) was the most successful of his published works.

Nicias (d. 413 BC, Sicily [now in Italy]), Athenian politician and general during the Peloponnesian War (431–404 BC) between Sparta and Athens. He was in charge of the Athenian forces engaged in the siege of Syracuse, Sicily, and the failure of the siege contributed greatly to the ultimate defeat of Athens.

In the first 10 years of the conflict, Nicias proved his ability as a leader of offensive expeditions and in 421 negotiated the Peace of Nicias and an alliance with Sparta. The hostility of Sparta's allies and the opposition of the Athenian general Alcibiades, however, foiled Nicias' efforts to uphold the peace. Warfare was renewed, and in 415 Nicias reluctantly allowed himself to be appointed, with Alcibiades and Lamachus, leader of the Sicilian expedition.

The recall of Alcibiades and the death of Lamachus left Nicias, although ill, in sole charge of the siege of Syracuse. The wall his forces attempted to build around Syracuse was not completed owing to the defenders' efforts. Nicias asked to be relieved of his command, but instead reinforcements under Demosthenes arrived early in 413. When these failed to reverse the situation, Demosthenes favoured the withdrawal of the Athenian army, but an eclipse of the Moon occurred on Aug. 27, 413, and the superstitious Nicias accepted his soothsayers' advice to delay setting out. The Syracusans soon afterward forced the surrender of the Athenian forces, including Nicias, whom they executed.

Nicias (fl. 4th century BC), Athenian painter who was noted for his skill in chiaroscuro (the depiction of form by means of light and shadow).

Nicias was famous for his ability to make his figures stand out by means of chiaroscuro. He seems to have excelled in the depiction of female figures in dramatic situations. He was a younger contemporary of the sculptor Praxiteles and apparently painted in the details on some of the latter's statues. The Roman author Pliny the Elder relates that when Praxiteles was asked which of his works in marble he admired most, he replied, "Those which had been touched by the hands of Nicias." Pliny also reports that King Ptolemy I of Egypt once offered Nicias a large sum of money for his painting of "Odysseus Questioning the Dead in the Underworld," but that Nicias chose instead to make the painting a present to his native Athens. None of Nicias' original paintings still exists. Among those listed by Pliny are "Portrait of Alexander," "Io," and "Perseus and Andromeda."

nickel (Ni), chemical element, ferromagnetic metal of Group VIII of the periodic table, markedly resistant to oxidation and corrosion.

Properties, occurrence, and uses. Silvery-white, tough, and harder than iron, nickel is widely familiar because of its use in coinage but is more important either as the pure metal or in the form of alloys for its many domestic and industrial applications. Elemental nickel very sparingly occurs together with iron in terrestrial and meteoric deposits. The metal was isolated (1751) by a Swedish chemist and mineralogist, Baron Axel Fredrik Cronstedt, who prepared an impure sample from an ore containing niccolite (nickel arsenide). Earlier, an ore of this same type was called *Kupfernickel* after "Old Nick" and his mischievous gnomes because, though it resembled copper ore, it yielded a brittle, unfamiliar metal. Twice as abundant as copper, nickel constitutes about 0.007 percent of the Earth's crust; it is a fairly common constituent of igneous rocks, though singularly few deposits qualify in concentration, size, and accessibility for commercial interest. The most important sources are pentlandite, found with nickel-bearing pyrrhotite and chalcopyrite, and nickel-bearing laterites, such as garnierite.

For information about the mining, refining, and production of nickel, *see* MACROPAEDIA: Industries, Extraction and Processing.

Nickel (atomic number 28) resembles iron (atomic number 26) in strength and toughness but is more like copper (atomic number 29) in resistance to oxidation and corrosion, a combination accounting for many of its applications. More than half the nickel produced is used in alloys with iron (particularly in stainless steels), and most of the rest is used in corrosion-resistant alloys with copper (including Monel) and in heat-resistant alloys with chromium. Nickel is also used in electrically resistive, magnetic, and many other kinds of alloys, such as nickel silver (with copper and zinc but no silver). The unalloyed metal is utilized to form protective coatings on other metals, especially by electroplating. Finely divided nickel is employed to catalyze the hydrogenation of unsaturated organic compounds (*e.g.,* fats and oils).

Natural nickel consists of five stable isotopes: nickel-58 (68.27 percent), nickel-60 (26.10 percent), nickel-61 (1.13 percent), nickel-62 (3.59 percent), and nickel-64 (0.91 percent). It has a face-centred-cubic crystal structure. Nickel is ferromagnetic up to 358° C, or 676° F (its Curie point). The metal is uniquely resistant to the action of alkalies and is frequently used for containers for concentrated solutions of sodium hydroxide. Nickel reacts slowly with strong acids under ordinary conditions to liberate hydrogen and form Ni^{2+} ions.

Compounds. In its compounds nickel exhibits oxidation states of −1, 0, +1, +2, +3, and +4, though nickel(II) is by far the most common. Divalent nickel forms a large number of complexes, encompassing coordination numbers 4, 5, and 6 and all of the main structural types—*e.g.,* octahedral, trigonal bipyramidal, tetrahedral, and square.

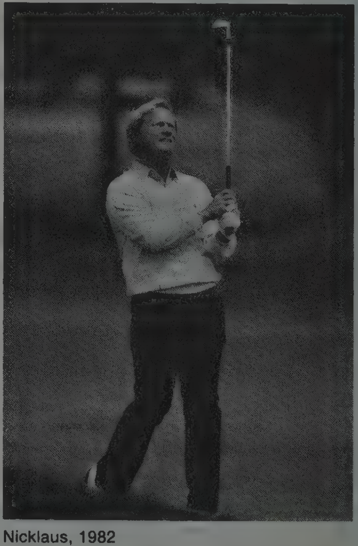
Nickel(II) compounds have a variety of industrial applications. For example, nickel chloride, $NiCl_2$, nickel nitrate, $Ni(NO_3)_2 \cdot 6H_2O$, and nickel sulfamate, $Ni(SO_3NH_2)_2 \cdot 4H_2O$, are employed chiefly in nickel electroplating baths. Nickel sulfate, $NiSO_4$, is also used in nickel plating as well as in the preparation of catalysts, ground-coat enamels, and mordants (fixatives) for dyeing and textile printing. Nickel oxide, NiO, and nickel peroxide, Ni_2O_3, are prepared for use in fuel cells and storage batteries, respectively. Nickel ferrites are utilized as magnetic cores for various types of electrical equipment such as antennas and transformers.

Among other important commercial compounds are nickel carbonyl, or tetracarbonylnickel, $Ni(CO)_4$. This zerovalent nickel compound is used primarily as a carrier of carbon monoxide in the synthesis of acrylates (compounds utilized in the manufacture of plastics) from acetylene and alcohols. It was the first of a class of compounds called metal carbonyls to be discovered (1890). The colourless, volatile liquid is formed by the action of carbon monoxide on finely divided nickel and is characterized by an electronic configuration in which the nickel atom is surrounded by 36 electrons. This type of configuration is quite comparable to that of the noble-gas atoms.

atomic number	28
atomic weight	58.69
melting point	1,453° C (2,647° F)
boiling point	2,732° C (4,950° F)
density	8.902 (25° C)
valence	0,1,2,3
electronic config.	2-8-16-2 or $(Ar)3d^84s^2$

Nicklaus, Jack (William) (b. Jan. 21, 1940, Columbus, Ohio, U.S.), American professional golfer, a dominating figure in world golf from the 1960s to the 1980s.

While a student at Ohio State University, Nicklaus won the U.S. Amateur championship in 1959 and again in 1961. Also in 1961



Nicklaus, 1982
Focus on Sports Inc.

Nicklaus set a record 282 for an amateur in the United States Open. After he turned professional in 1962, Nicklaus won the Masters Tournament (1963, 1965, 1966, 1972, 1975, 1986), the United States Open (1962, 1967, 1972, 1980), the PGA (Professional Golfers' Association of America) championship (1963, 1971, 1973, 1975, 1980), and the British Open (1966, 1970, 1978). His victories overseas included six Australian Open titles. Nicklaus was a member of the winning U.S. World Cup team six times (1963, 1964, 1966, 1967, 1971, 1973) and was a record three-time individual World Cup winner (1963, 1964, 1971). By 1986 he had played in 100 major championships, finishing in the top three 45 times. Nicklaus was named PGA Player of the Year five times (1967, 1972, 1973, 1975, 1976), and he was elected to the World Golf Hall of Fame in 1974. He joined the U.S. Senior Tour in 1990.

In addition to great natural ability and power, Nicklaus showed remarkable composure under the severest competitive pressure. He designed several golf courses, including Muirfield Village Golf Course in Ohio. He also wrote several books on golf.

Nicobar Islands, island group, Andaman and Nicobar Islands union territory, India. The islands lie in the Bay of Bengal and have a land area of 711 square miles (1,841 square km). With the nearby Andaman Islands, they constitute a union territory of India (*see* Andaman and Nicobar Islands). The Nicobar group includes the islands of Car Nicobar (north), Camorta (Kamorta) and Nancowry (central group), and Great Nicobar (south).

Though very little is known about the islands' earliest history, the Thanjāvūr inscription (1050) of the Cōḷa dynasty describes the land as Nakkavaram ("Land of the Naked"). Danish missionaries visited the islands in 1756. In 1869–88 they were claimed by the British, who established a penal colony there. The islands were occupied by the Japanese during World War II.

Car Nicobar is flat with rich, fertile soils; Nancowry, Camorta, and Great Nicobar are hilly. The highest peak is Mount Thullier, rising to 2,106 feet (642 m) on Great Nicobar. The islands are densely forested with coconut, betel nut, pandanus, mango, margosa, and casuarina. The population consists mostly of two ethnic groups, the Nicobarese and the Shompens. Agriculture is the principal occupation; crops include rice, corn (maize), fruits, vegetables, coconuts, and betel nuts. Copra making and oil pressing are the chief industries. The only important town is on Car Nicobar. Pop. (1991 prelim.) 39,022.

Nicobarese languages, Austroasiatic languages spoken on the Nicobar Islands and once considered to form a distinct family within the Austroasiatic stock. More recent data on these hitherto poorly known languages suggest that they form a distinct branch of the Mon-Khmer family, itself a part of the Austroasiatic stock. The Nicobarese languages are usually classified into four groups: North Nicobar, including the Car, Chowra, Teressa, and Bompaka languages; Central Nicobar, including the Camorta, Nancowry, Trinkat, and Katchall languages; South Nicobar, including the Coastal Great Nicobar and the Little Nicobar languages; and Inland Great Nicobar, including the Shompe language.

Nicodemus THE HAGIORITE, SAINT, also called SAINT NICODEMUS OF THE HOLY MOUNTAIN (b. 1748, Naxos Island, Ottoman Empire [now in Greece]—d. July 14, 1809, Mount Athos; canonized May 31, 1955), Greek Orthodox monk and author of ascetic prayer literature. He was influential in reviving the practice of Hesychasm, a Byzantine method of contemplative prayer.

Forced to flee Turkish persecution in the midst of his studies at Smyrna (now İzmir, Turkey), Nicodemus entered a monastery on Mount Athos. He was inspired to theological scholarship by a contemporary, Macarius of Corinth, whose collection of old Eastern prayer texts Nicodemus edited and published as *Philokalia* in 1782. After this book had occasioned a renewed interest in Hesychasm throughout the Orthodox churches, Nicodemus edited Macarius' essays on liturgical prayer, emphasizing the Eucharist, or the Lord's Supper. This work was at first criticized for erroneous doctrine, but its orthodoxy was vindicated by the Synod of Constantinople in 1819.

Nicodemus' outstanding work, the *Pedalion,* or *Rudder of the Ship of Knowledge,* is a commentary on Greek church law. Its bias against the Latin church, although partly attributable to interpolations by another editor, reflects the author's negative feelings toward the institutions of Western Christianity. Nicodemus did not hesitate, however, to use the treatises of Latin theologians on asceticism and contemplative prayer. His *Enchiridion of Counsels* (1801), a handbook on the religious life, continues to guide modern Greek spirituality. He was proclaimed a saint by the Greek Orthodox church in 1955.

Nicol, Davidson, in full DAVIDSON SYLVESTER HECTOR WILLOUGHBY NICOL, also called ABIOSEH NICOL (b. Sept. 14, 1924, Freetown, Sierra Leone—d. Sept. 20, 1994, Cambridge, Eng.), Sierra Leonean diplomat, physician, medical researcher, and writer.

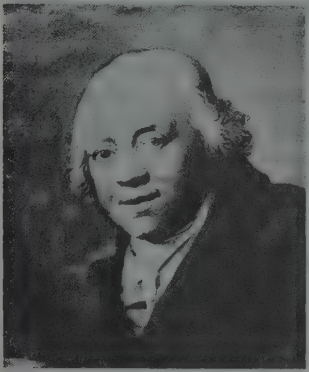
Nicol was educated in medicine and natural sciences in Sierra Leone, Nigeria, and England, and he subsequently served in various medical posts in those countries. He became known for his research into the structure of insulin, and he lectured and wrote widely on medical topics. He was principal of Fourah Bay College, Freetown (1960–68), vice chancellor of the University of Sierra Leone (1966–68), and his country's ambassador to the United Nations (1969–71). Nicol was president of the UN Security Council in 1970, and from 1972 to 1982 he served as executive director of the United Nations Institute for Training and Research (UNITAR). He was president of the World Federation of UN Associations from 1983 to 1987.

Nicol's short stories were published in *Two African Tales* (1965) and *The Truly Married Woman, and Other Stories* (1965), under the name Abioseh Nicol. They centre upon life in the government service and upon the interaction of Africans with colonial administrators in preindependent Sierra Leone. His short stories and poems appeared in anthologies and journals. He also wrote *Africa, A Subjective View* (1964) and edited several other nonfiction works.

Nicola DI **LORENZO**: *see* Cola di Rienzo.

Nicolai, Friedrich, in full CHRISTOPH FRIEDRICH NICOLAI (b. March 18, 1733, Berlin, Prussia [Germany]—d. Jan. 8, 1811, Berlin), writer and bookseller who, with Gotthold Ephraim Lessing and Moses Mendelssohn, was a leader of the German Enlightenment (*Aufklärung*) and who, as editor of the reformist journal *Allgemeine deutsche Bibliothek* ("German General Library"), was critical of such younger writers as Johann Wolfgang von Goethe and Friedrich von Schiller.

Nicolai went to Frankfurt an der Oder, where he learned his father's bookselling business and became acquainted with English literature. On his return to Berlin (1752), he took part in a literary controversy over John Milton by defending the English poet against the grammarian Johann Christoph Gottsched. Nicolai's *Briefe über den jetzigen Zustand der schönen Wissenschaften in Deutschland* (1755; "Letters on the Current State of the Fine Arts in Germany"), published anonymously, was directed against both Gottsched and Gottsched's Swiss opponents, the critics Johann Jakob Bodmer and Johann Breitinger. Nicolai's enthusiasm for English literature gained him the friendship of Lessing and Mendelssohn. He cofounded, with Mendelssohn, the periodical *Bibliothek der schönen Wissenschaften* (1757–60; "Library of Fine Arts") and, with both Lessing and Mendelssohn, *Briefe, die neueste Litteratur betreffend* (1761–66; "Letters on the Modern Literary Question"). He also edited the *Allgemeine deutsche Bibliothek* (1765–92), the organ of the "popular philosophers" who fought against authority in religion and what they conceived to be extravagance in literature. Nicolai showed a complete incomprehension of the new movement of ideas represented by Goethe, Schiller, Johann Gottfried von Herder, and Johann Gottlieb Fichte.



Friedrich Nicolai, oil painting by A. Graff
Historia-Photo

Nicolai wrote many independent works. His *Charakterischen Anekdoten von Friedrich II* (1788–92), an account of events in the court of Frederick II the Great, has some historical value. His romances are forgotten, although they were well known in their time. *Die Beschreibung einer Reise durch Deutschland und die Schweiz,* 12 vol. (1788–96; "The Description of a Journey Through Germany and Switzerland"), a record of his reflections on man and the state of science, religion, industry, and morals, was widely read by 1796 and reflects the rather narrow conservativism of his later views.

Nicolai, Otto, in full CARL OTTO EHRENFRIED NICOLAI (b. June 9, 1810, Königsberg, Prussia [now Kaliningrad, Russia]—d. May 11, 1849, Berlin, Prussia [Germany]), German composer known for his comic opera *Die lustigen Weiber von Windsor* (*The Merry Wives of Windsor*), based on William Shakespeare's comedy.

In his youth Nicolai was exploited as a musical prodigy by his father. He studied in Berlin in 1827 and later under Giuseppe Baini in Rome. From 1838 onward he produced successful operas in Italy and Vienna. In 1841 he became court conductor in Vienna, and he founded the Philharmonic Society there in 1842. In 1847 he became conductor of the Berlin Opera, where he produced *Die lustigen Weiber von Windsor* in 1849. It remains one of the most popular comic operas of the 19th century.

Nicolas-Favre disease: *see* lymphogranuloma venereum.

Nicolaus (Latin personal name): *see under* Nicholas.

Nicole, Pierre (b. Oct. 19, 1625, Chartres, France—d. Nov. 16, 1695, Paris), French theologian whose writings, chiefly polemical, supported the Roman Catholic reform movement known as Jansenism.

Educated in Paris, Nicole taught literature and philosophy at Port-Royal des Champs, a Cistercian abbey that was a stronghold of Jansenism. With the Jansenist leader Antoine Arnauld and others, he wrote several textbooks, among them *La Logique, ou L'art de Penser* (1662; *Logic; or, The Art of Thinking*). Nicole was an influential spokesman from 1655 to 1668 through his writing or editing of most of the Jansenist pamphlets. He was probably the source of the celebrated distinction between the two "questions of fact," an adroit device allowing him to separate into two parts the charge of heresy often made against the Jansenists. The two questions were: Are Jansenist doctrines rightly called heretical? And did Jansen in fact teach these doctrines? By answering the first question affirmatively and the second negatively, Nicole enabled the Jansenists to pursue their program of criticism and reform without openly breaking with the Roman Catholic church.

Nicole, detail of an engraving by Cornelius Vermeulen after a painting by Élisabeth Chéron
J.E. Bulloz

From 1669 on, Nicole used his talents to defend Catholic dogma against Protestant criticism. A friend of the French philosopher Blaise Pascal, he used one of his numerous pseudonyms to translate into Latin Pascal's *Provinciales* ("Provincial Letters"). Nicole's best-known work is the *Essais de morale,* 4 vol. (1671; "Essays on Morality"), eventually enlarged to 14 volumes, in which he discussed the problems raised for ethics by human nature, which he found seldom capable of virtue.

Nicolet, Jean (b. 1598, Cherbourg, France—d. Nov. 1, 1642, Sillery, Que., Can.), French North American explorer who was the first known European to discover Lake Michigan and what is now the state of Wisconsin.

The son of a dispatch carrier, Nicolet was 20 years old when he traveled to New France (Canada) at the request of Samuel de Champlain. He lived with a friendly Indian tribe on Allumette Island in the Ottawa River, learned the Algonquian language and culture, and participated in negotiations with the Iroquois. He returned to Quebec in 1620 and was then sent to live among the distant Nipissing tribe. In 1624 he became their interpreter. Nine years later he returned to the Three Rivers settlement in New France and became the colony's official interpreter.

In early 1634 Nicolet joined an expedition that journeyed westward into the Huron territory. There he obtained a large canoe and with seven Huron braves proceeded from Lake Huron through the Straits of Mackinac to discover Lake Michigan. The lake was not the Northwest Passage to the Pacific Ocean that Nicolet anticipated, but he sailed on to Green Bay and there concluded a friendship treaty with the Winnebago tribe.

He explored the region of present-day Wisconsin for a short time before he returned to Quebec during the autumn of 1634. He resumed his duties as colony interpreter and earned considerable respect from both French settlers and local Indian tribes. Nicolet was drowned when his boat capsized during a sudden storm on the St. Lawrence River.

Nicolle, Charles-Jules-Henri (b. Sept. 21, 1866, Rouen, France—d. Feb. 28, 1936, Tunis, Tunisia), French bacteriologist who received the 1928 Nobel Prize for Physiology or Medicine for his discovery (1909) that typhus is transmitted by the body louse.

After practicing and engaging in bacteriological research in Rouen, Nicolle became director of the Pasteur Institute in Tunis (1902–32). There he founded the Archives de l'Institut Pasteur de Tunis, which during his tenure became a distinguished centre for bacteriological research and for the production of serums and vaccines to combat infectious diseases. He extended his work on typhus to distinguish between the classical louse-borne form of the disease and murine typhus, which is conveyed to humans by the rat flea. Nicolle also made valuable contributions to the knowledge of rinderpest, brucellosis, measles, diphtheria, and tuberculosis.

Nicollet, Joseph Nicolas, also called JEAN-NICOLAS NICOLLET (b. July 24, 1786, Cluses, Savoy, France—d. Sept. 11, 1843, Washington, D.C., U.S.), mathematician and explorer.

Nicollet showed promise in mathematics and astronomy early; he became a teacher of mathematics at the age of 19. In 1817 he began working with the scientist Pierre-Simon Laplace at the Paris Observatory, and in the 1820s he became a professor of mathematics at the Collège Louis-le-Grand in Paris.

In 1832 Nicollet emigrated to the United States after financial reverses in France. With support from the wealthy Chouteau family of St. Louis, Nicollet in 1836–37 led an expedition that surveyed the sources of the Mississippi River. In 1838 he accepted a position with the U.S. Army Corps of Topographical Engineers, and in 1838–39 he led a government surveying expedition to map the region between the upper Mississippi and Missouri rivers, assisted by John C. Frémont. Nicollet later prepared a detailed map of the region and wrote a report on the expedition; these were published in 1843, after his death.

Nicolls, Richard (b. 1624, Ampthill, Bedfordshire, Eng.—d. May 28, 1672, in the North Sea, off Suffolk, Eng.), the first English governor of the province of New York.

The son of a barrister, Nicolls was a stalwart Royalist who served in the army during the English Civil Wars and followed the Stuarts into exile, where he entered the service of James, Duke of York. Upon the Restoration of Charles II, Nicolls was appointed gentleman of the bedchamber to the duke. In 1664 Charles II decided to seize the Dutch colony of New Netherland (now New York state) and confer some of its lands on his brother, the Duke of York. Nicolls was appointed by the Duke of York to be the governor of this prospective territory. Accordingly, in May of that year Nicolls sailed with a squadron of four vessels and a force of troops and blockaded the chief city of New Netherland, New Amsterdam (now New York City). In September 1664 the Dutch officials in New Amsterdam surrendered peacefully to the generous terms Nicolls had set, and he began organizing an English administration of the province. Nicolls renamed both the province and its chief city New York in honour of his patron, the duke, and he also gave the present-day city of Albany its name. Nicolls achieved the transition from Dutch to English rule tactfully and gradually, and his subsequent government of New York was so efficient and fair that he earned the general esteem of both its Dutch and English colonists. In 1665 he issued "the Duke's Laws," which served as the first legal code of New York and remained in force until 1683.

Nicolls resigned the governorship in 1668 and returned to England, where he resumed his post as gentleman of the bedchamber to the Duke of York. Upon the outbreak of the Dutch War (or Third Anglo-Dutch War) in 1672, Nicolls volunteered to fight and was killed in the naval battle of Solebay.

Nicolson, Sir Harold, in full HAROLD GEORGE NICHOLSON (b. Nov. 21, 1886, Tehrān, Iran—d. May 1, 1968, Sissinghurst Castle, Kent, Eng.), British diplomat and author of more than 125 books, including political essays, travel accounts, and mystery novels. His three-volume *Diaries and Letters* (1966–68) is a valuable document of British social and political life from 1930 to 1964.

Nicolson was born in Iran, where his father, Sir Arthur Nicolson (later 1st Baron Carnock of Carnock), was chargé d'affaires. Throughout his youth, his family moved about from diplomatic post to post, in central Europe, Turkey, Madrid, and Russia. He studied at Balliol College, Oxford. He entered the Foreign Office in 1909, with which he remained for 20 years, serving at such overseas posts as Madrid, Tehrān, and Berlin.

In 1929 Nicolson decided to abandon his diplomatic career. He had already published several biographies: *Paul Verlaine* (1921), *Tennyson* (1923), *Byron, the Last Journey* (1924), *Swinburne* (1926), and *Some People* (1927), as well as a novel and other pieces. On Jan. 1, 1930, he became a columnist for Lord Beaverbrook's *London Evening Standard* and also, on that day, began a diary, in which he made daily entries until Oct. 4, 1964. (Three volumes were edited and published by his son Nigel Nicolson in the late 1960s.)

Along with his newspaper work, Nicolson also wrote book reviews and gave radio talks. From 1935 to 1945 he was a member of Parliament. He was knighted in 1953. Some of his later books were *Curzon, the Last Phase* (1934), *Politics in the Train* (1936), *Helen's Tower* (1938), *Diplomacy* (1939), *The Congress of Vienna* (1946), *King George V* (1952), and *Journey to Java* (1957).

In 1913 Nicolson married the poet and novelist Victoria Sackville-West. Although both proved to have homosexual proclivities, their marriage of deep friendship lasted until her death in 1962.

BIBLIOGRAPHY. James Lees-Milne, *Harold Nicolson,* 2 vol. (1980–81), examines his diplomatic career, his writings, and his marriage.

Nicomachus (fl. 4th century BC, Thebes, Boeotia [Greece]), Greek painter.

Nicomachus' work was overshadowed by that of his great contemporaries; the Roman connoisseur Vitruvius said that if his fame was less than that of others, it was the fault of fortune rather than of demerit. Pliny the Elder gave a list of his works, including "Rape of Persephone," "Victory in a Quadriga," a group of Apollo and Artemis, and the "Mother of the Gods Seated on a Lion." Pliny also said that he was a rapid worker and used only four colours.

Nicomachus OF GERASA (fl. *c.* AD 100, Gerasa, Roman Syria [now Jarash, Jordan]), Neo-Pythagorean philosopher and mathematician who wrote *Arithmētikē eisagōgē* (*Introduction to Arithmetic*), an influential treatise on number theory. Considered a standard authority for 1,000 years, the book sets out the elementary theory and properties of numbers and contains the earliest-known Greek multiplication table. In his *Arithmētikē* Nicomachus, unlike Euclid, gave no abstract proofs of his theorems. Instead he merely enunciated the theorems and illustrated them with specific numerical examples. A Latin translation of the *Arithmētikē* by Apuleius of Madaurus (*c.* AD 125) is lost, but Boethius' version survived and was used as a schoolbook up to the Renaissance. Nicomachus' *Encheiridion Harmonikēs* ("Handbook of Harmony") is on the Pythagorean theory of music. He also wrote *Theologoumena arithmetikēs*, 2 vol. ("The Theology of Numbers"), on the mystic properties of numbers, but only fragments of this work have survived.

Nicopolis, Battle of (Sept. 25, 1396), military engagement that resulted in a Turkish victory over an army of European crusaders. It brought an end to massive international efforts to halt Turkish expansion into the Balkans and central Europe.

When the Ottoman sultan Bayezid I (ruled 1389–1402) laid siege to Constantinople (now Istanbul) in 1395, the Byzantine emperor Manuel II Palaeologus appealed to the Christian rulers of Europe for aid. King Sigismund of Hungary responded by organizing a crusade. In July 1396 knights from France, Burgundy, England, Germany, and the Netherlands joined Sigismund at Buda and set out first to evict the Turks from the Balkans and then to march through Anatolia and Syria to Jerusalem.

Having entered Turkish territory (August) and conquered the garrisons at Vidin and Rahova, the crusaders laid siege to Nicopolis, the main Turkish stronghold on the Danube River. While they waited for the well-stocked, well-fortified town to submit, Bayezid marched from Constantinople and established his army on a hill several miles from Nicopolis. Although Sigismund urged his allies to maintain a defensive position, the knights charged up the hill, scattering the first lines of the Turkish cavalry and infantry. Bayezid awaited them, however, with another cavalry contingent reinforced by a Serbian army, and by that time the heavily armoured Western knights were too exhausted to fight effectively. Sigismund, whose army had not participated in the initial attack, tried to rescue the knights, but his Walachian and Transylvanian contingents deserted and his Hungarian force was insufficient. The Turks slaughtered most of the crusaders and pushed the remainder back to the Danube. Although a small portion of the allied army, including Sigismund, escaped, most survivors were captured and executed by Bayezid.

By their victory at Nicopolis, the Turks discouraged the formation of future European coalitions against them. They maintained their pressure on Constantinople, tightened their control over the Balkans, and became a greater menace to central Europe.

Nicopolis Actia, Modern Greek NIKÓPOLIS, formerly PALAIOPRÉVEZA, city about 4 miles (6 km) north of Préveza, northwestern Greece. It was founded in 31 BC by Octavian (who in 27 BC was to become the Roman emperor Augustus) in commemoration of his victory over Antony and Cleopatra at Actium. Nicopolis Actia became the capital of the coastal region, encompassing Acarnania and southern Epirus (now Ípiros).

Nicosia, Greek LEVKOSÍA, Turkish LEFKOŞA, city and capital of the Republic of Cyprus. It lies along the Pedieos River, in the centre of the Mesaoria Plain between the Kyrenia Mountains (north) and the Troodos range (south). The city is also the archiepiscopal seat of the autocephalous (having the right to elect its own archbishop and bishops) Church of Cyprus.

Nicosia came successively under the control of the Byzantines (330–1191), the Lusignan kings (1192–1489), the Venetians (1489–1571), the Turks (1571–1878), and the British (1878–1960), and thus reflects the vicissitudes of Cypriot history and both Eastern and Western influences. Nicosia, known in antiquity as Ledra, is a medieval corruption of the Byzantine name Lefkosia. The city was a kingdom in the 7th century BC and has been a bishopric from the 4th century AD. It has been the seat of government of Cyprus since the 10th century. The city's walled fortifications, originally erected by the Lusignan kings and later rebuilt by the Venetians to encompass a smaller area (3 miles [5 km] round), did not prevent invasions by the Genoese in 1373, the Mamlūks in 1426, and the Turks in 1570. Standing in mute testimony to the religious and political changes of the city is the Cathedral of St. Sophia. Begun in 1209, completed in 1325, and pillaged by invaders, it was converted into the chief mosque of Cyprus in 1571. In 1954 its name was changed to the Selimiye Mosque in honour of the Ottoman sultan Selim II, under whose reign Cyprus was conquered.

During the 20th century the city boundaries were extended beyond the existing circular Venetian walls, and the old town within them was rebuilt. As a result of the Turkish intervention in 1974, part of the northern section of Nicosia, including the former international airport, has remained within the United Nations Forces in Cyprus operational boundary separating the Republic of Cyprus (south) from the Turkish Cypriot administered areas (north). The city also experienced an influx of an estimated 35,000 Greek Cypriot refugees from the north in the mid-1970s.

Nicosia's light industries, mainly serving the local market, include the manufacture and processing of cotton yarns and textiles, cigarettes, flour, confectionery, soft drinks, footwear, and clothing. Nicosia is connected by good roads with the other major towns of the island; a new international airport was established in 1974 at Larnaca, about 21 miles (34 km) southeast of Nicosia. The Cyprus Museum in the city houses many archaeological treasures. Most of the population in the surrounding area is engaged in agriculture, and crops produced include wheat, barley, vegetables, and fruits; goats and sheep are also raised. Pop. (1999 est.) 195,000.

Modern housing in Nicosia, Cyprus

nicotine, an organic compound that is the principal alkaloid of tobacco. (An alkaloid is one of a group of nitrogenous organic compounds that have marked physiological effects on humans.) Nicotine occurs throughout the tobacco plant and especially in the leaves. The compound constitutes about 5 percent of the plant by weight. Both the tobacco plant (*Nicotiana tabacum*) and the compound are named for Jean Nicot, a French ambassador to Portugal, who sent tobacco seeds to Paris in 1550.

Crude nicotine was known by 1571, and the compound was obtained in purified form in 1828; the correct molecular formula was established in 1843, and the first laboratory synthesis was reported in 1904. Nicotine is one of the few liquid alkaloids. In its pure state it is a colourless, odourless liquid with an oily consistency, but when exposed to light or air, it acquires a brown colour and gives off a strong odour of tobacco. Nicotine's chemical formula is $C_{10}H_{14}N_2$.

Nicotine is the chief addictive ingredient in the tobacco used in cigarettes, cigars, and snuff. In its psychoactive effects, nicotine is a unique substance with a biphasic effect; when inhaled in short puffs it has a stimulant effect, but when smoked in deep drags it can have a tranquilizing effect. This is why smoking can feel invigorating at some times and can seem to block stressful stimuli at others. Nicotine is also an addictive drug, though, and smokers characteristically display a strong tendency to relapse after having successfully stopped smoking for a time. When ingested in larger doses, nicotine is a highly toxic poison that causes vomiting and nausea, headaches, stomach pains, and, in severe cases, convulsions, paralysis, and death.

Nicotine is commercially obtained from tobacco scraps and is used as an insecticide and as a veterinary vermifuge. Nitric acid or other oxidizing agents convert it to nicotinic acid, or niacin, which is used as a food supplement.

nicotinic acid: *see* niacin.

Nicoya, Gulf of, Spanish GOLFO DE NICOYA, inlet that indents the west-central part of the Pacific coast of Costa Rica. The inlet extends northward and northwestward from Cape Blanco and Judas Point for about 50 miles (80 km). Cape Blanco, on the Nicoya Peninsula, and Judas Point, on the mainland, are about 25 miles (40 km) apart, but the gulf narrows to a width of approximately 15 miles (24 km) farther northward. The Tempisque, Abangares, and Tárcoles rivers empty into the gulf. It has several islands, most notably Chira, the largest, and San Lucas. The largest town and port of the many settlements on the shores of the gulf is Puntarenas, on the east.

Nicoya Peninsula, Spanish PENÍNSULA DE NICOYA, peninsula in western Costa Rica that is bounded on the west and south by the Pacific Ocean, on the northeast by the Cordillera de Guanacaste, and on the southeast by the Gulf of Nicoya. Costa Rica's largest peninsula, Nicoya measures about 85 miles (140 km) northwest–southeast and 40 to 60 miles (65 to 96 km) southwest–northeast. The base of the peninsula lies in the arid Guanacaste lowlands, but in the central and southern parts a range of mountains rises abruptly to over 3,000 feet (900 m). Descendants of the pre-Columbian Chorotega-Mangues Indians are still found in villages on the peninsula, but their original Mexican language has been totally replaced by Spanish. There is some mining of gold in the north. Nicoya, the principal town—as well as the other main villages on the peninsula—is linked by highway to Liberia, capital of Guanacaste province.

Niderviller ware, French faience (tin-glazed earthenware) and porcelain produced in the 18th and 19th centuries by a factory at Niderviller, in Lorraine. Production of the faience falls into three periods. In 1755–70, under the ownership of Baron de Beyerlé and the artistic directorship of his wife, the decoration was polychrome and made up of naturalistically rendered flowers, birds, and landscapes. In 1770–90, under Count de Custine, the decoration was inspired by the painter Nicolas Lancret. The Lanfrey period, 1790–1827, was the most original, producing trompe l'oeil wares.

Niderviller faience figures, c. 1775; in the Victoria and Albert Museum, London

By courtesy of the Victoria and Albert Museum, London

The secret of the porcelain was introduced by a workman from Saxony, but when the town became part of France in 1766, its manufacture was forbidden because of royal edicts in favour of the Sèvres factory. The Count de Custine ignored the interdiction and resumed production in 1770. The decoration of Niderviller porcelain is, on the whole, the same as that of its faience.

Nidularium, genus of about 25 South American plants of the pineapple family (Bromeliaceae) that grow upon the branches of trees. Several species are cultivated indoors as decorative plants for their handsome foliage and colourful red, purplish, or white flowers.

The best-known *Nidularium* is the blushing bromeliad (*N. fulgens*), not to be confused with *Neoregelia carolinae,* which is also commonly known as blushing bromeliad. Both it and *Nidularium innocenti* have white flowers surrounded by bright red bracts.

Nidwalden, *demi-canton* ("half canton"), central Switzerland, formerly part of the canton of Unterwalden. Drained by the Engelberger Aa (river), it occupies the eastern part of former Unterwalden canton. Nidwalden means "below the forest" and refers to the great forest of Kerns that divided the two *demi-cantons* in the Middle Ages. Nidwalden was the first of the two *demi-cantons* to ally with Uri and Schwyz in the Everlasting League in 1291, the nucleus of the Swiss Confederation. It acted independently of Obwalden in its revolt against the Helvetic Republic in 1798 and in its refusal to accept the federal constitution of 1815. The latter action resulted in its loss of the abbey lands of Engelberg to Obwalden. A sovereign *demi-canton* since 1803, with its capital at Stans (*q.v.*), it is administratively independent of Obwalden. Nidwalden offers winter sports and tourist facilities along Lake Lucerne (Vierwaldstätter See). Most of the population is German speaking and Roman Catholic. Area 107 square miles (276 square km). Pop. (1994 est.) 35,393.

Niebuhr, Barthold Georg (b. Aug. 27, 1776, Copenhagen, Denmark—d. Jan. 31, 1831, Bonn, Prussia [Germany]), German historian who started a new era in historical studies by his method of source criticism; all subsequent historians are in some sense indebted to him.

Barthold Georg Niebuhr, detail from an engraving

Bavaria-Verlag

Niebuhr was the only son of the Danish explorer Carsten Niebuhr. Up to his matriculation at the University of Kiel he had a solitary education that perhaps intensified his leaning toward a life of scholarship. But on his father's advice he spent over a year in England and Scotland and then embarked on a career in state service, becoming private secretary to Count Schimmelmann, the Danish minister of finance, and in 1804 director of the national bank. In 1806, at the request of Baron von Stein, the Prussian chief minister, he took up a similar post in Prussia. Two years after Stein's fall (1808), however, disapproving of Prince von Hardenberg's policy, he resigned and became state historiographer. At the same time he became a member of the Berlin Academy of Sciences and was thereby empowered to lecture at the newly founded University of Berlin. In 1810 he began the series of lectures on Roman history that were the basis of his great book. In 1816 he went as Prussian ambassador to the Vatican, retiring to Bonn in 1823.

Niebuhr's *Römische Geschichte,* 3 vol. (1811–32; *History of Rome*) marked an era in the study of its special subject and had a momentous influence on the general conception of history. Although Niebuhr made particular contributions of value to learning (*e.g.,* his study of social and agrarian problems), some of his theories were extravagant and his conclusions mistaken. His permanent contribution to scholarship was his method. The failings of classical sources were already recognized, but it was Niebuhr who evolved what Johann Wolfgang von Goethe called *tätige Skepsis*—the "constructive skepticism" which is the root of a scientific method of criticism. It was Niebuhr who showed how to analyze the strata in a source, particularly poetical and mythical tradition, and how to discard the worthless and thereby lay bare the material from which the historical facts could be reconstructed. He thus laid the foundation for the great period of German historical scholarship.

Niebuhr, Carsten (b. March 17, 1733, Lüdingworth, Hanover [Germany]—d. April 26, 1815, Meldorf, Holstein), German traveler who was the sole survivor of the first scientific expedition to Arabia and the compiler of its results.

He learned surveying and in 1760 was invited to join the Arabian expedition being sent out by Frederick V of Denmark. The party visited the Nile, Mount Sinai, Suez, and Jidda, the port of Mecca, and then went overland to Mocha (al-Mukhā) in southwestern Arabia. The death of the expedition's philologist (May 1763) was followed by that of the naturalist in July. The remaining party members visited Ṣanʿāʾ, the capital of Yemen, and returned to Mocha. The group then sailed for Bombay, where the artist and the surgeon of the expedition died, leaving Niebuhr alone. He stayed 14 months in India and then turned homeward by way of Muscat (in southeastern Arabia), Persia, Mesopotamia, Cyprus, and Asia Minor, reaching Copenhagen in November 1767. He wrote *Beschreibung von Arabien* (1772; "Description of Arabia") and *Reisebeschreibung nach Arabien und andern umliegenden Ländern* (1774; *Travels Through Arabia*).

Niebuhr, Helmut Richard (b. Sept. 3, 1894, Wright City, Mo., U.S.—d. July 5, 1962, Greenfield, Mass.), American Protestant theologian and educator who was considered a leading authority on ethics and U.S. church history. He was a foremost advocate of theological existentialism.

The younger brother of the theologian Reinhold Niebuhr, Helmut was educated at Elmhurst (Ill.) College, Eden Theological Seminary (St. Louis, Mo.), Washington University, Yale Divinity School, and Yale University, where he was one of the first students to receive a Ph.D. in religion (1924). Ordained a pastor of the Evangelical and Reformed Church in 1916, he taught at Eden Theological Seminary (1919–22; 1927–31) and also served as president of Elmhurst College (1924–27). From 1931 he taught theology and Christian ethics at Yale Divinity School.

Influenced by Karl Barth, Søren Kierkegaard, and Ernst Troelsch, Niebuhr advocated historical criticism of religious beliefs, urging that church teachings be interpreted in a way to make them meaningful in contemporary culture. His views on theological existentialism allowed for relative interpretations of revelation and values within the framework of a monotheistic faith. Niebuhr argued that there is a correlation between religious belief and secular culture and that churches must account for the social context of their existence.

Among the most important works published by Niebuhr are *The Social Sources of Denominationalism* (1929), *The Kingdom of God in America* (1937), *The Meaning of Revelation* (1941), *The Purpose of the Church and Its Ministry* (1954), *Radical Monotheism and Western Culture* (1960), and *The Responsible Self* (1963).

BIBLIOGRAPHY. Studies of his life and works include Lonnie D. Kliever, *H. Richard Niebuhr* (1977, reissued 1991); Jon Diefenthaler, *H. Richard Niebuhr* (1986); James W. Fowler, *To See the Kingdom: The Theological Vision of H. Richard Niebuhr* (1974, reprinted 1985); and C. David Grant, *God the Center of Value: Value Theory in the Theology of H. Richard Niebuhr* (1984).

Niebuhr, Reinhold (b. June 21, 1892, Wright City, Mo., U.S.—d. June 1, 1971, Stockbridge, Mass.), American theologian who had extensive influence on political thought and whose criticism of the prevailing theological liberalism of the 1920s significantly affected the intellectual climate within American Protestantism. His exposure, as a pastor in Detroit, to the problems of American industrialism led him to join the Socialist Party for a time. A former pacifist, he actively persuaded Christians to support the war against Hitler and after World War II had considerable influence in the U.S. State Department. His most

Reinhold Niebuhr, 1963

prominent theological work was *The Nature and Destiny of Man,* which was planned as a synthesis of the theology of the Reformation with the insights of the Renaissance.

Early life. Niebuhr was the son of Gustav and Lydia Niebuhr, who had emigrated to the United States at an early age from Germany. Gustav Niebuhr was a minister of the Evangelical Synod of North America, a denomination with a Lutheran and Reformed German background that merged into the Evangelical and Reformed Church in 1934 and is now a part of the United Church of Christ. At an early age Reinhold Niebuhr decided to emulate his father and become a minister. He graduated from his denomination's Elmhurst College, Illinois (1910), and Eden Theological Seminary, St. Louis, Mo. (1913), and completed his theological education at Yale University, receiving a bachelor of divinity degree (1914) and a master of arts (1915). He was ordained to the ministry of the Evangelical Synod in 1915.

Pastor and theologian. Niebuhr served as pastor of Bethel Evangelical Church in Detroit from 1915 to 1928. His earliest writings exhibit the religious liberalism and social idealism that pervaded the theological atmosphere of the time. But his experience in Detroit—and especially his exposure to the American automobile industry before labour was protected by unions and by social legislation—caused him to become a radical critic of capitalism and an advocate of socialism. His *Leaves from the Notebook of a Tamed Cynic* (1929) is an account of his years in Detroit. Niebuhr left the pastoral ministry in 1928 to teach at Union Theological Seminary in New York City, where he served as professor of applied Christianity (from 1930) and was a great intellectual and personal force until his retirement in 1960.

As a theologian Niebuhr is best known for his "Christian Realism," which emphasized the persistent roots of evil in human life. In his *Moral Man and Immoral Society* (1932) he stressed the egoism and the pride and hypocrisy of nations and classes. Later he saw these as ultimately the fruit of the insecurity and anxious overdefensiveness of man in his finiteness; here he located "original sin." He emphasized the tendency for sin—in the form of destructive pride—to appear on every level of human achievement, especially where claims to perfection were made, either in religious or political terms. His powerful polemics against liberal beliefs in assured progress and radical utopian hopes have caused a neglect of his more hopeful teaching concerning the image of God in all men that is never completely destroyed by sin and concerning "common grace" that is not dependent on recognized Christian redemption in personal or collective life. Also, he was himself a hopeful political activist and emphasized the good that could be achieved if pretentions were overcome. His outlook is well expressed in his statement that "the saints are tempted to continue to see that grace may abound, while sinners toil and sweat to make human relations a little more tolerable and slightly more just." He always had faith in what he called "indeterminate possibilities" for humanity in history as long as men did not deceive themselves into thinking that absolute solutions of historical problems were in their control. Though he did much to encourage the revival of the theology of the Reformation, with its emphasis on sin and grace—so-called Neo-orthodoxy—his salient theological work, *The Nature and Destiny of Man,* 2 vol. (1941–43), was planned by him as a synthesis both of the insights of the Reformation and of the Renaissance, with its hopefulness about cultural achievements.

His distance from the strongly Christocentric forms of Protestant Neo-orthodoxy can be seen in his unusual attitude toward the Jewish community. He was perhaps the first Christian theologian with ecumenical influence who developed a view of the relations between Christianity and Judaism that made it inappropriate for Christians to seek to convert Jews to their faith.

Political activist. His early political activities were influenced by his socialist convictions (he was a founder of the Fellowship of Socialist Christians), and he ran for office several times on the Socialist ticket. In the 1930s he broke with the Socialist Party over its pacifist or noninterventionist attitude in foreign policy, and in the 1940s he became a left-wing, anti-Communist Democrat. He was a founder and for a time chairman of the Americans for Democratic Action and he was vice chairman of the Liberal Party in the state of New York. In the 1930s he was much influenced by Marxist theory, but he rejected Marxist absolutism and both the tactics of Communists in the United States and Stalinism in the Soviet Union.

He did much to persuade Christians influenced by pacifism to support the war against Hitler. He himself had been a pacifist as a result of his revulsion against World War I, but during the 1930s he became the strongest theological opponent of any form of pacifism that claimed to have universally applicable nonviolent solutions of political problems. Identifying himself with the resistance to Hitler within Germany, he opposed a vindictive peace after World War II, and he had considerable influence with the policy planners in the U.S. State Department. He was a strong supporter of the United States' resistance to Soviet political expansion in Europe during the postwar years. His political activity ended during the early stage of the Cold War, but his later thought showed his capacity to transcend the outlook of that period. His book *The Irony of American History* (1952), while justifying American anti-Communist policies, gave much attention to criticism of American messianism and the American tendency to engage in self-righteous crusades. He always attacked American claims to special virtue. Early he favoured the recognition by the United States of Communist China, and he was an early opponent of American participation in the Vietnam War. He regarded as an error attempts to impose U.S. solutions on the new countries that emerged out of the colonial empires after World War II.

In addition to the works mentioned above, Niebuhr's writings include *Faith and History: A Comparison of Christian and Modern Views of History* (1949), a theological orientation; *The Self and the Dramas of History* (1955), probably his profoundest philosophical work; and *The Structure of Nations and Empires* (1959), his chief systematic discussion of international relations. Four volumes of essays, some of which are essential for understanding Niebuhr's thought and his influence on events, are *Christianity and Power Politics* (1940); *Christian Realism and Political Problems* (1953); *Pious and Secular America* (1958); and *Faith and Politics: A Commentary on Religious, Social, and Political Thought in a Technological Age,* ed. by Ronald H. Stone (1968). *Love and Justice,* ed. by D.B. Robertson (1957), is a collection of shorter writings showing Niebuhr's response to events; *Children of Light and Children of Darkness: A Vindication of Democracy and a Critique of Its Traditional Defence* (1944), a brief but comprehensive discussion of social ethics.

Niebuhr was an editor of *The World Tomorrow,* a religious pacifist and socialist journal; *Christianity and Crisis,* a biweekly with wide-ranging social and religious concerns; and a quarterly, now discontinued, first named *Radical Religion* and later *Christianity and Society.* He married Ursula M. Keppel-Compton in 1931. His wife was herself a teacher of religion at Barnard College in New York City, and they worked closely together. After 1952 Niebuhr's public activities were seriously limited as the result of a stroke, but he was able to continue much of his teaching and writing.

Assessment. Niebuhr's enormous influence on political thought, both inside and outside the church, caused Hans J. Morgenthau, an eminent political scientist, to say that Niebuhr was "the greatest living political philosopher of America." He was probably the most popular preacher in university chapels from the early 1920s to the early 1950s. Many contemporary Christians trace their conviction that Christianity makes sense to the influence of his preaching. He was not a specialized scholar in any field, including theology, but his broad learning and his original and incisive thought made him the subject of many theses and other scholarly writings, and he exercised a seminal influence on scholarship and thought in a variety of fields. (J.C.Be.)

BIBLIOGRAPHY. Richard Wrightman Fox, *Reinhold Niebuhr: A Biography* (1985), includes research based on interviews with his family. June Bingham, *Courage to Change: An Introduction to the Life and Thought of Reinhold Niebuhr* (1961, reissued 1993), is an impressionistic biography based on careful research. Gordon Harland, *The Thought of Reinhold Niebuhr* (1960), is one of the best overall expositions with theological emphasis. Ronald H. Stone, *Reinhold Niebuhr, Prophet to Politicians* (1972), focuses on his mature thought; while Paul Merkley, *Reinhold Niebuhr: A Political Account* (1975), concentrates on the early and middle periods. Charles W. Kegley (ed.), *Reinhold Niebuhr: His Religious, Social, and Political Thought,* 2nd ed. (1984), includes a comprehensive bibliography.

Articles are alphabetized word by word, not letter by letter

Niederbayern, English LOWER BAVARIA, *Regierungsbezirk* (administrative district), east-central Bavaria *Land* (state), southeastern Germany. Niederbayern is bordered by the Czech Republic to the northeast, Austria to the southeast, and the *Regierungsbezirke* of Oberbayern (Upper Bavaria) to the southwest and west and Oberpfalz (Upper Palatinate) to the north. Together with Oberbayern and Oberpfalz, the district comprises most of the historic region of Bavaria (*q.v.*). Its name is derived from that of the Baiuvarii, or Baiuwarii, a mixture of Germanic people who moved westward from Bohemia between AD 488 and 520, establishing their original settlement in the Danube River valley between modern Regensburg and Vilshofen. In 1180 when Otto of Wittelsbach gained control of the Bavarian lands, the duchy was bounded by the Bohemian Forest, the Alps, and the Inn and Lech rivers. The first division of the duchy into southwestern lands, afterward known as Upper Bavaria, and northeastern lands, or Lower Bavaria, was made in 1255 between the sons of Duke Otto II. Frequent changes of territorial boundaries followed, and in 1392 a threefold division of Bavaria took place, creating separate duchies centred at Ingolstadt, Landshut, and Munich. Landshut, which is located on the Isar River, rose to major importance as the residence of the dukes of Lower Bavaria, and today that city serves as the administrative seat of Niederbayern *Regierungsbezirk*.

Hops growing near Mainburg, in the Hallertau district, Niederbayern, Germany

Ulrich Hofmann—© Silvestris

The Danube River flows across central Niederbayern from the northwest border southeast to Passau, which is an important economic, cultural, and transportation centre situated at the confluence of the Danube, Inn, and Ilz rivers. The Inn River, joining the Danube from the southwest, forms the district's southeastern border with Austria. Along the southern bank of the Danube the Gäuboden plain, a fertile farm basin known as the granary of Bavaria, extends nearly 19 miles (30 km) in width. Here villages lie close to one another amid fields of sugar beets, wheat, barley, rye, and cabbage. Straubing serves as the major market centre for the region's agricultural goods and produces electrical equipment and beer.

Rising to the south of the Danube basin are the Lower Bavarian Uplands, a region comprising long ridges of hills broken by the Isar, Vils, and Rott rivers. Many small villages lie along the rivers, as well as the growing industrial cities of Landshut and Dingolfing. Electrical and mechanical engineering and the manufacture of automobiles and textiles are among the leading industries. The rural population of the uplands live in small hamlets or on individual farms scattered about the countryside. Wheat is the chief crop, and animal husbandry, particularly horse breeding, is also important. Immediately northwest of Landshut is the Hallertau district, Germany's largest hop-growing region.

North of the Danube River, the Bavarian Forest rises to merge with the Bohemian Forest along the district's eastern frontier with the Czech Republic. The landscape consists mainly of granite and gneiss hills covered with mixed woodland of spruce, silver fir, and beech. A number of larger mountain peaks rise above the hills, including the Grosser Arber with an elevation of 4,777 feet (1,456 m). Poor economic conditions have caused decades of depopulation in the forest region. Given its harsh climate and thin soils, small farms confined to the upland valleys produce only modest yields of rye, oats, and potatoes. In addition, the region's traditional stone, timber, ceramics, and glass industries have suffered from a loss of traditional market centres in central Europe since World War II. The tourist trade, however, is growing along the beautiful Bavarian Eastern Marches Highway and near such scenic attractions as the Bavarian Forest National Park, where more than 98 percent of the park's 51-square-mile (131-square-kilometre) area is tree-covered and many species of birds and small animals thrive.

The people of Niederbayern speak Bavarian, one of three principal German dialects in Bavaria. More than three-quarters of the population are Roman Catholics. Higher education in the *Regierungsbezirk* is centred at Passau University, which was founded in 1972. Bavaria's second largest popular folk festival, the Gäubodenfest, is celebrated during the month of August in Straubing. Area 3,989 square miles (10,331 square km). Pop. (1991 est.) 1,078,110.

Niedere Tauern, English LOWER TAUERN, range of the Eastern Alps in central Austria; lying between the Enns and Mur rivers, it extends 75 miles (120 km) westward to the headstreams of the two rivers. The scenic, well-forested mountains rise to their highest elevation at Hochgolling (9,393 feet [2,863 m]), and a road crosses the range at the Radstädter Tauern (pass; 5,705 feet). The range is divided into the Radstädter Tauern, Schladminger Tauern, and Rottenmanner Tauern. Summer resorts and winter-sports centres lie in the mountains, which are also noted for their cattle-grazing meadows.

Niederösterreich, English LOWER AUSTRIA, *Bundesland* (federal state), northeastern Austria. It is bordered by the Czech Republic on the north, Slovakia on the east, and by *Bundesländer* Burgenland on the southeast, Steiermark (Styria) on the south, and Oberösterreich (Upper Austria) on the west. Niederösterreich *Bundesland* surrounds but does not include Austria's largest city and national capital, Vienna, which is a separate administrative entity.

The *Bundesland* is roughly bisected by the Danube River, which flows from west to east through it. The borders of the state are demarcated by the mouths of the Enns River on the west and the March River on the east as they join the Danube River. Niederösterreich has an area of 7,403 square miles (19,174 square km).

The Waldviertel ("forest quarter") in the northwest, with deeply incised rivers, is part of the granite plateau called the Mühlviertel ("Mühl District") and extends southward to cross the Danube. The Weinviertel ("Wine District") in the northeast is low, hilly country with extensive loess soil cover and a favourable climate. The Vienna Basin, a lowland area lying immediately east of Vienna, contains Austria's richest and most productive farmland. Vienna itself is bordered on the west by the well-known Vienna Woods (Wienerwald). The southern part of the *Bundesland* includes parts of the Central Alps with heights exceeding 6,500 feet (1,980 m). Along the Danube and in the southeastern part of the state is a small but economically important Alpine foreland, a hilly, well-watered region with a productive agriculture.

There were prehistoric settlements in the Danube Gorge (Wachau), in the southeast, and in the Vienna Basin. Later, the area was part of the Roman province of Noricum and of Charlemagne's empire. The region was granted to the Bavarian Babenberg margraves in 976; the name Ostarichi (Eastern Region) dates from that period. A permanent administrative division between Upper and Lower Austria was made about 1450. Although the province's official name until 1918 was Österreich unter der Enns ("Austria Below the Enns"), it was popularly called Niederösterreich. An area near Gmünd was ceded to Czechoslovakia after World War I. Niederösterreich became a *Bundesland* in 1918, and in 1920 it lost Vienna, except as the seat of its administration. It was part of the Reichsgau Niederdonau (Lower Danube Reich District) during the *Anschluss,* or incorporation into Germany (1938–45). In 1938 Niederösterreich yielded land to Vienna; it regained *Bundesland* status in 1945 and recovered most of the lost area

Dürnstein, on the Danube River in the Danube Gorge, Niederösterreich, Austria; ruins of a 12th-century castle stand above the town

(309 square miles [800 square km]) in 1954 under a district reorganization law.

Most of the people are Roman Catholic, but there are small Protestant communities. Approximately half of all Austria's towns are located in Niederösterreich, the principal ones being Sankt Pölten, Wiener Neustadt, Klosterneuburg, Baden, Krems, Mödling, Schwechat, Amstetten, and Stockerau. Rural settlement in the state is characterized principally by villages and small farms of less than 12 acres (5 hectares).

Agriculture and forestry, once the mainstay of the state's economy, now support only about one-eighth of the working population; more than half of the land surface is used for farming, and more than one-third is forested. Wheat, rye, corn (maize), barley, potatoes, sugar beets, and fodder beets are grown in the Vienna Basin and in the Alpine foreland. There is extensive viticulture in the Weinviertel and the Danube Gorge, along the southern bank of the Danube east of Vienna, and on the slopes of the Vienna Basin; and fruit is grown in these areas and in the Alpine foreland. Livestock raising is widespread, with market gardening around Vienna.

Oil and natural gas are found in the northern Vienna Basin, and there are hydroelectric power stations at Ybbs-Persenbeug on the Danube and Sankt Pantaleon on the Enns. Gypsum is mined near Grünbach and graphite in the Wachau; limestone is quarried for a cement plant near Mannersdorf. Metal and textile industries, food processing, sugar refining, brewing, sawmilling, and paper, cellulose, and chemical factories are important. There are large rubber plants at Traiskirchen and Wimpassing.

The tourist trade is significant in the Alps, in various thermal spas in the state, and along the Danube River's gorge. The 18-mile- (30-kilometre-) long stretch of the Danube River valley between Melk and Krems, in the western portion of Niederösterreich, is particularly well known. Known as the Wachau, it is one of the most beautiful sections of the Danube's entire valley. Picturesque villages stand along the riverbank in the midst of terraced vineyards and orchards, while the ruins of fortified castles crown the crests of the gorge. The small town of Dürnstein, known as the "pearl of the Wachau," possesses perfectly preserved medieval and Baroque buildings and the ruins of a fortified castle that once held Richard I of England as a prisoner (1192–93).

River (Danube), rail, and road transport make the state a commercial throughway, and Vienna's airport at Schwechat is the largest in Austria. Pop. (1993 est.) 1,505,236.

Niedersachsen (state, Germany): *see* Lower Saxony.

Niel, Adolphe (b. Oct. 4, 1802, Muret, France—d. Aug. 13, 1869, Paris), French army officer and marshal who, as minister of war, made an unsuccessful attempt to reorganize the French army in 1868.

Niel was trained as an engineer and spent most of his life in military service after receiving his commission in 1825. In 1849 he distinguished himself in the French forces' capture of Rome from the republicans. Appointed a general of division in 1853, he twice commanded the engineers during the Crimean War. The next year he became an aide-de-camp to Napoleon III, and in 1857 he was made a senator. He went to Turin in January 1859 to help conclude the alliance between France and Sardinia-Piedmont, and in the ensuing war against Austria he played a decisive role in the Battle of Solferino, for which he was made a marshal the next day (June 25, 1859). After Niel was appointed minister of war on Jan. 18, 1867, he planned a radical reorganization of the French army, but he met with obstruction and did not live long enough to put his program into effect.

niello, black metallic alloy of sulfur with silver, copper, or lead that is used to fill designs that have been engraved on the surface of a metal (usually silver) object. Niello is made by fusing together silver, copper, and lead and then mixing the molten alloy with sulfur. The resulting black-coloured sulfides are powdered, and after the engraved metal, usually silver, has been moistened with a flux, some of the powder is spread on it and the metal strongly heated; the niello melts and runs into the engraved channels. The excess niello is then removed by scraping until the filled channels are clearly visible, and finally the surface is polished. The contrast of the black niello against the bright silver surface produces an attractive decorative effect.

"Coronation of the Virgin," sulfur cast of an engraving for niello, Italian, *c.* 1459–64; in the British Museum

By courtesy of the trustees of the British Museum; photograph, J.R. Freeman & Co. Ltd.

Objects decorated with niello, called nielli, are usually small in scale. During the Renaissance, at the height of its popularity, the technique was widely used for the embellishment of liturgical objects and for the decoration of such utilitarian objects as cups, boxes, knife handles, and belt buckles. Before filling in the incised design with niello, Renaissance metalsmiths commonly made a record of the design by making a sulfur cast of the engraved metal plate or by taking its impression on paper.

Nielli were produced by the ancient Romans, and the ring of King Aethelwulf (839–858) in the British Museum demonstrates that the technique was well established in England at an early date. The art of niello reached its peak in 15th-century Italy in the workshop of the Florentine goldsmith Maso Finiguerra. Russian goldsmiths working in Tula in the late 18th century revived the craft, and niello work came to be known in Russia as Tula work. Fine quality niello is still being produced in India and the Balkans.

Nielsen, A.C., in full ARTHUR CHARLES NIELSEN (b. Sept. 5, 1897, Chicago, Ill., U.S.—d. June 1, 1980, Chicago), American market-research engineer and business executive, best known for the "Nielsen ratings," which offer a national rating of television viewing.

Nielsen's parents were both accountants, and he acquired mathematical interests at an early age. In 1918 he graduated from the University of Wisconsin and then worked briefly as an engineer. In 1923, with the financial backing of his fraternity brothers, he founded A.C. Nielsen Co., which eventually became the largest market-research concern in the world. In the early years the company had difficulties, almost going bankrupt twice, but it finally established a business foothold by analyzing retail food and drug sales, which thereafter remained the company's largest and most profitable operation. A.C. Nielsen Co. entered the radio program rating field in 1942 but became best known to the general public for its television rating service, which from 1950 gauged the popularity of television shows.

The rating system was based on a sampling of more than 1,000 television homes scattered around the United States. Each member of the sample had a small box, called an Audimeter, attached to the set, which recorded when the set was on and what channel was tuned in. These data were relayed to a computer centre, which also collected data from viewing diaries kept by a smaller sampling of households. Based on such information, the Nielsen raters projected a total audience for each program, as well as the age and sex of the viewers. A Nielsen rating of 20 denotes that 20 percent of all American households equipped with a television tuned in to a program. A "share," by contrast, denotes what percentage of all the viewers watching television at a particular time tuned in to a particular program; a 30 share means that 30 percent of the viewing audience watched that program.

Nielsen, Carl, in full CARL AUGUST NIELSEN (b. June 9, 1865, Sortelung, near Norre Lyndelse, Den.—d. Oct. 3, 1931, Copenhagen), violinist, conductor, and Denmark's foremost composer, particularly admired as a symphonist.

Nielsen studied at the Royal Conservatory in Copenhagen from 1884 to 1886. He was a violinist in the court orchestra at Copenhagen intermittently from 1886 to 1905. He subsequently served as Kapellmeister at the Royal Theatre (1908–14) and conductor of the Copenhagen Musical Society (1915–27), and from 1915 he taught at the Royal Conservatory, where he became director in 1931, shortly before his death.

Romanticism influenced Nielsen's early music, but his later style is a powerful fusion of chromatic and often dissonant harmony, solid contrapuntal structure, concentrated motivic treatment, and bold extensions of tonality with frequent polytonal passages. His six symphonies, written between 1890 and 1925, are forceful works that feature decisively articulated tonal progressions. The best known of these symphonies are the second, called *The Four Temperaments* (1902), the third, called *Sinfonia Espansiva* (1911), and the fourth, *The Inextinguishable* (1916). He also wrote three concertos—for violin, for flute, and for clarinet; the operas *Saul og David* (1902) and *Maskarade* (1906); four string quartets, two quintets, and choral and keyboard works. His songs based on Danish folk traditions are particularly highly regarded.

Nielsen, Morten (b. Jan. 3, 1922, Ålborg, Den.—d. Aug. 29, 1944, Copenhagen), Danish poet who became the symbol of his generation's desire for freedom and who was killed as a result of his participation in the organized Danish resistance to the German occupation during World War II.

Nielsen was only 22 when he was killed, but the role he played in Denmark was that not of a martyr or agitator but of a poet. He had been able to express, in well-formed verse, matters that were engaging the minds of his generation and his fellow countrymen. In contrast to most of the poetry of the occupation, Nielsen's verse is still read in Denmark.

A large edition of the collected poems was published 10 years after his death.

Niemann-Pick disease, inherited metabolic disorder in which a deficiency of the enzyme sphingomyelinase impairs the breakdown of the phospholipids lecithin and sphingomyelin, causing them to accumulate in various body tissues. Symptoms consist of extreme liver and spleen enlargement, mental retardation, and a brownish-yellow skin discoloration; foamy cells containing phospholipids are found in several organs.

There are five distinct varieties of the disease, the most common of which is the acute infantile form (type A). Affected infants are retarded in growth; they lose weight and undergo a decline in mental and neurologic functions, usually dying by age four. In the chronic visceral form (type B), development is normal for several years until poor muscle coordination and liver enlargement become apparent; there are no mental or other neurologic symptoms. Type C, which appears in adolescence, is similar to the acute infantile form, as is type D, which is found among a small group of people whose common ancestry is traced to Nova Scotia. The rare adult form (type E) resembles chronic visceral disease, but symptoms leading to diagnosis do not become apparent until adulthood.

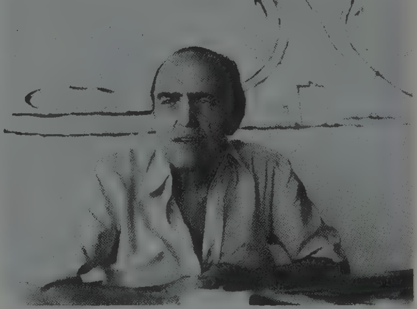
Niemcewicz, lithograph by François le Villain after a portrait by Fabian Sarnecki

By courtesy of the Muzeum Narodowe, Krakow, Pol.

Niemcewicz, Julian Ursyn (b. Feb. 6, 1757/58, Skoki, Pol.—d. May 21, 1841, Paris), Polish playwright, poet, novelist, and translator whose writings, inspired by patriotism and concern for social and governmental reform, reflect the turbulent political events of his day. He was the first Polish writer to know English literature thoroughly; he translated works of such authors as John Dryden, John Milton, Alexander Pope, and Samuel Johnson during a period of imprisonment in 1794–96 and introduced the historical novel to Poland, his *Jan z Tęczyna,* 3 vol. (1825; "Jan of Tęczyn") being influenced by the Scottish novelist Sir Walter Scott.

Educated in the Warsaw cadet corps between 1770 and 1777, Niemcewicz spent most of the period 1783–88 in western Europe and in 1788 was elected deputy to the Sejm (parliament) of Poland. In 1790 he wrote *Powrót Posła* ("The Deputy's Return"), a political comedy very popular in its day. After participating in the unsuccessful insurrection of 1794, he was captured at Maciejowice and imprisoned in St. Petersburg for two years. Upon his release, he travelled to England and then to the United States, where he married and remained until 1807, when he returned to Poland. Until 1831 he devoted himself to literary work, publishing *Śpiewy historyczne* (1816; "Historical Songs"), a series of simple song poems that became very popular, and *Lebje i Sïora* (1821; "Leybe and Syora"), the first Polish novel to discuss the Jewish problem. In 1831 Niemcewicz journeyed to England to attempt to persuade the western European powers to intervene on behalf of the Polish insurrection against the Russians. He failed to do so, however, and spent the last years of his life in Paris, campaigning for Polish freedom. His memoirs appeared in 1848.

Niemeyer (Soares Filho), Oscar (b. Dec. 15, 1907, Rio de Janeiro), Brazilian architect and early exponent of modern architecture in Latin America, particularly noted for his work on Brasília, the new capital of Brazil.



Niemeyer, 1972

Claus C. Meyer—Black Star/EB Inc.

Niemeyer studied architecture at the National School of Fine Arts, Rio de Janeiro. Shortly before his graduation in 1934, he entered the office of Lúcio Costa, a leader of the modern movement in Brazilian architecture. He worked with Costa from 1937 to 1943 on the design for the Ministry of Education and Health building, considered by many to be the first modern architectural masterpiece in Brazil. Le Corbusier, the Swiss-born French architect, was a consultant on the building, which shows his influence. Niemeyer also worked with Costa on the designs for the Brazilian Pavilion for the New York World's Fair of 1939–40. The plan for Pampulha, a new suburb of Belo Horizonte, was Niemeyer's first major project on his own. The project, commissioned in 1941 by Juscelino Kubitschek de Oliveira, then mayor of Belo Horizonte, is notable for the free-flowing forms used in many of its buildings. Other commissions followed, and in 1947 Niemeyer represented Brazil in the planning of the United Nations buildings in New York City.

Following his election to the presidency of Brazil in 1956, Kubitschek asked Niemeyer to design the new capital city of Brasília. Niemeyer agreed to design the government buildings but suggested a national competition for the master plan, a competition subsequently won by his mentor, Lúcio Costa. Niemeyer served as chief architect for NOVACAP, the government building authority in Brasília, from 1956 to 1961. Among the Brasília buildings designed by Niemeyer are the President's Palace, the Brasília Palace Hotel, the presidential chapel, and the cathedral. In 1961 Niemeyer returned to private practice and lived in Paris and Israel. In 1966 he designed an urban area in Grasse, near Nice, Fr., and a building for the French Communist Party in Paris. From 1968 he lectured at the University of Rio de Janeiro.

Niemeyer's other architectural projects included the Ministry of Defense building in Brasília in 1968 and the National Party Headquarters in Algiers in 1976. He was the recipient of many international architectural awards and received the Lenin Peace Prize in 1963.

Niemöller, (Friedrich Gustav Emil) Martin (b. Jan. 14, 1892, Lippstadt, Ger.—d. March 6, 1984, Wiesbaden, W.Ger.), prominent German anti-Nazi theologian and pastor, founder of the Bekennende Kirche (Confessing Church) and a president of the World Council of Churches.

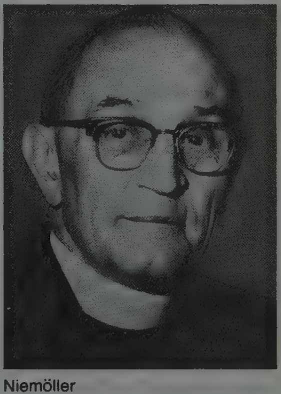
The son of a pastor, Niemöller was a naval officer and commander of a German U-boat in World War I before beginning theological studies at Münster.

In 1931 Niemöller became a pastor in Dahlem, a fashionable suburb of Berlin. Two years later, as a protest against interference in church affairs by the National Socialists (Nazi Party), Niemöller founded the Pfarrernotbund (Pastors' Emergency League). The group, among its other activities, helped combat rising discrimination against Christians of Jewish background. As founder and a leading member of the Confessing Church, within the larger Evangelical Church (Lutheran and Reformed) of Germany, Niemöller was influential in building opposition to Adolf Hitler's efforts to bring the German churches under control of the Nazis and the "Deutschen Christen" ("German Christians"). The resistance of the Confessing Church was openly declared and solidified at its Synod of Barmen in 1934. Niemöller continued to preach throughout Germany and in 1937 was arrested by Hitler's police, the Gestapo. Eventually sent to Sachsenhausen and then to Dachau concentration camps, he was moved in 1945 to the Tirol, where Allied forces freed him at the end of World War II. He helped rebuild the Evangelical Church, in 1945 becoming head of its foreign-relations office, in 1948 becoming a member of the Council of the Church, and from 1947 until 1964 serving as president of the Hesse-Nassau regional church.

Because of his experiences in the Hitler era, Niemöller became convinced of the collective guilt of the Germans and was responsible to a large extent for the Evangelical Church's declaration of such in 1945 with the "Stuttgarter Schuldbekenntnis" ("Stuttgart Confession of Guilt"). In 1961 he was elected one of the six presidents of the World Council of Churches, a position that he held until 1968.

Increasingly disillusioned with the prospects for demilitarization, both in his own country and in the world, Niemöller became a controversial pacifist. Lecturing widely, he spoke freely in favour of international reconciliation and against armaments. He stood up against the Western orientation of the Federal Republic of Germany, fought against the nuclear arms race, and sought contact with Eastern bloc countries. He travelled in 1952 to Moscow and in 1967 to North Vietnam. His writings include several volumes of sermons and an autobiography, *Vom U-Boot zur Kanzel* (1934; *From U-Boat to Pulpit*). His life is recorded in D. Schmidt's *Pastor Niemöller* (Eng. trans., 1959), and in C. Start-Davidson's *God's Man* (1959).

In recognition of his struggle in the interest of world peace, Niemöller received the Lenin Peace Prize in 1967 and the Grand Cross



Niemöller

Bavaria-Verlag

of Merit, West Germany's highest honour, in 1971.

Nien-ch'ing-t'ang-ku-la Mountains, Wade–Giles romanization NIEN-CH'ING-T'ANG-KU-LA SHAN, Pinyin NIANCHINGTANGGULA SHAN, mountain range forming the eastern section of a mountain system in the southern part of the Tibet Autonomous Region, China. In the west the system comprises a northern range, the A-ling Mountains, and a southern range, the Kailas Range, which is much more rugged and heavily glaciated, though its highest peak, at 22,031 feet (6,715 m), is lower than peaks of the A-ling Mountains. East of about longitude 88° E the two chains unite in the Nien-ch'ing-t'ang-kula Mountains proper, often called the Trans-Himalaya, which form a high watershed between the Ya-lu-tsang-pu River valley of southern Tibet and the area of inland drainage and salt lakes on the high plateau.

Southern slopes of the range are very rugged; many sections are above 20,000 feet (6,100 m), with some individual peaks well above 23,000 feet (7,000 m) in the area northwest of Lhasa, the capital of the Tibet Autonomous Region. The southern slopes also are comparatively well watered, and the natural environment is clearly divided into vertical zones, rich in grasses and shrubs affording good mountain pastures. The slopes drain into the Ya-lu-tsang-pu (Tsangpo) River, the Chinese name for the Brahmaputra. In the west, the northern slopes of the range form part of the interior drainage of the southeastern area of the Ch'iang-t'ang basin and are generally dry and covered with hardy grasses; at the eastern end of the range the northern slopes drain into the upper headwaters of the Salween River and have a much richer cover of alpine grasses. The main route across the range crosses the Shang-shung Pass between Yang-pa-ching and Hei-ho. This carries the main road from Lhasa north to the Tsaidam Basin and to the Sinkiang Uighur Autonomous Region.

nien-hao, English REIGN NAME, or ERA NAME, system of dating that was adopted by the Chinese in 163 BC. The *nien-hao* system was introduced by Emperor Wen-ti (reigned 180/179–157/156 BC) of the Western Han, and every emperor thereafter gave his reign a *nien-hao* at the beginning of his accession (sometimes a new *nien-hao* was assigned on the basis of signs of a particularly auspicious or ominous nature or on special occasions). The *nien-hao* system persisted until and informally for some years after the establishment of the republic in 1911, which was considered year one of a new period in the *nien-hao* manner. In 1949, upon the founding of the People's Republic of China, the Gregorian calendar was adopted.

Nien Rebellion (*c.* 1852–68), major revolt in the North China provinces of Shantung, Honan, Kiangsu, and Anhwei; it occurred when the Ch'ing dynasty was preoccupied with the great Taiping Rebellion (1850–64) in South and central China. An offshoot of the Buddhist-inspired White Lotus secret societies, the Nien were motley bands of peasants, army deserters, and salt smugglers who had fomented sporadic outbreaks since the first decade of the 19th century. Oppressed by famine resulting from flooding during the 1850s and stimulated by government preoccupation with the Taiping, several Nien bands formed a coalition under the leadership of Chang Lo-hsing in 1852–53 and began to expand rapidly.

Numbering from 30,000 to 50,000 soldiers and organized into five armies, they began to conduct raids into adjacent regions. In 1863 they received a setback when their citadel, Chih-ho, was captured and Chang Lo-hsing was killed. But they soon reorganized, and in 1864 they were joined by those Taiping soldiers not defeated in the fall of the Taiping capital at Nanking that same year. They began to adopt guerrilla hit-and-run tactics, using mobile mounted units to strike at the weak points of the Ch'ing armies and then retreating into strategic hamlets.

But, with the government free from problems with the Taiping, it began to concentrate on the Nien and adopted a strategy of blockade. The rebels were gradually trapped and defeated.

Nienhuys, Jacobus (b. July 15, 1836, Rhenen, Neth.—d. July 27, 1927, Bloemendaal), Dutch businessman and planter, who was responsible for establishing the tobacco industry in Sumatra (now part of Indonesia).

Nienhuys went to Sumatra in 1863 in hopes of purchasing tobacco as a middleman but found production there insufficient for commercial exploitation. To increase the output he imported Chinese labour from Singapore and began cultivating tobacco around what is now the Medan area. The leaves produced there were of exceptionally high quality and were normally used as wrappers for cigars. Originally only a single crop of tobacco was raised on a piece of ground, in the belief that it permanently sapped the fertility of the soil. Later it was discovered that eight fallow years were sufficient to restore soil fertility, and plots of land began to be reused.

Nienhuys in 1869 established the Deli Company, dealing in tropical produce, and returned to The Netherlands the following year for reasons of health. From 1880 until his death he was commissioner for the company.

Niepce, (Joseph-)Nicéphore (b. March 7, 1765, Chalon-sur-Saône, Fr.—d. July 5, 1833, Chalon-sur-Saône), French inventor who was the first to make a permanent photographic image.

The son of a wealthy family suspected of royalist sympathies, Niepce fled the French Revolution but returned to serve in the French army under Napoleon Bonaparte. Dismissed because of ill health, he settled near his native town of Chalon-sur-Saône, where he remained engaged in research for the rest of his life.

In 1807 he and his brother Claude invented an internal-combustion engine, which they called the Pyréolophore, explaining that the word was derived from a combination of the Greek words for "fire," "wind," and "I produce." Working on a piston-and-cylinder system similar to 20th-century gasoline-powered engines, the Pyréolophore initially used lycopodium powder for fuel, and Niepce claimed to have used it to power a boat.

When lithography became a fashionable hobby in France in 1813, Niepce began to experiment with the then-novel printing technique. Unskilled in drawing, and unable to obtain proper lithographic stone locally, he sought a way to provide images automatically. He coated pewter with various light-sensitive substances in an effort to copy superimposed engravings in sunlight. From this he progressed in April 1816 to attempts at photography, which he called heliography (sundrawing), with a camera. He recorded a view from his workroom window on paper sensitized with silver chloride but was only partially able to fix the image. Next he tried various types of supports for the light-sensitive material bitumen of Judea, a kind of asphalt, which hardens on exposure to light. Using this material he succeeded in 1822 in obtaining a photographic copy of an engraving superimposed on glass. In 1826/27, using a camera, he made a view from his workroom on a pewter plate, this being the first permanently fixed image from nature. Metal had the advantage of being unbreakable and was better suited to the subsequent etching process to produce a printing plate, which was Niepce's final aim. This photograph is now in the Gernsheim Collection, University of Texas, Austin. In 1826, he had produced another heliograph, a reproduction of an engraved portrait, which was etched by the Parisian engraver Augustin-François Lemaître, who pulled two prints. Thus Niepce not only solved the problem of reproducing nature by light, but he invented the first photomechanical reproduction process.

While on a visit to England in 1827, he addressed a memorandum on his invention to the Royal Society, London, but his insistence on keeping the method secret prevented the matter from being investigated.

Unable to reduce the very long exposure times by either chemical or optical means, Niepce in 1829 finally gave in to the repeated overtures of Louis-Jacques-Mandé Daguerre, a Parisian painter, for a partnership to perfect and exploit heliography. Niepce died without seeing any further advance, but, building on his knowledge, and working with his materials, Daguerre eventually succeeded in greatly reducing the exposure time through his discovery of a chemical process for development of (making visible) the latent (invisible) image formed upon brief exposure.

Nietzsche, Friedrich (b. Oct. 15, 1844, Röcken, Saxony, Prussia [now in East Germany]—d. Aug. 25, 1900, Weimar, Thuringian States), German classical scholar, philosopher, and critic of culture, an impassioned critic of the ethos of his time, especially of Christianity, conformism, and nationalism.

A brief account of Friedrich Nietzsche follows. For full treatment, *see* MACROPAEDIA: Nietzsche.

Nietzsche studied classical philology at Bonn and Leipzig (1864–68) and became a Swiss subject and a professor of classics at Basel, Switz. (1869). He served as a medical orderly for a brief time during the Franco-German War, but his health was so bad that he soon returned to Basel. There he wrote *The Birth of Tragedy* (1872), which contains his well-known Apollonian-Dionysian dichotomy. He resigned from the university permanently in 1879.

During the 10 years following his retirement, Nietzsche turned out such important works as *Thus Spake Zarathustra* (first three parts published 1883–84), *Beyond Good and Evil* (1886), and *On the Genealogy of Morals* (1887). When living in Switzerland, Nietzsche had been a friend and admirer of the composer Richard Wagner. With the passing of time, however, their philosophies diverged, and a formal break was made in 1878. Nietzsche published *The Case of Wagner* in 1888, the same year that Georg Brandes began lecturing on Nietzsche at the University of Copenhagen. Brandes' lectures were the first significant public notice of Nietzsche's works and thought. In 1889 Nietzsche suffered a breakdown and spent about a year in an asylum; he was thereafter attended by his mother and later his sister.

After his death, his sister Elisabeth secured the rights to his literary remains and edited them for publication without scruple or understanding. While she gained a wide audience for her misinterpretations, she withheld his own self-interpretation, *Ecce Homo,* until 1908.

Nieuw Nickerie, port, northwestern Suriname. It lies on the Nickerie River, near the mouth of the Courantyne (Dutch Corantijn) River, 3 miles (5 km) from the Atlantic coast. Rice is the principal crop grown in the area, and cocoa, baboen lumber, and balata, used in making golf balls, are other exports. Small oceangoing vessels can reach the port, and there is regular service to Paramaribo, the capital of Suriname, about 150 miles (240 km) to the east, to which Nieuw Nickerie is also linked by road. Pop. (1980 prelim.) 6,078.

Nieuwland, Julius Arthur (b. Feb. 14, 1878, Hansbeke, Belg.—d. June 11, 1936, Washington, D.C., U.S.), Belgian-born American chemist whose studies of acetylene culminated in the discovery of lewisite, a chemical-warfare agent, and neoprene, the first commercially successful synthetic rubber.

Nieuwland, emigrating with his parents to the United States in 1880, graduated in 1899 from the University of Notre Dame, Ind. Ordained a Roman Catholic priest in 1903, he studied botany and chemistry at the Catholic University of America, Washington, D.C., receiving a Ph.D. in 1904. Returning to Notre Dame, he was professor of botany from 1904 to 1918 and professor of organic chemistry from 1918 to 1936. His doctoral research concerned the chemistry of acetylene, a lifelong interest. Early in his studies he discovered dichloro(2-chlorovinyl)arsine, but, because of its highly poisonous properties, he suspended all research on it. Later known as lewisite, this compound was developed as a chemical weapon but was never used.

In 1920 Nieuwland discovered that acetylene could be polymerized (its molecules combined to form giant molecules) to produce divinylacetylene, a substance similar to rubber. Eleven years later, a group of chemists working under Wallace H. Carothers at E.I. du Pont de Nemours & Company succeeded in modifying Nieuwland's polymerization procedure to produce neoprene.

Nieuwpoort (Flemish), French NIEUPORT, municipality, West Flanders province, western Belgium, on the Yser (IJzer) River. Established in the 12th century as a new port for Ypres (replacing Lombardsijde), it was besieged 10 times after it was first fortified in 1163. The scene of a Dutch victory over the Spanish in 1600, it was the key to the defense of the Ypres salient in World War I. Its six sluices flooded the entire area, halting the German advance and completely destroying the town, which was rebuilt after 1918. An important port for fishing and oyster culture, it is in a coastal resort region. The North Sea resort of Nieuwpoort-Bad is 2 miles (3 km) northwest. Pop. (1992 est.) mun., 9,718.

Nièvre, *département,* Bourgogne *région,* central France, created from the historic province of Nivernais and a small part of Orléanais. Its area includes the mountainous, forested Morvan in the east, the hilly, wooded Nivernais plateau in the centre, and the valley of the Loire River in the west. The terrain attains elevations of more than 2,600 feet (800 m) in the Morvan and 1,400 feet (430 m) in the centre. The lowest parts, 460 feet (140 m), are in the Sologne region in the northwest between the Loire and the Vrille, which form the western boundary. The Loire River enters in the south, passes through the ancient town of Decize, where it is joined by the Aron, and through Nevers, the capital, where it receives the Nièvre, a small tributary for which the *département* is named. Southwest of Nevers, the Loire is joined by the Allier and flows north before entering Loiret *département.*

In the Morvan the climate is variable, with early winters and hot summers, while on the Nivernais plateau it is continental and in the Loire valley mild. The *département* is predominantly agricultural—cattle, sheep, cereals, and forestry. Some industry, including metallurgical and chemical works, is found in the Nevers region and in Clamecy and Decize. The white wines of Pouilly-sur-Loire have good standing in France.

The view across the Loire of the town of La Charité, with its Romanesque abbey church, its 16th-century stone bridge, and its ramparts, is one of the most delightful in central France. The old towns of Château-Chinon and Clamecy, in the Morvan mountains on the Yonne River, are popular tourist attractions. The *département* is divided into the *arrondissements* of Nevers, Château-Chinon, Clamecy, and Cosne-Cours-sur-Loire. It is in the educational division of Dijon. Area 2,632 square miles (6,817 square km). Pop. (1993 est.) 230,800.

Niffer (ancient Mesopotamian city): *see* Nippur.

Niflheim, Old Norse NIFLHEIMR, in Norse mythology, the cold, dark, misty world of the dead, ruled by the goddess Hel. In some accounts it was the last of nine worlds, a place into which evil men passed after reaching the region of death (Hel). Situated below one of the roots of the world tree, Yggdrasill, Niflheim contained a well, Hvergelmir, from which many rivers flowed. In the Norse creation story, Niflheim was the misty region north of the void (Ginnungagap) in which the world was created.

Nifo, Agostino, Latin AUGUSTINUS NIPHUS, or NIPHUS SUESSANUS, Niphus also spelled NYPHUS (b. *c.* 1473, Sessa, Kingdom of Naples [Italy]—d. after 1538, possibly Salerno), Renaissance philosopher noted for his development from an anti-Christian interpreter of Aristotelian philosophy into an influential Christian apologist for the immortality of the individual soul.

While attending the University of Padua about 1490, Nifo studied the Averroist Aristotelianism of Nicoletto Vernia and Siger of Brabant. This philosophical school interpreted Aristotle according to the principles of the 12th-century Arab philosopher and physician Averroës and that emphasized the eternity of the world and an immortal, universal intellect subsuming the souls of all individuals at death. Nifo expressed such teaching in his *De intellectu et daemonibus* (1492; "On the Intellect and Demons"). Later, however, he made a critical edition of Averroës' commentaries on Aristotle with conclusions more open to Christian doctrine, in the manner of Siger of Brabant.

After succeeding the strict Averroist Pietro Pomponazzi in the chair of philosophy at Padua in 1496, Nifo resigned when Pomponazzi returned. He then assumed teaching posts successively at Naples, Rome, and Salerno. Through the Neoplatonic influence of the Florentine school, he adapted his Aristotelianism to the 13th-century Christian synthesis of St. Thomas Aquinas. Consequently, at the request of Pope Leo X, he wrote *Tractatus de immortalitate animae contra Pomponatium* (1518; "Treatise on the Immortality of the Soul Against Pomponazzi") as a refutation of Pomponazzi's view that the human soul is essentially a material organism dissolving at death. Nifo argued, in a polemic that amounted to a personal attack, that Pomponazzi had neglected to consider the intrinsic relation between the nonmaterial idea and the intellectual power able to communicate it, thus making the soul something more than a bodily organism. The success of this work earned Nifo in 1520 the title of count.

Named as professor at the University of Pisa, Nifo by 1523 had published a plagiarized version of Niccolò Machiavelli's treatise on the ethics of ruling, *Il principe* (1513; "The Prince"), under the title *De regnandi peritia* ("On Skill in Governing"). This action has prompted some commentators to judge that by this time Nifo had exchanged his intellectual interests for those of a time-serving courtier.

Niğde, city, south-central Turkey; it lies at an elevation of 4,100 feet (1,250 m) below a hill crowned by a ruined 11th-century Seljuq fortress on the road between Kayseri and the Cilician Gates, north-northwest of Adana. The city is thought by some historians to be on the site of Nakida, mentioned in Hittite texts. After the decline of ancient Tyana (10th century), Niğde and nearby Bor emerged as the towns controlling the mountain pass, a vital link on the northern trade route from Cilicia to inner Anatolia and Sinope (modern Sinop) on the Black Sea coast. A prosperous and important city of the Seljuq Sultanate of Rūm, Niğde by 1333 was, nevertheless, in ruins (probably because of the wars between the Mongols and Karaman, a Turkmen principality that succeeded the Sultanate of Rūm) when the North African traveler Ibn Baṭṭūṭah visited there. Thereafter it changed hands among the Turkmen principalities of Eretna, Karaman, and Burhanettin before its absorption into the Ottoman Empire in the second half of the 15th century.

Niğde, Tur.

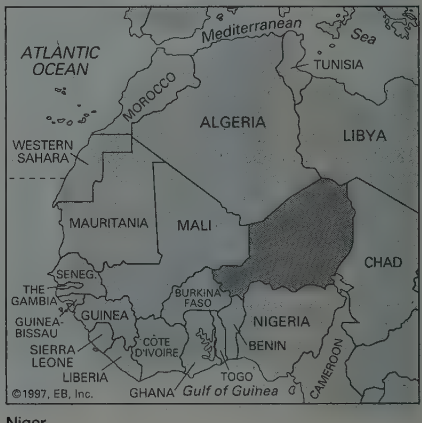
Farrell Grehan—Photo Researchers

Niğde has many medieval (Seljuq as well as Ottoman) buildings, including the Alâeddin Mosque (13th century); Sungur Bey Mosque (14th century), built by the Mongol chief; and Diş Mosque (16th century). The octagonal Hudavend Mausoleum dates from 1312. The Ak Madrasah (1409), a former religious school, now houses the regional museum of antiquities.

Industries include flour milling and wine making and the manufacture of cement, textiles, and tools. The city is linked by rail with the principal urban centres of Turkey.

The surrounding region is semiarid steppe country bounded on the south by the high ranges of the Taurus Mountains and on the northwest by the massive volcanic Melendiz Mountain. Soils are fertile when irrigated, producing potatoes, onions, rye, fruits, and raisins. Stock raising is important. Angora goats are raised for mohair. The region's mineral deposits include lignite and antimony. Pop. (1990 prelim.) 54,822.

Niger, officially REPUBLIC OF NIGER, French RÉPUBLIQUE DU NIGER, landlocked country of western Africa, covering an area of 458,075 square miles (1,186,408 square km). The cap-



Niger

ital is Niamey. Lying on the southern edge of the Sahara (desert), Niger is bounded on the northwest by Algeria, on the northeast by Libya, on the east by Chad, on the south by Nigeria and Benin, and on the west by Burkina Faso (formerly Upper Volta) and Mali. Pop. (1993 est.) 8,516,000.

A brief treatment of Niger follows. For full treatment, *see* MACROPAEDIA: Western Africa.

For current history and for statistics on society and economy, *see* BRITANNICA BOOK OF THE YEAR.

The land. Niger is dominated by arid highlands in the north and by the Aïr Massif, a highland rising to about 5,900 feet (1,800 m). The massif consists of a range trending north-south in the centre of the country. The highest point in the country is Mount Gréboun, which reaches an elevation of 6,379 feet (1,944 m). To the northeast is a series of high plateaus that form a bridge between the Ahaggar Mountains of Algeria and the Tibesti Mountains of Chad. The sandy regions of the Nigerian Sahara extend to either side of the Aïr Massif. The lower plateaus of the south, along the Niger River and eastward along the southern border with Nigeria, comprise (west to east) the Djerma region, the central Adar Hill and Majia areas, and to the east the Damagarim, Mounio, and Koutous regions. The Lake Chad basin lies in the extreme southeast.

The Niger River basin, lying in the westernmost region of Niger, occupies more than two-fifths of the country's total land area. About one-fourth of the Niger River basin and about one-fifth of the Lake Chad basin lie within the national territory of Niger. Soils are infertile in the Saharan region in the north, except in a few oases. To the south the soils are thin and white, covered with salty deposits that form an infertile crust. In the Niger River basin area, soils are rich and fertile.

The southern part of the country has a single rainy season, between June and October. Temperatures rise from February to May (the hottest month), when they average more than 100° F (38° C) in the afternoon at most stations. They drop during the rainy season but rise again afterward. Lowest monthly averages occur in January, when afternoon temperatures are still in the 90s Fahrenheit (mid-30s Celsius) at most stations. On January nights, however, temperatures may drop to the freezing level in desert locations. In the south, rainfall averages some 22 inches (560 mm) annually. The northern two-thirds of Niger is desert, and the remainder in the south is savanna. The vegetation of the desert zone clusters around oases and includes the date palm and cultivated corn (maize). The savanna zone includes a vast variety of herbaceous vegetation with mahogany, kapok, and baobab trees. Wildlife in southern Niger, which has declined in numbers, includes lion, buffalo, elephant, and various antelopes. In the Niger River, crocodile, hippopotamus, and sometimes manatee are found.

Only some 3 percent of Niger's area is considered arable, and about 7 percent of its area is used for grazing cattle. Niger is, however, among the top uranium-producing countries in the world. Reserves of phosphate, iron ore (containing about 50 percent iron), and coal are also substantial.

The people. Niger's population is distributed very unevenly. A majority lives in the south, occupying about one-fourth of the national territory. Three groups of sedentary peoples are found there: the Hausa, Songhai-Zerma, and Kanuri. The Hausa, who constitute more than one-half of the population of Niger, occupy the centre of southern Niger. The second largest group, the Songhai-Zerma (about one-fifth of the total population), live in the southwest along the Niger River. The Kanuri, together with the Manga people, live near Lake Chad in the east of the country. The Fulani, or Peul, people are scattered through all of these regions. Except for a few oases, northern Niger is virtually empty of human life. The Tibesti region in the extreme northeast is the land of the nomadic Teda, and elsewhere northern Niger remains the domain of the nomadic Tuareg. Nomadic populations still constitute about one-sixth of the country's total, but there is a trend among the nomads to settle down. Urban population is about one-sixth and is concentrated mainly in four cities: Niamey, Zinder, Maradi, and Tahoua.

Niger does not suffer from demographic pressure on the land, but its population growth rate is one of the highest in western Africa. Nearly one-half the population is less than 15 years of age. Immigration is insignificant, but emigration (of seasonal agricultural workers and industrial job seekers) to Ghana, Togo, Cameroon, Nigeria, and Chad is important. Some 500,000 nationals of Niger are thought to be living abroad.

Though French is the official language, at least five principal indigenous languages are spoken. A majority understands Hausa, which has an abundant literature; the second most important language is Songhai; the language of the Fulani is Fulfulde; and Tamashek is the language of the Tuareg. Many of the people of Niger speak Arabic.

Christianity is principally a religion of the towns; Islām is the religion of the rural majority of the peoples of Niger. Many black Africans, however, continue to adhere to traditional animist religions.

Economy. Niger has a developing economy based largely on agriculture and uranium mining. Rapid economic growth caused by uranium development slowed in the 1980s when the world price for uranium declined sharply. The gross national product (GNP) declined through the 1980s, while the population continued to grow rapidly; the GNP per capita is among the lowest in the world.

Agriculture accounts for two-fifths of the gross domestic product (GDP) and employs about four-fifths of the workforce. Millet and sorghum are the main food crops; others include cassava, green beans, and rice. Expanding food production has generally matched population growth except during drought years, and Niger is largely self-sufficient in food grains. Expanding livestock (cattle, sheep, and goat) production, severely retarded by the Sahel droughts of the mid-1970s and early '80s, has subsequently generated significant export earnings. The most important export crop is cowpeas; peanuts (groundnuts) and cotton are also widely grown.

The industrial sector, accounting for about one-eighth of the GDP, is largely dominated by uranium mining. The processing plant at the Arlit mine is largely under French control. A second mine, opened in the late 1970s, is operated by a consortium comprising the government of Niger, French and Spanish companies, and Japanese interests. A third mine, also largely French-controlled, opened in 1987. Manufacturing is limited to the processing of agricultural commodities and the production of import substitution goods. Electricity consumption is rising rapidly, and domestic generation covers only part of the demand, with the gap being met by supplies from Nigeria. A coal-operated power station began operation at Arlit in the early 1980s.

Services (including transportation, trade, finance, and public administration) account for about two-fifths of the GDP. Despite considerable foreign aid for road development, the transportation system remains inadequate. Road access to the harbour at Lomé (Togo) and access to other seaports is being improved. Major airports are located at Niamey and Agadez.

Niger's imports generally exceed exports, with higher import spending reflecting higher petroleum prices and larger investments in capital equipment for mining. The country receives substantial development aid, primarily from France. Other donors include a variety of multilateral agencies and noncommunist countries. France, Nigeria, Côte d'Ivoire, Spain, and Germany are Niger's principal trading partners.

Government and social conditions. Under the constitution approved in 1992, Niger is a unitary, multiparty republic. The head of state is the president, who is elected to a five-year term, renewable once. The president appoints the prime minister, who is responsible to the unicameral National Assembly. The members of this body also serve a five-year term. Elections are by direct, universal adult suffrage. The constitution also provides for an independent judiciary.

Niger's social-welfare system provides benefits to employed persons for old age, disability, sickness, maternity, and work injury. A family-allowance law also offers benefits to employees with one or more children younger than 14 years of age.

Health conditions are relatively poor. There are major hospitals in Niamey and Zinder, with a smaller hospital in Dosso, but the rural population has only limited access to medical treatment. Vaccination programs have reduced deaths due to measles and eliminated those due to smallpox, but malaria and trachoma remain serious health problems. Life expectancy is very low at 46 years, and the country has a very high infant mortality rate.

Niger has one of the lowest literacy rates in western Africa, but teaching facilities are being expanded with aid from France and the United Nations Educational, Scientific and Cultural Organization. Approximately one-fourth of primary-school–age children attend school, but less than 10 percent of those aged 12 to 17 attend secondary schools. The country's major institution of higher education is the University at Niamey, which was established in 1973. The Islāmic University of Niger was founded in 1987 in Say.

All the nation's news media are owned and operated by the government.

Cultural life. Although the influence of Islām is predominant in Niger, pre-Islāmic cultural traditions are also strong. Since independence, greater interest has been shown in the country's cultural heritage, particularly with respect to traditional architecture, handicrafts, dances, and music. There is a regional centre of oral traditions, as well as a national museum in Niamey. A major cultural celebration is National Youth Week, held annually in December.

History. There are carved stones from the Acheulian industry (the earliest stage of Paleolithic stone-tool–working industries) in the Bilma region and later Neolithic remains, both of which give evidence of the Tuareg's early existence in the Sahara region. The Tuareg established themselves in the Aïr Massif about the 11th century, and the Tuareg sultanate of Agadès arose about the 15th century. The Zerma, speaking Songhai, established an empire on the Niger River in the 17th century. The Hausa, who probably entered the region from the northeast, formed from the 14th century onward a number of kingdoms, of which one, the Gobir, expanded vastly in the 18th century and displaced the Tuareg. The Fulani had long been infiltrating into the Hausa land, and in 1804 Sheikh Usman dan Fodio proclaimed himself commander of the faithful and preached jihad ("holy war") against the Hausa. He defeated them and established in the former Hausa states the empire of Sokoto.

Friederich Hornemann, Mungo Park, and other Europeans explored the region in the 18th–19th century. In the latter part of the 19th century, Niger became part of the French sphere of influence. In 1904 it was formally constituted a French West African territory. It became an autonomous republic within the French Community in 1958.

Niger proclaimed its independence in 1960, withdrew from the French Community, and joined the United Nations. Hamani Diori was the first elected president. In 1974 a military coup removed Diori and put Lieutenant Colonel Seyni Kountché into power. Kountché released Diori, who had been detained after the 1974 coup, in 1980. General Ali Saibou became chief of state and president in 1987 following the death of Kountché. In August 1991 a national conference voted to suspend the constitution. Saibou remained as interim head of state, but his powers were largely ceremonial. A new constitution was approved by national referendum in December 1992, and after multiparty elections were held, Mahamane Ousmane became president in April 1993. A military coup in 1996 brought to power Colonel Ibrahim Baré Maïnassara. Widespread political unrest followed, as students and members of the civil service protested and military units mutinied. Following Baré's assassination in 1999 the country returned to democratic government under President Tandja Mamadou.

Niger, state, west-central Nigeria. It consists mostly of wooded savannas and includes the floodplains of the Kaduna River. The state is bounded on the south by the Niger River. It is also bounded by the states of Kebbi and Sokoto on the north, Kaduna on the north and northeast, Kogi on the southeast, and Kwara on the south. The Abuja Federal Capital Territory is on Niger state's eastern border, and the Republic of Benin is its western border. Niger province was created by the British in 1908 and called Nupe province from 1918 to 1926; it included the Abuja, Agaie, Bida, Kontagora, and Lapai emirates, the Gwari (Gbari), Kamuku, and Wushishi chiefdoms, and the Zuru federation. In 1967 Niger province became the southern part of North-Western state, and in 1976 it became Niger state (excluding the newly created Abuja Federal Capital Territory). In 1991 part of northwestern Kwara state, lying between the Niger River and the Republic of Benin, was added to Niger state.

Niger state is populated mainly by the Nupe people in the south, the Gwari in the east, the Busa in the west, and Kamberi (Kambari), Hausa, Fulani, Kamuku, and Dakarki (Dakarawa) in the north. Islām is the predominant religion. Most of the inhabitants are engaged in farming. Cotton, shea nuts, yams, and peanuts (groundnuts) are cultivated both for export and for domestic consumption. Sorghum, millet, cowpeas, corn (maize), tobacco, palm oil and kernels, kola nuts, sugarcane, and fish are also important in local trade. Paddy rice is widely grown as a cash crop in the floodplains of the Niger and Kaduna rivers, especially in the area around Bida. Cattle, goats, sheep, chickens, and guinea fowl are raised for meat. Pigs are raised around Minna for sale to southern Nigeria.

Gold, tin, iron, and quartz (used by the glass artisans in Bida) are mined mainly for local craftsmen. Pottery, brasswork, glass manufactures, raffia articles, and locally dyed cloth are significant exports. Marble is quarried at Kwakuti, near Minna, the state capital; and Minna has a brickmaking factory. Niger state has a share in all three dams of the Niger Dams Project, including one at Shiroro Gorge on the Kaduna River and one at Jebba (in Kwara state), the reservoir of which lies partly in Niger state. The Kainji Dam (1969) and part of its reservoir, Kainji Lake, also lie in the state. Besides generating hydroelectric power, these dams sustain irrigation projects, and fishing has developed as an industry on their reservoirs.

Minna and Bida are the state's chief towns and also the main education centres, with teacher-training colleges, a polytechnic institute in Bida, and a federal university of technology in Minna. A railway from Lagos traverses Niger state. The main highway system runs north of the railway and serves the market towns of Mokwa, Kontagora, Tegina, Kagara, and Kusheriki. The state's other large towns are served by networks of local roads. Area 29,484 square miles (76,363 square km). Pop. (1995 est.) 2,775,526.

Niger, Pescennius, original name GAIUS PESCENNIUS NIGER JUSTUS (d. 194), rival Roman emperor from 193 to 194.

An equestrian army officer from Italy, Niger was promoted to senatorial rank about 180. Most of his earlier service had been in the eastern provinces, but in 185–186 he commanded an expeditionary force against deserters who had seized control of a number of cities in southern Gaul. After serving a term as consul (*c.* 189), he was appointed legate of Syria. By the end of the emperor Commodus' reign in 192, Niger had won great popularity, both in the east and among the urban populace of Rome. When Commodus' successor, Pertinax, was murdered in the spring of 193, Niger was proclaimed emperor by his legions and was accepted as ruler in all the Asiatic provinces. Septimius Severus, who was proclaimed emperor by the troops of Pannonia Superior, marched east and decisively defeated Niger in the Battle of Issus (in southeast Anatolia) in the autumn of 194. Niger fled but was overtaken and killed.

Niger-Congo languages, family of some 1,400 languages (and thousands of dialects) spoken across a broad region of Africa. The area in which these languages are spoken stretches from Dakar, Senegal, at the westernmost tip of the continent, east to Mombasa in Kenya and south to Cape Town, South Africa. Excluding northern Africa (Mauritania to Egypt and The Sudan) and the Horn of Africa (Ethiopia to Somalia), some 85 percent of the population of Africa—at least 600 million people—speak a Niger-Congo language.

A brief treatment of the Niger-Congo languages follows. For full treatment, *see* MACROPAEDIA: Languages of the World: *Niger-Congo languages.*

All indigenous peoples of sub-Saharan Africa west of the Nile River are speakers of Niger-Congo languages, with the exception of a few to the extreme south (who speak languages of the Khoisan family) and a more substantial number along the northern rim of the area (who speak Chadic languages of the Afro-Asiatic family or Nilo-Saharan languages). In only two countries of this region—Niger and Chad—do speakers of Niger-Congo languages constitute a minority.

Linguists sometimes divide the Niger-Congo family into six branches: West Atlantic (Atlantic), Mande, Voltaic (Gur), Kwa, Benue-Congo, and Adamawa-Eastern (Adamawa-Ubangi). The Benue-Congo branch alone, which includes the enormous Bantu subgroup, contains more than than 550 languages.

Many languages in the Niger-Congo family have more than 1 million speakers and at least 12 Bantu languages have more than 5 million speakers. Several Bantu languages, including Xhosa and Zulu, have incorporated all or some of the click sounds typical of the Khoisan languages (*q.v.*).

Niger River, principal river of western Africa and the third longest in Africa.

A brief treatment of the Niger River follows. For full treatment, *see* MACROPAEDIA: Africa.

The river rises in Guinea on the eastern side of the Fouta Djallon highlands and flows in a great arc northeast to Taoussa in Mali, then southeast through western Niger, continuing to Lokoja, Nigeria, where it turns south to flow into the Gulf of Guinea, of the Atlantic Ocean, west of Port Harcourt. The Niger drainage system is bounded in the south by such highlands as the Fouta Djallon, the Banfora Cliffs, the Plateau of Yorubaland, and the Cameroon highlands. The northern edge of the Niger basin is less clearly defined. The river's upper-course tributaries include the Mafou, Niandan, Milo, Sankarani, and Tinkisso; its major middle-course tributary is the Bani; and its major lower-course tributaries are the Kaduna and the Benue, the latter approximately doubling the volume of the Niger's annual discharge. At the confluence of the Niger and Benue at Lokoja, the rivers form a lakelike stretch of water about 2 miles (3 km) wide that is dotted with islands and sandbanks. In the Niger River delta, extending over an area of 14,000 square miles (36,000 square km), the river breaks up into an intricate network of channels called rivers, which include the Nun, the Forcados, the Brass, the Sambreiro, and the Bonny.

Within the Niger basin, climate shows great variability; mean annual rainfall decreases northward from more than 160 inches (4,060 mm) annually in the delta to less than 10 inches (255 mm) in Timbuktu. Because of climatic variations, the annual river flood does not occur at the same time in all parts of the basin. Along its course the Niger traverses virtually all of the vegetational zones of western Africa, including sedge vegetation, savanna grassland, thorny shrub and acacia wood, rain forest, and mangrove swamps. Many varieties of fish are found in the Niger and its tributaries; catfish, carp, and Nile perch supply an important economic activity along the length of the river system. Other Niger fauna include hippopotamus, crocodile, lizards, and a rich collection of birds.

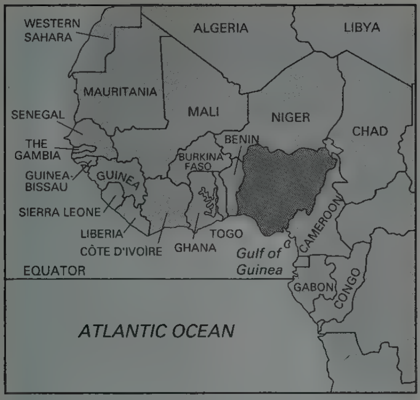
The Niger River valley is sparsely settled, with the exception of population concentrations in the lake region of central Mali and in the Nupe area in Nigeria. The ethnic pattern along the course of the river includes such peoples as the Bambara, the Malinke, the Songhai, and the Zerma (Djerma). The Niger provides a tremendous source for irrigation and hydroelectric development. Most of the river is used by commercial shipping, and rail and road routes cross it at many points. Length 2,600 miles (4,200 km); drainage basin 730,000 square miles (1,890,600 square km); mean annual discharge 212,000 cubic feet (6,000 cubic m) per second.

Nigeria, officially FEDERAL REPUBLIC OF NIGERIA, country situated on the southern coast of western Africa, extending about 650 miles (1,050 km) from north to south and 700 miles (1,130 km) east to west. Nigeria is the most populous African nation. Facing the Bight of Benin (southwest) and the Bight of Biafra (southeast), both of the Gulf of Guinea, Nigeria is bordered by Niger on the north, Lake Chad on the northeast, Cameroon on the east, and Benin on the west. The national capital is the new town of Abuja, located in the Federal Capital Territory. Area 356,669 square miles (923,768 square km). Pop. (2000 est.) 123,338,000.

A brief treatment of Nigeria follows. For full treatment, *see* MACROPAEDIA: Western Africa.

For current history and for statistics on society and economy, *see* BRITANNICA BOOK OF THE YEAR.

The land. Nigeria's topography consists of several eroded surfaces occurring as high plateaus at elevations between 2,000 and 4,000 feet (600 and 1,200 m) and the lowlands be-



Nigeria

tween them, which are mainly basins of the country's major rivers. The coastal areas along the Gulf of Guinea form gently undulating plains. The characteristic landforms in the western and north-central parts of the country are high plains with broad, shallow valleys studded with numerous dome-shaped isolated hills and elongated ridges. Other prominent relief forms include the central Jos Plateau and the northeastern Biu Plateau, both consisting of extensive lava surfaces dotted with many extinct volcanoes. The Niger-Benue River basin occupies three-fifths of Nigeria's land area and dominates the hydrology of the country. About one-tenth of the Lake Chad basin lies within the national territory of Nigeria. The Niger River and the Benue, its largest tributary, are the principal rivers. Others include the Sokoto, Kaduna, and Gongola. Low fertility because of excessive leaching is a problem on most of the country's soils, especially in the south, where rainfall is heaviest.

Near the coast in the south, temperatures rarely exceed 90° F (32° C), but the humidity is very high, and the wet season is nearly yearlong. Inland, the wet season lasts from April to October and the dry season from November to March, with summer temperatures often exceeding 100° F (38° C). The dry season of the northern part of Nigeria is nearly eight months long and is dominated by a hot, dusty Sahara wind called the harmattan. Average rainfall varies from 70 to more than 120 inches (1,800 to more than 3,000 mm) along the coast to only about 20 inches (500 mm) in the far north.

Nigeria's zones of natural vegetation progress south to north from swampland to rain forest and finally to tree-studded savanna. The animal life includes chimpanzee, gorilla, African wild dog, leopard, elephant, giraffe, lion, crocodile, and snakes of many species. About one-third of Nigeria's land area is considered arable, and another two-fifths is available as pasture. Nigeria's estimated petroleum reserves in the late 20th century represented nearly one-third of Africa's total reserves. Nigeria's estimated reserves of natural gas were also about one-third of the continent's total. There are also abundant deposits of iron ore.

The people. The great diversity of peoples and cultures in Nigeria is largely the result of the country's location at the meeting point of transcontinental migration routes. There are more than 250 ethnic groups in the country, each with its own customs, traditions, and language. Ten groups—the Hausa, Yoruba, Igbo (or Ibo), Fulani, Ibibio, Kanuri, Edo, Tiv, Ijo, and Nupe—account for approximately nine-tenths of the country's population. The Hausa of the far north have become integrated with the minority Fulani who conquered them in the 19th century, and together they are mostly Muslim. Another important ethnic group consists of the Yoruba-speaking peoples of southwestern Nigeria. The Igbo-speaking peoples of the southeastern region are the third-largest group. Less numerous groups include the Ibibio, who live near the Igbo, and the Edo people of Benin City. In central Nigeria, where the greatest concentration of different ethnic groups occurs, the Tiv and the Nupe are the largest groups.

Almost half of Nigeria's people are Muslims; the others are either animists or Christians.

Hausa is by far the most widely spoken language in Nigeria, and the continued political domination of the country by the Hausa-Fulani group has contributed to its spread. English is the official language of Nigeria but is used mostly in the cities. Urban life has a long history in Nigeria, with such centres as Kano, Katsina, and Zaria dating from the 11th century AD and Benin City dating from the late 16th century.

The main concentrations of people are in the south-central rain-forest belt, in the coastal lowland between Lagos and Port Harcourt, and in the northwestern part of the country. Vast areas of the middle belt, the Lake Chad basin, and the eastern Cross River basin are virtually uninhabited.

Demographic trends in Nigeria are similar to those in other developing nations. High birth and death rates are characteristic, although since the 1950s there has been a considerable decline in the relatively high rate of infant mortality. The country's natural rate of population increase is among the highest in the world, and in sub-Saharan Africa it is exceeded by only a few other countries. Considerable migration takes place within the country, mostly from the north to the more urbanized south.

The economy. Nigeria has a developing, mixed economy based largely on petroleum production and agriculture. Rapidly expanding economic growth was interrupted in the early 1980s when prices for Nigerian crude oil fell significantly. The government then introduced a variety of severe austerity measures and a program to expand non-oil exports, especially in agriculture and industry. Many state-owned enterprises were privatized in the early 1990s. The gross national product (GNP) began to grow again in the mid-1980s but not as rapidly as the population. The GNP per capita remains lower than those of most other western African countries.

Agriculture accounts for two-fifths of the gross domestic product (GDP) and employs close to half the workforce. Agricultural production declined drastically since the 1960s as a result of drought, government-set low market prices for crops, and the competition for skills and labour arising from other sectors of the economy. Nigeria is largely self-sufficient in meat products, but its production of staple food crops (corn [maize], sorghum, taro, yams, cassava, and rice) has not kept pace with the growing population, and food imports have continued to be high. Cacao and rubber are the only significant export crops. About one-eighth of the country's area is forested, and there is potential for exploitation, but illegal deforestation is a major problem, and most of the wood cut is used for fuel.

Industry and mining, accounting for about one-fifth of the GDP and employing only a small percentage of the workforce, are dominated by petroleum production. Exploration and production is carried out mainly in the southern part of the country and in the offshore area of the Gulf of Guinea. The Nigerian National Petroleum Corporation has a stake in all large oil firms. Tin ore and limestone are mined in significant quantities, and the production of natural gas is being developed.

Despite growth, manufacturing remains primarily small-scale and underdeveloped. Textiles are the major manufacture, but the industry suffers from competition with smuggled imports. Some four-fifths of Nigeria's installed electrical generating capacity is thermal, and hydroelectric sources account for the remainder. Demand for electricity continues to outstrip capacity.

Services, trade, and transportation account for one-third of the GDP and employ more than two-fifths of the workforce. Nigeria has a fairly extensive road network (almost half of which is paved), the principal ports have been expanded and modernized in recent years, and airports at Lagos and Kano have both national and international flights.

Nigeria's budget depends largely on income from petroleum exports. In years of high oil prices, the balance of trade is positive, but when oil prices are low, exports fall below imports. Major imports include machinery and transport equipment, chemicals, manufactured goods, and food. Nigeria's chief trading partners include the United States, Germany, the United Kingdom, France, and Spain.

Government and social conditions. Nigeria is a federal republic of 30 states. The constitution, drawn up in 1988 while the country was under military rule, allocated power between the federal and state governments and retained a presidential form of government. Executive authority rested with the president and the Armed Forces Ruling Council. Legislative power was vested in a bicameral national assembly.

Nigerian politics has been characterized by the tendency of political parties to proliferate along ethnic, sectional, or religious lines. To alleviate this problem, the military government of President Ibrahim Babangida in the late 1980s created two new parties, the centre-right National Republican Convention and the centre-left Social Democratic Party, and banned all previously existing parties. His government sponsored a gradual return to civilian democratic rule, with local elections held in 1991 and national legislative elections held in 1992. Presidential elections were held in June 1993 despite allegations of unfair practices, but, shortly thereafter, the results were voided by the ruling council. In August of that year Babangida ceded power to a mostly civilian transitional government. In November 1993 the military seized power and dissolved the institutions set up under Babangida; the transitional government was replaced by the Provisional Ruling Council.

Health conditions are relatively poor in Nigeria. Medical and health services, which are the responsibility of state governments, remain largely inadequate. Many hospitals are understaffed, and drugs are chronically scarce. Significant numbers of people die from malaria, water-borne gastrointestinal diseases, tuberculosis, cerebrospinal meningitis, and other preventable diseases. In the late 20th century, life expectancy was relatively low at 51 years for men and 54 years for women.

Six years of primary schooling are officially compulsory. The enrollment ratio for primary schools increased greatly between 1970 and 1980, when educational development was undertaken with the Universal Primary Education (UPE) program as one of its central features. The enrollment ratio for secondary schools remains low, however, as the secondary sector has not expanded sufficiently to absorb the pupils completing the UPE program. Several universities and colleges were founded during the 1970s and '80s, and high priority was given to training technical workers and teachers.

Most Nigerian newspapers are wholly or partially owned by the federal government or the states, and the few private newspapers are either personal or party organs. Press freedom, however, is an established tradition; despite instances of government censorship, there is generally free expression of opinions. Television and radio broadcasting are also government-owned.

History. The earliest identified culture in Nigeria is that of the Nok people, who flourished between about 500 BC and about AD 200 in the area north of the confluence of the Niger and Benue rivers on the Jos Plateau. The Kanuri peoples of Bornu and the Hausa and Fulani peoples subsequently migrated into the northern regions. By the end of the 11th century the empire of Kanem, of which Bornu (now in extreme eastern Nigeria) was a province, extended east and west of Lake Chad and included the greater part of the Hausa lands. In the 13th century Islām was introduced into the northern area and influenced the social as well as the religious life of the inhabitants. Toward the end of the 14th century the power of Kanem waned and the empire shrank, leaving only Bornu province. Meanwhile, to the west of Bornu, the fortunes of the Hausa states rose and fell. These states, the most important of which were Kano, Zaria, Daura, and Katsina, had existed from an early date and had often fought for supremacy with each other or joined in a loose confederacy for mutual defense. They were conquered in turn by Kanem, by the Songhai kingdom of the Sudan, and by Bornu and then Kebbi, but they retained their identities and continued to engage in internecine wars. Meanwhile, a people known as the Fulani had long been migrating into the Hausa lands; most of the Fulani were nomadic, but some settled in towns and mingled with the Hausa population. In the early 19th century, Fulani emirs were appointed rulers of several Hausa states, and the Fulani empire emerged, extending from Gandu in the west to Adamawa in the east (excluding Bornu). To the south of Bornu and the Hausa lands were the Yoruba and Benin kingdoms, which occupied what later became the Western region of Nigeria, and the Igbo, in what later became the Eastern region.

The first Europeans to reach the Nigerian coast were the Portuguese in the 15th century. They began acquiring slaves from the Benin peoples, and by the 17th century British slave ships were visiting the coast of Nigeria. Much of the trade was with various tribes and minor chiefs in the Niger River delta and on the banks of other rivers. The slaves were usually obtained from the interior. Throughout the duration of the slave trade no European nation attempted to bring any part of Nigeria under its control.

The slave trade was abolished by the British in 1807, but the trade continued as ships of other nations carried cargoes of slaves across the Atlantic. A British naval squadron was then stationed on the coast of western Africa to intercept the slavers, and British merchant ships began to trade in palm oil and other products. At that time little was known of the hinterland, but eventually several European explorers penetrated the interior.

Official British control of the area began with the annexation of Lagos in 1861. Nigeria was established as a separate British colony in 1886, and in 1914 the region became the Colony and Protectorate of Nigeria. In 1960 Nigeria achieved independence within the Commonwealth and joined the United Nations. Nigeria became a republic in 1963, and the regions were replaced by 12 states (subdivided in 1996 into 36 states). In 1966 clashes between the Hausa and Igbo peoples resulted in the killing of thousands of Igbo in the former Northern region, and many Igbo fled to their tribal homelands in the former Eastern region. A military government was formed, and a year later, civil war broke out when the Igbos of the former Eastern region declared it the independent Republic of Biafra. By 1969 federal troops had captured much of Biafra, and in 1970 the Biafrans surrendered. Military governments have since alternated with briefer periods of ineffective and corrupt civilian rule in Nigeria. Apart from political instability and underlying ethnic and religious rivalries, Nigeria's chief problems remained its rapidly growing population (by far the largest of any nation in Africa), chronic governmental corruption, and a large foreign debt representing squandered oil revenues. The return to a democratically elected government in 1999 signaled a more hopeful future, with pledges to repair the deteriorated infrastructure, return assets looted by the military regime, more equitably distribute oil revenues, and purge corrupt officials.

Nigerian theatre, variety of folk opera of the Yoruba people of southwestern Nigeria that emerged in the early 1940s. It combined a brilliant sense of mime, colourful costumes, and traditional drumming, music, and folklore. Directed toward a local audience, it uses Nigerian themes, ranging from modern-day satire to historical tragedy. Although the plays are performed entirely in the Yoruba language, they may be understood and appreciated by speakers of other languages with the aid of a translated synopsis.

Three types of themes are explored: the fantastic folktale, the farcical social satire, and the historical or mythological account derived from oral tradition. Generally speaking, both text and music evolved from a synthesis of liturgies from different religious sects.

Although there are more than a dozen traveling theatre companies, three professional troupes are particularly notable: those of Hubert Ogunde (author of *Yoruba Ronu* ["Yorubas, Think!"] and *Journey to Heaven*); Kola Ogunmola (*The Palmwine Drinkard* and *Love of Money*); and Duro Ladipo (*Oba Koso* ["The King Did Not Hang"] and *Eda* ["Everyman"]). Each of these troupes has created a distinctive style shaped by the tastes of its founder, who generally writes or adapts and produces the plays, arranges the music, and performs the leading roles.

This contemporary dramatic form grew out of biblical episodes in Christmas and Passion plays presented by separatist African churches in the 1930s and '40s. Some of these plays have been performed abroad, notably, *Oba Koso* and *The Palmwine Drinkard.*

In 1945 Ogunde was the first to establish a professional touring company. Some of his plays are satires on Yoruba types: the jealous husband, the stingy father, the reckless son. Others deal with topical political events.

In 1947 Ogunmola organized some of his pupils into an acting troupe, forming his own Theatre Party. Ogunmola's operas reveal a Christian influence in the use of biblical material for the basic plots. Ogunmola employs folklore by incorporating praise poetry, proverbs, and incantations into the dialogue, as evidenced in his celebrated production of Amos Tutuola's novel *The Palm-Wine Drinkard.*

In the early 1960s Ladipo, a composer of church music who wished to preserve the traditional arts, wrote cultural plays based on historical material. While he was no doubt influenced by his predecessors, Ladipo employed ceremonial drumming, chanting, and singing as well as traditional costume appropriate to specific historical or religious groups represented in his productions. Some of Ladipo's actors had performed in religious rituals before joining the theatre company; thus, their ceremonial material was incorporated within a contemporary mold.

Nigg, village, Highland council area, historic county of Ross-shire, historic region of Ross and Cromarty, northeast coast of Scotland. It is closely associated with and heavily dependent on the offshore petroleum industry. Construction of a huge dry dock began at Nigg in 1972, utilizing a sheltered 200-acre (80-hectare) site close to deep tidal water for the production of large drilling platforms for the North Sea oil fields. A pipeline brings oil from the sea onshore at the Nigg oil terminal. Nigg Old Church, rebuilt in 1626, houses an elaborately carved 8th-century Pictish stone. Pop. (latest est.) 380.

Niggli, Paul (b. June 26, 1888, Zofingen, Switz.—d. Jan. 13, 1953, Zürich), Swiss mineralogist who originated the idea of a systematic deduction of the space group (one of 230 possible three-dimensional patterns) of crystals by means of X-ray data and supplied a complete outline of methods that have since been used to determine the space groups.

Niggli studied at the Federal Polytechnic School in Zürich and the University of Zürich, where his thesis research, a field study of schistose rocks, was a pioneering application of physicochemical principles to the study of stress metamorphism. After postgraduate work, he moved in 1915 to a chair at the University of Leipzig, and in 1918 to Tübingen. He succeeded to the chair of mineralogy and petrology at the University of Zürich in 1920.

Niggli's synthesis of mathematical crystallography and experimental X-ray techniques forms the foundation of crystal-structure analysis. His *Lehrbuch der Mineralogie und Kristallchemie* (1920; "Textbook of Mineralogy and Crystal Chemistry") set a new standard of achievement and provided a new vista of the content of modern mineralogy.

Night and Fog Decree, German NACHT-UND-NEBEL-ERLASS, secret order issued by Adolf Hitler on Dec. 7, 1941, under which "persons endangering German security" in the German-occupied territories of western Europe were to be arrested and either shot or spirited away under cover of "night and fog" (that is, clandestinely). The decree was issued in response to the increased activity of the Resistance in France. Some 7,000 people are known to have been sent to concentration camps as a result of this decree.

night blindness, also called NYCTALOPIA, failure of the eye to adapt promptly from light to darkness and reduced ability to see in dim light or at night. It occurs as a symptom of numerous diseases that cause degeneration of the rods of the retina (the sensory cells responsible for vision in dim light); as an inherited deficiency in visual purple, or rhodopsin, which is the pigment of the rods; or as a result of vitamin A deficiency.

Congenital night blindness with or without myopia (nearsightedness) occurs as either a dominant, a recessive, or a sex-linked hereditary trait and usually remains stable throughout life. Night blindness developing during childhood or adolescence may be an early sign of retinitis pigmentosa, in which continued deterioration of vision often leads to blindness. Vitamin A deficiency causes night blindness that is usually not severe, and vision recovers when adequate levels of the vitamin are administered. Night blindness also occurs in the light-sensitive condition known as xerophthalmia but is treatable with vitamin A.

night-blooming cereus, also called MOON CACTUS (genus *Selenicereus*), any member of a group of about 20 species of cacti in the family Cactaceae. The plants are native to tropical and subtropical America, including the West Indies. They are widely grown in suitable American climates and have escaped from cultivation. The genus is known for its large, usually fragrant, night-blooming white flowers, which are among the largest in the cactus family. Some species clamber along the ground; others cling with aerial roots to trees and other objects. The queen-of-the-night (*S. grandiflorus*), the popular night-blooming cereus, is often grown indoors.

Stems are ribbed, angled, or flattened. *S.*

hamatus has backward-projecting lobes that aid clinging.

night fighter, in military aviation, a fighter aircraft (*q.v.*) with special sighting, sensing, and navigating equipment enabling it to function at night.

night monkey (primate): *see* durukuli.

Night of Broken Glass (Germany): *see* Kristallnacht.

nightclub: *see* cabaret.

nightglow, weak, steady light emanating from the whole night sky. *See* airglow.

nighthawk, any of several species of birds comprising the subfamily Chordeilinae of the family Caprimulgidae (*q.v.*). Unrelated to true hawks, they are classified with the nightjars, frogmouths, and allies in the order Caprimulgiformes. They are buffy, rufous (reddish), or grayish brown, usually with light spots or patches, and range in length from about 15 to 35 centimetres (6 to 14 inches). They fly about at night, especially at evening and dawn, catching flying insects in their mouths.

The common nighthawk (*Chordeiles minor*), or bullbat, inhabits most of North America, migrating to South America in winter. It is about 20 to 30 centimetres (8 to 12 inches) long, grayish brown, with a white throat and wing patches. It has a sharp nasal call. During courtship it dives swiftly, creating audible whirring sounds.

Common nighthawk (*Chordeiles minor*)

Kenneth W. Fink—Root Resources

Related species are found in the Southwestern U.S. and Central and South America. *See also* nightjar.

nightingale, any of several small Old World thrushes, belonging to the family Turdidae (order Passeriformes), renowned for their song. The name refers in particular to the Eurasian nightingale (*Erithacus,* or *Luscinia, megarhynchos*), a brown bird, 16 centimetres (6½ inches) long, with a rufous tail. Its strong and varied song, in which crescendo effects are prominent, is uttered by day or night from perches in shrubbery.

Eurasian nightingale (*Erithacus megarhynchos*)

H. Reinhard—Bruce Coleman Inc.

The thrush nightingale, or sprosser (*E. luscinia*), is a closely related, somewhat more northerly species with slightly darker plumage. Its song lacks the crescendo.

The term nightingale is also applied to other birds with rich songs, such as members of the neotropical nightingale thrush (*q.v.*) group, the Chinese nightingale (*see* Leiothrix), and, in the West Indies, the mockingbird (*q.v.*).

Nightingale, Florence, byname LADY OF THE LAMP (b. May 12, 1820, Florence—d. Aug. 13, 1910, London), English nurse and the founder of trained nursing as a profession for women.

In 1854–56, during the Crimean War, she was in charge of nursing in the military hospitals at Scutari, in Turkey, where she coped with conditions of crowding, inadequate sanitation, and shortage of basic necessities. In 1860 she established in London the Nightingale School for Nurses, the first such in the world.

Florence Nightingale, *c.* 1885

By courtesy of the Gernsheim Collection, the University of Texas, Austin

The second daughter of William Edward Nightingale and Frances (Fanny) Smith, Florence Nightingale was born in Florence where her well-to-do parents were temporarily resident. She grew up in Derbyshire, Hampshire, and London, where her family maintained comfortable homes. She was educated largely by her father, who taught her Greek, Latin, French, German, Italian, history, philosophy, and mathematics. Throughout her life she read widely in many languages. Social life was generally unsatisfying for Nightingale. On Feb. 7, 1837, she believed that she had heard the voice of God informing her that she had a mission, but it was not until nine years later that she realized what that mission was. Meanwhile, she strove to escape to a life of her own. Her proposal to study nursing at a hospital was scotched. She was then persuaded to study parliamentary reports, and in three years she was regarded by influential friends as an expert on public health and hospitals.

In 1846 a friend sent Nightingale the Year Book of the Institution of Protestant Deaconesses at Kaiserswerth, Ger., which trained country girls of good character to nurse the sick. Four years later she entered the institution and went through the full course of training as a nurse. In 1853 she was appointed superintendent of the Institution for the Care of Sick Gentlewomen, in London. The changes that she made and her administration were very successful. But she yearned for a wider field; by January 1854 she was referring to the institution as "this little molehill."

The Crimean War broke out in March 1854, and the allied British and French armies landed on the Crimea in September. Almost at once the British conscience was dismayed by published graphic reports of the disgraceful conditions suffered by sick and wounded British soldiers. Women were urged to serve as nurses like the French Sisters of Charity. Nightingale volunteered at once to leave in three days for Constantinople, taking three nurses with her. Meanwhile, she was officially approached by her old friend, the then secretary of state at war, Sidney Herbert (later Lord Herbert of Lea), to take out a much larger party of nurses. She was to have complete charge of the nursing in the military hospitals in Turkey (*i.e.,* at Scutari). The party left England on Oct. 21, 1854, and entered the Barrack Hospital at Scutari on November 5.

On her party's arrival she found that they had no decent facilities whatever. Their quarters were infested with rats and fleas, and the water allowance was one pint per head per day for all purposes. She had to use the provisions brought with her. The doctors were hostile, and at first the nurses were not allowed in the wards. After the Battle of Inkerman (fought on the very day of her arrival) the hospital was soon grossly overcrowded with sick and wounded. Furniture, clothing, and bedding were deficient, and in the corridors men lay on straw palliasses amidst filth caused by inadequate sanitation. Nightingale was then asked to help, and one of her first requisitions was for 200 scrubbing brushes. She next arranged for the patients' filthy clothes to be washed outside the hospital.

All supplies had completely broken down, but Nightingale had authority to purchase outside the hospital; she had brought £30,000 with her. By the end of the year she was purveying the hospital. She was harassed by the cares of administration, a vast correspondence, and the writing of numerous official and private reports, as well as by the insubordination of her nurses, some of whom had to be sent home because of drunkenness or immorality. She spent many hours a day in the wards, and there was scarcely a man whom she had not personally attended. After 8:00 PM she would allow no woman in the wards except herself. The night nursing—such as it was—was done by convalescent orderlies. Each night, however, she made her rounds, giving comfort and advice and establishing the wounded soldiers' conception of "The Lady with the Lamp."

By May 1855 nursing the sick had become her secondary interest, and her prime concern now was the welfare of the British Army. She now transferred herself and some of her nurses to the Crimea, and on landing at Balaklava she was very ill with Crimean fever. Then her opponent, the inspector general of hospitals, contended that she had authority only at Scutari and none in the Crimea. It was not until March 16, 1856, that her position as general superintendent of the Female Nursing Establishment of the Military Hospitals of the Army was confirmed in general orders.

Shortly after the last patient left the Barrack Hospital, Nightingale sailed for England, where she had long been a national hero. But she refused official transport home and every kind of public reception. Nightingale returned home determined to destroy her popular image and to inaugurate official action to improve the health, living conditions, and food of the British soldier. In the first she succeeded extraordinarily well. In the second she encountered difficulties, as the important men regarded her scheme tolerantly but without enthusiasm. In October 1856, however, she had a long interview with Queen Victoria, the Prince Consort, and Lord Panmure, Herbert's successor. She later had a private interview with the Queen, and Panmure promised a royal commission.

The Royal Commission on the Health of the Army was appointed in May 1857. Nightingale gave extensive evidence and compiled an immense confidential report, covering the whole field of army medical and hospital administration, which was later privately printed as her *Notes on Matters Affecting the Health, Efficiency and Hospital Administration of the British Army* (1858). One consequence of the commission's activities was the foundation of the Army Medical School in 1857. The Indian Mutiny in the same year turned Nightingale's interest to the health of the army in India, and for that purpose another royal commission was appointed in 1859. This resulted in 1868 in the establishment of a Sanitary Department in the India Office with supreme authority in India.

Meanwhile, Nightingale had been engaged in other pioneering activities. In 1860 she used the Nightingale Fund of £45,000, subscribed by the public to commemorate her Crimean work, to establish at St. Thomas's Hospital the Nightingale School for Nurses—the first of its kind in the world. Within a few years she was largely instrumental in inaugurating training for midwives and for nurses in workhouse infirmaries, and she played a part in the reform of workhouses. All these works were accomplished by a woman generally supposed to have died. From 1857 Nightingale had lived, mainly in London, as an invalid. Her correspondence was enormous. Lying on her couch year after year, she received innumerable visitors, from the highest to the humblest, and few came who did not give information or receive it. Although she had never been to India, she was an acknowledged master of most things Indian, and successive viceroys consulted her before assuming their offices. She drove her influential friends to obtain for her those things that she felt her cause needed. When Sidney Herbert, a dying man, was forced to discontinue his active cooperation in their work, she sent him a very cruel letter.

It has never been shown that Florence Nightingale had any organic illness; her invalidism may have been partly neurotic and partly intentional. By this apparent stratagem she was able to devote herself night and day to the task at hand. Her sight gradually failed, until in 1901 she became completely blind. In 1907 the king conferred on her the Order of Merit—the first woman ever to receive it. Florence Nightingale died in 1910. The offer of a national funeral and burial in Westminster Abbey was, by her wish, declined.

(E.A.U.)

BIBLIOGRAPHY. Nightingale's life and influence are recounted in Edward Cook, *The Life of Florence Nightingale,* 2 vol. (1913, reissued in 1 vol., 1942); Cecil Woodham-Smith, *Florence Nightingale, 1820–1910* (1950, reprinted 1983), a full and well-written modern biography; Zachary Cope, *Florence Nightingale and the Doctors* (1958); Elspeth Huxley, *Florence Nightingale* (1975), with many illustrations; and F.B. Smith, *Florence Nightingale: Reputation and Power* (1982).

nightingale thrush, any of 11 species of thrushes of the New World genus *Catharus* (family Turdidae). They are of slender build and have rather drab plumage and rich songs—qualities reminiscent of the European nightingale. In some tropical species, the eye rims, bill, and legs are orange, and the underparts are unspotted; an example is the slaty-backed nightingale thrush (*C. fuscater*), 16 cm (6.5 inches) long, of mountain forests from Costa Rica to Bolivia. In more northerly species, sometimes placed in the genus *Hylocichla,* the eye rims are whitish, the bill is dark, and the underparts are spotted. An example is the hermit thrush (*C. guttatus*), 18 cm (7 inches) long, a famous singer that is found in Canadian and U.S. coniferous woodlands. Common in eastern broadleaf forests of the United States is a spotted, rusty-headed form, the wood thrush (*Hylocichla mustelina*), 20 cm (8 inches) long.

Orange-billed nightingale thrush (*Catharus aurantiirostris*)

nightjar, any of about 60 to 70 species of birds that make up the subfamily Caprimulginae of the family Caprimulgidae and sometimes extended to include the nighthawks, subfamily Chordeilinae (*see* nighthawk). The name nightjar is sometimes applied to the entire order Caprimulgiformes. (*See* caprimulgiform.)

True nightjars occur almost worldwide in temperate to tropical regions, except for New Zealand and some islands of Oceania. They have protective colouring of gray, brown, or reddish brown. They feed on flying insects that they catch on the wing at night.

The common nightjar (*Caprimulgus europaeus*) is representative of some 35 similar species making up the largest genus in the order Caprimulgiformes. It is characterized by its flat head, wide mouth fringed with bristles, large eyes, and soft plumage that results in noiseless flight. About 30 cm (12 inches) long, it breeds throughout Europe and in western Asia, wintering in Africa.

The lyre-tailed nightjar (*Uropsalis lyra*) inhabits northwestern South America. Its outermost tail feathers may measure 60 cm (24 inches) or more, accounting for 80 to 90 percent of the bird's total length.

Male common nightjar (*Caprimulgus europaeus*) landing
Frank V. Blackburn

The pennant-winged nightjar (*Semeiophorus vexillarius*) of Africa gets its name from its boldly patterned black and white wing, which has greatly lengthened innermost primary flight feathers (50 to 70 cm [20 to 28 inches]).

The North American relatives of nightjars are chuck-will's-widow, pauraque, poorwill, and whippoorwill (*qq.v.*).

nightshade, any plant of the genus *Solanum* (family Solanaceae; *q.v.*), which has about 2,300 species, and certain other plants of the same family and other families. The species usually called nightshade in North America and England is *Solanum dulcamara,* also called bittersweet and woody nightshade. Its foliage and egg-shaped red berries are poisonous, the active principle being solanine, which can cause convulsions and death if taken in large doses. The black nightshade (*S. nigrum*) is also generally considered poisonous, but its fully ripened fruit and foliage are cooked and eaten in some areas.

Nightshade (*Solanum dulcamara*)
Kitty Kohout from Root Resources—EB Inc.

The aptly named deadly nightshade, or dwale, is the belladonna (*q.v.; Atropa belladonna*), a tall, bushy herb of the same family and the source of several alkaloid drugs. Enchanter's nightshade is a name applied to plants of the genus *Circaea* (family Onagraceae). Malabar nightshade refers to twining herbaceous vines of the genus *Basella* (family Basellaceae).

nigun, wordless song sung by Ḥasidic Jews as a means of elevating the soul to God. Because they lacked words, the *nigunim* were felt to move the singer beyond the sensual and rational toward the mystic. Such songs were spontaneously extemporized by a rabbi or one of his disciples, the entire group of men then repeating the song in unison. Melodically, the songs are strongly influenced by Slavic folk song, but they are freer in rhythm.

In the 18th century, when persecutions caused many eastern European Jews to migrate to western Europe, the *nigunim* were often appropriated by cantors who sought to combine them with western European musical styles; only rarely were such combinations truly successful. A number of *nigunim* have been preserved in musical notation.

nihilism (from Latin *nihil,* "nothing"), a philosophy of skepticism that originated in 19th-century Russia during the early years of the reign of Alexander II. The term is an old one, applied to certain heretics in the Middle Ages. In Russian literature nihilism was probably first used by N.I. Nadezhdin in an article in the *Messenger of Europe,* applying it to Aleksandr Pushkin. Nadezhdin, as did V. Bervi later in 1858, equated nihilism with skepticism. Mikhail N. Katkov, a well-known conservative journalist mainly responsible for interpreting nihilism as synonymous with revolution, presented nihilism as constituting a social menace by its negation of all moral principles.

It was Ivan Turgenev in his celebrated novel *Fathers and Sons* (1862) who popularized the term through the figure of Bazarov the nihilist. Eventually the nihilists of the 1860s and '70s came to be regarded as disheveled, untidy, unruly, ragged men who rebelled against tradition and social order. The philosophy of nihilism then began to be associated erroneously with the regicide of Alexander II (1881) and the political terror that was employed by those active at the time in clandestine organizations against absolutism.

If to the conservative elements the nihilists were the curse of the time, to the liberals such as N.G. Chernyshevsky they represented a mere transitory factor in the development of national thought, a stage in the struggle for individual freedom, a true spirit of the rebellious young generation. In his novel *What Is to Be Done?* (1863) Chernyshevsky endeavoured to detect positive aspects in the nihilist philosophy. Similarly, in his *Memoirs,* Prince Peter Kropotkin, the leading Russian anarchist, defined nihilism as the symbol of struggle against all forms of tyranny, hypocrisy, and artificiality, and for individual freedom.

Fundamentally, nihilism represented a philosophy of negation of all forms of aestheticism; it advocated utilitarianism and scientific rationalism. The social sciences and classical philosophical systems were rejected entirely. Nihilism represented a crude form of positivism and materialism, a revolt against the established social order; it negated all authority exercised by the state, by the church, or by the family. It based its belief on nothing but scientific truth; science became the cure-all for social problems. All evils, nihilists believed, derived from a single source—ignorance—which science alone would overcome.

The thinking of nihilists was profoundly influenced by such men as Ludwig Feuerbach, Charles Darwin, Henry Buckle, and Herbert Spencer. Since nihilists denied the duality of man as a combination of body and soul, of spiritual and material substance, they came into violent conflict with ecclesiastical authorities. Since nihilists questioned the doctrine of divine right, they came into similar conflict with secular authorities. Since they scorned all social bonds and family authority, the conflict between fathers and sons became equally immanent, and it is this theme that is best reflected in Turgenev's novel. A comparison between Turgenev's hero, Bazarov, and the hero of Leonid Andreyev's drama, Savva, written during the early 20th century, reveals the deterioration of nihilist philosophy, which changed from a faith in science into a justification of terror and destruction as a means to attain the set goals.

Nihon: *see* Japan.

Nihon keizai shimbun (Japanese: "Japanese Economic Newspaper"), Nihon also spelled NIPPON, Japan's most widely respected daily business-oriented newspaper. It deals principally with news of commerce, industry, finance, government regulation of business, world trade, and economic news in general.

The newspaper has as its roots the *Chūgai bukka shimpō* ("Domestic and Foreign Prices News"), established in 1876 to report on Meiji Japan's massive economic development; in 1889 the name was changed to *Chūgai shōgyō shimpō* ("Domestic and Foreign Commercial News"). The newspaper acquired its present name in 1946.

Nihon keizai shimbun is actually two newspapers. Its national edition is published mornings and evenings in Ōsaka, Sapporo, Seibu, and Tokyo and has a combined circulation of some 2,800,000. *Nihon keizai shimbun* has offices in major world capitals.

Nihon shoki, also called NIHON-GI (Japanese: "Chronicles of Japan"), text that, together with the *Kojiki* (*q.v.*), comprises the oldest official history of Japan, covering the period from its mythical origins to AD 697.

The *Nihon shoki,* written in Chinese, reflects the influence of Chinese civilization on Japan. It was compiled in 720 by order of the imperial court to give the newly Sinicized court a history that could be compared with the annals of the Chinese. It was the first of six officially compiled chronicles that were continued to 887 by imperial command.

The *Nihon shoki* consists of 30 chapters. The first part deals with many myths and legends of ancient Japan and is an important source for Shintō thought. The later chapters, for the period from about the 5th century on, are historically more accurate and contain records of several of the politically powerful clans as well as of the imperial family. Among the events described are the introduction of Buddhism and the Taika reforms of the 7th century.

Niigata, *ken* (prefecture), north-central Honshu, Japan. It lies along the Sea of Japan and includes the offshore islands of Sado and Awa. Silt deposited by the Shinano and Ara rivers in the central part of the long coastline has created the lowland called the Echigo Plain, which contains the majority of the population. The rest of the prefecture is mountainous except for small southern coastal plains and lowlands along other river courses. Niigata is one of Japan's largest rice producers, providing major surpluses for shipment to city markets. Plentiful hydroelectric power generated in the interior mountains has stimulated industrial growth (chemicals, metals, machinery) in such cities as Niigata, Kashiwazaki, Naoetsu, Sanjō, and Takada. The prefecture also produces petroleum (Nagaoka, Kashiwazaki) and natural gas. Niigata is the prefectural capital and largest city. Area 4,857 square miles (12,579 square km). Pop. (1993 est.) 2,478,000.

Mouth of the Shinano River at Niigata in Niigata prefecture, Japan

Kokunai Jigyo Kouku

Niigata, capital of Niigata *ken* (prefecture), north-central Honshu, Japan. Niigata lies on the coastal edge of the Echigo Plain at the mouth of the Shinano River. It was an important rice port in feudal times and has continued as the country's leading port along the Sea of Japan, carrying on trade with South Korea and Russia. Coal and raw material imports predominate. Niigata is also an industrial city that produces chemicals, cotton textiles, metals, machinery, paper, and ships. Local deposits of natural gas and available hydroelectricity have attracted many large factories. A severe earthquake struck the city and surrounding area in June 1964, causing extensive loss of life and property damage. Pop. (1993 est.) 490,237.

Niihama, city, Ehime *ken* (prefecture), Shikoku, Japan. It lies on the Inland Sea coast. Originally a small fishing village, it grew after 1691 as a transit port for copper from an inland copper mine to Ōsaka. The foundation of modern smelting works (1883) and a hydroelectric company (1913) laid the basis of present industrialization in the city. The port was enlarged for the importation of foreign copper ores, and in the 1970s Niihama was the core of the East Ehime New Industrial City Program, producing copper, aluminum, chemicals, and machinery. Pop. (1993 est.) 128,716.

Niihau, volcanic island, Kauai county, Hawaii, U.S. Niihau lies 17 miles (27 km) southwest of Kauai Island. It was sold in 1863 by King Kamehameha IV to Elizabeth Sinclair of Scotland. Her descendants, the Kamaaina (meaning "old-timer") Robinson family, continue to live at Makaweli and have attempted to preserve Hawaiian culture on Niihau. Residency on Niihau is restricted to Hawaiians, and tourism is prohibited; in 1959 it was the only island to vote against statehood. Although English is taught, residents prefer to speak the old Hawaiian language. Niihau has an area of 72 square miles (186 square km). The island is mostly arid lowland that supports sheep and cattle ranching. The chief village, Puuwai, is on the west coast. Pop. (1990) 230.

Niitsu, city, Niigata *ken* (prefecture), Honshu, Japan. It lies on the Uetsu Line (railway), 150 miles (240 km) north-northwest of Tokyo. Oil was discovered southeast of Niitsu in the 17th century, and exploitation began in 1898. Three railway lines were subsequently opened through the city. Although the output of the oil fields has decreased significantly, Niitsu continues to be an important

Tulip plantation, Niitsu, Japan

Shiro Shirahata—Bon

transport and commercial centre, producing tulip and hyacinth bulbs for export to the United States. In the late 1960s it developed as a residential suburb of Niigata city. Pop. (1995) 65,572.

Nijhoff, Martinus (b. April 20, 1894, The Hague—d. Jan. 26, 1953, The Hague), greatest Dutch poet of his generation, who achieved not only an intensely original imagery but also an astounding command of poetic technique.

In his first volume, *De wandelaar* (1916; "The Wanderer"), his negative feelings of isolation and noninvolvement are symbolized in wildly grotesque figures, and the image of the dance of death is prevalent. The only solution to this spiritual frustration is suicide, as enacted in the short verse drama *Pierrot aan de lantaarn* (1918; "Pierrot at the Lamppost"). The demonic element is again apparent in his second volume, *Vormen* (1924; "Forms"), which also reveals Nijhoff's realistic, direct approach to Christianity in, for example, "De soldaat die Jezus kruisigde" ("The Soldier Whom Jesus Crucified").

Nijhoff's best volume, *Nieuwe gedichten* (1934; "New Poems"), shows a spiritual rebirth, an affirmation of the richness of earthly existence, which is most apparent in the optimism of the magnificent "Awater." This tale of a mythical, biblical character set in a sober modern townscape combines a sensitive use of colloquialism with extreme virtuosity of form.

"Awater" and *Het uur U* (1942; "U-Hour"), the story of a stranger's shattering effect on a self-satisfied community, firmly establish Nijhoff as one of Europe's foremost 20th-century poets.

Nijinsky, Vaslav, Russian in full VATSLAV FOMICH NIZHINSKY (b. March 12 [Feb. 28, old style], 1890, Kiev—d. April 8, 1950, London), Russian-born ballet dancer of almost legendary fame, celebrated for his spectacular leaps and sensitive interpretations. After a brilliant school career, Nijinsky became a soloist at the Mariinsky Theatre, St. Petersburg, in 1907, appearing in such classical ballets as *Giselle, Swan Lake,* and *The Sleeping Beauty.* In 1909 he joined Sergey Diaghilev's Ballets Russes, and the company's choreographer Michel Fokine created *Le Spectre de la rose, Petrushka, Schéhérazade,* and other ballets expressly for him. Nijinsky's own works as a choreographer include *L'Après-midi d'un faune* and *Le Sacre du printemps.*

Nijinsky in *Spectre de la rose*

Vaslav was the second son of Thomas Laurentiyevich Nijinsky and Eleonora Bereda; both his parents were celebrated dancers, and his father in particular was famous for his virtuosity and enormous leaps. The Nijinskys had their own dance company and performed throughout the Russian Empire. Nijinsky's childhood was mostly spent in the Caucasus, where he danced as a small child with his brother Stanislav and his little sister Bronisława. His father, noticing the child's great disposition for dancing, gave him his first lessons.

At the age of nine, at the end of August 1898, Nijinsky entered the Imperial School of Dancing in St. Petersburg, where his teachers, the foremost of the time, soon discovered his extraordinary talent. When he was 16 years old, they urged him to graduate and enter the Mariinsky Theatre. Nijinsky declined, preferring to fulfill the customary period of study. At the time he already had been heralded as the "eighth wonder of the world" and the "Vestris of the North" (in reference to Auguste Vestris, a famous French dancer of the 18th century). During his school years he appeared at the Mariinsky Theatre, first as a member of the corps de ballet, later in small parts. He danced in St. Petersburg before the Tsar at the Chinese Theatre of Tsarskoe Selo and the Hermitage Theatre of the Winter Palace.

Nijinsky was graduated in the spring of 1907 and on July 14, 1907, joined the Mariinsky Theatre as a soloist. His first appearance was in the ballet *La Source* with the Russian ballerina Julia Sedova as his partner; the public and the ballet critics burst out immediately in wild enthusiasm. Among his Mariinsky partners were three great ballerinas, Mathilde Kschessinskaya, Anna Pavlovna Pavlova, and Tamara Platonovna Karsavina. As *danseur noble,* he danced the leading parts in many ballets, including *Ivanotschka, Giselle, Swan Lake, The Sleeping Beauty,* and *Chopiniana.* From 1907 to 1911 Nijinsky danced all of the leading parts at the Mariinsky Theatre and at the Bolshoi Theatre in Moscow, where he was a guest performer. His success was phenomenal.

In 1909 Sergey Diaghilev, former assistant to the administrator of the Imperial Theatres, was commissioned by the grand duke Vladimir to organize a ballet company of the members of the Mariinsky and Bolshoi theatres. Diaghilev decided to take the company to Paris in the spring and asked Nijinsky to join as principal dancer. Its first performance was on May 17, 1909, at the Théâtre du Châtelet. Nijinsky took Paris by storm. The expression and beauty of his body, his featherweight lightness and steel-like strength, his great elevation and incredible gift of rising and seeming to remain in the air, and his extraordinary virtuosity and dramatic acting made him a genius of the ballet. From 1907 to 1912 he worked with the company's choreographer, Michel Fokine. With his phenomenal talent for characterization, he created some of his most renowned roles in Fokine's *Le Carnaval, Les Sylphides* (a revision of *Chopiniana*), *Le Spectre de la rose, Schéhérazade, Petrushka, Le Dieu bleu, Daphnis et Chloé,* and *Narcisse.* His later ballets were *Mephisto Valse, Variations on the Music of Johann Sestian Bach, Les Papillons de nuit,* and *The Minstrel.* Until 1917 Nijinsky appeared all over Europe, in the United States, and in South America. He was called *le dieu de la danse.*

In 1912 he began his career as a choreographer. He created for Diaghilev's Ballets Russes the ballets *L'Après-midi d'un faune, Jeux,* and *Le Sacre du printemps. Till Eulenspiegel* was produced in the United States without Diaghilev's personal supervision. His work in the field of choreography was generally considered daringly original.

Nijinsky married Romola, countess de Pulszky-Lubocy-Cselfalva, in Buenos Aires on Sept. 10, 1913. During part of World War I and again in World War II, he was interned in Hungary as a Russian subject. In 1919, at the age of 29, he retired from the stage, owing to a nervous breakdown, which was diagnosed as schizophrenia. He lived from 1919 until 1950 in Switzerland, France, and England, and died in London in 1950. Nijinsky is buried next to Auguste Vestris in the cemetery of Montmartre in Paris. (R.Ni.)

BIBLIOGRAPHY. The standard biographies, both by his wife, Romola Nijinsky, are *Nijinsky* (1933), and *The Last Years of Nijinsky* (1952), both reprinted in 1980. Bronisława Nijinska, *Early Memoirs* (Eng. trans. 1981), the first volume of his sister's life, is an invaluable source containing previously unpublished material about Nijinsky's childhood. Other important studies are Geoffrey Withworth, *Nijinsky* (1911); Cyril W. Beaumont, *Nijinsky* (1932); Colin Wilson, *The Outsider* (1956); and Lincoln Kirstein, *Nijinsky Dancing* (1975). Nijinsky's diary was published as *The Diary of Vaslav Nijinsky* (1936). *Nijinsky As We Knew Him* (1972), is a collection of reminiscences of the dancer by such prominent writers, artists, musicians, and dancers as Paul Claudel, Jean Cocteau, Auguste Rodin, Marcel Proust, Sergei Prokofiev, and Tamara Karsavina.

Nijlen, Jan van (b. Nov. 10, 1884, Antwerp—d. Aug. 14, 1965, Forest, Belg.), one of the most distinguished Flemish poets of his generation.

Of a retiring nature, van Nijlen, a high official with the Ministry of Justice in Brussels, usually published his verse in limited editions. Among his early volumes were *Het angezicht der aarde* (1923; "The Face of the Earth"), *De vogel phoenix* (1928; "The Phoenix Bird), and *Geheimschrift* (1934; "Secret Writing"). He gained a wider audience when in 1938 he at last published a one-volume selection from his poems, *Gedichten, 1904–1938.* Subsequent publications included *De Dauuwtrapper* (1947; "The Dew Trapper") and *Te laat voor deze wereld* (1957; "Too Late for This World").

Van Nijlen's characteristic tone is melancholic and elegiac, reflecting his disillusionment with the modern world. His verses recall the Romantics' longing to escape to a simpler and truer life; they are marked, however, by a classical clarity and finish. Van Nijlen also wrote studies of the French authors Charles Peguy (1919) and Francis Jammes (1918).

Nijmegen, German NIMWEGEN, *gemeente* (municipality), Gelderland *provincie* (province), eastern Netherlands, on the Waal River (southern arm of the Rhine). It originated as the Roman settlement of Noviomagus and is the oldest town in The Netherlands. Often an imperial residence in the Carolingian period, it became a free city and later joined the Hanseatic League. In 1579 it subscribed to the Union of Utrecht against Spain. It was taken by the French (1672) in the third of the Dutch Wars, and the treaties—between Louis XIV, the Netherlands, Spain, and the Holy Roman Empire—that ended the hostilities were signed there in 1678–79. Nijmegen was the capital of Gelderland until its capture in 1794 by the French, who moved the capital to Arnhem. It served as a frontier fortress until its defenses were dismantled in 1878. Occupied by the Germans during World War II, the town was badly damaged and was the scene of a U.S. airborne landing in 1944. Rebuilt, it is now an important industrial centre, a rail junction, and an inland shipping centre.

A scenic park, the Valkhof ("Falcon's Court"), contains ruins of Charlemagne's castle, which was destroyed by the Vikings but rebuilt by Frederick Barbarossa in 1155 before being demolished by French Revolutionary troops in 1796; a 16-sided baptistry (consecrated in 799) and the choir of its 12th-century church remain. The fine Renaissance Grote Kerk ("Great Church") of St. Stephen and the town hall (1554) both suffered war damage but have been restored. Other notable buildings include the Latin School (1544–45), the Weighhouse (1612), and the modern Church of St. Peter Canisius (1960). Nijmegen has the Catholic University of Nijmegen (1923), with an important medical faculty and hospital; a municipal museum; the G.M. Kam State Museum at Nijmegen (1922), with a notable collection of Roman antiquities; and a theatre and a concert hall. Pop. (1993 est.) 146,993; metropolitan area, 246,885.

Nijmegen, Treaties of, Nijmegen also spelled NIMWEGEN, peace treaties of 1678–79 that ended the Dutch War (*q.v.*), in which France had opposed Spain and the Dutch Republic (now The Netherlands). France gained advantages by arranging terms with each of its enemies separately.

Although negotiations had begun in 1676, the first treaty, between France and the Dutch Republic, was not concluded until Aug. 10, 1678. France agreed to return Maastricht and to suspend Jean-Baptiste Colbert's anti-Dutch tariff of 1667; these concessions represented a major victory for Dutch naval power and commerce. In the second treaty, concluded between France and Spain on Sept. 17, 1678, Spain was forced to make major concessions, indicating that its power had declined since the Peace of Westphalia in 1648. Spain gave up Franche-Comté, Artois, and 16 fortified towns in Flanders to France. France returned some of its enclaves in the Spanish Netherlands to Spain to round out the formerly arbitrary frontier line there. On the whole, France gained substantially by the possession of a more rational northeastern border and of border fortresses that secured the safety of Paris. Furthermore, with Franche-Comté finally in French hands, Spain had lost its "corridor" between Milan and the Spanish Netherlands.

The Holy Roman emperor Leopold I finally accepted French terms on Feb. 5, 1679, keeping Philippsburg but giving up Freiburg im Breisgau to France and granting free access through his territory to it from Breisach (French since 1648). France also continued to occupy Lorraine, since its duke, Charles V, refused the conditions imposed for his restoration. Two further treaties in 1679 terminated hostilities between France and Brandenburg (Peace of Saint-Germain-en-Laye) and between France and Denmark (Peace of Fontainebleau). Brandenburg and Denmark restored to France's ally, Sweden, territories taken by them.

Nijo Yoshimoto (b. 1320, Japan—d. 1388, Japan), Japanese government official and *renga* ("linked-verse") poet of the early Muromachi period (1338–1573) who is best known for refining the rules of *renga* composition.

Yoshimoto's father was *kampaku* (chief councillor) to the emperor Go-Daigo. Yoshimoto also served Go-Daigo, but after the mid-1330s he gave his allegiance to the emperors of the "northern" court. His first writings on linked-verse composition appeared in 1345 and were later put out in revised form as *Renri hishō* (roughly, "A Secret Selection of *Renga* Principles"). With the assistance of the poet Gusai (Kyūsei), Yoshimoto compiled *Tsukuba-shū* (1356), one of the first collections of *renga* (which were also called *tsukuba* at that time). In 1372 he and Gusai completed *Ōan shinshiki* ("New Rules of the Ōan Era"; also called *Renga shinshiki*), his most important work. Among his other treatises on *renga* composition is *Tsukuba mondō* (1372; "Questions and Answers on *Renga*").

Nika (people): *see* Nyika.

Nike, in Greek religion, the goddess of victory, daughter of the giant Pallas and of the infernal River Styx. Nike probably did not originally have a separate cult at Athens. As an attribute of both Athena, the goddess of wisdom, and the chief god, Zeus, Nike was represented in art as a small figure carried in the hand by those divinities. Athena Nike was always wingless; Nike alone was winged. She also appears carrying a palm branch, wreath, or Hermes staff as the messenger of victory. Nike is also portrayed erecting a trophy, or, frequently, hovering with outspread wings over the victor in a competition; for her functions referred to success not only in war but in all other undertakings. Indeed, Nike gradually came to be recognized as a sort of mediator of success between gods and men.

Nike, sculpture from a bronze vessel, probably made in a Greek city of southern Italy, *c.* 490 BC; in the British Museum

By courtesy of the trustees of the British Museum

At Rome, where Nike was called Victoria, she was worshiped from the earliest times. She came to be regarded as the protecting goddess of the Senate, and her statue in the Curia Julia (originally set up by Augustus in memory of the Battle of Actium) was the cause of the final combat between Christianity and paganism toward the end of the 4th century.

Among artistic representations of Nike are the sculpture by Paeonius (*c.* 424 BC) and the "Nike of Samothrace." The latter, discovered on Samothrace in 1863 and now in the Louvre Museum, Paris, was probably erected by Rhodians about 203 BC to commemorate a sea battle. Excavations have shown that the sculpture was placed alighting on a flagship, which was set in the ground in such a way that it appeared to float.

Nike missile, any of a group of U.S. surface-to-air missiles designed in the 1940s and '50s for defense against air attack. The first was Nike Ajax, a two-staged, liquid-fueled missile 6.4 m (21 feet) long. Guided by radar, it could intercept high-flying aircraft within a range of 40 km (21 miles) at more than twice the speed of sound. Beginning in 1953, Ajax missiles were installed in fixed launchers in cities and military sites throughout the United States. They were also distributed among U.S. allies in Europe and Asia.

In 1958 the larger Nike Hercules began to replace the Ajax. Its two-stage, solid-propellant engines could carry either a high-explosive or a nuclear warhead at over three times the speed of sound to targets as high as 45,000 m (150,000 feet) and more than 120 km (75 miles) away. A more sophisticated radar system enabled it to intercept short-range ballistic missiles as well as aircraft. Hercules missile sites in the United States were deactivated in 1974, after the signing of the Anti-Ballistic Missile Treaty with the U.S.S.R.; other Hercules missiles in Europe were replaced in the 1980s by the Patriot system.

Nike Zeus, the first missile designed to intercept intercontinental ballistic missiles, was developed between 1957 and 1963, but the program was abandoned in 1967.

Nikisch, Arthur (b. Oct. 12, 1855, Lébényi Szentmiklós, Hung.—d. Jan. 23, 1922, Leipzig, Ger.), one of the finest conductors of the late 19th century.

After study in Vienna, in 1878 Nikisch was appointed choral coach at the Leipzig Opera, becoming principal conductor in 1879. From 1889 to 1893 he was conductor of the Boston Symphony Orchestra, then conducted the Gewandhaus Orchestra at Leipzig from 1895 until his death. From 1897 he also led the Berlin Philharmonic Orchestra, with which he toured widely. He succeeded Hans von Bülow as conductor of the Philharmonic Concerts at Hamburg in 1897, toured the United States with the London Symphony Orchestra in 1912, and conducted Richard Wagner's *Ring* cycle of operas at Covent Garden in 1913. Although he excelled in performances of Wagner, he was a conductor of broad musical tastes. His style was marked by intensity of Romantic expression and his technique by precision and economy of gesture. As an accompanist at the piano, he appeared in recitals with his pupil Elena Gerhardt, a lieder singer.

Nikkatsu Motion Picture Company, Japan's oldest motion-picture company. Established as an independent company in 1912 with the title Japan Cinematograph Company, it had previously been a part of the Greater Japan Film Machinery Manufacturing Company, Ltd., an attempted monopoly of the industry modeled after the Motion Picture Patents Company in the United States. By 1915 Nikkatsu had captured two-thirds of the viewing market. It employed the first Japanese film star, Onoe Matsunosuke, and the first prominent Japanese director, Makino Shōzō. It was the first to successfully experiment with night photography, in *Ningenku* (1923; "Human Suffering"), and in the early 1930s it had the best sound system in Japan, the Western Electric sound process.

Poor management eventually led to financial difficulty, and in 1942 its production facilities were incorporated into the newly formed Daiei Company. Nikkatsu remained as a theatre-holding chain only until 1954, when it resumed production. Two years later the huge popularity of *Taiyo no Kisetsu* ("Season of the Sun") and *Kurutta Kajitsu* ("Crazed Fruit"), both based on novels by Ishihara Shintaro and dealt with revolt against tradition, gave Nikkatsu a place among the leading studios. The work of director Mizoguchi Kenji gave the company added prestige. Nikkatsu attracts a widely diversified audience and has expanded into television broadcasting.

Nikkō, city, Tochigi *ken* (prefecture), Honshu, Japan. The city lies along the Daiya River, north of Tokyo. One of the major pilgrimage and tourist centres in Japan, it is situated at the edge of Nikkō National Park. The name Nikkō means "sunlight." The splendour of the place is reflected in the Japanese proverb, "Do not say '*kekkō*' [magnificent] until you've seen Nikkō." A Shintō shrine may have existed at Nikkō as early as the 4th century AD, and in 766 a Buddhist temple was founded there. Since the 17th century, however, the city has been dominated by the great Tōshō Shrine, which contains the mausoleum of Tokugawa Ieyasu, the first Tokugawa shogun. Also important is the Daiyuin mausoleum, dedicated to Tokugawa Iemitsu, the third Tokugawa shogun, who died in 1651. The shrines and associated buildings are notable for their vibrant red colour (symbolizing blood), gilt ornamentation, and detail. Their picturesque setting, especially the grove of giant Japanese cedars in which they stand, considerably enhances the attractiveness of the city.

There are scores of hot mineral springs in the Mount Nasu area of Nikkō National Park. The park also contains the extinct volcano Mount Nantai, which is crowned by the Futarasan Shrine. Waterfalls such as the 325-foot (99-metre) Kegon Falls and the recreation centre and trout hatchery of Lake Chūzenji are also in the park. Pop. (1990) 20,128.

Torii (portal entrance) to the Futarasan Shrine in Nikkō, Japan

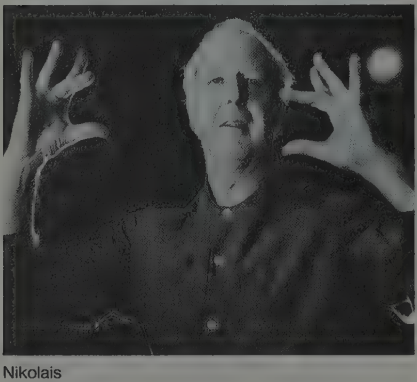
Bob and Ira Spring

Nikola (Serbo-Croatian, Montenegrin, etc., personal name): *see under* Nicholas.

Nikolaev (Ukraine): *see* Mykolayiv.

Nikolais, Alwin (b. Nov. 25, 1910/1912?, Southington, Conn., U.S.—d. May 8, 1993, New York, N.Y.), American choreographer, composer, and designer whose abstract dances combine motion with various technical effects and a complete freedom from technique and established patterns.

Initially a silent-film accompanist and puppeteer, Nikolais began his study of dance in about 1935 with Truda Kaschmann, a former student of modern dancer Mary Wigman, to understand Wigman's use of percussion accompaniment. In 1937 he founded a dance school and company in Hartford, Conn., and was director of the dance department of Hartt School of Music (now part of the University of Hartford) from 1940 to 1942 and from 1946 to 1949. After serving in World War II, Nikolais resumed dance studies with Hanya Holm and became her assistant. In 1948 he joined the Henry Street Settlement in New York City and founded its school of modern dance; the following year he became artistic director of its playhouse.



Nikolais

Martha Swope

The Nikolais Dance Theater (originally called the Playhouse Dance Company) was formed in 1951. In 1953 the company presented Nikolais' first major work, *Masks, Props, and Mobiles,* in which the dancers were wrapped in stretch fabric to create unusual, fanciful shapes.

In later works—such as *Kaleidoscope* (1956), *Allegory* (1959), *Totem* (1960), and *Imago* (1963)—he continued experiments in what he called the basic art of the theatre—an integration of motion, sound, shape, and colour, each given relatively equal emphasis. His later works include *Tent* (1968), *Scenarios* (1971), *Guignol* (1977), *Count Down* (1979), and *Talisman* (1981). Nikolais frequently composed electronic scores for these productions.

Although Nikolais' choreography was sometimes criticized as "dehumanizing," he maintained instead that it was liberating. He asserted that, in depersonalizing his dancers, they were relieved of their own forms and, hence, allowed to identify with whatever they portrayed. His term for this concept was "decentralization" (as opposed to egocentricity). These theories were developed under Hanya Holm and were displayed in such works as *Aviary, A Ceremony for Bird People* (1978).

During the 1970s the Nikolais group toured widely abroad. In 1978 the French Ministry of Culture, together with the French city of Angers, subsidized the new National Centre of Contemporary Dance at Angers, a Nikolais school and company that made its debut in Angers, France, in November 1979. Nikolais made films of his works, as well as broadcasts on American and British television.

Nikolaus (German personal name): *see under* Nicholas.

Nikolay (Russian personal name): *see under* Nicholas, except as below.

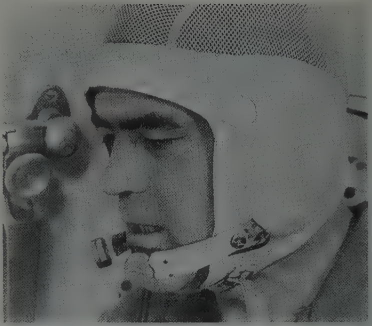
Nikolay Kasatkin, Saint, original name IVAN DMITROVICH KASATKIN, Kasatkin also spelled KASSATKIN (b. Aug. 13, 1836, Smolensk, Russia—d. Feb. 16, 1912, Tokyo, Japan), Russian Orthodox missionary and first Orthodox bishop of Japan.

Kasatkin, who adopted the name Nikolay when he took monastic vows, went to Japan in 1861 as chaplain to the Russian consulate in Hakodate. Because Christianity was a prohibited religion in Japan, he spent his first years in the Orient learning the Japanese language and culture, eventually celebrating Orthodox ceremonies in Japanese in the embassy chapel. By 1868 he had baptized his first three converts. As the number of converts grew, the Holy Synod created a regular mission for Japan in 1871. The laws against Christianity were lifted in 1873, and by 1874 the Orthodox community consisted of 400 Japanese converts. Kasatkin encouraged the autonomous aspects of the church, recruiting clergy from among the Japanese; in 1875 two of the original converts were ordained priests, and in 1880 Kasatkin was consecrated bishop.

Although the Russo-Japanese War (1904–05) strained relations between the Russian and Japanese Orthodox churches, the Japanese Orthodox church continued to grow and Nikolay remained loyal to it, becoming archbishop in 1906. At his death in 1912, the church was a self-supporting autonomous body numbering over 30,000 converts.

Nikolayev (city and *oblast,* Ukraine): *see* Mykolayiv.

Nikolayev, Andriyan Grigoryevich (b. Sept. 5, 1929, Shorshely, Chuvash A.S.S.R., U.S.S.R. [now Chuvashiya, Russia]), Soviet cosmonaut who piloted the Vostok 3 spacecraft, launched Aug. 11, 1962. When Vostok 4, piloted by Pavel R. Popovich, was launched a day later, there were, for the first time, two manned craft in space simultaneously. The two made radio and visual contact, but there was no attempt at docking. Both landed on August 15.



Nikolayev in a Soyuz 9 spaceship, 1970

Novosti Press Agency

The son of a worker on a collective farm, Nikolayev studied and worked in forestry until drafted into the Soviet army in 1950. An early interest in flying persisted, and he soon transferred to the air force; in 1954 he became a pilot. In 1957 he joined the Communist Party and in March 1960 entered cosmonaut training. From 1964 Nikolayev was the commander of the Soviet Astronauts' Detachment.

On Nov. 3, 1963, Nikolayev married Valentina Tereshkova, who in June 1963 had become the first woman to travel in space. They had one child and were subsequently divorced.

Nikolayev and Vitaly I. Sevastyanov manned the Soyuz 9 flight on June 1, 1970, and set a space endurance record of almost 18 days in orbit. The mission, primarily one of determining the effects of prolonged spaceflight, ended on June 19.

Nikolayevsk-na-Amure, also spelled NIKOLAJEVSK-NA-AMURE, English NIKOLAYEVSK-ON-AMUR, city, Khabarovsk *kray* (region), far eastern Russia. The city is situated at the head of the Amur River estuary. It was founded in 1850, but its importance as a Pacific port and naval base was overshadowed by the later development of Vladivostok and Sovetskaya Gavan, both with rail communications to the interior. It has ship repair yards and industries of local significance only, and a fishing fleet is based there. Pop. (1993 est.) 36,200.

Nikon, original name NIKITA MININ (b. 1605, Veldemanovo, Russia—d. Aug. 1 [Aug. 27, New Style], 1681, en route to Moscow), religious leader who unsuccessfully attempted to establish the primacy of the Orthodox Church over the state in Russia and whose reforms led to a schism in the church.

Nikon (Nikita) was born in the village of Veldemanovo, near Nizhny Novgorod,

Nikon, detail of a portrait by an unknown artist, 1687

Tass—Sovfoto

the son of a peasant of Finnic stock. After acquiring the rudiments of an education in a nearby monastery, Nikon married, entered the clergy, and settled in Moscow, until the death of all three of his children moved him to seek repentance and solitude. For the next 12 years, from 1634 to 1646, he lived as a monk, as a hermit, and finally as an abbot in several northern localities. In 1646 he went on monastic business to Moscow, where he made so favourable an impression on the young tsar Alexis and on Patriarch Joseph that they appointed him abbot of the Novospassky monastery in Moscow, the burial place of the Romanov family.

During his stay there, Nikon became closely associated with the circle led by the tsar's confessor, Stefan Vonifatyev, and the priests Ivan Neronov and Avvakum Petrovich (all, like him, natives of the Nizhny Novgorod region). This group of priests strove to revitalize the church by bringing about closer contact with the mass of the faithful, and they also sought to purify religious books and rituals from accidental errors and Roman Catholic influences. With their backing, Nikon became first metropolitan of Novgorod (1648) and then patriarch of Moscow and all Russia (1652).

Nikon accepted the highest post in the Russian Church only on condition that he be given full authority in matters of dogma and ritual. In 1654, when the tsar departed for the campaign against Poland, he asked Nikon to supervise the country's administration as well as watch over the safety of the tsar's family, and in 1657, with the outbreak of the new war with Poland, he invested Nikon with full sovereign powers. Enjoying the friendship of the tsar, the backing of the reformers, and the sympathy of the population of Moscow, Nikon stood at the pinnacle of his career.

It was not long, however, before Nikon alienated his friends and infuriated his opponents by his brutal treatment of all those who disagreed with him. On assuming the patriarchate, he consulted Greek scholars employed in Moscow as well as the books in the patriarchal library and concluded not only that many Russian books and practices were badly corrupted but also that the revisions of the circle of Vonifatyev had introduced new corruptions. He then undertook a thorough revision of Russian books and rituals in accord with their Greek models to bring them into line with the rest of the Orthodox Church. When his onetime friends questioned his reforms, Nikon had them exiled. Assisted by Greek and Kievan monks and supported by the Greek hierarchy, he next carried out several reforms of his own: he altered the form of bowing in the church, replaced a two-fingered manner of crossing oneself with a three-fingered one, and ordered that three alleluias be sung where Moscow tradition called for two. A council of the Russian clergy that he convened in 1654 authorized him to proceed with the revision of liturgical books. He next began to remove from churches and homes icons that he considered incorrectly rendered. To quell mounting opposition to these moves, he called in 1656 another council, which excommunicated those who failed to adopt the reforms.

Though all the changes introduced by Nikon affected only the outward forms of religion, some of which were not even very old, the population and much of the clergy resisted him from the beginning. The uneducated Muscovite clergy refused to relearn prayers and rituals, while the mass of the faithful was deeply troubled by Nikon's contempt for practices regarded as holy and essential to Russia's salvation. This was the origin of the Raskol, or great schism within the Russian Orthodox Church. Yet what really brought about Nikon's downfall was the hostility of the tsar's family and the powerful boyar (aristocratic) families, who resented the high-handed manner in which he exercised authority in the tsar's absence. They also objected to his claims that the church could interfere in affairs of state but was itself immune to state interference.

When Alexis returned to Moscow in 1658, relations between tsar and patriarch were no longer what they had been. Grown in self-confidence and incited by relatives and courtiers, Alexis ceased to consult the patriarch, though he avoided an open break with him. Nikon finally struck back after several boyars had insulted him with impunity and the tsar failed to appear at two consecutive services at which Nikon officiated. On July 20 (July 10, O.S.), 1658, in characteristically impetuous fashion, he announced his resignation to the congregation in the Assumption (Uspensky) Cathedral in the Kremlin, and shortly afterward he retired to the Voskresensky monastery.

Nikon had apparently hoped by this act to compel the tsar, whose piety was well-known, to recall him and to restore his previous influence. This did not happen. After several months in self-imposed exile, Nikon attempted a reconciliation, but the tsar either refused to answer his letters or urged him to formalize his resignation. Nikon refused to do so on the ground that he had resigned merely from the Moscow see, not from the patriarchate as such. For eight years, during which Russia was effectively without a patriarch, Nikon stubbornly held on to his post, while Alexis, troubled by lack of clear precedent and by the fear of damnation, could not decide on a formal deposition. Finally, in November 1666, Alexis convened a council attended by the patriarchs of Antioch and Alexandria to settle the dispute.

The charges against Nikon were presented by the tsar himself. They concerned largely his behaviour in the period of the tsar's absence from Moscow, including his alleged arrogation of the title of "grand sovereign." Many of the charges were entirely without foundation. The Greek hierarchy now turned against Nikon and decided in favour of the monarchy, whose favours it needed. A Greek adventurer, Paisios Ligaridis (now known to have been in collusion with Rome), was particularly active in bringing about Nikon's downfall. The council deprived Nikon of all his sacerdotal functions and on December 23 exiled him as a monk to Beloozero, about 350 miles (560 km) directly north of Moscow. It retained, however, the reforms he had introduced and anathematized those who opposed them and who were henceforth known as Old Ritualists (or Old Believers). In his last years, Nikon's relations with Alexis improved. The succeeding tsar, Fyodor III, recalled Nikon from exile, but he died while en route to Moscow.

Nikon was one of the outstanding leaders of the Russian Orthodox Church and an able administrator. His ultimate failure was due to two main factors: (1) his insistence on the hegemony of church over state had no precedent in Byzantine or Russian traditions and could not be enforced in any event; and (2) his uncontrollable temper and autocratic disposition alienated all who came in contact with him and enabled his opponents first to disgrace and then to defeat him. (R.E.Pi.)

Nikopol, town, northern Bulgaria. It lies along the Danube River near its confluence with the Osŭm (Ossăm) and opposite Turnu Măgurele, Rom. Nikopol was an important Danubian stronghold—ruined fortresses still dominate the town—founded by the Byzantine emperor Heraclius I in AD 629. In 1396 the Ottoman sultan Bayezid I defeated a crusader army led by King Sigismund of Hungary at Nikopol, an event that contributed significantly to Turkish domination of the Balkans for five centuries. Occupied by the Turks in 1393–1877, Nikopol was again fortified and became an important administrative town. Its population grew to approximately 40,000 before it was destroyed by the Russians in 1810; thereupon the Turks moved the regional centre of government northwest to Vidin, and Nikopol consequently declined. The Russians liberated Nikopol from Turkish control in 1877. Farming, viticulture, and fishing are the main means of livelihood; as a port, it has been superseded by Somovit. Pop. (1988 est.) 16,897.

Nikopol, also spelled NIKOPOL', city, Dnepropetrovsk *oblast* (province), south-central Ukraine. It lies along the northern shore of the Kakhovka Reservoir on the Dnieper River and on the Zaporozhye–Krivoy Rog railway. Founded as Nikitin Rog in the 1630s at a strategic crossing of the river, it was renamed Nikopol in 1782. It is important as the centre of the world's largest deposit of manganese, first mined there in 1886. Reserves are estimated at approximately 500,000,000 tons, much of which has a high metal content. The city's metallurgical industry produces ferroalloys, steel tubes, cranes, and agricultural machinery; food processing and brewing are also significant. A dam protects the lower part of the city from inundation by the reservoir. Pop. (1991 est.) 159,000.

Nikópolis (Greece): *see* Nicopolis Actia.

Nikšić, town in Montenegro, Yugoslavia, in the valley of the Zeta River. The Romans built a castrum (camp) called Anagastum there, probably on an old tribal settlement site. By the 12th century the name had been transliterated to Onogošt, and the name Nikšić was used by the Montenegrins *c.* 1355. The town was held by the Turks from 1455 to 1877.

Nikšić is an important industrial centre with a major steelworks, ironworks, a brewery, a malt factory, sawmills, woodworking factories, and a hydroelectric station. Bauxite is obtained from one of the largest mines in Europe. The planned development of underdeveloped Montenegro after World War II brought new buildings, parks, and service projects to Nikšić. An ancient Roman bridge crosses the Zeta, and ruins of Anagastum and another settlement at nearby Zavrh remain. Around the old Church of St. Peter is a graveyard of the heretical Bogomil sect, which died out in the late Middle Ages. Pop. (1981) 50,399.

Niku (Egyptian rulers): *see under* Necho.

Nil Sorsky, SAINT, original name NIKOLAY MAYKOV (b. *c.* 1433—d. 1508; feast day May 7), first Russian mystic to write about the contemplative life and to formulate a guide for spiritual self-perfection.

After a trip to Constantinople and Mount Athos, he founded his own monastery beside the Sora River (whence the name Sorsky). At a council in Moscow (1503), Nil spoke against monastic ownership of property and thus came to be identified with the "non-possessor" party within the Russian Church. He was also opposed to the involvement of monks in social-welfare and political activity. The writings and monastic rule of this Russian saint influenced Russian monasticism for several centuries.

Nile, Battle of the, also called BATTLE OF ABOUKIR BAY, Aboukir also spelled ABUKIR (Aug. 1, 1798), battle that was one of the greatest victories of the British admiral Horatio

Nelson. It was fought between the British and French fleets in Abū Qīr Bay, near Alexandria, Egypt.

The French Revolutionary general Napoleon Bonaparte in 1798 made plans for an invasion of Egypt in order to constrict Britain's trade routes and threaten its possession of India. The British government heard that a large French naval expedition was to sail from a French Mediterranean port under the command of Napoleon, and in response it ordered the Earl of St. Vincent, the commander in chief of the British fleet, to detach ships under Rear Admiral Sir Horatio Nelson to reconnoitre off Toulon and to watch French naval movements there. But Nelson's own ship was dismasted in a storm, and his group of frigates, now dispersed, returned to the British base at Gibraltar. Meanwhile, St. Vincent sent Nelson more ships, which joined Nelson on June 7, bringing his strength up to 14 ships of the line.

The French expedition eluded the British warships and sailed first for Malta, which the French seized from the British early in June. After spending a week at Malta, Napoleon sailed with his fleet for his main objective, Egypt. Meanwhile, Nelson had found Toulon empty and had correctly guessed the French objective, but because he lacked frigates for reconnaissance, he missed the French fleet, reached Egypt first, found the port of Alexandria empty, and impetuously returned to Sicily, where his ships were resupplied. Determined to find the French fleet, he sailed to Egypt once more and on August 1 he sighted the main French fleet of 13 ships of the line and 4 frigates under Admiral François-Paul Brueys d'Aigailliers at anchor in Abū Qīr Bay.

Although there were but a few hours left until nightfall and Brueys' ships were in a strong defensive position, being securely ranged in a sandy bay that was flanked on one side by a shore battery on Abū Qīr Island, Nelson gave orders to attack at once. Several of the British warships were able to maneuver around the head of the French line of battle and thus got inside and behind their position. Fierce fighting ensued, during which Nelson himself was wounded in the head. The climax came at about 10:00 PM, when Brueys' 120-gun flagship, which was by far the largest ship in the bay, blew up with most of the ship's company, including the admiral. The fighting continued for the rest of the night, with the end result that the British warships destroyed or captured all but two of Brueys' ships of the line. The British suffered about 900 casualties, the French about 10 times as many.

The Battle of the Nile had several important effects. It isolated Napoleon's army in Egypt, thus ensuring its ultimate disintegration. It ensured that in due time Malta would be retaken from the French, and it both heightened British prestige and secured British control of the Mediterranean.

Nile perch (species *Lates niloticus*), large food and game fish of the family Latidae (order Perciformes), found in the Nile and other rivers and lakes of Africa. A large-mouthed fish, the Nile perch is greenish or brownish above and silvery below and grows to about 1.8 m (6 feet) and 140 kg (300 pounds). It has an elongated body, a protruding lower jaw, a rounded tail, and two dorsal fins.

The family Latidae includes several other species, some found in the river systems of Africa, the others in estuaries and along the coasts of Asia and Australia. The members of the family are sometimes classified with snooks and glassfishes in the family Centropomidae.

Nile River, Arabic BAḤR AN-NĪL, or NAHR AN-NĪL, river, the longest of Africa and of the world, rising in highlands south of the equator and flowing northward through northeastern Africa to drain into the Mediterranean Sea.

A brief treatment of the Nile River follows. For full treatment, *see* MACROPAEDIA: Africa.

The Nile River at Aswān, Egypt
Erika Stone—Photo Researchers

The Nile River basin covers about one-tenth of the area of the African continent and falls naturally into seven major regions: the Lake Plateau of East Africa, the Al-Jabal River (Mountain Nile), the White Nile (Al-Baḥr al-Abyaḍ), the Blue Nile (Al-Baḥr al-Azraq), the Atbara ('Aṭbarah) River, the Nile north of Khartoum, and the Nile delta. The Nile's remotest headstream rises as the Kagera River in the eastern African lakes region of Burundi and flows northward, passing through or forming part of the boundaries of Tanzania, Rwanda, and Uganda before entering Lake Victoria from the west. The Nile proper rises from that lake as the Victoria Nile, passes through Lakes Kyoga and Albert, and leaves the latter as the Albert Nile. Entering southern Sudan at Nimule, this river's main course is then called the Al-Jabal, until its confluence with the Al-Ghazāl and Sobat rivers near Malakāl. Before reaching Malakāl the Al-Jabal and Al-Ghazāl rivers pass through As-Sudd, a swampy lowland region crowded with tall papyrus and other aquatic plants. After the river's confluence with the Sobat River, the main stream becomes the White Nile until its confluence with the Blue Nile, which rises in the central Ethiopian Plateau and enters the White Nile on its eastern bank near Khartoum. Downriver and northeast of Khartoum the Nile proper receives its last major tributary, the Atbara River, again on its eastern bank. Below its confluence with the Atbara the Nile describes a broad S-curve toward the northwest and passes over three cataracts before entering Lake Nasser (Lake Nubia in The Sudan) near the Egypt-Sudan border. After the Aswān High Dam has impounded the lake, the river flows northward through Egypt to the head of the Nile delta near Cairo, where it divides into several distributaries before discharging into the eastern end of the Mediterranean Sea.

The principal feature of the Nile River's hydrological regime below the Aswān High Dam is the annual flood. In the northern Sudan, the river usually begins to rise in May, reaches its maximum level in August, and decreases thereafter, having a low level from January to May. Although the flood is a regular phenomenon, it varies in both its volume and in its date of onset. The flood is caused by the Blue Nile and Atbara rivers, whose waters come from heavy seasonal rainfall on the Ethiopian Plateau. The Ethiopian Plateau contributes more than 80 percent of the Nile's total water supply, while the remainder comes from the Lake Plateau of East Africa. The greatest part of the Nile's flow is contributed by the Blue Nile and the least by the Atbara, but, during the season when the river's water level is low, the White Nile becomes the most important stream.

There is hardly an area within the Nile basin that experiences a true equatorial type of climate. The greater part of the region falls under the influence of the trade winds, which account for the prevailing aridity of most of the basin. The main stream of the Nile, from Khartoum northward to Aswān, flows between deserts and has a narrow strip of vegetation on either side. Where the soil permits, the river's banks and the neighbouring flatlands are cultivated by use of irrigation, thus supporting a modest population. From Aswān northward to Cairo the river is bordered by a floodplain of rich alluvial soil that gradually increases to a width of about 12 miles (19 km), all of which is cultivated by use of irrigation. Beyond this on both sides is the desert.

The desert region outside the Nile valley extends from the Mediterranean southward to Atbarah, in the north-central Sudan. Much of this area is almost rainless and possesses no vegetation except in occasional oases. South of the Atbarah the country becomes dotted with small thorny shrubs, mostly acacias. These grow increasingly thick toward the south and merge into savanna country that supports grasses and small thorny trees. South of this is found true savanna country, consisting of open grassy plains and a few trees, and becoming swampy during the rainy season. Farther south, along the Blue Nile, are to be found savanna forests and areas of true rain forest.

Many varieties of fish are found in the Nile River system. Notable species include the perchlike *Tilapia,* which is an important food source for humans; the giant Nile perch (*Lates niloticus*), which may reach weights of 300 pounds (140 kg); and several types of catfish. Reptiles include the crocodile, soft-shelled turtles, monitor lizards, and a wide variety of snakes, including two types of cobras.

Nilot is the general term used to describe the people of the upper Nile basin. Much of southern Sudan is populated by Nilotic and Bantu-speaking peoples, central Sudan by pastoral Semitic people, and northern Sudan by Muslim Arabs and Nubians, as well as Hamitic people. Egyptians are primarily of Hamitic descent intermixed with European elements to the north and Nubian elements to the south.

The first use of the Nile for irrigation in Egypt began when seeds were sown in the mud left after the river's annual floodwaters had subsided. Henceforth, the Nile supported a continuous human settlement for at least 5,000 years. Perennial irrigation was made possible by the completion of several barrages and waterworks on the river before the end of the 19th century, and, by the beginning of the 20th century, the canal system had been remodeled and the first dam at Aswān had been completed (in 1902). The Aswān High Dam (*q.v.*), constructed between 1959 and 1970, is built at a place where the river is 1,800 feet (550 m) wide and has steep banks of granite. The High Dam completed human control over the Nile's annual flooding and in the process created Lake Nasser, a reservoir that stretches more than 300 miles (500 km) upstream of the dam and extends into the northern Sudan. The High Dam provides protection for both population and crops against unusually high floods, and it also generates enormous amounts of hydroelectric power. The Nile River also serves as a vital waterway for the transportation of people and goods. Length 4,132 miles (6,650 km); drainage basin 1,293,000 square miles (3,349,000 square km); mean annual discharge 109,475 cubic feet per second (3,100 cubic m/sec).

Niles, city, Berrien county, southwestern Michigan, U.S. It lies along the St. Joseph River, 10 miles (16 km) north of South Bend, Ind. It is the only locality in the state to have been under the control of France, Great Britain, Spain, and the United States. The site became a stagecoach stop between Chicago and Detroit and was permanently settled in 1828 and named for publisher Hezekiah Niles. It developed as a centre for the farm produce of the St. Joseph River valley. Inc. village, 1835; city, 1859. Pop. (2000) 12,204.

Niles, city, Trumbull county, northeastern Ohio, U.S. It lies along the Mahoning River, 7 miles (11 km) northwest of Youngstown, and is a part of the Mahoning industrial complex. Ruben Harmon, the first white settler (1797), and others discovered deposits of coal, iron ore, and limestone there. James Heaton built a foundry and organized the Township of Heaton's Furnace (1806), which was renamed Nilestown in 1834 (shortened in 1843) to honour Hezekiah Niles, the influential Baltimore editor of the *Niles' Weekly Register* (1811–36). Industrialization was fostered by the railroads, which first arrived in 1856. The city's manufactures now include building materials, steel, lathes, and tools and dies. U.S. president William McKinley was born (1843) in Niles; the McKinley Memorial stands in the city centre. Inc. village, 1865; city, 1895. Pop. (2000) 20,932.

The McKinley Memorial, Niles, Ohio

Milt and Joan Mann from CameraMann

Niles, Hezekiah (b. Oct. 10, 1777, Jefferis' Ford, Chester county, Penn., U.S.—d. April 2, 1839, Wilmington, Del.), editor and newspaper publisher who was one of the foremost figures in early American journalism.

The son of Quakers, Niles at age 17 was apprenticed to a printer in Philadelphia, and upon his release from his apprenticeship three years later he went to Wilmington, Del., and embarked on various ventures, including the publication of a short-lived literary magazine called *The Apollo*. In 1805 he went to Baltimore and became editor of the *Baltimore Evening Post*, continuing in that post until 1811. In the latter year he issued the prospectus for his *Weekly Register* (later to be called *Niles' Weekly Register*), which he edited and published until 1836 and which became one of the most influential papers in the United States. Niles favoured protective tariffs and the gradual abolition of slavery, and he ceaselessly propaganized for both these causes. His newspaper remains an extremely valuable source for the study of the political and economic controversies in the America of his day.

Niles, John Jacob (b. April 28, 1892, Louisville, Ky., U.S.—d. March 1, 1980, Boothill Farm, near Lexington, Ky.), American folksinger, folklorist, and composer of solo and choral songs.

Niles came from a musical family. His great-grandfather was a composer, organist, and cello manufacturer; his mother, Lula Sarah Niles, taught him music theory. He was attracted to folk songs while working as a surveyor in the Appalachians, and after he served in World War I he was educated at the music conservatories in Cincinnati, Ohio, and Lyon, Fr., and at the Schola Cantorum of Paris.

In 1921 in New York City, Niles became master of ceremonies at the Silver Slipper nightclub before teaming up with Marion Kerby, with whom he toured widely in the United States and Europe as a folksinger. He made his own lutes and Appalachian dulcimers and specialized in the songs of the Appalachian Mountain region. His ballad collections frequently included material that he composed, such as "I Wonder As I Wander" and "Black Is the Color of My True Love's Hair," or arranged, as well as ballads transcribed directly from oral sources. His published works include *Songs My Mother Never Taught Me* (1929; with Douglas Moore), *Songs of the Hill Folk* (1934), *The Shape Note Study Book* (1950), and *The Ballad Book of John Jacob Niles* (1961). His last work (1972) was the Niles-Merton song cycles, settings of poems of the Trappist monk Thomas Merton.

nilgai, also called BLUEBUCK (species *Boselaphus tragocamelus*), Indian antelope, family Bovidae (order Artiodactyla), that ranges alone or in small groups in open plains or light forests.

The name bluebuck derives from the bluish gray coat of the male; the female is reddish brown. The adult stands about 1.4 m (55 inches) at the shoulder. Both sexes have a short mane and have white on the underparts, ears, face, throat, and immediately above the hooves. The male has short, slightly curved horns and a tuft of black hair on the throat.

Nilgai (*Boselaphus tragocamelus*)

Kenneth W. Fink from Root Resources—EB Inc.

Nīlgiri Hills, mountainous region of Tamil Nādu state, southeastern India. The peaks of the Nīlgiri rise abruptly from the surrounding plains to an elevation of 6,000–8,000 feet (1,800–2,400 m); one of them, Doda Betta (8,652 feet [2,637 m]), is the highest point in Tamil Nādu. Part of the Western Ghāts, the hills are separated from the Karnātaka plateau (north) by the Noyar River and from the Anaimalai and Palni hills (south) by the Pālghāt Gap. They are considerably cooler and wetter than the surrounding plains, the upper hills forming undulating grassy downs. Tea, cinchona (trees and shrubs whose bark yields quinine), coffee, and vegetables are grown extensively.

Nilo-Saharan languages, large group of African languages thought by many scholars to compose a language family. This hypothetical language family includes Songhai, Fur, the Koma languages, the Maba languages, the Saharan languages, and the Chari-Nile languages. Nilo-Saharan languages are spoken in an area extending from Mali in the west to Ethiopia in the east and from Egypt in the north to Tanzania in the south.

Nilópolis, city and suburb of Rio de Janeiro city, Rio de Janeiro *estado* ("state"), southeastern Brazil. It lies in the Guandu-Mirim River valley, at 92 feet (28 m) above sea level. Situated 15 miles (24 km) northwest of Rio de Janeiro, Nilópolis experienced significant growth during the 1960s and '70s, when much of the state's industry became concentrated in the periphery of the Greater Rio de Janeiro metropolitan area. Important industries include metallurgical and meat-packing plants, as well as ones manufacturing pharmaceuticals and chemicals, soaps, perfumes, candles, plastics, and leather products. There are extensive orange groves in the agricultural hinterland. Railroads and highways link Nilópolis to Rio de Janeiro and to communities farther inland, while electric commuter rail service provides residents of Nilópolis with rapid access to downtown Rio de Janeiro. Pop. (2000 prelim.) 153,572.

Nilot, plural NILOTES, any member of several east-central African peoples living in southern Sudan, northern Uganda, and western Kenya. The name refers to their habitat, mostly the region of the Upper Nile and its tributaries, and to a linguistic unity that distinguishes them from their neighbours who have similar physical characteristics and culture. (*See* Nilotic languages.) The Nilotes numbered about 7,000,000 in the late 20th century.

Most Nilotes occupy savanna country that is alternately subject to flooding and drought. They pursue a mixed economy of pastoralism and hoe cultivation, supplemented by fishing, hunting, and a little food gathering. Although Nilotes may cultivate out of necessity, all except the Anuak of The Sudan are pastoralists with a great love of cattle. Milk, milk products, and grain are staple foods. Cattle are not slaughtered indiscriminately for meat; they are paid in compensation and bridewealth, and their ownership determines status and wealth. Nilotic peoples have a rich cattle vocabulary; they spend much time caring for the herds and erecting large stables, or kraals, for their protection. A man commonly trains and decorates the horns of his favourite ox, and in many cases he is addressed by the animal's name. Cattle assume ritual importance, being dedicated and sacrificed to ancestors or spirits.

Nomadic or transhumant movements are especially pronounced among the Nuer and Dinka peoples. In the wet season they live in permanent village settlements above flood level and cultivate crops and herd cattle in the vicinity of their well-built, circular houses. In the dry season they occupy temporary cattle camps near permanent water supplies and pastures, where they live in windbreaks and engage in herding and fishing. Other Nilotic tribes are more sedentary.

The Shilluk are the most highly organized, having a divine king who symbolizes the whole realm. Organized chieftainships, associated with rainmaking, court ceremonial, and royal emblems, are found also among the

Anuak, Acholi, and others. In contrast, the Nuer, Dinka, and Luo of Kenya are without rulers, their egalitarian society being based on a relationship between lineage segments coordinated with territorial segments. A dominant clan is associated with a tribal territory; dominant lineages of this clan are found in subdivisions of the society. The principal opposition between segments and their fusion in relation to larger segments is marked; descent is patrilineal.

Ritual experts are often rainmakers; among the Dinka and Nuer they act also as mediators and peacemakers in feuds between lineages and between territorial subdivisions. There are strong ancestor cults and belief in a supreme being. Totemism exists in some societies but is important only among the Dinka.

Nilotic languages, group of related languages spoken in Uganda, Kenya, southern Sudan, and northern Tanzania. These languages are usually classified as belonging to the Eastern Sudanic subbranch of the Chari-Nile branch of the Nilo-Saharan language family. The languages of this group were formerly divided, primarily on the basis of racial and cultural considerations, into two groups named Nilotic (which includes Shilluk, Dinka, and Nuer in southern Sudan; Acholi in northern Uganda; and Luo in western Kenya and in Tanzania) and Nilo-Hamitic (which includes Bari and Lotuho in southern Sudan; Karamojong, Nandi, and Suk in Uganda; Turkana in Kenya; and Masai, extending from southern Kenya into northern Tanzania). Recently, however, a number of scholars have produced a considerable amount of evidence showing that the two groups of languages are closely related and should be considered as one group; these linguists often divide the Nilotic languages into a western group, including Shilluk, Nuer, and Luo; an eastern group, including Masai and Turkana; and a southern group, including Nandi and Suk.

In Nilotic sentences, the subject of a principal clause usually precedes the verb. The languages are tone languages, often using tones to distinguish the singular of a noun from its plural or to indicate the syntactic role of a word in a particular sentence. Some of the languages also indicate plurals by means of suffixes.

Nilsson, (Märta) Birgit, *née* SVENNSSON (b. May 17, 1918, West Karup, Swed.), Swedish operatic soprano, celebrated as a Wagnerian interpreter and known for her powerful, rich voice.

On the advice of a local choirmaster, she went to study with Joseph Hislop in Stockholm, where she joined the Royal Opera and made her debut in 1946 as Agathe in Carl Maria von Weber's *Der Freischütz.* A year later she achieved a major success there as Giuseppi Verdi's Lady Macbeth. Other successes followed, particularly in Vienna and Bayreuth, where between 1954 and 1970 her Wagnerian roles included Isolde, Sieglinde, and Brünnhilde.

In 1957 Nilsson made her debut at Covent Garden, London, as Brünnhilde in the complete *Ring* cycle of Richard Wagner, and in 1958 she first appeared at La Scala, Milan, in the title role of Giacomo Puccini's *Turandot.* She made her debut at the Metropolitan Opera, New York City, as Isolde in 1959. Her other significant roles include Richard Strauss's Salome and Elektra, Ludwig van Beethoven's Leonore, and Carl Maria von Weber's Rieza.

In 1975 she appeared in the demanding role of the Dyer's Wife in the first performance in Stockholm of Strauss's *Die Frau ohne Schatten,* which she repeated in San Francisco in 1980 and New York City in 1981. In 1969 the Austrian government gave her the honorary title of Kammersängerin ("court singer"), and in 1981 the Swedish government issued a postage stamp in her honour.

Nilus OF ANCYRA, SAINT, also called NILUS THE ASCETIC (d. *c.* 430, Ancyra, Galatia; feast day November 12), Greek Byzantine abbot and author of extensive ascetical literature that influenced both Eastern and Western monasticism. He also participated in the prevalent theological controversies concerning the Trinity and the person and work of Christ.

A protégé of the staunchly orthodox and reform patriarch of Constantinople, St. John Chrysostom, Nilus consistently supported him during his conflicts with ecclesiastical rivals and the imperial court. Thus influenced, Nilus composed several letters to leaders of the Goths in which he strongly refuted Arianism, the heretical doctrine that teaches the created nature of the Son and Holy Spirit in the Christian Trinity. In the letters he contended that Christ is God and man in one individual person; his mother is therefore Theotokos (God-bearer).

After leaving Constantinople, Nilus became a monk and eventually abbot of a monastery near Ancyra and soon won a reputation as a wonder-worker and spiritual counselor. He wrote a number of tracts on moral and monastic subjects, including *De monastica exercitatione* ("On Monastic Practice") and *De voluntaria paupertate* ("On Voluntary Poverty"), which stress the essence of monastic obedience as the renunciation of the will and all resistance to the religious superior, whose duty is to guide the prayer life of the monk and put him on guard against the wiles of Satan. The greatest poverty, Nilus states, is the exclusive dedication to the service of God; consequently, the ascetic life is led more effectively in the wilderness than in the city because, among other reasons, it avoids vainglory.

Supplementing these longer studies, Nilus wrote approximately 1,000 letters, which survive in a mutilated collection, to varied recipients. His letters are written in a blunt, sometimes coarse style, which established his reputation as an early master of Christian spirituality, balancing religious insight with worldly astuteness. He seems to have coined the term "spiritual philosophy" to indicate his central theme of casting Christ as man's effective exemplar for controlling his impulses. The object of this discipline, initiated by a divine gift or grace, is union with God. Moreover, Nilus criticized exaggerated asceticism, particularly that of the Stylite monks, contemplative solitaries who sat atop rocks or pillars, whence they sometimes dispensed advice. Throughout his writings are frequent interpretations of biblical texts, commentaries following the literal or historical sense, as is characteristic of the Antiochian school, although he occasionally used allegory. In another essay he discussed the expression of religious art in mosaics.

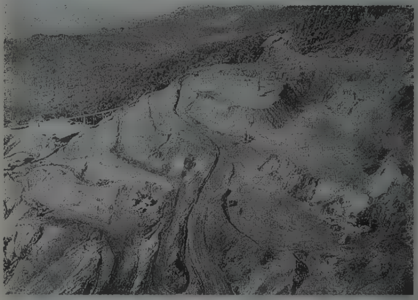
Certain works attributed to Nilus in the standard collection of early Greek Christian authors edited by J.-P. Migne, *Patrologia Graeca* (vol. 79, 1861; "Greek Patrology"), including treatises *De oratione* ("On Discourse"), a standard work on the subject, and *De malignis cogitationibus* ("On Evil Thoughts") are probably the work of the Greek theologian Evagrius Ponticus (346–399). Many authors suspected of heresy have hidden behind Nilus' reputation in the history of monasticism by affixing his name to their works. The sifting of the spurious from the genuine is still in process. The account, under Nilus' name, "Concerning the Capture of the Monks on Mount Sinai," depicting an invasion of the monastery by Saracens in 410, and the ransom of a certain Nilus of Sinai and his son Theodulus, refers to a legendary figure. This story has given rise to the "Nilus Question" in historical scholarship. The account, surprisingly for a Christian author, describes the cultic practice of animal sacrifice.

Nilus OF ROSSANO, SAINT, also called NILUS THE YOUNGER (b. *c.* 905, Rossaro, Calabria, Kingdom of Naples [Italy]—d. Dec. 29, 1005, Abbey of Santa Agata, near Rome; feast day September 26), abbot and promoter of Greek monasticism in Italy, who founded several communities of monks in the region of Calabria following the Greek rule of St. Basil of Caesarea. A supporter of the regular successors to the papal crown in their controversies with antipopes, he also helped establish (1004) the noted abbey of Grottaferrata, near Rome, that remains today the centre of Greek monasticism and liturgy in Italy.

Nīmach, also spelled NEEMUCH, town, western Madhya Pradesh state, central India, located on a barren ridge. Handloom weaving is the major industry. Formerly a large British cantonment of Gwalior princely state, the town in 1822 became the headquarters of the combined Rājputāna–Mālwa political agency and of the Mālwa Agency in 1895. It is a road junction and distribution centre for agricultural products and building stone. There is a college affiliated with Vikram University. The surrounding country was once famous as a tiger-hunting area. Pop. (1981) town, 65,860; metropolitan area, 68,853.

Nimba Range, mountain chain extending in a southwest–northeast direction along the Guinea–Côte d'Ivoire–Liberia border. It reaches its highest elevation at Mount Nimba (5,748 feet [1,752 m]) in Guinea. Surrounded by lowland rain forest to the south and savanna to the north, the mountains are the source of the Nuon (Nipoué, Cestos) and Cavalla rivers, which form the Liberia–Côte d'Ivoire boundary. All three countries have set aside nature and forest reserves on the mountain slopes.

The range has considerable mineral wealth; extensive iron-ore deposits were mined by the Liberian American-Swedish Minerals Company (Lamco) after 1963 and exported via the 168-mile (270-kilometre) company railroad to the port of Buchanan. A mining concession was granted to Consafrique, a European consortium, to mine the Guinean section of the range after an agreement had been reached with Liberia to use the Lamco railway.



Iron-ore mine in the Nimba Range of West Africa
Jacques Jangoux

Nimbārka, also called NIMBĀDITYA, OR NIYAMĀNANDA (fl. 12th or 13th century?, South India), Telugu-speaking Brahman, yogi, minor philosopher, and prominent astronomer who founded the devotional sect called Nimbārkas, Nimandi, or Nimāvats, who worshiped the deity Krishna (Kṛṣṇa) and his consort, Rādhā.

Nimbārka has been identified with Bhāskara, a 9th- or 10th-century philosopher and celebrated commentator on the *Brahma-sūtra* (*Vedānta-sūtra*). Most historians of Hindu mysticism, however, hold that Nimbārka probably lived in the 12th or 13th century because of the similarities between his philosophical and devotional attitudes and those of Rāmānuja (traditionally dated 1017–1137). Both adhered to *dvaitādvaita* (Sanskrit: "dualistic non-dualism"), the belief that the creator-god and the souls he created were distinct but shared in the same substance, and both stressed devotion to Krishna as a means of liberation from the cycle of rebirth.

The Nimanda sect flourished in the 13th and 14th centuries in eastern India. Its philosophy held that men were trapped in physical bodies constricted by *prakṛti* (matter) and that only by surrender to Rādhā-Krishna (not through their own efforts) could they attain the grace necessary for liberation from rebirth; then, at death, the physical body would drop away. Thus Nimbārka stressed *bhakti* yoga, the yoga of devotion and faith. Many books were written about this once-popular cult, but most sources were destroyed by Muslims during the reign of the Mughal emperor Aurangzeb (1659–1707), and thus little information has survived about Nimbārka and his followers.

nimbus (in art): *see* halo.

Nimeiri, Gaafar Mohamed el-, also spelled JAʿFAR MUḤAMMAD AN-NUMAYRĪ, Nimeiri also spelled NIMEIRY, NEMERY, or NUMEYRI (b. Jan. 1, 1930, Wad Nubawi, Omdurman, Sudan), major general, commander of the armed forces, and president of The Sudan (1971–85).

After graduating from the Sudan Military College in 1952, Nimeiri acted as commander of the Khartoum garrison and led campaigns against rebels in Southern Sudan. He also joined in a number of attempts to overthrow the Sudanese government. In 1966 he graduated from the U.S. Army Command College at Fort Leavenworth, Kan. Three years later he overthrew the civilian regime of Ismāʿīl al-Azharī and was promoted to major general. He became prime minister and chairman of the Revolutionary Command Council (RCC). He put down a right-wing revolt led by Ṣādik al-Mahdī in March 1970 but was briefly overthrown by a Communist coup in July 1971. In September 1971 he was elected president in a plebiscite with 98.6 percent of the vote.

Upon his election as president, Nimeiri dissolved the RCC and established in 1972 the Sudanese Socialist Union, of which he also became president. He was credited with bringing about negotiations that led to a settlement of a 10-year conflict in the Southern Sudan region, which he granted autonomy in 1972.

When Nimeiri assumed power, he first pursued a socialist economic policy but soon shifted course in favour of capitalist agriculture, designed to make The Sudan a major food producer. In March 1981 he inaugurated the Kinānah sugar project, one of the largest sugar refineries in the world. His efforts were hampered, however, by a succession of economic crises brought on in part by overly ambitious development plans, and his reign was punctuated by many attempted coups. Nimeiri became the first Muslim leader to back the Egyptian president Anwar el-Sadāt's efforts to establish peace with Israel. As president of the Organization of African Unity (OAU) in 1978, Nimeiri reasserted his position that Africa should keep free from entanglements of "alignment" with external powers. His attempts to promulgate measures of Islāmic law in The Sudan alienated many in the predominantly Christian Southern Region.

In April 1985, while he was abroad (in Egypt), he was overthrown by his defense minister in a bloodless coup. The new regime turned to closer relations with Libya, which Nimeiri had spurned.

Nîmes, city, capital of Gard *département,* Languedoc-Roussillon region, southern France, south-southwest of Lyon. Situated at the foot of some barren hills called the Monts Garrigues to the north and west of the city, Nîmes stands in a vine-planted plain extending south and east.

Named after Nemausus, the genie of a sacred fountain, Nîmes was the capital of a Gaulish tribe that submitted to Rome in 121 BC. The emperor Augustus founded a new city there and gave it privileges that rapidly brought it prosperity. In the 5th century Nîmes was plundered by the Vandals (a Germanic people) and the Visigoths (a westerly division of the Teutonic peoples known as the Goths). It was later occupied by the Saracens (Arabs), who were driven out in 737.

Tour Magne, a ruined Roman tower, Nîmes, Fr.
Art Resource—EB Inc.

In the 10th century the city passed to the counts of Toulouse, and it was joined to the French crown in 1229. At the time of the Reformation, it became largely Protestant and suffered from persecution after the revocation in 1685 of the Edict of Nantes, which had accorded a measure of religious liberty to Protestants in 1598. Damaged in 1815 during the fighting between royalists and Bonapartists, Nîmes became prosperous once more with the coming of the railways later in the 19th century.

In Roman times one of the richest towns of Gaul, the city is famous for its many Roman remains, which are mostly in an excellent state of preservation. The vast amphitheatre, probably built in the 1st century AD to seat 24,000, is an ellipse (440 by 330 ft [135 by 100 m]), standing 69 ft (21 m) high. From outside it presents the aspect of a double row of 60 arches surmounted by an attic. It was built of large stones from a nearby quarry, put together without mortar. Originally intended for gladiatorial shows, chariot races, and naval spectacles, it was used as a fortress in the 5th century by the Visigoths. In the Middle Ages, houses, and even a church, were built inside it. Cleared of buildings in 1809, it is now used for bullfights. Despite this checkered history, it is one of the best preserved Roman amphitheatres in existence. The famous Maison Carée (1st century AD), a rectangular temple 82 ft (25 m) long by 40 ft (12 m) wide, dedicated to Gaius and Lucius Caesar, adopted sons of the first Roman emperor Augustus, is one of the most beautiful monuments built by the Romans in Gaul, and certainly the best preserved. Like the amphitheatre, the building has had varied uses (town hall, private house, stable, and church) through the ages. It now houses a collection of Roman sculptures. The Tour Magne, atop a hill just outside the city, is the oldest Roman building, 92 ft high, but probably originally higher. Its original function is not known, but it was incorporated into the Roman wall in 16 BC.

Near the Tour Magne is a reservoir from which the water carried by the great Roman aqueduct, the Pont du Gard, was distributed throughout the town. The pleasant Jardin de la Fontaine, situated on the edge of the city, was designed in 1745. The fountain and the canals that flow through it are partly Roman. The Archeological Museum, which is housed in a former Jesuit college, has a fine collection of Roman objects, as well as some Iron Age artifacts.

The city's population grew considerably after 1960, from both rural immigration and immigrants from North Africa, especially Algeria. The traditional manufacture of textiles and clothing still flourishes. New industries include shoe manufacturing, food processing (canned fruit, brandy), and the manufacturing of electrical and agricultural equipment. Nîmes is also an important market town, notably for wine. The city is an important crossroads for rail transportation, particularly of commercial traffic such as meats. Pop. (1982) 120,515.

Nimitz, Chester W(illiam) (b. Feb. 24, 1885, Fredericksburg, Texas, U.S.—d. Feb. 20, 1966, near San Francisco), commander of the U.S. Pacific Fleet during World War II. One of the navy's foremost administrators and strategists, he commanded all land and sea forces in the Pacific area.

A graduate (1905) of the U.S. Naval Academy at Annapolis, Nimitz served in World War I as chief of staff to the commander of the U.S. Atlantic submarine force, a tour of duty that convinced him of the effectiveness of submarine warfare. He held a variety of posts at sea and on shore until 1939, when he was appointed chief of the Bureau of Navigation of the U.S. Navy.

Nimitz, 1941
By courtesy of the U.S. Navy

After the Japanese attack on Pearl Harbor (December 1941), Nimitz was elevated to commander in chief of the Pacific Fleet, a command that brought both land and sea forces under his authority. By June 1942 he had proudly announced the decisive victory at the Battle of Midway and the Coral Sea, where enemy losses were 10 times greater than those of the United States at Pearl Harbor. In succeeding years, the historic battles of the Solomon Islands (1942–43), the Gilbert Islands (1943), the Marshalls, Marianas, Palaus, and Philippines (1944), and Iwo Jima and Okinawa (1945) were fought under his direction.

The Japanese capitulation was signed aboard his flagship, the USS "Missouri," in Tokyo Bay on Sept. 2, 1945. In December 1944 Nimitz had been promoted to the Navy's newest and highest rank—that of fleet admiral.

After the war, Nimitz served as chief of naval operations (1945–47). In 1947, in answer to interrogatories by the German Adm. Karl Dönitz, on trial for war crimes, Nimitz gave his justification for the unrestricted nature of U.S. submarine warfare in the Pacific during World War II. With E.B. Potter he edited *Sea Power, a Naval History* (1960).

Nimrod, also spelled NEMROD, legendary biblical figure, described in Gen. 10:8–12 as "the first on earth to be a mighty man. He was a mighty hunter before the Lord." The only other references to Nimrod in the Old Testament are Mic. 5:6, where Assyria is called the land of Nimrod, and I Chron. 1:10. The beginning of his kingdom is said in Genesis to be Babel, Erech, and Akkad in the land of Shinar. Nimrod is said to have built Nineveh, Calah (modern Nimrūd), Rehoboth-Ir, and Resen. There is some consensus among biblical scholars that the mention of Nimrod in Genesis is a reference not to an individual but to an ancient people in Mesopotamia.

The description of Nimrod as a "mighty hunter before the Lord" is an intrusion in this context, but probably, like the historical notices, derived from some old Babylonian saga; however, no equivalent of the name has yet been found in the Babylonian or other cuneiform records. In character there is a certain resemblance between Nimrod and the Mesopotamian epic hero Gilgamesh.

Nimrūd (ancient Assyrian city): *see* Calah.

Nimwegen (The Netherlands): *see* Nijmegen.

Nimzowitsch, Aron (b. Nov. 7, 1886, Riga Latvia, Russian Empire—d. March 16, 1935, Denmark), Latvian-born chess master and theoretician, renowned for his book *My System* (1925) but who failed to win a world championship, despite many attempts.

Nimzowitsch learned to play chess from his father, a wholesale merchant, when he was eight years old, but only after he entered the University of Berlin in 1904 did he concentrate on the game. *My System,* which advocates what came to be called the hypermodern school of chess, remains a classic.

Nimzowitsch is best-remembered for having created a new vocabulary for chess that made the strategy of the masters more intelligible. He also developed several theories of play, including the Nimzowitsch-Indian defense.

Nin, Anaïs (b. Feb. 21, 1903, Neuilly, Fr.—d. Jan. 14, 1977, Los Angeles), French-born author of novels and short stories whose literary reputation rests on the eight published volumes of her personal diaries. Her writing shows the influence of the Surrealist movement and her study of psychoanalysis under Otto Rank.

Brought to New York City by her mother in 1914, Nin was educated there but later returned to Europe. She launched her literary career with the publication of *D.H. Lawrence: An Unprofessional Study* (1932); the book led to a lifelong friendship with the American author Henry Miller.

At the beginning of World War II Nin returned to New York City. There she continued—at her own expense—to print and publish her novels and short stories, and although no critical acclaim was forthcoming, her works were admired by many leading literary figures of the time. Not until 1966, with the appearance of the first volume of her diaries, did she win recognition as a writer of significance. The success of the diary provoked interest in her earlier work entitled *Cities of the Interior* (1959), a five-volume *roman fleuve,* or continuous novel, which consisted of *Ladders to Fire* (1946); *Children of the Albatross* (1947); *The Four-Chambered Heart* (1950); *A Spy in the House of Love* (1954); and *Solar Barque* (1958).

Nin's literary contribution was a subject of controversy in her lifetime and has remained so since her death. Many critics admire her unique expression of femininity, her lyrical style, and her psychological insight. Some dismiss her concern with her own fulfillment as self-indulgent and narcissistic. Opinion was further divided by the posthumous *Delta of Venus: Erotica* (1977) consisting of previously unpublished erotic stories written on commission during the financially lean years of the early 1940s. Her other works of fiction include a collection of short stories, *Under a Glass Bell* (1944); the novels *House of Incest* (1936), *Seduction of the Minotaur* (1961), and *Collages* (1964); and three novelettes collected in *Winter of Artifice* (1939).

Ninazu, in Mesopotamian religion, Sumerian deity, the city god of Enegir, which was located on the Euphrates River between Larsa and Ur in the southern orchard region. Ninazu was also the city god of Eshnunna (modern Tall al-Asmar in eastern Iraq). Ninazu, whose name means "water knower," was primarily an underworld deity, although the exact nature of his character or functions is not clear. In Enegir he was considered the son of Ereshkigal, goddess of the netherworld; according to another tradition, however, he was the son of Enlil (Akkadian Bel) and Ninlil (Belit). His spouse was Ningirda, a daughter of Enki (Ea).

9/11 attacks: *see* September 11 attacks.

Nine Men's Morris, also called MORRIS, MORELLES, MERELLES, MERELS, MILL, or THE MILL, board game of great antiquity, most popular in Europe during the 14th century and played throughout the world in various forms.

The board is made up of three concentric squares and several transversals, making 24 points of intersection. In modern play the diagonal lines of the board are usually omitted. Two players, each provided with nine counters of a single colour, lay pieces alternately upon the points, the object being to get three in a row (a mill) upon any line. On doing so, the player is entitled to remove from the board (capture) one adverse counter, but not one that is in a mill. Having placed all their counters, the players continue moving alternately, with the same object. A mill may be opened by moving one piece off the line; returning the same piece to its original position counts as a new mill. The player who captures all but two of the adverse pieces wins. A move is normally from one point to the next in either direction along a line, but the rule is sometimes made that, when a player has only three pieces left, he may move them from any point to any point regardless of the lines.

ninepins, bowling game that probably originated in continental Europe during the Middle Ages. Many regional variations of the game developed. Early German ninepins lanes were made of clay or cinders; later a single long plank about one foot wide was added, on which the ball was rolled. The pins were set up in a square formation with one corner toward the bowler. These features are retained in the modern games asphalt, bohle, and schere, which are recognized for international competition by the Fédération Internationale des Quilleurs (International Federation of Bowlers). Skittles (*q.v.*), a British variation of ninepins, is also still played. The game of ninepins was brought to America by early Dutch colonists, but it was supplanted there in the mid-19th century by the tenpin game.

1927, Generation of, Spanish GENERACIÓN DEL 1927, in Spain, a group of poets and other writers who rose to prominence in the late 1920s and who derived their collective name from the year in which several of them produced important commemorative editions of the poetry of Luis de Góngora y Argote on the tercentenary of his death. In contrast to the earlier Generation of '98, most of whom were prose writers, the members of the Generation of 1927 were almost without exception poets. Chief among them were Federico García Lorca, Rafael Alberti, Jorge Guillén, Vicente Aleixandre, Luis Cernuda, Pedro Salinas, Gerardo Diego, and Dámaso Alonso. Generally speaking, these poets were influenced by such wider European movements as Symbolism, Futurism, and Surrealism, and they helped introduce the tenets of these movements into Spanish literature. They rejected the use of traditional metre and rhyme and discarded anecdotal treatment and strictly logical descriptions in their poems. Instead, they made a constant and audacious use of metaphor, coined new words, and introduced highly symbolic or suggestive images into their poems in an effort to convey aspects of inner personal experience. They also drew on ballads, traditional songs and lyrics, and on Góngora's poetry itself for subject matter.

The poets of the Generation of 1927 differed in their individual styles and concerns but collectively formed the dominant trend in Spanish poetry during the 1920s, '30s, and early '40s. The Spanish Civil War (1936–39) and its aftermath blunted the type of experimentation practiced by these poets, however, and subsequent Spanish poetry turned away from their cultivated and abstruse aestheticism.

1932, Revolution of (Thailand): *see* Promoters Revolution.

'98, Generation of, also called GENERATION OF 1898, Spanish GENERACIÓN DEL '98, or GENERACIÓN DEL 1898, in Spain, the novelists, poets, essayists, and thinkers active at the time of the Spanish–American War (1898), who reinvigorated Spanish letters and restored Spain to a position of intellectual and literary prominence that it had not held for centuries.

The shock of Spain's defeat in the war, which left it stripped of the last vestiges of its empire and its international prestige, provided an impetus for many writers and thinkers to embark on a period of self-searching and an analysis of Spain's problems and its destiny.

The term Generation of '98 was used loosely at the turn of the century but was elaborated by the literary critic Azorín (*q.v.*) in critical essays that appeared in various periodicals and were collected in his *Clásicos y modernos* (1913). It was soon generally applied to the writers who concerned themselves with Spain's heritage and its position in the modern world. Never an organized movement or school, the Generation of '98 worked in diverse fields and styles and rarely agreed on approaches or solutions to Spain's problems, but all had in common a desire to shake the Spanish people out of what they saw as apathy and to restore a sense of national pride.

Joaquín Costa, Ángel Ganivet, and Miguel de Unamuno are generally considered precursors of the Generation of '98, but many literary historians consider Ganivet and, usually, Unamuno as members of the group proper. Other outstanding figures were Azorín himself, the philosopher and critic José Ortega y Gasset, the novelists Pío Baroja, Vicente Blasco Ibáñez, and Ramón María del Valle-Inclán, and the poets Antonio Machado y Ruiz and Manuel Machado y Ruiz (*qq.v.*). In their revitalization of Spanish letters, they brought a new seriousness of purpose to the Spanish novel and elevated the essay—critical, psychological, philosophical—to a position of literary importance. At the same time, they brought to Spain an awareness of trends in foreign literature and thought that enabled the Spanish people to reassess their own values in the context of the modern world, thus awakening a national consciousness that paved the way for subsequent cultural development.

Ninety-five Theses, propositions for debate concerned with the question of indulgences, written (in Latin) and posted, according to legend, by Martin Luther on the door of the Schlosskirche (Castle Church), Wittenberg, on Oct. 31, 1517. This event is often seen as the beginning of the Protestant Reformation.

Luther was simply following current practice, when he nailed the theses to the church door, of inviting debate and discussion. Ordinarily, Luther's theses would have been of interest only to professional theologians, but various political and religious situations of the time, and the fact that printing had been invented, combined to make the theses known throughout Germany within a few weeks. Luther did not give them to the people, although he did send copies to the Archbishop of Mainz and to the Bishop of Brandenburg. Others, however, translated them into German and had them printed and circulated. Thus, they became a manifesto that turned a protest about an indulgence scandal into the greatest crisis in the history of the Western Christian Church.

The doctrine concerning indulgences (*q.v.*) was uncertain in the Roman Catholic Church prior to the Council of Trent (1545–63), which defined the doctrine and eliminated abuses. Indulgences were the commutation for money of part of the temporal penalty due for sin—*i.e.,* the practical satisfaction that was a part of the sacrament of penance. They were granted on papal authority and made available through accredited agents. Not at any time did they imply that divine forgiveness could be bought or sold or that they availed for those who were impenitent or unconfessed. But during the Middle Ages, as papal financial difficulties grew more complicated, they were resorted to very often, and abuses grew common. Further misunderstanding developed after Pope Sixtus IV extended indulgences to souls in purgatory. The often outrageous statements of indulgence sellers were a matter of protest among theologians.

The immediate cause of scandal in Germany in 1517 was the issue of an indulgence that was to pay for the rebuilding of St. Peter's in Rome. But by secret agreement of which most Germans, probably including Luther, were unaware, half the proceeds of the German sales were to be diverted to meet the huge debt owed to the financial house of Fugger by the archbishop and elector Albert of Mainz, who had incurred the debt in order to pay the Pope for appointing him to high offices. Such a prince could not afford to be squeamish about the methods and language used by his agents, and the agent in Germany, the Dominican Johann Tetzel, made extravagant claims for the indulgence he was selling. The sale of this indulgence was forbidden in Wittenberg by the elector Frederick III the Wise, who preferred that the faithful should make their offerings at his own great collection of relics, exhibited in the Church of All Saints. Nevertheless, Wittenberg church members went to Tetzel, who was preaching nearby, and they showed the pardons for their sins received from him to Luther. Outraged at what he considered grave theological error, Luther wrote the Ninety-five Theses.

The theses were tentative opinions, about some of which Luther had not decided. In the theses the papal prerogative in this matter was not denied, though by implication papal policy was criticized. The spiritual, inward character of the Christian faith was stressed. The fact was emphasized that money was being collected from poor people and sent to the rich papacy in Rome, a point popular with the Germans, who had long resented the money they were forced to contribute to Rome.

Subsequently, the Archbishop of Mainz, alarmed and annoyed, forwarded the documents to Rome in December 1517, with the request that Luther be inhibited. A counterthesis was prepared by a Dominican theologian and defended before a Dominican audience at Frankfurt in January 1518. When Luther realized the extensive interest his tentative theses had aroused, he prepared a long Latin manuscript with explanations of his Ninety-five Theses, published in the autumn of 1518.

The practice of dating the beginning of the Reformation from the date that the Ninety-five Theses were posted did not develop until after the mid-17th century.

Ninety Mile Beach, western coast of Aupori Peninsula, the northernmost extension of North Auckland Peninsula, North Island, New Zealand. It stretches for 55 mi (88 km) from Scott Point (northwest) to Ahipara Bay (southwest) and is bordered by scrubland and sand dunes.

In 1643 the Dutch navigator Abel Tasman referred to the beach as "a desert coast." Now a resort area, it offers fishing (especially for toheroa, a shellfish delicacy) and automobile racing on the hard-packed strand.

Nineveh, the oldest and most populous city of the ancient Assyrian Empire, situated on the east bank of the Tigris opposite modern Mosul (in Iraq). From time immemorial, roads from the foothills of Kurdistan debouched there, and a tributary of the Tigris, the Khawṣar River, added to the value of the fertile agricultural and pastoral lands in the district.

The first person to survey and map Nineveh was the archaeologist Claudius J. Rich in 1820, a work later completed by Felix Jones and published by him in 1854. Excavations have been undertaken intermittently since that period by many persons. A.H. (later Sir Henry) Layard during 1845–51 discovered the palace of Sennacherib and took back to England an unrivalled collection of stone bas-reliefs together with thousands of tablets inscribed in cuneiform from the great library of Ashurbanipal. Hormuzd Rassam continued the work in 1852. During 1929–32 R. Campbell Thompson excavated the temple of Nabu (Nebo) on behalf of the British Museum and discovered the site of the palace of Ashurnasirpal II. In 1931–32, together with M.E.L. (later Sir Max) Mallowan, Thompson for the first time dug a shaft from the top of the Quyunjik (Acropolis), 90 feet (30 metres) above the level of the plain, down through strata of accumulated debris of earlier cultures to virgin soil. It was then proved that more than four-fifths of this great accumulation is prehistoric.

History. The first settlement, a small Neolithic hamlet, was probably founded not later than the 7th millennium BC. Hassuna-Sāmarrā' and Tall Ḥalaf painted pottery of the subsequent Early Chalcolithic phases, characteristic of the north, was succeeded by gray wares such as occur westward in the Jabal Sinjār. Farmers during the 4th millennium used clay sickles of [illegible] type found in the Ubaid Period, and these imply contact with the south.

One of the most remarkable discoveries that Mallowan and Thompson made in the prehistoric strata consisted of roughly made, bevelled bowls, overturned in the soil and filled with vegetable matter. These may have been intended as magical offerings to expel evil spirits from houses. Their typology conforms exactly with that of Uruk (Erech) pottery, widespread throughout the Tigris–Euphrates Valley in the late 4th millennium. In these levels also large metal vases occur, again characteristic of southern Babylonia, and technologically this district of the Tigris had much in common with the cities of the lower Euphrates Valley at this period. This similarity is of particular interest because it indicates that some time before 3000 BC a period of economic prosperity had united the commercial interests of north and south; later these two civilizations diverged widely.

A little before and after 3000 BC, unpainted Ninevite pottery was similar to that used at Sumerian sites; to approximately the same period belongs a series of attractively painted and incised ware known as Ninevite V, which is a home product distinct from that of the south. Beads found in these strata may be dated *c.* 2900 BC.

The most remarkable object of the 3rd millennium BC is a realistic bronze head—life-size, cast, and chased—of a bearded monarch. This, the finest piece of metal sculpture ever recovered from Mesopotamia, may represent the famous king Sargon of Akkad (*c.* 2334–*c.* 2279 BC). This bronze head, however (now in the Iraq Museum, Baghdad), because of its brilliant technique and elaborately modelled features, is thought by some authorities to belong to a rather later stage of the Akkadian Period (*c.* 2334–*c.* 2154 BC); if so, the head might represent King Naram-Sin (*c.* 2254–*c.* 2218 BC). The hypothesis for the earlier period seems preferable, for metal work advanced more rapidly in style in Mesopotamia at that period than did stone sculpture, and it is known from inscriptions that Sargon's second son, Manishtusu, had built the temple of E-Mashmash at Nineveh by virtue of being the "son of Sargon"; thus a model of the founder of the dynasty would have been appropriately placed there.

Surprisingly, there is no large body of evidence to show that Assyrian monarchs built at all extensively in Nineveh during the 2nd millennium BC. Later monarchs whose inscriptions have appeared on the Acropolis include Shalmaneser I and Tiglath-pileser I, both of whom were active builders in Ashur; the former had founded Calah (Nimrūd). Nineveh had to wait for the neo-Assyrians, particularly from the time of Ashurnasirpal II (ruled 883–859 BC) onward, for a considerable architectural expansion. Thereafter successive monarchs kept in repair and founded new palaces, temples to Sin, Nergal, Nanna, Shamash, Ishtar, and Nabu (Nebo). Unfortunately, severe depredations have left few remains of these edifices.

It was Sennacherib who made Nineveh a truly magnificent city (*c.* 700 BC). He laid out fresh streets and squares and built within it the famous "palace without a rival," the plan of which has been mostly recovered and has overall dimensions of about 600 by 630 feet. It comprised at least 80 rooms, of which many were lined with sculpture. A large part of the famous "K" collection of tablets was found there (see below); some of the principal doorways were flanked by human-headed bulls. At this time the total area of Nineveh comprised about 1,800 acres (700 hectares), and 15 great gates penetrated its walls. An elaborate system of 18 canals brought water from the hills to Nineveh, and several sections of a magnificently constructed aqueduct erected by the same monarch were discovered at Jerwan, about 25 miles (40 kilometres) distant.

His successor Esarhaddon built an arsenal in the Nabī Yūnus mound, south of Quyunjik, and either he or his successor set up statues of the pharaoh Taharqa (Tarku) at its entrance as trophies to celebrate the conquest of Egypt. These were discovered by Fuad Safar and Muhammad 'Alī Muṣṭafā on behalf of the Iraqi Department of Antiquities in 1954.

Ashurbanipal later in the 7th century BC constructed a new palace at the northwest end of the Acropolis. He also founded the great library and ordered his scribes to collect and copy ancient texts throughout the country. The "K" collection included more than 20,000 tablets or fragments of tablets and incorporated the ancient lore of Mesopotamia. The subjects are literary, religious, and administrative, and a great many tablets are in the form of letters. Branches of learning represented include mathematics, botany, chemistry, and lexicology. The library contains a mass of information about the ancient world and will exercise scholars for generations to come.

Fourteen years after the death of Ashurbanipal, however, Nineveh suffered a defeat from which it never recovered. Extensive traces of ash, representing the sack of the city by Babylonians, Scythians, and Medes in 612 BC, have been found in many parts of the Acropolis. After 612 BC the city ceased to be important, although there are some Seleucid and Greek remains. Xenophon in the *Anabasis* recorded the name of the city as Mespila. In the 13th century AD the city seems to have enjoyed some prosperity under the atabegs of Mosul. Subsequently, houses continued to be inhabited at least as late as the 16th century AD. In these later levels imitations of Chinese wares have been found.

Outline of the city. From the ruins it has been established that the perimeter of the great Assyrian city wall was about 7.5 miles (12 km) long and in places up to 148 feet (45 m) wide; there was also a great unfinished outer rampart, protected by a moat, and the Khawṣar River flowed through the centre of the city to join the Tigris on the western side of it.

The 15 great gates that intersected the Acropolis walls were built partly of mud brick and partly of stone. The long eastern sector, about 3 miles (5 km), contained six gates; the southern sector, 2,624 feet (800 m), contained only one, the Ashur Gate; the western sector, about 2.5 miles (4 km), had five gates; the northern sector, about 1.2 miles (1.9 km), three gates, Adad, Nergal, and Sin. Several of these entrances are known to have been faced with stone colossi (lamassu). In the Nergal Gate two winged stone bulls, attributable to Sennacherib, have been reinstalled: a site museum has been erected adjacent to it by the Iraqi Department of Antiquities. The Adad Gate contained many inscribed tiles, and what may prove to be the Sin Gate contained a corridor that led through an arched doorway into a ramp or stairwell giving access to the battlements.

Most impressive was the Shamash Gate, which has been thoroughly excavated by Tariq Madhloum on behalf of the Iraqi Department of Antiquities. It was found to have been approached across two moats and a watercourse by a series of bridges in which the arches were cut out of the natural conglomerate. The wall was faced with limestone and surmounted by a crenellated parapet, behind which ran a defense causeway. The structure was constructed of mud as well as burnt bricks, which bore the stamp of Sennacherib. There was an entrance 14.8 feet (4.5 m) wide in the centre of a long, projecting bastion, which was further strengthened by six towers. Crudely incised stone slabs on the inner side of the gateway depicted the burning of a tower; it is possible that these carvings represented the fall of Nineveh and are post-Assyrian. The internal plan of the gate includes six great chambers lined with uncarved orthostats (upright slabs), which were discovered by Layard and Rassam.

Archaeologists also have been active within the Quyunjik (Acropolis). Since 1966 restoration has proceeded on the throne room of Sennacherib's palace and some of the adjoining chambers. All the entrances to the two main chambers were found flanked by winged bull colossi, and a series of orthostats not recorded by any of the 19th-century excavators has been recovered. One such slab illustrates a foreign city, heavily defended by towers, surrendering to the Assyrian army. Adjoining the throne room is a stone-paved bathroom, and the great antehall contained no fewer than 40 carved orthostats. The subjects represented include Sennacherib's campaigns against mountain-dwelling peoples, besieged cities, and units of the Assyrian army.

(M.Mn.)

Ning-po, also called YIN-HSIEN, Pinyin NINGBO, or YINXIAN, city in the coastal plain of northeastern Chekiang *sheng* (province), China. Ning-po ("Calm Waves") is situated on the Yung River, some 16 miles (25 km) upstream from its mouth, at the junction with its chief western tributary, the Yu-yao. Ning-po was from an early period itself a port, although the mouth of the river was masked by a mud bar. It has an outport on the western bank of the estuary, called Chen-hai, which originally had been a fishing port.

After Kou-chang *hsien* (county), a few miles to the east, was transferred to what is now Ning-po in 625, it became the seat of an independent *chou* (prefecture), Ming, in 738. In 908 the county seat's name, Mao-hsien since 625, was changed to Yin-hsien, which it has since retained. Under the Southern Sung (1126–1279), Ming *chou* was promoted in 1198 to a *fu* (superior prefecture), Ch'ing-yuan. It kept this name through the Yüan (Mongol) period (1206–1368). In 1368 it became Ning-po *fu,* which name it kept until 1912, when it was demoted to county status, taking the formal name of Yin-hsien.

Ning-po first rose to importance during the latter part of the 5th century, when Korean shipping found it the most convenient port for contacts with the southern capital at Nanking (Nan-ching; then called Chien-k'ang). Under the T'ang (618–907) this traffic continued. Although official relations lapsed after 838, private trade continued on a large scale. In the 11th century Ning-po became a centre of the coastal trade. Its importance grew with the establishment of the Southern Sung capital at Hang-chou in 1127, when overseas trade to and from the capital flowed through Ning-po. It grew rapidly during the Sung (960–1279) and Yüan periods.

The early period of the Ming dynasty (1368–1644) brought a setback to Ning-po's development. Overseas trade was deliberately curtailed by the government and the building of oceangoing ships prohibited, and even coastal trade was severely restricted. Ning-po was attacked by Japanese pirates, and it became a defensive base of some importance. Its growth seems to have stagnated, however, until the last quarter of the 15th century, when the rural prosperity of its hinterland began to recover.

This recovery was assisted when the Portuguese began trading in Ning-po in 1545, at first illicitly, but later (after 1567) legally. Still later, Dutch and British merchants arrived, and the Ning-po merchants began to trade with the China coast from Manchuria to Canton, as well as with the Philippines and Taiwan. Ning-po was the commercial centre of the coastal plain to the east of Shao-hsing and an outport for the Yangtze River Delta area, to which it was linked by the Che-tung Canal leading to Shao-hsing and the Ch'ien-t'ang River. As a result, in the 17th and 18th centuries the Ning-po merchants became important in China's internal commerce and began to play a national role as bankers in the early 19th century. In 1843 Ning-po was opened to foreign trade as a treaty port, but trade declined, and its place was taken by Shanghai.

Modern Ning-po is a local commercial centre and a busy port for northeastern Chekiang. Steamships of 3,000 tons can use the port, and there are regular steamer services to Shanghai. A large passenger terminal was built in 1979. A separate new port, Pei-lun, nearby was designed to be one of China's largest transfer docks and a centre for the import of Australian iron ore. There is a rail link with Shanghai via Hang-chou, and Ning-po is also the centre of a transportation network of coastal junk traffic, canals, and roads. It is a collection centre for cotton and other agricultural produce of the plain, for the marine products of the local fishing industry, and for timber from the mountains in the hinterland and is a major distribution centre for coal, oil, textiles, and consumer goods. In 1984 Ning-po was designated one of China's "open" cities in the new open-door policy inviting foreign investment.

Cotton-spinning mills, flour mills, textile plants, and tobacco factories were established before World War II, and from 1949 industrialization continued. The textile industry has expanded with new textile plants, knitting factories, dyeing plants, and yarn-spinning mills. Food processing—flour milling, rice polishing, oil extraction, wine making, and particularly the canning of foodstuffs—has become a large-scale industry. In addition, Ning-po supports a number of manufacturing concerns. A large shipbuilding industry constructs fishing vessels. Factories produce diesel engines, agricultural and other machinery, generators, machine tools, and petrochemicals.

The oldest library building in China, T'ien-i Ko, is in the western part of the city. Its collection of rare books and documents goes back to the 11th century and includes many unique local chronicles of the Ming dynasty. Pop. (1985 est.) city centre, 422,000; city, 615,600; city and administratively attached counties, 4,841,900.

Ning Tsung, Pinyin NING ZONG (temple name), personal name CHAO K'UO (b. 1168, Hangchow, Chekiang Province, China—d. 1224, Hangchow), 13th emperor of the Sung dynasty, whose reign (1194/95–1224/25) is noted as a period of intellectual and cultural achievement; Chu Hsi, the great Neo-Confucian philosopher, wrote some of his most famous works during this time. The government, however, was plagued by rising inflation, and the emperor came under the domination of the minister Han T'o-chou, who attempted to recover the Sung territory in North China that had been lost to the Juchen several generations earlier. The war was disastrous, and more territory was lost to the Juchen, who demanded a huge annual indemnity. During the negotiations with the Juchen, Han was assassinated, and a peace treaty was finally signed in 1208.

Ning Zong (Chinese emperor): *see* Ning Tsung.

Ningirsu (Mesopotamian god): *see* Ninurta.

Ningishzida, in Mesopotamian religion, Sumerian deity, city god of Gishbanda, near Ur in the southern orchard region. Although Ningishzida was a power of the netherworld, where he held the office of throne bearer, he seems to have originally been a tree god, for his name apparently means "Lord Productive Tree." In particular, he probably was god of the winding tree roots, since he originally was represented in serpent shape. When pictured in human form, two serpent heads grow from his shoulders in addition to the human head, and he rides on a dragon. He was a son of Ninazu and Ningirda and was the husband of Ninazimua ("Lady Flawlessly Grown Branch").

Ningre-Tongo (creole language): *see* Sranantonga.

Ningsia, in full HUI AUTONOMOUS REGION OF NINGSIA, Chinese (Wade–Giles romanization) NING-HSIA-HUI-TSU TZU-CHIH-CH'Ü, Pinyin NINGXIA HUIZU ZIZHIQU, autonomous region of the People's Republic of China, located in northern China and bounded on the west by Kansu, on the north by the Inner Mongolia Autonomous Region, and on the east by Shansi *sheng* (province) and otherwise surrounded by Kansu *sheng*. Ningsia is nearly coextensive with the ancient kingdom of the Tangut people.

A brief treatment of the Hui Autonomous Region of Ningsia follows. For full treatment, *see* MACROPAEDIA: China.

Irrigation canals on the Ningsia plains of the Huang Ho (river) dating from about 220 BC provide evidence that the area has long been inhabited. In the 11th century AD it became part of the kingdom of Tangut in western China. Yin-ch'uan, its chief city, was captured by Genghis Khan early in the 13th century and remained a tributary to China. After this conquest it was named Ningsia ("Peaceful Hsia"). In 1914 the area became a part of the province of Kansu, and in 1928 it was constituted as the province of Ningsia. In 1954 it again merged with Kansu; in 1956 that part of Ningsia largely occupied by Mongolians became a part of the Inner Mongolia Autonomous Region. In 1958 the rest of the former province became the Hui Autonomous Region of Ningsia. The capital is Yin-ch'uan.

Most of the region is desert, but the vast plain of the Huang Ho in the north has been irrigated for centuries. Over the years many canals have been built. The network of willow-lined canals and paddy fields gives the landscape a look resembling that of southern China. The river enters from a plateau in Kansu and flows east and then north into Inner Mongolia. West of the plain are the Ho-lan Mountains, which serve as a shelter against the sandstorms from the Ala Shan, a desert to the west. The plain is extremely arid, receiving only 8 inches (200 mm) of rainfall per year. The climate is continental.

The ethnic composition of Ningsia includes the Han (Chinese-speaking Chinese), Hui (Chinese Muslims), Mongolians, and Manchu. The people speak Mandarin Chinese, Tibetan, and Mongolian. Most of the population live in rural areas and farm the land. Ningsia is one of China's more sparsely settled regions. In the widely scattered cities, most workers are engaged in handicrafts, although mining and manufacturing, recently developed, offer employment opportunities.

Abundant wheat and high-quality rice are produced on the Ningsia plain. Cash crops include sesame and sugar beet. Other crops are millet, cotton, melons, and apricots. Sheep are raised. The Manchu particularly, are well known for raising and breeding pigs. The province's mineral resources are limited to coking-coal reserves in the P'ing-lo area, near the Inner Mongolian border.

Industry and agriculture in Ningsia have been aided in their development by the Pao-t'ou–Lan'chou railway, an extension of the main Peking–Pao-t'ou railway. Area 23,000 square miles (60,000 square km). Pop. (1985 est.) 4,060,000.

Ningsia carpet, floor covering woven in Hui Autonomous Region of Ningsia, China, characterized by a stylized pictorial design and subtle use of blue, red, and beige. Geometrical patterns are sometimes used. The heavy wool pile of the Ningsia is cut so that the design is in relief. The foundation weave is cotton.

Ninhar, also called NINGUBLA, in Mesopotamian religion, Sumerian deity, city god of Kiabrig, near Ur in the southern herding region. Ninhar was god of the thunder and rainstorms that made the desert green with pasturage in the spring; as such he was represented in the form of a roaring bull. He was the son of Nanna (Akkadian Sin) and Ningal and the husband of Ninigara ("Lady of Butter and Cream"), goddess of the dairy.

Ninhursag, also spelled NINHURSAGA (Sumerian), Akkadian BELIT-ILI, in Mesopotamian religion, city goddess of Adab and of Kish in the northern herding regions; she was the goddess of the stony, rocky ground, the *hursag*. In particular, she had the power in the foothills and desert to produce wildlife. Especially prominent among her offspring were the onagers (wild asses) of the western desert. As the sorrowing mother animal she appears in a lament for her son, a young colt, but as goddess of birth she is not only the goddess of animal birth but the Mother of All Children, a mother-goddess figure. Her other names include: Dingirmakh ("Exalted Deity"), Ninmakh ("Exalted Lady"), Aruru ("Dropper," *i.e.*, the one who "loosens" the scion in birth), and Nintur ("Lady Birth Giver"). Her husband is the god Shulpae, and among their children were the sons Mululil and Ashshirgi and the daughter Egime. Mululil seems to have been a dying god, like Dumuzi, whose death was lamented in yearly rites.

Ninian, SAINT, also called NYNIA, NINIAS, RIGNA, TRIGNAN, NINNIDH, RINGAN, NINUS, or DINAN (b. *c.* 360, Britain—d. *c.* 432, Britain; feast day September 16), bishop generally credited as the first Christian missionary to Scotland, responsible for widespread conversions among the Celts.

The two primary historical sources about Ninian's life and work are of dubious reliability. According to one, a 12th-century life by abbot Aelred (Ethelred) of Rievaulx, Ninian was the son of a Christian Briton chieftain. He made a pilgrimage to Rome, where he was consecrated as a bishop, and, in Aelred's narrative, traveled through Gaul on his return journey, along the way befriending St. Martin of Tours. An earlier source, the Venerable Bede's 8th-century *Ecclesiastical History of the English People,* implies that Ninian began the conversion of the Picts, a notion based on even earlier—and not entirely trustworthy—accounts of the period.

More certainly, Ninian was the first bishop of Galloway. That he established his see at Whithorn, Caledonia, is a supposition borne out by modern anthropology. There, in about 397, he built a whitewashed stone church (hence Whithorn, or White House, from the Anglo-Saxon *Huitaern;* Latin *Candida Casa*)—a notable departure from the customary wooden churches of the Britons. The monastery that he established at Whithorn was, by the 6th century, a leading Anglo-Saxon monastic centre.

Historically, there is little doubt that Ninian carried out his mission in Scotland, although there is some confusion about the areas that he visited. Modern scholars believe that, though his influence among the Picts may have been overestimated, his success with the Celts was evidently much greater. Indisputable evidence of his influence survived in the large number of churches dedicated to him throughout Scotland and in several locations in northern England, and it is generally agreed that his missionary work prepared the foundation for the later efforts of Saints Columba and Kentigern.

St. Ninian's shrine at Whithorn drew many pilgrims, among them King James IV of Scotland, who was a regular visitor. The Roman Catholic diocese of Galloway retains Candida Casa as its official name.

Ninigi, in full NINIGI NO MIKOTO, Japanese deity, grandson of the sun goddess Amaterasu. Ninigi's supposed descent to earth established the divine origin of the Yamato clan, the Imperial house of Japan. He is said to have been the great-grandfather of the first emperor, Jimmu.

Amaterasu delegated Ninigi to assume ownership and rule of the central land of the reed plains (Japan) and gave him three signs of his charge: a jewel (symbolizing benevolence), a mirror (purity), and Kusanagi, the "grass-mowing" sword (courage). The jewel, the mirror, and the sword are still the Japanese Imperial symbols. On his descent to earth Ninigi landed on Kyushu, the southernmost of the main islands. Ōkuninushi no Mikoto, who was already sovereign there, was reluctant to give up his own right to rule but submitted when he was permitted to retain control of "secret" (religious) affairs, with Ninigi supervising "public" (political) affairs. Today, Ōkuninushi remains an important folk deity, while Ninigi is no longer venerated.

Nininsina, also called NINKARRAK (Mesopotamian deity): *see* Bau.

Ninlil (Mesopotamian deity): *see* Belit.

Ninnidh, SAINT: *see* Ninian, Saint.

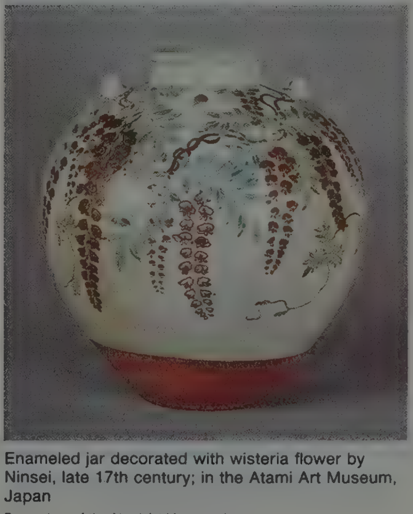
Niño, El (oceanic phenomenon): *see* El Niño.

Ninomiya Sontoku, also called NINOMIYA KINJIRŌ (b. Sept. 4, 1787, Kayama, Sagami Province, Japan—d. Nov. 17, 1856, Imaichi, Shimotsuke Province), Japanese agrarian reformer who helped improve agricultural techniques and whose writings exalting rural life earned him the affectionate title of the "Peasant Sage of Japan."

Born into a poor family, Ninomiya was completely self-educated. Through diligence and careful planning he was able to develop and increase his family's landholdings. His success came to the attention of local officials, and he was soon invited to join the government. There was nothing revolutionary in Ninomiya's system. He taught peasant families how to budget their expenses and plan their work, and he advocated mutual aid and cooperation in farm communities. Nevertheless, his methods achieved remarkable success in improving agriculture; his fame became widespread when the regions that he had developed suffered very little during the great national famine of 1836.

Ninomiya was also a moral leader who believed in the value of hard work and the dignity of manual labour and was able to instill in the peasants pride in their own occupations and the urge to follow his example of working to improve the general welfare. In the long run his ideas may have helped spur a desire for a more equalitarian social order.

Ninsei, pseudonym of NONOMURA SEISUKE, also called SEIEMON (fl. 17th century), Japanese



Enameled jar decorated with wisteria flower by Ninsei, late 17th century; in the Atami Art Museum, Japan

By courtesy of the Atami Art Museum, Japan potter active in Kyōto during the Edo period between the Meireki (1655–57) and the Genroku (1688–1703) eras. He learned the art of ceramics by working at the Awata-guchi kiln in Kyōto and the Seto kiln in Mino. His patron, the prince of the Ninna Temple at Omuro Katamachi, allowed him to build his kiln in front of the temple complex. He specialized in tea ceremony wares, notable for their delicate shapes and fine glaze and decorated in traditional motifs. Some of his finest works are his tea urns, or *cha-tsubo.*

Ninsun, in Mesopotamian religion, Sumerian deity, city goddess of Kullab in the southern herding region. As Ninsun's name, "Lady Wild Cow," indicates, she was originally represented in cow form and was considered the divine power behind, as well as the embodiment of, all the qualities the herdsman wished for in his cows: she was the "flawless cow" and a "mother of good offspring that loves the offspring." She was, however, also represented in human form and could give birth to human offspring. The Wild Bull Dumuzi (as distinct from Dumuzi the Shepherd) was traditionally her son, whom she lamented in the yearly ritual marking his death. In her role as a mother figure, her other Sumerian counterparts include Ninhursag (Akkadian: Belit-ili) and Ninlil (Belit). Ninsun's husband was the legendary hero Lugalbanda. *See also* Tammuz.

Ninth of Av (Judaism): *see* Tisha be-Av.

Ninurta, also called NINGIRSU, in Mesopotamian religion, city god of Girsu (Ṭal'ah, or Telloh) in the Lagash region. Ninurta was the farmer's version of the god of the thunder and rainstorms of the spring. He was also the power in the floods of spring and was god of the plow and of plowing. Ninurta's earliest name was Imdugud (now also read as Anzu), which means "rain cloud," and his earliest form was that of the thundercloud envisaged as an enormous black bird floating on outstretched wings roaring its thunder cry from a lion's head. With the growing tendency toward anthropomorphism, the old form and name were gradually disassociated from the god as merely his emblems; enmity toward the older inacceptable shape eventually made it evil, an ancient enemy of the god.

Ninurta was the son of Enlil (Akkadian: Bel) and Ninlil (Belit) and was married to Bau, in Nippur called Ninnibru, Queen of Nippur. A major festival of his, the Gudsisu Festival, marked in Nippur the beginning of the plowing season.

Ninus, in Greek mythology, king of Assyria and the eponymous founder of the city of Nineveh, which itself is sometimes called Ninus. He was said to have been the son of Belos, or Bel, and to have conquered in 17 years all of western Asia with the help of Ariaeus, king of Arabia. During the siege of Bactra he met Semiramis, the wife of one of his officers, Onnes; he then took her from Onnes and married her. The fruit of the marriage was Ninyas—*i.e.,* the Ninevite.

Ninus, SAINT: *see* Ninian, Saint.

Niobe, in Greek mythology, the daughter of Tantalus (king of Sipylus in Lydia) and wife of King Amphion of Thebes. She was the prototype of the bereaved mother, weeping for the loss of her children. According to Homer's *Iliad,* she had six sons and six daughters and boasted of her progenitive superiority to the Titan Leto, who had only two children, the twin deities Apollo and Artemis. As punishment for her pride, Apollo killed all Niobe's sons, and Artemis killed all her daughters. The bodies lay for nine days unburied because Zeus had turned all the Thebans to stone, but on the 10th day they were buried by the gods. Niobe went back to her Phrygian home, where she was turned into a rock on Mount Sipylus (Yamanlar Dağı, northeast of Izmir, Tur.), which continues to weep when the snow melts above it.

The story of Niobe illustrates the favourite Greek theme that the gods are quick to take vengeance (nemesis) on human pride and arrogance (hubris). Niobe is the subject of lost tragedies by both Aeschylus and Sophocles, and Ovid tells her story in his *Metamorphoses.* The number of her children, which varies with different authors, is generally given in post-Homeric literature as seven sons and seven daughters. The origin of the name Niobe is uncertain; it may have been of non-Greek origin and perhaps derived from Asia Minor, which seems also to have been the source of her story.

Apollo and Artemis killing the children of Niobe, red-figure calyx krater by the Niobid Painter, c. 455–450 BC; in the Louvre, Paris

Cliche Musees Nationaux, Paris

Niobid Painter (fl. *c.* 475–450 BC), painter of flower-shaped Greek vases, named for a calyx krater (mixing bowl) with a representation of the death of the children of Niobe, now at the Louvre Museum, Paris. The vessel is thought to reflect the innovative technique of the now lost mural paintings of Polygnotus, another Greek painter of the 5th century BC.

In the scene of the death of the children of Niobe and in the scene of Athena and Heracles on the other side of the krater, the Niobid Painter has arranged his figures so that they are set on different levels, suggesting different ground lines by means of a fine, painted white line. Landscape setting, too, is suggested: Athena and Heracles appear to be standing on a hilly terrain. Apparently, the Niobid Painter made a deliberate attempt to express space and depth.

niobium (Nb), chemical element, refractory metal of Group Vb of the periodic table, used in alloys, tools and dies, and superconductive magnets. Niobium is closely associated with tantalum in ores and in properties.

A brief treatment of niobium follows. For information on the mining, recovery, and applications of niobium, *see* MACROPAEDIA: Industries, Extraction and Processing.

Niobium was first discovered (1801) in a New England mineral by the English chemist Charles Hatchett, who called the element columbium; it was rediscovered and named (1844) by the German chemist Heinrich Rose. International agreement among chemists (about 1950) finally established the name niobium, though columbium persisted in the U.S. metallurgical industry.

Niobium, more plentiful than lead and less abundant than copper in the Earth's crust, occurs dispersed except for a relatively few minerals, of which columbite and pyrochlore are the principal commercial sources. Natural niobium occurs entirely as the stable isotope niobium-93. Separation from tantalum, when necessary, is effected by solvent extraction; the niobium is then precipitated and roasted to niobium pentoxide, which is reduced to niobium powder through metallothermic and hydriding processes. The powder is consolidated and purified further by electron-beam melting. Vacuum sintering of powder is also used for consolidation.

The pure metal is soft and ductile; it looks like steel or, when polished, like platinum. Although it has excellent corrosion resistance, niobium is susceptible to oxidation above about 400° C (750° F). Completely miscible with iron, it is added in the form of ferroniobium to some stainless steels to give stability on welding or heating. Niobium is used as a major alloying element in nickel-based superalloys and as a minor but important additive to high-strength, low-alloy steels. Because of its compatibility with uranium, resistance to corrosion by molten alkali-metal coolants, and low thermal-neutron cross section, it has been used alone or alloyed with zirconium in claddings for nuclear reactor cores. Cemented carbides used as hot-pressing dies and cutting tools are made harder and more resistant to shock and erosion by the presence of niobium. Niobium is useful in constructing cryogenic (low temperature) electronic devices of low power consumption. Niobium-tin (Nb_3Sn) is a superconductor below 18.45 Kelvins (K), and niobium metal itself, below 9.15 K.

Compounds of niobium are of relatively minor importance. Those found in nature are pentavalent, but compounds of lower valences (2–4) have been prepared. Tetravalent niobium, for example, in the form of the carbide, NbC, is used for making cemented carbides.

atomic number	41
atomic weight	92.906
melting point	2,468° C (4,474° F)
boiling point	4,927° C (8,901° F)
specific gravity	8.57 (20° C)
valence	2, 3, 4, 5
electronic config.	2-8-18-12-1 or $(Kr)4d^45s^1$

Niobrara Limestone, geologic division of rocks in the United States during the Late Cretaceous Period (97.5 to 66.4 million years ago). Named for exposures studied along the Missouri River near the mouth of the Niobrara River, Knox county, Neb., the Niobrara occurs over a wide area including Nebraska, Kansas, North and South Dakota, Minnesota, Montana, Wyoming, Colorado, and New Mexico. The Niobrara Limestone varies in thickness from about 60 m (200 feet) to more than 270 m and consists of chalks, shales, limestones, and many thin layers of bentonite (altered volcanic-ash deposits that appear like soapy clays).

The Niobrara marks the withdrawal of the Cretaceous seas from the region of the Rocky Mountain geosyncline. Aquatic reptiles such as the mosasaur *Clidastes,* which was about 4.5 m long, and flying reptiles such as *Pteranodon,* possessing a 7.5-metre wingspread, have been found in the Niobrara.

Articles are alphabetized word by word,
not letter by letter

Niobrara River, river rising near Lusk, Wyo., U.S., and flowing east across the High Plains, the northern edge of the sandhills, and the low eastern plains of Nebraska to join the Missouri at the village of Niobrara, Neb., at the South Dakota line. The name is of Indian origin and means "running, or spreading, water." Both are apt designations because the Niobrara has a more uniform flow than do most plains streams, due to steady groundwater contributions from tributaries in the sandhills, while in its lower course it is wide and shallow. The river is 447 miles (720 km) long and drains 12,000 square miles (31,080 square km). Box Butte Dam (1946) is on the river near Marsland, Neb.

Niort, town, capital of Deux-Sèvres *département,* Poitou-Charentes *région,* western France. The town lies on the slopes of two hills facing one another on the left bank of the Sèvre Niortaise River, above its silted estuary. It grew up in the shelter of a 12th–13th-century castle erected by Henry II of England and his son Richard I the Lion-Heart. The two square towers of the castle keep dominate the river. Niort became one of the centres of Protestantism in western France and suffered severely after the revocation of the Edict of Nantes in 1685. The 15th–16th-century Church of Notre-Dame stands south of the castle, and the 16th-century former town hall is on the opposite hill.

Niort is a major centre for the insurance industry and other commercial services. Besides its traditional production of chamois leather, the town specializes in the plywood industry and has electrical, chemical, and glove factories. Pop. (1990) 58,660.

Nipigon, Lake, lake, Thunder Bay district, west-central Ontario, Canada. Lake Nipigon lies 80 miles (130 km) northeast of Thunder Bay. It is about 70 miles (110 km) long and 50 miles (80 km) wide and has an area of 1,872 square miles (4,848 square km). The lake lies at an elevation of 1,050 feet (320 m) and has maximum depths of 540 feet (165 m). Its Indian name means "deep, clear water." The lake is studded with numerous islands, and promontories and large bays characterize its shoreline. The lake is drained southward into Lake Superior by the Nipigon River, which drops 250 feet (76 m) in its 30-mile (48-kilometre) course to Nipigon Bay. A hydroelectric development provides power for mining and for the entire lakehead region.

Nipissing, Lake, lake, southeastern Ontario, Canada. Lake Nipissing lies midway between the Ottawa River and Georgian Bay. It is 321 square miles (832 square km) in area and has a maximum length of 50 miles (80 km) and a maximum width of 30 miles (48 km). A remnant of glacial Lake Algonquin, which emptied eastward via the Ottawa River, Lake Nipissing ("little water") is now drained by the French River westward to Georgian Bay. It was discovered by a French explorer, Étienne Brûlé, about 1610 and later served as a fur-trading route linking the Ottawa River with the upper Great Lakes.

Nipkow, Paul Gottlieb (b. Aug. 22, 1860, Lauenburg, Pomerania [Germany]—d. Aug. 24, 1940, Berlin, Ger.), German engineer who discovered television's scanning principle, in which the light intensities of small portions of an image are successively analyzed and transmitted. Nipkow's invention in 1884 of a rotating disk (Nipkow disk) with one or more spirals of apertures that passed successively across the picture made a mechanical television system possible. The Nipkow disk was supplanted in 1934 by electronic scanning devices.

Nippon (Japanese: "Japan," or "Japanese"): *see under* Nihon, except as below.

Nippon (country, Asia): *see* Japan.

Nippon Hōsō Kyōkai (NHK), English JAPAN BROADCASTING CORPORATION, public radio and television system of Japan. It operates two television and three radio networks and is notable for its innovations in high-definition television.

NHK was founded as a state public utility corporation controlled by Japan's Ministry of Communications. It began operations in 1926 with the merger of the radio stations in Tokyo, Ōsaka, and Nagoya. Beginning in 1930 NHK became a propaganda outlet for Japan's increasingly militaristic government. With a new broadcast law in 1950, NHK was dissolved and a new public broadcasting corporation, also named NHK, was formed; the law forbade government intervention in programming and also, for the first time, permitted competition by private broadcasting stations. NHK began television broadcasting in 1953.

NHK, which does not broadcast advertising, is supported entirely by fees paid by its audience. One of its television networks provides educational programming, and the other provides general programming, including news (for which it is especially noted), cultural programs, sports (especially sumo wrestling and baseball), and entertainment. Both networks can be seen throughout Japan's principal islands. The NHK laboratories developed a television system using 1,125 scanning lines, and some of its satellite programming uses this high-definition system daily.

Since 1951 the network has sponsored Japan's oldest and largest classical music ensemble, the NHK Symphony Orchestra.

Nippon Kōkan KK: *see* NKK Corporation.

Nippon Steel Corporation, Japanese SHIN NIPPON SEITETSU KK, Japanese corporation created by the 1970 merger of Yawata Iron & Steel Co., Ltd., and Fuji Iron & Steel Co., Ltd. It ranks among the world's largest steel corporations. Its headquarters are in Tokyo, and it has several offices overseas.

In 1896 the Japanese government established a steelmaking bureau, and five years later the Imperial Japanese Government Steel Works began operation at Yawata (now part of Kita-Kyūshū) in northern Kyushu. In the following three decades several private steelmakers were also founded. In 1934 the imperial Diet passed legislation creating the state-operated Japan Iron & Steel Co., Ltd., which incorporated the Yawata works and six private steelmakers (Wanishi, Kamaishi, Fuji, Kyushu, Toyo, and Mitsubishi). By the end of 1939 this giant trust had developed several large, modern, integrated steelworks. During World War II, however, bombings and loss of raw materials put most of the works out of operation. The disintegration was completed in 1950, when, under pressure from the Allied occupation authority, the trust was dissolved. Its assets were distributed among four new private companies, including Yawata and Fuji.

The Japanese economy prospered greatly following the outbreak of the Korean War in 1950, and world prosperity in the 1950s and '60s sparked an enormous demand for inexpensive steel. To meet this demand, Yawata and Fuji launched successive modernization programs that resulted in large-scale integrated mills, more efficient operations, and improvement of raw-material treatment technology. The merger of Yawata and Fuji in 1970, forming Nippon Steel Corporation, further strengthened their corporate resources. At its peak in the early 1970s, Nippon Steel had a steelmaking capacity of 47 million tons per year; it passed the United States Steel Corporation in 1975 to become the world's largest steelmaker. Declining worldwide demand for steel and other changes in the global economy forced the company to cut back its steelmaking capacity in the 1980s and to diversify its operations, however.

Nippon Telegraph and Telephone Corporation (NTT), Japanese NIHON DENSHIN DENWA KŌSHA, also called DENDEN KŌSHA, Japanese telecommunications company that almost monopolizes Japan's domestic electronic communications industry. It is Japan's largest company and one of the largest companies in the world.

NTT was established in 1952 as a public corporation and the sole telecommunications company in Japan. NTT oversaw the vast expansion of the nation's telephone network in the postwar period, with the number of telephone subscribers growing from 1.5 million in 1953 to 20 million by 1972. NTT was able to make telephone service available nationwide in 1977. Telephone service still provides almost 80 percent of the company's income.

In 1968 the corporation also became involved in data communications. Because of its demand for increasingly sophisticated electronics equipment and its ability to utilize vast financial resources in the support of technology research and development, NTT was a major factor in Japan's domination of the computer microchip industry. In the 1980s the company was developing non-telephone linkage systems for computer data systems and fibre-optic telecommunications systems. NTT was privatized in 1985, and from then on it was in competition with other telecommunications companies in Japan.

Nippur, modern NIFFER, or NUFFAR, ancient city of Mesopotamia, now in southeastern Iraq. It lies northeast of the town of Ad-Dīwānīyah. Although never a political capital, Nippur played a dominant role in the religious life of Mesopotamia.

In Sumerian mythology Nippur was the home of Enlil, the storm god and representation of force and the god who carried out the decrees of the assembly of gods that met at Nippur. Enlil, according to one account, created man at Nippur. Although a king's armies might subjugate the country, the transference to that king of Enlil's divine power to rule had to be sought and sanctioned. The necessity of this confirmation made the city and Enlil's sanctuary there especially sacred, regardless of which dynasty ruled Mesopotamia.

The first American archaeological expedition to Mesopotamia excavated at Nippur from 1889 to 1900; the work was resumed in 1948. The eastern section of the city has been called the scribal quarter because of the many thousands of Sumerian tablets found there; in fact, the excavations at Nippur have been the primary source of the literary writing of Sumer. Excavation in 1990 uncovered an Akkadian tomb and a large temple to Bau (Gula), the Mesopotamian goddess of healing.

Female figure, made of gypsum, with a gold mask that stood at a temple altar in Nippur, *c.* 2700 BC; in the Iraq Museum, Baghdad

By courtesy of the Iraq Museum, Baghdad; photograph, David Lees

Little is known about the prehistoric town, but by 2500 BC the city probably reached the extent of the present ruins and was fortified. Later, Ur-Nammu (reigned 2112–2095 BC), first king of the 3rd dynasty of Ur, laid out Enlil's sanctuary, the E-kur, in its present form. A ziggurat and a temple were built in an open courtyard surrounded by walls.

Parthian construction later buried Enlil's sanctuary and its enclosure walls, and in the 3rd century AD the city fell into decay. It was finally abandoned in the 12th or 13th century.

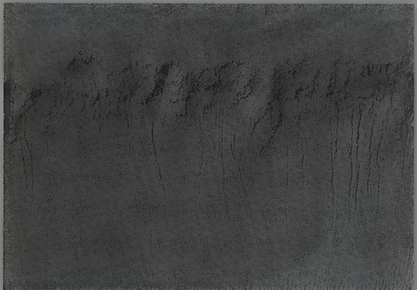
Niraṅkārī, religious reform movement within Sikhism. The Niraṅkārī movement was founded by Dayāl Dās (died 1855), who belonged to a half-Sikh, half-Hindu community in Peshāwar. He believed that God is formless, or *niraṅkār* (hence the name Niraṅkārī).

The chief contribution of the Niraṅkārī movement is its standardization of rituals connected with birth, marriage, and death based on the Sikh scriptures. Its members differ from the orthodox Sikhs in their disapproval of the militant brotherhood, the Khālsā, and in the homage they accord Dayāl Dās and his successors, to whom they accord the status of living Gurū. The headquarters of the sect is at Chandīgarh.

Nirenberg, Marshall Warren (b. April 10, 1927, New York City), U.S. biochemist and Nobel laureate who played a major role in deciphering the genetic code. He demonstrated that, with the exception of "nonsense codons," each possible triplet (called a codon) of four different kinds of nitrogen-containing bases found in deoxyribonucleic acid (DNA) and, in some viruses, in ribonucleic acid (RNA) ultimately causes the incorporation of a specific amino acid into a cell protein.

Nirenberg received his Ph.D. from the University of Michigan in 1957, and that year joined the staff of the National Institutes of Health in Bethesda, Md. His research earned him the National Medal of Science in 1965 and the Nobel Prize for Medicine or Physiology in 1968, which he shared with Robert W. Holley and Har Gobind Khorana.

Nirgal Vallis, sinuous, branching valley located on the planet Mars near 28° S, 42° W. It is roughly 400 km (250 miles) long and 5 km (3 miles) wide. First seen in Mariner 9 spacecraft images, the valley has several tributaries and appears to have been cut by running water. The source of the water, whether from rainfall, snowfall, or groundwater seepage, is controversial. Also contentious is the origin of gullies on the valley's steep walls photographed by the Mars Global Surveyor spacecraft. Some scientists have proposed that they are the result of recent groundwater seepage; others have suggested that they were created by flows of dry or gas-lubricated debris.



Gullies on a south-facing wall of Nirgal Vallis, image by Mars Global Surveyor, July 1999

nirguṇa (Sanskrit: "distinctionless"), concept of primary importance in the orthodox Hindu philosophy of Vedānta, raising the question of whether the supreme being, Brahman, is to be characterized as without qualities (*nirguṇa*) or as possessing qualities (*saguṇa*).

The Advaita (Nondualist) school of Vedānta assumes on the basis of selected passages of the *Upaniṣad*s that Brahman is beyond all polarity and therefore cannot be characterized in the normal terms of human discursive thought. This being the case, Brahman cannot possess qualities that distinguish it from all other magnitudes, as Brahman is not a magnitude but is all.

The fundamental text of this tenet is the *Bṛhadāraṇyaka Upaniṣad* definition of Brahman as *neti-neti* ("not this! not that!" 2.3.6). The scriptural texts that ascribe qualities to Brahman, leading to the conception of a qualified Brahman (*saguṇa*) are, according to the Advaita school, merely preparatory aids to meditations. Others, notably the theistic schools of Vedānta (for example, Viśiṣṭādvaita), argue that God (Brahman) is possessed of all perfections and that the scriptural passages denying qualities deny only imperfect ones.

nirjarā, in Jaina religious belief of India, the destruction of *karman* (merit and demerit). For the soul to achieve *mokṣa*, or liberation from rebirths, the believer must rid himself of existing *karman* and prevent the accumulation of new *karman*. *Nirjarā* is accomplished by such physical and spiritual austerities as fasting, mortification of the body, confession and penance, reverence to superiors, service to others, meditation and study, and indifference to the body and its needs, the last practice in its extreme form leading to self-starvation. The prevention of new *karman* is called *saṃvara* and is accomplished by the observation of moral vows (*vrata*s); control of the activities of body, speech, and mind; care in walking and handling things; and the development of moral virtues and the patient endurance of troubles.

Nirmala, an ascetic order of the Sikhs, a religious group of India. Nirmalas ("those without blemish") at first wore only white garments but later adopted the ochre robes worn by Hindu ascetics and shared some other practices, such as birth and death rites, with Hindus. Like the Udāsī order of Sikh ascetics the Nirmalas carried on missionary activities for the Sikhs and served as *mahant*s (priests) of their temples.

Nirvāṇa (Sanskrit: Extinction, or Blowing Out), Pāli NIBBĀNA, in Indian religious thought, the supreme goal of the meditation disciplines. The concept is most characteristic of Buddhism, in which it signifies the transcendent state of freedom achieved by the extinction of desire and of individual consciousness. According to the Buddhist analysis of the human situation, delusions of egocentricity and their resultant desires bind man to a continuous round of rebirths and its consequent suffering (*dukkha*). It is release from these bonds that constitutes Enlightenment, or the experience of Nirvāṇa.

Liberation from rebirth does not imply immediate physical death; the death of an *arhat* (a perfected person) or a Buddha is usually called the *parinirvāṇa,* or complete Nirvāṇa. In the Mahāyāna Buddhist tradition, the realization of Nirvāṇa is deferred by the *bodhisattva* ("Buddha-to-be") while he continues, out of compassion (*karuṇā*), to work for the salvation of others.

Nirvāṇa is conceived somewhat differently within various schools of Buddhism. In the Theravāda tradition, it is tranquillity and peace. In the schools of the Mahāyāna tradition, Nirvāṇa is equated with *śūnyatā* (emptiness), with *dharma-kāya* (the real and unchanging essence of the Buddha), and with *dharma-dhātu* (ultimate reality).

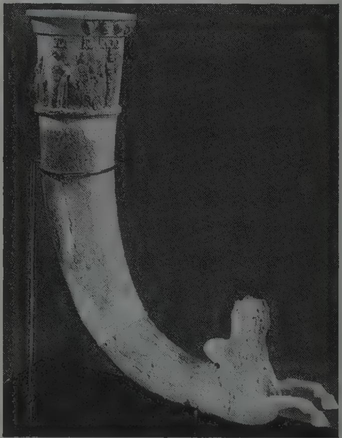
Niš, town in Serbia, Yugoslavia, on the Nišava River. The town is important for its command of the Morava–Vardar and the Nišava River corridors, the two principal routes from central Europe to the Aegean. The main rail line from Belgrade and the north divides at Niš for Thessaloníki, in Greece, and Sofia.

The ancient Roman city, Naissus, which probably succeeded a Celtic settlement, was cited in the 2nd century by Ptolemy, in his *Guide to Geography.* The old fortress on the right bank of the river is believed to have been built on this site. Under its walls, in AD 269, the emperor Claudius II defeated an army of the Goths. Niš is the birthplace of Constantine the Great (*c.* 280). During migrations of the Huns in the 5th century, the town was destroyed, and the Bulgarians conquered it in the 9th century but ceded it in the 11th century to the Hungarians, from whom the Byzantine emperor took it in 1173. Toward the end of the 12th century, the town came under the Serbian Nemanja dynasty, but in 1375 the Turks captured it from the Serbians.

Niš was recovered briefly several times, but Turkish domination lasted for 500 years, and the town became an important station on the route from Istanbul to Hungary. In the first Serbian uprising (1809), the Serbs fired their powder magazine and destroyed themselves and a large number of the enemy; in the ruins of the Turkish-built Ćele Kula (Tower of Skulls) are embedded the skulls of more than 900 of the Serbians who fell at the Battle of Čegar. The Serbs' army liberated Niš in 1877, and the town was ceded to them by the Treaty of Berlin (1878). In World War I, Niš was for a period the capital of Serbia. Heavy bomb damage from World War II and postwar construction erased much of the town's Turko-Byzantine style. Historical buildings include a 5th-century Byzantine crypt.

Industries include textiles, beer, tobacco products, locomotives, household appliances, and electronic materials. A university was opened in 1965; a modern centre for its faculty of medicine was opened in 1977 in the Niška Banje spa just east of Niš. The spa is a centre for the treatment of cardiovascular diseases. Pop. (2000 est.) 182,583.

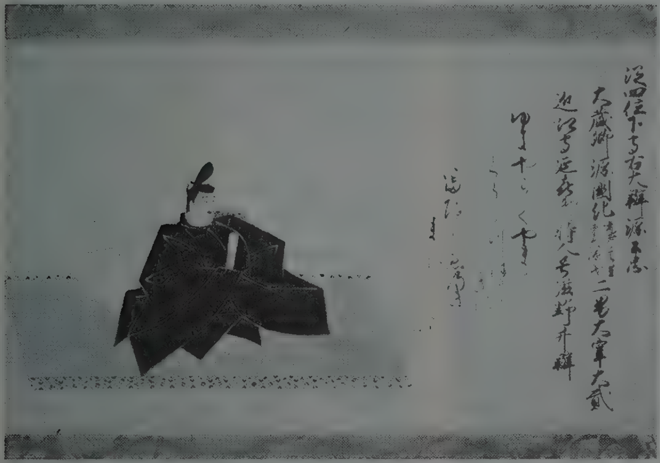
Nisa, also called PARTHAUNISA, first capital of the Parthians, located near modern Ashkhabad in Turkmenistan. Nisa was traditionally founded by Arsaces I (reigned *c.* 250–*c.* 211 BC), and it was reputedly the royal necropolis of the Parthian kings. Excavations at Nisa have revealed substantial buildings, many inscribed documents, and a looted treasury. Also many Hellenistic art works have been uncovered, as well as a large number of ivory rhytons, the outer rims decorated with Iranian subjects or classical mytholog-



Ivory rhyton from Nisa, 2nd–1st century BC; in the Hermitage, St. Petersburg

By courtesy of the State Hermitage Museum, St. Petersburg ical scenes. In fact, almost all the art and architecture at Nisa exhibits a great intermingling of Western and Iranian styles. Nisa was later renamed Mithradatkirt by Mithradates I (reigned 171–138 BC).

nise-e (Japanese: "likeness painting"), form of sketchy portraiture that became fashionable in the court circles of 12th- and 13th-century Japan. Realistic art was originally outside the tradition of Japanese portraiture, which, until the 12th century, was purely religious in character. Alongside the rise of scroll painting, which depicted incidents of real life, a parallel trend in the field of portraiture arose in the second half of the 12th century. The skill of *nise-e* consisted in catching a man's character in a few simple lines, although portraits expressed not so much a feeling for the individual and his characteristics as veneration for his accomplishments. The angular, geometric, almost abstract treatment of robes contrasts strikingly with the realistic treatment of the face.



Nise-e of Minamoto Kintada, one of the 36 poets, from a handscroll by Fujiwara Nobuzane, Kamakura period (1192–1333); in the Freer Gallery of Art, Washington, D.C.

By courtesy of the Smithsonian Institution, Freer Gallery of Art, Washington, D.C.

Fujiwara Takanobu (1142–1205) initiated the trend, and his son, Fujiwara Nobuzane, a courtier and poet like his father, won a great reputation as a painter. His important successors included Shinkai, Tametsugu, Korenobu, Tamenobu, Tametada, and Gōshin.

Nisei (Japanese: "second-born"), second-generation Japanese in the United States. During World War II all persons of Japanese ancestry on the U.S. West Coast were forcibly evacuated from their homes and relocated in inland detention centres as a result of mass hysteria following the Japanese attack on Pearl Harbor (Dec. 7, 1941). The U.S. government claimed it was forced by public hysteria, agitation by the press and radio, and military pressure to establish the War Relocation Authority by executive order (March 18, 1942); this agency administered the mass evacuation.

Under the jurisdiction of the Western Defense Command, during the spring and summer of 1942 110,000 Japanese-Americans (including a number who were still aliens) were placed in 10 war relocation centres located in isolated areas from the Sierra Nevada to the Mississippi River. The sparsely furnished military barracks in these camps afforded meagre "work opportunities" for adults and a minimal education for children. By the time the evacuation was complete, U.S. forces were largely in command of the Pacific and all danger of a possible Japanese invasion had passed. After individual screening at the centres to prove their loyalty, 17,600 Nisei were accepted for service in the U.S. armed forces; many of their units were later cited for bravery.

Demands for redress for the losses and injury suffered by the evacuees during the war were met in 1988 when the U.S. government apologized for the internments and passed legislation providing partial monetary payments to the approximately 60,000 surviving Japanese-Americans who had been interned.

Nīshāpūr (Iran): *see* Neyshābūr.

Nishapur pottery, Islāmic ceramics produced at Nishapur (modern Neyshābūr, Iran) that were of bold style and showed links with Sāssānian and Central Asian work. The style originated in Transoxania, an ancient district of Iran, during the 9th century AD and showed such specific characteristics as black and ochre birds with dashes of white and green. A rougher type portraying human and animal figures against an ornamental background also existed.

Nishi Amane (b. March 7, 1829, Tsuwano, Iwami province, Japan—d. Jan. 30, 1897, Tokyo), philosopher, writer, and publisher who helped introduce Western philosophy, especially British empiricism, to Japan.

After study at the University of Leiden, The Netherlands, he became a professor at Kaieisho College in Tokyo. Together with Mori Arinori (1847–89), later minister of education, Nishi founded the famous Meirokusha publishing house. Its journal featured articles on a wide range of Western philosophers, including Jean-Jacques Rousseau, Montesquieu, Ernst Haeckel, John Stuart Mill, Herbert Spencer, and Henry Buckle. The publishing house also introduced other aspects of Western civilization to Japan.

Nishi not only translated J.S. Mill's *Utilitarianism* but also wrote many commentaries on Western philosophy. He is regarded as the first philosopher to create modern philosophical terminology in Japanese, which permitted Japanese philosophers to compare Oriental and Western thought.

Nishida Kitarō (b. June 17, 1870, near Kanazawa, Ishikawa prefecture, Japan—d. June 7, 1945, Kamakura), Japanese philosopher who exemplified the attempt by the Japanese to assimilate Western philosophy into the Oriental spiritual tradition.

Early life. Nishida's father, Nishida Yasunori, was for a time a teacher of an elementary school among whose few pupils was Kitarō. His mother, Tosa, was a pious devotee of the Jōdo, or True Pure Land, school of Buddhism. Although Nishida's family was descended from a former village landowner, Yasunori ruined his fortune when Kitarō was young, and the entire Nishida family had to move to Kanazawa in 1883. Kitarō entered primary course at Kanazawa Normal School in that year but had to leave on account of sickness in the following year. He was admitted in 1886 into the second class of the high school, and in 1888 he became a student of the Fourth Higher School (junior college).

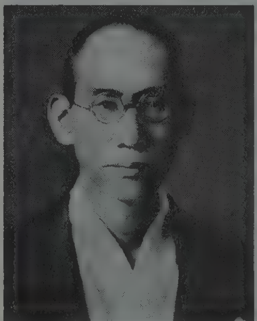
In his boyhood, Nishida took traditional lessons in Chinese from an excellent Confucian teacher, and in his higher school days he was taught by another scholar erudite in Chinese. Another important teacher of Nishida's was Hōjō Takiyoshi, a professor of mathematics of the Fourth Higher School, under whom Nishida had studied mathematics even before he entered high school. This exposure to Chinese culture enriched his life with a lasting Confucian quality and worldview. Later, when Western philosophy and Buddhism (especially Zen Buddhism) were merged in his mature mind, there remained deep within him an undercurrent of Confucian conviction with regard to "the ideal man," "the Way" to good and truth, sincerity, self-negation, and detachment. He and his contemporaries belonged to the last Japanese generation whose education in the Chinese Classics molded their personal character. From his boyhood days, he made several good friends in Kanazawa, among whom was D.T. Suzuki, later an eminent Buddhologist and the main interpreter of Zen Buddhism to the West. Nishida and Suzuki became classmates at higher school, and from that time their mutual spiritual influence continued until Nishida's death.

In his memoirs, entitled "A Certain Professor's Statement upon Retirement (from Kyōto Imperial University, December 1928)," he writes:

> My student days at the Fourth Higher School were the happiest of my life. I was filled with youthful zest. I did anything I wished, heedless of the consequences. As a result I had to leave school before my graduation. At the time I thought it was not necessarily true that one could not achieve anything by studying alone. In fact I thought it would be better to rid myself of the fetters of school and to read freely. But within one year I was prohibited to read any more by my doctor, since I was afflicted with an eye disease. I had to abandon my principle, and went to Tokyo to be a non-regular student of philosophy, in Tokyo University (1891–1894).

At that time in the Faculty of Letters and Law, there were several promising students who later became famous, some as men of letters and others as university professors. Together with them, Nishida appeared at the same lectures but could not form close friendships, as he had done in higher school.

Academic career. After graduation he became a teacher in a middle school near his home (1895). In the following year, he was appointed a lecturer in the Fourth Higher School at Kanazawa, and, after two years as a lecturer and later as a professor at the



Nishida Kitarō

By courtesy of the International Society for Educational Information Tokyo, Inc.

Yamaguchi Higher School in Yamaguchi, he was again appointed as a professor of the Fourth Higher School, teaching psychology, logic, ethics, and German (1899–1909). During his Yamaguchi and Kanazawa teaching periods, he was much engaged in the practice of Zen meditation. Remarks about Zen practice are overwhelmingly conspicuous in his diary of this period. From this effort and through his lectures at the higher school came Nishida's maiden work, *Zen no kenkyū* (1911; *A Study of Good,* 1960). At about this time parts of the book were published in Japanese philosophical journals, and his name as an original philosopher attracted attention in the Japanese philosophical world.

Nishida's philosophy of Nothingness. After one year as professor at Gakushūin University (Tokyo) in 1909, he was appointed associate professor of ethics at Kyōto Imperial University. In 1913 he was appointed professor of philosophy of religion and in 1914 professor of philosophy, a post he held until his retirement in 1928. About the end of his professorship in Kyōto Imperial University, Nishida's philosophy attained its maturity, which can be defined as "the philosophy of the *topos* (place) of Nothingness." In his latter years he delved most deeply into philosophical problems and endeavoured to explain more concrete facts by his logic. Thus his idea of the true reality that overcomes the dichotomy of subjectivity and objectivity (the mind and its objects) in the *topos* of Nothingness became significant, he emphasized, for "historical reality in the historical world." Nishida developed this implication of absolute Nothingness in his *Tetsugakuron bunshū* ("Philosophical Essays"; 7 vol.), which he wrote after his retirement. In his last days, as World War II was coming to an end, looking at the fires of the burning cities in the darkness of night, Nishida was much inspired by the words of the prophets of Israel in the Old Testament. He said that the result of this war might be something that neither the victors nor the vanquished could at that time foresee. He died in 1945 at Kamakura.

Nishida's philosophy was attacked by the nationalists and militarists during World War II because of the Western way of his philosophical thinking. Since then he has been criticized for his loyalty to his nation and for his alleged metaphysical obscurantism by Marxist philosophers and antimetaphysical Rationalist philosophers, but such criticism is decreasing for lack of solid grounds. More philosophically important are the criticisms by Takahashi Satomi and Tanabe Hajime. Takahashi was the first scholar to appreciate and evaluate the distinctively Japanese philosophy in Nishida's *Zen no kenkyū,* and later he contributed his critical investigation of Nishida's philosophy in its mature form. Tanabe, Nishida's disciple, who succeeded him in the chair of professor of philosophy at Kyōto Imperial University (1927–45), contributed valuable criticism from his own philosophical point of view.

The stages of Nishida's thought. Nishida says in his memoirs that he thought of his life in terms of a change of position with the blackboard as an axis; in the first half of his life he sat at a desk facing the blackboard, while in the latter half he sat with the blackboard behind him. Continuing this metaphor, it may be said that in the third stage, represented by his philosophy of the *topos* of Nothingness, he wished to relinquish both positions, whether in front of or behind the blackboard, so that he and his logic became chalk on the blackboard of the historical world. In Nishida's philosophy, each stage has its independent value. Like a series of vortexes floating on the stream when two (*i.e.,* Western and Eastern) rivers converge, each closes its own circle. The preceding system should not be replaced by the later, even if they flow successively.

In the first stage of his philosophy, Nishida derived his basic insights from his long, concentrated practice of Zen. He was also much inspired by William James's philosophy and psychology and tried to interpret his own basic insights philosophically with the use of psychological concepts borrowed from James. The opening page of Nishida's *Zen no kenkyū* indicates the general direction of his thought:

> To experience means to know events precisely as they are. It means to cast away completely one's attitude of discriminative reflection, and to know in accordance with the events. Since people include some reflection even when speaking of experience, the word "pure" is here used to signify a condition of true experience itself without the addition of the least thought or reflection. For example, it refers to that moment of seeing a color or hearing a sound which occurs not only before one has added the judgment that this seeing or hearing relates to something external or that one is feeling this sensation, but even before one has judged what color or what sound it is. Thus, *pure experience* is synonymous with *direct experience.* When one experiences directly one's conscious state there is as yet neither subject nor object, and knowledge and its object are completely united. This is the purest form of experience.

The concept of pure experience expounded here is the Western philosophical mold into which Nishida poured his own religious experience cultivated by his Zen training. As it is beyond the dichotomy of subject and object, so it is far removed from the difference of whole and part. The whole universe is, as it were, crystallized into one's own being. In the total activity of one's own pure and alert life, one's entire being becomes transparent, so that it reflects, as in a mirror, all things as they become and also participates in them. This is "to know in accordance with the events." The profoundness of reality, the directness of one's experience of reality, a dynamic system developing itself in the creative stream of consciousness—these are the characteristic motifs of Nishida's philosophy, all suggesting where his thinking was ultimately rooted.

According to Nishida, judgment is formed by analysis of the intuitive whole. For instance, the judgment that a horse runs is derived from the direct experience of a running horse. The truth of a judgment is grounded on the truth of the original intuitive whole from which the judgment is formed through the dichotomy of subject and predicate or that of subject and object. For the establishment of its truth a judgment is, through its dichotomy itself, referred back to intuition as its source, because intuition is here considered a self-developing whole, similar to Hegel's Notion (*Begriff*). As Hegel says, "All is Notion," or "All is judgment," so could Nishida say, "All (reality) is intuition," or "All reality is immediate consciousness." For this is practically the import of his dictum, "Consciousness is the Unique Reality."

Influence of Neo-Kantian thought. In the second stage of his philosophy, Nishida was under the influence of the philosophy of Henri Bergson, a French philosopher, which he tried to synthesize with a Neo-Kantian type of German thought that was then prevalent in Japanese philosophical circles. He thus entered the second stage of his thinking, the result of which was incorporated into a book entitled *Jikaku ni okeru chokkan to hansei* (1917; "Intuition and Reflection in Self-Consciousness"). His basic notion did not undergo any change, but he tried to express what he once called pure experience in a different way. Neo-Kantian influence led him to eliminate from his thought all psychological terms and to follow strictly the path of logical thinking to the end. Actually, however, he found himself standing at the end of a blind alley, where he came up against something that was impenetrable to his logic. "After a long struggle with the Unknowable my logic itself bade me surrender to the camp of mysticism," so he himself says in the preface. Thus the self as the unity of thought and intuition acquires a mystical background. It is pure activity but ultimately finds itself in the abyss of darkness, enveloping every light of self-consciousness. This darkness, however, is "dazzling obscurity" giving the self the unfathomable depth of meaning and being. The self is thus haloed with a luminous darkness.

The third stage of Nishida's philosophy was marked by a reversal of his whole procedure, as is shown in his *Hataraku mono kara miru mono e* (1927; "From the Acting to the Seeing Self"). Whereas he had always made the self the starting point for his philosophical thinking, he now parted definitely with Transcendental Idealism or, rather, broke through it to find behind it a realm of reality corresponding to his own mystical experience. This may be called the realm of Non-self, or Nothingness, which should not be confused with the non-self of Idealism as the realm of the objective over against that of the subjective, or with annihilating nothingness of Sartre's Existentialism. The "Non-self" of Nishida is the ultimate reality where all subject–object cleavage is overcome. In accordance with Buddhist tradition he called it "Nothingness" and sought to derive the individual reality of everything in the world, whether it be a thing or a self, from the supreme identity of Nothingness. The Idealist "pure self," as the universal consciousness or consciousness in general, is still abstract, while the "Non-self" of Nishida establishes itself as true individuality in the absolute Nothingness, which includes, not excludes, the individual reality of the thing-in-itself (the ultimate reality of things). Indeed, the problem of the individual now became Nishida's chief concern. In his quest for its solution he made an intensive study of Greek philosophy, especially Plato and Aristotle.

He found the thinking of these philosophers to be relatively free from the cleavage of subject and object, in comparison with modern Western philosophy, which always presupposes, consciously or unconsciously, the *cogito* (the thinking subject) as the starting point of thought. The ontology of Plato and Aristotle rather makes a logic of reality reveal itself, a logic that explains the world of reality as seen from within. Whether "explaining" or "seeing," such a logic is to be understood as an act taking place in the world of reality itself. Nishida seeks thus to clarify the significance of the individual and the universal from the viewpoint of the Absolute Nothingness. Thus he propounds that Nothingness or *mu* is the universal that is to be sought behind the predicate as the universal concept and, at the same time, is the abyss of Nothingness in which the self as the individual is crystalized. He developed the idea of the "*topos* of Nothingness," adopting the concept of *topos* from Plato's *Timaeus* and from this time on Nothingness is explained as the uniqueness of the *topos.*

In the fourth stage of the development of his thought, Nishida applied the idea of the *topos* of Nothingness to the explanation of his "historical world." (Y.T.)

BIBLIOGRAPHY. Shimomura Toratarō, "Nishida Kitaro and Some Aspects of His Philosophical Thought," the preface to Nishida's *A Study of Good* (1960), gives an excellent description of the development of Nishida's thought, especially the early period, when Japan was undergoing westernization. Valdo H. Viglielmo, "Nishida Kitaro, The Early Years," in *Tradition and Modernization in Japanese Culture,* ch. 13 (1971), goes into details of Nishida's younger days (until 1903). David A. Dilworth, "The Initial Formations of 'Pure Experience' in Nishida Kitaro and William James," in *Monumenta Nipponica,* 24:93–111 (1969), treats the influence of William James on Nishida's thought. See also the same author's "The Range of Nishida's Early Religious Thought: Zen no Kenkyū," *Philosophy East and West,* 19:409–421 (1969); and "Nishida's Final Essay: The Logic of Place and Religious World-View," *ibid.,* 20:355–367 (1970); and Nōda Matao, "East–West Syntheses in Kitarō Nishida," *ibid.,* 4:345–359 (1955), which compares Nishida's later thought with the philosophical ideas of Whitehead.

The following works of Nishida are available in English translation. *A Study of Good,* trans. by Valdo H. Viglielmo (1960), is Nishida's maiden work, which gives a well-balanced treatment of philosophical problems. *Intelligibility and the Philosophy of Nothingness,* trans. by Robert Schinzinger (1958), and *Fundamental Problems of Philosophy,* trans. by David A. Dilworth (1970), include introductory remarks on Nishida's life and work. See also "Nishida Kitarō: The Problem of Japanese Culture," trans. by Abe Masao in *Sources of the Japanese Tradition,* pp. 857–872 (1958); and Gino K. Piovesana, *Recent Japanese Philosophical Thought, 1862–1962* (1963).

Nishikawa Sukenobu, byname MAGOUEMON (b. 1671, Kyōto—d. Aug. 20, 1750, Kyōto), Japanese painter of the Ukiyo-e school of popular, colourful paintings and prints, who also was a book designer of the Kyōto–Ōsaka area. Nishikawa studied painting with masters of two schools, the Kanō (stressing Chinese subjects and techniques) and the Japanese-oriented Tosa. Eventually, however, he was influenced by Ukiyo-e painters, especially Hishikawa Moronobu (died 1694). In his time Edo (now Tokyo) was already considered the centre of Ukiyo-e, and that school's prints were often referred to as Edo-e or Edo paintings and prints.

"Kesho suru onna" ("Woman Making-up"), painting by Nishikawa Sukenobu; in the Atami Art Museum, Japan

By courtesy of the Atami Art Museum, Japan

Nishikawa established his own school of Ukiyo-e and gathered numerous pupils in the Kyōto area, where the classical tradition predominated. His style was graceful and sensuous, and it influenced many Edo artists, such as the late 18th-century painters Suzuki Harunobu and Ishikawa Toyonobu. He was a prolific artist, particularly known for his diverse kimono designs. The two-volume illustrated book *Hyakunin jorō shinasadame* ("One Hundred Types of Women") is one of his masterpieces.

nishiki-e, Japanese polychrome woodblock prints of the Ukiyo-e (*q.v.*) school that were first made in 1765. The invention of the technique is attributed to Kinroku, and its greatest early master was Suzuki Harunobu.

Nishinomiya, city, Hyōgo Prefecture (*ken*), Honshu, Japan, at the mouth of the Muko-gawa (Muko River) on the Inland Sea. It is part of the Hanshin Industrial Region. The city occupies a narrow lowland between Ōsaka-wan (Ōsaka Bay) and interior Rokkō-zan (Mt. Rokkō). Nishinomiya is famed for its fine sake (rice beer). Its coastal areas are assigned to industry (metals, machinery, chemicals, rubber goods, soap, cosmetics, and beer). The city has a professional baseball stadium and has excellent railway and road connections with adjacent urban areas. Pop. (1990) 426,919.

Nishio, city, Aichi Prefecture (*ken*), Honshu, Japan, on the lower reaches of the Yahagi-gawa (Yahagi River). Nishio was a castle town and commercial centre during the Tokugawa era (1603–1867). The opening of two railways through the city in 1911 and 1928 resulted in the establishment of industry, particularly the manufacture of textiles and metal castings. Tea is cultivated on Inari-yama (Mt. Inari) in the western part of the city. Pop. (1990) 95,198.

Nishiyama Sōin, original name NISHIYAMA TOYOICHI (b. 1605, Higo Province, Japan—d. May 5, 1682, Kyōto?), *renga* ("linked-verse") poet of the early Tokugawa period (1603–1867) who founded the Danrin school of haikai poetry. Sōin's haikai (comical *renga*) became the transition between the light and clever haikai of Matsunaga Teitoku and the more serious and aesthetic haiku of Matsuo Bashō.

In his youth Sōin was a samurai retainer for a daimyo in Kyushu, but his lord encouraged him to develop his literary talents. In 1622 Sōin went to Kyōto and by 1633 he was a professional *renga* poet. His interest in haikai was slow to develop, and it was not until 1673 that his first anthology of haikai, *Sōin senku* ("One Thousand Verses by Sōin") was published.

The poems in this volume, although written in the Teitoku style, demonstrated a higher degree of sophistication than the earlier haikai. Young students—including Ihara Saikaku and Okanishi Ichū—who were dissatisfied with the old school flocked to Sōin's Danrin school. His numerous volumes of poetry include *Sōin gohyakku* (1676; "Five Hundred Verses by Sōin") and *Baiō Sōin hokku shū* (1681; "The Collected Hokku [Haiku] of the Plum Old Gentleman Sōin").

INDEX
first

Nisibis, School of, intellectual centre of East Syrian Christianity (the Nestorian Church) from the 5th to the 7th century. The School of Nisibis (now Nusaybin, Tur.) originated soon after 471, when Narsai, a renowned teacher and administrator at the School of Edessa, and his companions were forced to leave Edessa (modern Urfa, Tur.) because of theological disputes. Under Narsai's directorship (471–496), a number of former teachers and students from the School of Edessa were enlisted in the new institution; they gave shape to Christianity according to the Nestorian creed, which so stressed the independence of the divine and human natures of Christ that the natures seemed in effect two persons loosely joined in a moral union.

The school experienced tremendous growth during Abraham de Bet Rabban's tenure (until *c.* 569) as director. Its teachers wrote in the fields of literature, history, philology, and theology, as well as translating from Greek into Syriac. The school gained renown in the West and became a major centre of education for members of the clergy and hierarchy. It was primarily through Syriac translations that the Arabs became acquainted with Greek thought.

The Nestorian theology of the school, however, was undermined by the administration of Ḥenānā (*c.* 570–*c.* 609), who preferred Origen (a Christian theologian who flourished in the early 3rd century) to Theodore of Mopsuestia, the recognized Nestorian authority. Ḥenānā's views led to a revolt by students, and the director required royal support to maintain his position.

The only outstanding figure after Ḥenānā was Surin, who held office for some time in the second quarter of the 7th century. His literary work must have created considerable attention, and its vitality sustained the school in its subsequent history of decline, especially in the areas of historiography and monastico-historical inquiry. The school was unable to retain its preeminence among other schools and was superseded by the school of Seleucia-Ctesiphon.

niṣprapañca (Sanskrit), in the Mādhyamika and Vijñānavāda schools of Buddhist philosophy, ultimate reality. *See* prajñapti.

Nissaba, in Mesopotamian religion, Sumerian deity, city goddess of Eresh on the ancient Euphrates River near Erech in the farming regions; she was goddess of the grasses in general, including the reeds and the cereals. As goddess of the reeds and provider of the reed stylus used by the scribes, she became the patroness of writing and the scribal arts, particularly of accounting.

Nissan Motor Co., Ltd., Japanese NISSAN JIDŌSHA KK, Japanese industrial corporation that manufactures automobiles, trucks, and buses under the names Nissan and Datsun. The company also designs and manufactures such products as communications satellites, pleasure boats, and machinery. Headquarters are in Tokyo.

The company originated in two earlier companies—Kwaishinsha Co. (founded in 1911 to produce Dat cars) and Jitsuyo Jidōsha Co. (founded in 1919)—which merged in 1925 to form Dat Jidōsha Seizō Co. In 1933 the assets of this company were taken over by new investors, who established the Jidōsha Seizō Co., Ltd., giving it its present name the following year. The new company was engaged in the production and sale of vehicles and parts under a new name, Datsun.

During the war years (from 1938) the company converted entirely to production of trucks and military vehicles. In 1945 the Allied occupation forces seized the main Nissan plants; though allowing production of Nissan and Datsun vehicles to resume at one plant, they did not restore all other facilities to Nissan until 1955. Thereafter, especially during the 1960s, when Nissan entered the world market, production and sales grew phenomenally. The company is engaged in joint ventures abroad, and Nissan has established assembly plants in several foreign countries, including Australia, Peru, Mexico, the United States, and Germany.

Nistrul River (Ukraine and Moldova): *see* Dniester River.

Nisus, in Greek mythology, a son of King Pandion of Megara. His name was given to the Megarian port of Nisaea. Nisus had a purple lock of hair with magic power: if preserved, it would guarantee him life and continued possession of his kingdom. When King Minos of Crete besieged Megara, Nisus' daughter Scylla fell in love with Minos (or, in some accounts, was bribed): she betrayed her city by cutting off her father's purple lock. Nisus was killed (or killed himself) and became transformed into a sea eagle. Scylla later drowned, possibly at the hand of Minos, and was changed into a sea bird (Greek *keiris,* Latin *ciris*), possibly a heron, constantly pursued by the sea eagle.

NIT (basketball): *see* National Invitation Tournament.

Niten (Japanese artist): *see* Miyamoto Musashi.

niter: *see* saltpetre.

Niterói, city, Rio de Janeiro *estado* ("state"), eastern Brazil. It lies on the eastern side of the entrance to Guanabara Bay. The city of Rio de Janeiro on the opposite side is connected to Niterói by ferry, railroad, and, since 1974, the President Costa e Silva Bridge, spanning Guanabara Bay; this is one of the longest bridges in Brazil. Both cities are located on low ground at the heads of inlets, many of which indent the shores, with various sections separated by steep rocky ridges extending into the bay.

Icarai Beach on Guanabara Bay, Niterói, Braz.

Walter Aguiar

Founded in 1671, the settlement became a village in 1819, with the name of Villa Real da Praia Grande. It was made the capital of Rio de Janeiro state in 1835, the year after the city of Rio de Janeiro and the Federal District were separated from Rio de Janeiro state. In 1836 it became a city and was renamed Niterói (or Nictheroy, from an Indian term meaning "hidden water"). It lost its capital status temporarily in 1894–1903 to Petrópolis and permanently from 1975 to the city of Rio de Janeiro.

Niterói is a residential suburb of the city of Rio de Janeiro and is well developed industrially. It is the site of Brazil's chief shipbuilding and ship-repair yards and has metal and machinery industries, pharmaceutical and food-processing plants, and textile mills. It is also the seat of the Fluminense Federal University (1960). Pop. (2000 prelim.) 458,465.

Nithard (b. 790?—d. June 14, 844), Frankish count and historian whose works, utilizing important sources and official documents, provide an invaluable firsthand account of contemporary events during the reign of the West Frankish king Charles II.

A son of Charlemagne's daughter Bertha and the renowned poet and imperial chancellor Angilbert, Nithard was reared at court. On the death of the emperor Louis I the Pious (840), he became counselor to the youngest of Louis's sons, Charles II the Bald. Failing to prevent a civil war, Nithard fought for Charles in the Battle of Fontenoy (841) against Lothair I, Charles's eldest half brother. In the same year Charles requested that Nithard write an account of recent events. The resulting four-volume *Historiae* or *De dissensionibus filiorum Ludovici pii* ("On the Dissensions of the Sons of Louis the Pious") deals with the discord between the sons of Louis during the years 840–843.

In 843 Charles made Nithard lay abbot of Saint-Riquier, a position he held for only a few months before he died in a battle against the forces of Pepin II of Aquitaine.

Nithsdale, valley of the River Nith, Dumfries and Galloway region, southwestern Scotland. It comprises the western part of the historic county of Dumfriesshire and a small portion of eastern Kirkcudbrightshire. The valley's upper end lies along the border with Ayrshire, where the Nith flows through a gap in the Southern Uplands. Nithsdale broadens southeastward toward the lowland along the Solway Firth. Sheep are bred in the hills and fattened in the lowland. Dumfries, on the Nith, is the region's largest town and commercial and administrative centre.

Nitra, German NEUTRA, Hungarian NYITRA, town, Západní Slovensko *kraj* (region), Slovakia. It lies along the Nitra River.

The centre of the Nitra principality in the beginning of the 9th century, it was later a stronghold and religious centre. The first Christian church in what is now Slovakia was established there in AD 830 and consecrated by Saints Cyril and Methodius. Town privileges were acquired in 1248. The town's dominant features are still the old fortification gate, above which the Zobor (a hill 1,929 feet [588 m] high) rises to the north, and the medieval castle enclosure, which includes the cathedral.

Nitra is an important road junction and a food-processing centre for the farming area to the south. Nitra's College of Agriculture was founded in 1946. Pop. (1998 est.) 87,548.

nitrate, any member of either of two classes of compounds derived from nitric acid. The salts of nitric acid are ionic compounds containing the nitrate ion, NO_3^-, and a positive ion, such as NH_4^+ in ammonium nitrate. Esters of nitric acid are covalent compounds having the structure $R—O—NO_2$, in which R represents an organic combining group, such as ethyl (C_2H_5) in ethyl nitrate. *See also* nitro compound.

nitrate and iodate minerals, small group of naturally occurring inorganic compounds that are practically confined to the Atacama Desert of northern Chile; the principal locality is Antofagasta. These minerals occur under the loose soil as beds of grayish caliche (a hard cemented mixture of nitrates, sulfates, halides, and sand) 2–3 m (7–10 feet) thick. The much rarer iodate minerals occur sporadically, intermixed with the nitrates, and are distinguished from the former by their yellow colour. The caliche has accumulated as a result of drainage. Because most of these compounds are soluble and unstable, they are practically confined to arid regions and soils, which possess a paucity of microorganisms.

Before World War I, Chile possessed a near monopoly on nitrates, with as many as 100 plants in operation. The introduction of practical methods for the fixation of nitrogen early in the 20th century resulted in a decline of the marketing of natural nitrates.

The nitrate and iodate minerals are structurally related to the carbonate minerals. The most important nitrates are soda nitre, nitre (saltpetre), darapskite, and humberstonite. Among the iodates are lautarite and dietzeite.

nitre: *see* saltpetre.

nitric acid (HNO_3), colourless, fuming, and highly corrosive liquid (freezing point −42° C [−44° F], boiling point 83° C [181° F]) that is a common laboratory reagent and an important industrial chemical for the manufacture of fertilizers and explosives. It is toxic and can cause severe burns.

The preparation and use of nitric acid were known to the early alchemists. A common laboratory process used for many years, ascribed to a German chemist, Johann Rudolf Glauber (1648), consisted of heating potassium nitrate with concentrated sulfuric acid. In 1776 Antoine-Laurent Lavoisier showed that it contained oxygen, and in 1816 Joseph-Louis Gay-Lussac and Claude-Louis Berthollet established its chemical composition.

The principal method of manufacture of nitric acid is the catalytic oxidation of ammonia. In the method developed by the German chemist Wilhelm Ostwald in 1901, ammonia gas is successively oxidized to nitric oxide and nitrogen dioxide by air or oxygen in the presence of a platinum gauze catalyst. The nitrogen dioxide is absorbed in water to form nitric acid. The resulting acid-in-water solution (about 50–70 percent by weight acid) can be dehydrated by distillation with sulfuric acid.

Nitric acid decomposes into water, nitrogen dioxide, and oxygen, forming a brownish yellow solution. It is a strong acid, completely ionized into hydrogen and nitrate ions in aqueous solution, and a powerful oxidizing agent (one that acts as electron acceptor in oxidation-reduction reactions). Among the many important reactions of nitric acid are: neutralization with ammonia to form ammonium nitrate, a major component of fertilizers; nitration of glycerol and toluene, forming the explosives nitroglycerin and trinitrotoluene, respectively; preparation of nitrocellulose; and oxidation of metals to the corresponding oxides or nitrates.

nitric oxide (NO), colourless, toxic gas, formed from nitrogen and oxygen by the action of electric sparks or high temperatures or, more conveniently, by the action of dilute nitric acid upon copper or mercury. It was first prepared about 1620 by the Belgian scientist Jan Baptist van Helmont, and it was first studied in 1772 by the English chemist Joseph Priestley, who called it "nitrous air."

Nitric oxide liquefies at −151.8° C (−241.2° F) and solidifies at −163.6° C (−262.5° F); both the liquid and the solid are blue in colour. The gas is almost insoluble in water, but it dissolves rapidly in a slightly alkaline solution of sodium sulfite, forming the compound sodium dinitrososulfite, $Na_2(NO)_2SO_3$. It reacts rapidly with oxygen to form nitrogen dioxide, NO_2. Nitric oxide is one of the few stable compounds containing an odd number of electrons; it can gain or lose one electron to form the ions NO^- or NO^+, which are present in the nitrosyls, compounds somewhat similar to the carbonyls formed from carbon monoxide and transition metals.

An industrial procedure for the manufacture of hydroxylamine is based on the reaction of nitric oxide with hydrogen in the presence of a catalyst. The formation of nitric oxide from nitric acid and mercury is applied in a volumetric method of analysis for nitric acid or its salts.

nitride, binary compound of nitrogen with a more electropositive element, such as boron, silicon, and most metals. Certain metal nitrides are unstable, and most react with water to form ammonia and the oxide or hydroxide of the metal; but the nitrides of boron, vanadium, silicon, titanium, and tantalum are very refractory, resistant to chemical attack, and hard—and thus are useful as abrasives and in making crucibles. Nitrides are formed during a process for hardening the surface of steel objects by heating them with ammonia at temperatures usually between 950° and 1,050° F (500° and 550° C) for 5 to 100 hours, depending on the depth of hardened case desired. *See also* surface hardening.

nitrifying bacterium, plural NITRIFYING BACTERIA, any of a small group of aerobic bacteria (family Nitrobacteraceae) that use inorganic chemicals as an energy source. They are microorganisms that are important in the nitrogen cycle as converters of soil ammonia to nitrates, compounds usable by plants. The nitrification process requires the mediation of two distinct groups:

bacteria that convert ammonia to nitrites (*Nitrosomonas, Nitrosospira, Nitrosococcus,* and *Nitrosolobus*) and bacteria that convert nitrites (toxic to plants) to nitrates (*Nitrobacter, Nitrospina,* and *Nitrococcus*). In agriculture, irrigation with dilute solutions of ammonia results in an increase in soil nitrates through the action of nitrifying bacteria.

See also nitrogen cycle.

nitrile, also called CYANO COMPOUND, any of a class of organic compounds having molecular structures in which a cyano group ($-C{\equiv}N$) is attached to a carbon atom (C). Nitriles are colourless solids or liquids with distinctive odours.

Acrylonitrile is produced in large quantities by a process called ammoxidation that depends on the oxidation of propylene in the presence of ammonia and a catalyst. Acrylonitrile constitutes an important component of several polymeric substances, including the acrylic textile fibres and synthetic rubbers and thermoplastic resins.

Some nitriles are manufactured by heating carboxylic acids with ammonia in the presence of catalysts. This process is used to make nitriles from natural fats and oils, the products being used as softening agents in synthetic rubbers, plastics, and textiles and for making amines. Nitriles are also formed by heating amides with phosphorous pentoxide. They can be reduced to primary amines through the action of lithium aluminum hydride or hydrolyzed to carboxylic acids in the presence of either an acid or a base.

nitrite, any member of either of two classes of compounds derived from nitrous acid. Salts of nitrous acid are ionic compounds containing the nitrite ion, NO_2^-, and a positive ion such as Na^+ in sodium nitrite ($NaNO_2$). Esters of nitrous acid are covalent compounds having the structure $R-O-N-O$, in which R represents a carbon-containing combining group such as ethyl (C_2H_5) in ethyl nitrite. These covalent nitrites are isomers of the nitro compounds—*e.g.,* nitroethane—which are considered to be derivatives of nitric acid rather than of nitrous acid.

Nitrites usually are prepared by absorption of nitric oxide and nitrogen dioxide in an alkaline solution. In an older method, sodium nitrate was fused with lead, and the resulting sodium nitrite was dissolved in water and separated from the by-product, lead oxide, by filtration. Nitrites are used as food preservatives and in medicine as vasodilators to relieve cardiac pain. *See also* nitroso compound.

nitro compound, any of a family of chemical compounds in which the nitro group ($-O-N{=}O$) forms part of the molecular structure. The most common examples are organic substances in which a carbon atom is linked by a covalent bond to the nitrogen atom of the nitro group. Nitro compounds are polar, and those with no other chemically reactive grouping are colourless or pale yellow liquids that are only slightly soluble in water. Many nitro compounds are commercially produced for use as explosives, solvents, or chemical intermediates (substances valued as raw materials in further chemical processing).

A nitro compound ordinarily is made by the reaction, called nitration, between nitric acid and an organic compound. Nitration of aromatic compounds, such as benzene or toluene, is commonly effected by treating them with a mixture of nitric and sulfuric acids at temperatures of 100° C or lower. These temperatures are not high enough for nitrating aliphatic compounds; propane, however, is commercially converted to a mixture of nitromethane, nitroethane, 1-nitropropane, and 2-nitropropane by allowing it to react with nitric acid vapours at temperatures of about 400° C. The mixture is then separated into its components by fractional distillation.

The most important reaction of aromatic nitro compounds is their reduction, which can be brought about by a wide variety of agents. Under acidic conditions, reduction almost always produces an amine. In neutral media, reduction may yield a hydroxylamine. In alkaline solution, compounds containing nitrogen-to-nitrogen bonds (azo, hydrazo, or azoxy compounds) are formed.

nitrobenzene, the simplest aromatic nitro compound, having the molecular formula $C_6H_5NO_2$. It is used in the manufacture of aniline, benzidine, and other organic chemicals. Nitrobenzene is a colourless to pale yellow, oily, highly toxic liquid with the odour of bitter almonds.

Nitrobenzene was first prepared in 1834 by the German chemist Eilhardt Mitscherlich, who treated benzene with fuming nitric acid. Commercially, both batch and continuous processes employing mixed nitric and sulfuric acids are used to make nitrobenzene.

Nitrobenzene undergoes nitration, halogenation, and sulfonation much more slowly than does benzene. It may be reduced to a variety of compounds, depending on the reaction conditions. Most nitrobenzene produced is reduced to aniline; smaller amounts are converted to azobenzene, hydrazobenzene (the intermediate for benzidine), and phenylhydroxylamine. Reduction of both the nitro group and the benzene ring affords cyclohexylamine. Nitrobenzene is used as a mild oxidizing agent in the syntheses of quinoline and fuchsin.

nitrocellulose, also called CELLULOSE NITRATE, a mixture of nitric esters of cellulose, and a highly flammable compound that is the main ingredient of modern gunpowder. Nitrocellulose is a fluffy white substance that retains some of the fibrous structure of untreated cellulose. It is not stable to heat, and even carefully prepared samples will ignite on brief heating to more than about 150° C (300° F). When nitrocellulose decomposes, it forms products that catalyze further decomposition; this reaction, if not stopped in time, results in an explosion.

In 1838 T.-J. Pelouze discovered that cotton could be made explosive by dipping it in concentrated nitric acid. C.F. Schönbein in 1845 improved the manufacturing method by dipping cotton in a mixture of nitric and sulfuric acids and then washing the substance to remove the excess acid. The form of nitrocellulose known as guncotton came into use as an ingredient of gunpowder in the 1860s. The early history of its use was punctuated by many disastrous explosions, however, and in 1868 Sir Frederick Augustus Abel showed that the methods then prevalent for washing nitrocellulose after nitration did not remove enough acid. Paul Vieille added special stabilizers to nitrocellulose to neutralize the catalytically active decomposition products; the first stable and reliable propellant, smokeless powder, resulted from his work and became the main form of gunpowder.

The manufacturing process uses either cotton linters or wood pulp as the source of cellulose. These materials are treated in a mixture of nitric and sulfuric acid at a ratio of one part cellulose to 30 parts acid. Most of the spent acid is removed by centrifuging the moist nitrocellulose, which is washed in a large quantity of water and is then subjected to boiling in acidified water to eliminate the remaining unstable by-products of nitration. The material is then pulped to disintegrate the cellulose fibres, and a subsequent washing removes the last traces of acid. Wood pulp is the preferred material for nitrocellulose used as a gun propellant.

If cotton is treated until almost all of the cellulose molecules' hydroxyl groups have been esterified but the molecules' structure has not yet been broken down, the result is guncotton. This form of nitrocellulose has more than 13 percent nitrogen and is soluble in acetone but not in ether and alcohol. It is used for propellants, either alone or combined with nitroglycerin.

Less completely nitrated celluloses are called collodion cotton or pyroxylin and are inferior to guncotton in explosive properties. Collodion with a nitrogen content of not more than 12 percent is used chiefly for lacquers and celluloid plastics. Materials with a nitrogen content of about 11.5 percent were once used as artificial silk but have been replaced by other materials such as viscose rayon. This same material was used for manufacturing photographic film until safety film made of cellulose acetate plastics became popular.

nitrogen (N), nonmetallic element of Group Va of the periodic table. It is a colourless, odourless, tasteless gas that is the most plentiful element in the Earth's atmosphere, and a constituent of all living matter.

A treatment of nitrogen follows. For additional treatment, *see* MACROPAEDIA: Chemical Elements.

Daniel Rutherford, a medical student in Edinburgh, is usually credited with the discovery of nitrogen (1772) because he was first to publish his findings; but in England the chemists Joseph Priestley and Henry Cavendish and in Sweden the chemist Carl Wilhelm Scheele also discovered it about the same time. The French chemist Antoine Lavoisier first recognized the gas as an element and named it azote because of its inability to support life (Greek *zōē,* "life"). The present name (from "nitre" plus the suffix "-gen," thus "nitre-forming") was coined in 1790 to indicate the presence of the element in nitre (ordinary saltpetre, or potassium nitrate, KNO_3).

Occurrence, properties, and uses. Among the elements, nitrogen ranks sixth in cosmic abundance. It occurs in the Earth's atmosphere to the extent of 78 percent by volume, or about 75 percent by weight. Free nitrogen also is found in many meteorites; in gases of volcanoes, mines, and some mineral springs; in the Sun; and in some stars and nebulae. In combination it is found in the minerals nitre and Chile saltpetre (sodium nitrate, $NaNO_3$); in the atmosphere, rain, soil, and guano as ammonia and ammonium salts; in seawater as ammonium (NH_4^+), nitrite (NO_2^-), and nitrate (NO_3^-) ions; and in living organisms as complex organic compounds such as proteins.

Animals obtain the nitrogen of their tissue proteins from vegetable or other animal proteins of food. Plants synthesize their proteins from inorganic nitrogen compounds from soil and to some extent from uncombined nitrogen in the air. A bacterium living in the roots of leguminous plants, such as peas, beans, clover, alfalfa, and peanuts, assimilates atmospheric nitrogen. Certain free-living anaerobic bacteria and blue-green algae also can extract nitrogen from the air. Other microorganisms in soils convert ammonium salts to nitrates. Lightning and sunlight cause a limited amount of nitrogen to combine with atmospheric oxygen, forming several oxides that are conveyed by rain in the form of nitric and nitrous acids to the soil, where they are neutralized, becoming nitrates and nitrites. The nitrogen content of cultivated soil is generally enriched and renewed artificially by fertilizers containing nitrates and ammonium salts. Excretion and decay of animals and plants return nitrogen compounds to the soil and air, and some bacteria in soil decompose nitrogen compounds and return the element to the air.

Inhaled nitrogen dissolves slightly in the blood and in other body fluids; under increased pressure, the amount dissolved is greater. The bends, or decompression sickness, is caused mainly by bubbles of nitrogen coming out of solution in the bloodstreams of persons such as divers, aviators, and those who work in deep caissons on whom the air pressure has been reduced too quickly.

Commercially, nitrogen is prepared almost entirely by the fractional distillation of liquid air. Nitrogen, which has a lower boiling point (−195.8° C, or −320.4° F) than oxygen (−183.0° C, or −297.4° F), tends to evaporate first. On a small scale, pure nitrogen is made from its compounds, for example, by heating ammonium nitrite, NH_4NO_2, or barium azide, $Ba(N_3)_2$.

Chemically, nitrogen gas is quite inert, especially at ordinary temperatures. Owing to its inertness, nitrogen gas is utilized in the chemical industry as a diluent or as a blanket to exclude oxygen and moisture. The low temperature (and inertness) of nitrogen in the liquid state make it suitable for freeze-drying food and as a refrigerant when transporting perishable commodities. Liquid nitrogen also has proved useful in cryogenic research.

Natural nitrogen on Earth consists of a mixture of two stable isotopes, nitrogen-14 (99.63 percent) and nitrogen-15 (0.37 percent). The first artificially induced nuclear transmutation was reported (1919) by a British physicist, Ernest Rutherford, who bombarded nitrogen-14 with alpha particles to form oxygen-17 nuclei and protons. Three other radioactive isotopes are known: nitrogen-12, nitrogen-13, and nitrogen-16.

Compounds. Most elemental nitrogen is consumed in the manufacture of nitrogen compounds.

Large quantities of nitrogen are used together with hydrogen to produce ammonia, NH_3, a colourless gas with a pungent, irritating odour. The chief commercial method of synthesizing ammonia is the Haber-Bosch process (*q.v.*). Ammonia is one of the two principal nitrogen compounds of commerce; it has numerous uses in the manufacture of other important nitrogen compounds. A large portion of commercially synthesized ammonia is converted into nitric acid (HNO_3) and nitrates, which are the salts and esters of nitric acid. Much ammonia is used in the ammonia-soda process (*q.v.*) to produce soda ash, Na_2CO_3. Ammonia is also utilized in the preparation of hydrazine, N_2H_4, a colourless liquid used as a rocket fuel and in many industrial processes.

Nitric acid is the other main commercial compound of nitrogen. A colourless, highly corrosive liquid, it is much used in the production of fertilizers, dyes, drugs, and explosives. Ammonium nitrate (NH_4NO_3), a salt of ammonia and nitric acid, is the most common nitrogenous component of artificial fertilizers.

With oxygen, nitrogen forms several oxides, including nitrous oxide, or nitrogen(I) oxide, N_2O; nitric oxide, or nitrogen(II) oxide, NO; and nitrogen dioxide, or nitrogen(IV) oxide, NO_2. Many of the nitrogen oxides are extremely volatile; they are prime sources of pollution in the atmosphere. Nitrous oxide, also known as laughing gas, is sometimes used as an anesthetic; when inhaled it produces mild hysteria. Nitric oxide reacts rapidly with oxygen to form nitrogen dioxide, an intermediate in the manufacture of nitric acid and a powerful oxidizing agent utilized in chemical processes and rocket fuels.

Also of some importance are certain nitrides, solids formed by direct combination of metals with nitrogen, usually at elevated temperatures. They include hardening agents produced when alloy steels are heated in an atmosphere of ammonia, a process called nitriding. Those of boron, titanium, zirconium, and tantalum have special applications. One allotrophic form of boron nitride (BN), for example, is nearly as hard as diamond and less easily oxidized and so is useful as a high-temperature abrasive.

The inorganic cyanides contain the group CN^-. Hydrogen cyanide, or formonitrile, HCN, is a highly volatile and extremely poisonous gas that is used in fumigation, ore concentration, and various other industrial processes. Cyanogen, or oxalonitrile, $(CN)_2$, is also used as a chemical intermediate and a fumigant.

Azides, which may be either inorganic or organic, are compounds that contain three nitrogen atoms as a group, represented as $(-N_3)$. Most azides are unstable and highly sensitive to shock. Some of them, such as lead azide $[Pb(N_3)_2]$, are used in detonators and percussion caps. The azides, like the halogen compounds, readily react with other substances by displacement of the so-called azide group and yield many kinds of compounds.

Nitrogen forms many thousands of organic compounds. Most of the known varieties may be regarded as derived from ammonia, hydrogen cyanide, cyanogen, and nitrous or nitric acid. The amines, amino acids, and amides, for example, are derived from or closely related to ammonia. Nitroglycerin and nitrocellulose are esters of nitric acid. Nitro compounds are obtained from the reaction (called nitration) between nitric acid and an organic compound. Nitrites are derived from nitrous acid (HNO_2). Nitroso compounds are obtained by the action of nitrous acid on an organic compound. Purines and alkaloids are heterocyclic compounds in which nitrogen replaces one or more carbon atoms.

atomic number	7
atomic weight	14.0067
melting point	−209.86°C (−345.8°F)
boiling point	−195.8°C (−320.4°F)
density (1 atm, 0° C)	1.2506 g/l
usual oxidation states	−3, +3, +5
electron config.	2-5 or $1s^2 2s^2 2p^3$

nitrogen cycle, circulation of nitrogen in various forms through nature. Nitrogen, a component of proteins and nucleic acids, is essential to life on Earth. Although 78 percent by volume of the atmosphere is nitrogen gas, this abundant reservoir exists in a form unusable by most organisms. Through a series of microbial transformations, however, nitrogen is made available to plants, which in turn ultimately sustain all animal life. The steps, which are not altogether sequential, fall into the following classifications: nitrogen fixation, nitrogen assimilation, ammonification, nitrification, and denitrification.

Nitrogen fixation, in which nitrogen gas is converted into inorganic nitrogen compounds, is mostly (90 percent) accomplished by certain bacteria and blue-green algae (*see* nitrogen fixation). A much smaller amount of free nitrogen is fixed by abiotic means (*e.g.,* lightning, ultraviolet radiation, electrical equipment) and by conversion to ammonia through the Haber-Bosch process (*q.v.*).

Nitrates and ammonia resulting from nitrogen fixation are assimilated into the specific tissue compounds of algae and higher plants. Animals then ingest these algae and plants, converting them into their own body compounds.

The remains of all living things—and their waste products—are decomposed by microorganisms in the process of ammonification, which yields ammonia. (Under anaerobic, or oxygen-free, conditions foul-smelling putrefactive products may appear, but they too are converted to ammonia in time.) Ammonia can leave the soil or be converted into other nitrogen compounds, depending in part on soil conditions.

Nitrification, a process carried out by nitrifying bacteria (*q.v.*), transforms soil ammonia into nitrates, which plants can incorporate into their own tissues.

Nitrates also are metabolized by denitrifying bacteria (*q.v.*), which are especially active in water-logged, anaerobic soils. The action of these bacteria tends to deplete soil nitrates, forming free atmospheric nitrogen.

nitrogen euphoria (medicine): *see* nitrogen narcosis.

nitrogen fixation, any natural or industrial process that causes free nitrogen, which is a relatively inert gas plentiful in air, to combine chemically with other elements to form more reactive nitrogen compounds such as ammonia, nitrates, or nitrites.

Under ordinary conditions nitrogen does not react with other elements. Yet nitrogenous compounds are found in all fertile soils, in all living things, in many foodstuffs, in coal, and in such naturally occurring chemicals as sodium nitrate (saltpetre) and ammonia. Nitrogen is also found in the nucleus of every living cell as one of the chemical components of DNA.

Nitrogen is fixed, or combined, in nature as nitric oxide by lightning and ultraviolet rays, but more significant amounts of nitrogen are fixed as ammonia, nitrites, and nitrates by soil microorganisms. More than 90 percent of all nitrogen fixation is effected by them. Two kinds of nitrogen-fixing microorganisms are recognized: free-living (non-symbiotic) bacteria, including the cyanobacteria (or blue-green algae) *Anabaena* and *Nostoc* and such genera as *Azotobacter, Beijerinckia,* and *Clostridium;* and mutualistic (symbiotic) bacteria such as *Rhizobium,* associated with leguminous plants, and *Spirillum lipoferum,* associated with cereal grasses.

The symbiotic nitrogen-fixing bacteria invade the root hairs of host plants, where they multiply and stimulate the formation of root nodules, enlargements of plant cells and bacteria in intimate association. Within the nodules the bacteria convert free nitrogen to nitrates, which the host plant utilizes for its development. To ensure sufficient nodule formation and optimum growth of legumes (*e.g.,* alfalfa, beans, clovers, peas, soybeans), seeds are usually inoculated with commercial cultures of appropriate *Rhizobium* species, especially in soils poor or lacking in the required bacterium. (*See also* nitrogen cycle.)

Nitrogenous materials had long been used in human agriculture as fertilizers, and in the course of the 19th century, fixed nitrogen's importance to growing plants was increasingly understood. Accordingly, ammonia released in making coke from coal was recovered and utilized as a fertilizer, as were deposits of sodium nitrate (saltpetre) from Chile. Wherever intensive agriculture was practiced, there arose a demand for nitrogen compounds to supplement the natural supply in the soil. At the same time, the increasing quantity of Chile saltpetre used to make gunpowder led to a worldwide search for natural deposits of this nitrogen compound. By the end of the 19th century it was clear that recoveries from the coal-carbonizing industry and the importation of Chilean nitrates could not meet future demands. Moreover, it was realized that in the event of a major war a nation cut off from the Chilean supply would soon be unable to manufacture munitions in adequate amounts.

During the first decade of the 20th century, intensive research efforts culminated in the development of several commercial nitrogen-fixation processes. The three most productive approaches were the direct combination of nitrogen with oxygen, the reaction of nitrogen with calcium carbide, and the direct combination of nitrogen with hydrogen. In the first approach, air or any other uncombined mixture of oxygen and nitrogen is heated to a very high temperature, and a small portion of the mixture reacts to form the gas nitric oxide. The nitric oxide is then chemically converted to nitrates for use as fertilizers. By 1902 electric generators were in use at Niagara Falls, N.Y., to combine nitrogen and oxygen in the high temperatures of an electric arc. This venture failed commercially, but in 1904 Christian Birkeland and Samuel Eyde of Norway used an arc method in a small plant that was the forerunner of several larger, commercially successful plants that were built in Norway and other countries. The arc process, however, was costly and inherently inefficient in its use of energy, and it was soon abandoned for better processes. One such method used the reaction of nitrogen with calcium carbide at high temperatures to form calcium cyanamide, which hydrolyzes to ammonia and urea. The cyanamide process was utilized on a large scale by several countries before and during World War I, but it too was energy-intensive, and by 1918 the Haber-Bosch process had rendered it obsolete.

The Haber-Bosch process (*q.v.*) directly synthesizes ammonia from nitrogen and hydrogen and is the most economical nitrogen-fixation process known. About 1909 the German chemist Fritz Haber ascertained that nitrogen from the air could be combined with hydrogen under extremely high pressures and moderately high temperatures in the presence of an active catalyst to yield an extremely high proportion of ammonia, which is the starting point for the production of a wide range of nitrogen compounds. This process, made commercially feasible by Karl Bosch, came to be called the Haber-Bosch process, or the synthetic ammonia process. Germany's successful reliance on this process during World War I led to a rapid expansion of the industry and the construction of similar plants in many other countries after the war. The Haber-Bosch method is now one of the largest and most basic processes of the chemical industry throughout the world.

nitrogen group element, any of the chemical elements that constitute Group Va of the periodic table. This group consists of nitrogen (N), phosphorus (P), arsenic (As), antimony (Sb), and bismuth (Bi).

A brief treatment of the nitrogen group elements follows. For full treatment, *see* MACROPAEDIA: Chemical Elements. *See also* MICROPAEDIA for entries on each member of this element family.

All of the elements of the nitrogen group occur in the Earth's crust. Moreover, nitrogen itself is the most abundant gas in the atmosphere and on the average constitutes about 16 percent by weight of the complex compounds called proteins that are present in all living organisms. Phosphorus is the 12th most abundant element in the terrestrial crust and one of the most widely distributed. Because of its high chemical reactivity, however, it does not occur uncombined. The other three members of the group are found in substantially smaller amounts. They exist both in the native state and in the form of compounds.

The nitrogen elements probably have the widest range in physical state of any group in the periodic table. Nitrogen, for example, is a gas that liquefies at roughly −210° C, whereas bismuth is a solid that melts at 271° C. Nitrogen and phosphorus are nonmetals; arsenic and antimony are metalloids; and bismuth is a typical metal. The elements of this group also exhibit considerable diversity in appearance. Nitrogen is colourless both as a gas and as a liquid. Phosphorus occurs in a variety of allotropic forms, including the familiar highly reactive white form, a much less reactive red form, and a black modification that appears to be the most stable of all. Arsenic exists ordinarily as a dull gray metallic solid. Antimony is a silver, metallic-appearing but somewhat brittle solid. Bismuth is a silver-white metal with a trace of pink in its lustre.

The nitrogen group elements are clearly differentiated from each other chemically, but they do manifest certain general similarities in chemical behaviour. These similarities reflect common features of the electronic structure of their atoms. Each element of the group has an outermost shell of five electrons. In every case, these electrons occupy an *s* orbital completely with two electrons and contribute one electron to each of three *p* orbitals. The arrangement of outer electrons in the atoms of nitrogen elements therefore provides three half-filled orbitals that can form three covalent bonds by interaction with half-filled orbitals of the atoms of other elements; an unshared, or lone, pair of electrons, remains after the three covalent bonds have been formed. With the exception of nitrogen, all other elements in this group can also form five covalent bonds.

nitrogen narcosis, also called NITROGEN EUPHORIA, or RAPTURES OF THE DEEP, effects produced by the gas nitrogen when it is breathed under increased pressure. Nitrogen, a major constituent of air, is quite inert and passes into the fluids and tissues of the body without undergoing chemical change. Even though it is not used to sustain the bodily functions, it, nevertheless, has certain effects upon the tissues when it is present in excess of the amounts breathed at atmospheric pressures.

As divers descend in the water, the pressure upon their bodies increases proportionally to the water depth; in order for them to breathe normally, they are supplied with air at a pressure equal to that of the water. A diver situated at 30 m (100 feet) under water is breathing air that is four times more dense than at sea level; the quantity of nitrogen is, likewise, four times greater.

Nitrogen is absorbed by the fatty tissue (lipids) much faster than by other tissues; the brain and the rest of the nervous system have a high lipid content. Consequently, when a high concentration of nitrogen is breathed, the nervous system becomes saturated with the inert gas, and normal functions are impaired. Each individual has his own threshold of susceptibility; some divers experience narcosis at 15 m, while others can go to 60 m without any apparent effects. Most often, nitrogen narcosis begins to be apparent at about 10 m of depth. As a diver goes deeper, the symptoms increase in severity. When the diver ascends, the symptoms terminate with essentially no aftereffects or permanent harm done.

Mild cases begin as an intoxicating feeling of light-headedness, euphoria, numbness, and carefreeness. The reasoning ability and manual dexterity may next be slowed down. Emotional instability and irrationality may then ensue. Persons severely affected lapse into convulsions and unconsciousness. Divers swimming in clear, warm water seem to experience pleasant sensations, while those in dark, cold water seem to encounter panic, fear, anxiety, and depression. Unless the narcosis is severe, the victim is capable of functioning physically and may not fully realize that his rationality is being impaired. Irrationality itself, however, can cause the diver to inflict bodily harm upon himself by rising too fast or by failing to realize that his air supply has been depleted.

Because helium dissolves less readily in body tissue than nitrogen, mixtures of helium and oxygen are used in place of the usual nitrogen-oxygen mixtures for deep dives.

See also decompression sickness.

nitroglycerin, also called GLYCERYL TRINITRATE, a powerful explosive and an important ingredient of most forms of dynamite (*q.v.*). It is also used with nitrocellulose in some propellants, especially for rockets and missiles, and it is employed as a vasodilator in the easing of cardiac pain.

Pure nitroglycerin is a colourless, oily, somewhat toxic liquid having a sweet, burning taste. It was first prepared in 1846 by the Italian chemist Ascanio Sobrero by adding glycerol to a mixture of concentrated nitric and sulfuric acids. The hazards involved in preparing large quantities of nitroglycerin have been greatly reduced by widespread adoption of continuous nitration processes.

Nitroglycerin, with the molecular formula $C_3H_5(ONO_2)_3$, has a high nitrogen content (18.5 percent) and contains sufficient oxygen atoms to oxidize the carbon and hydrogen atoms while nitrogen is being liberated, so that it is one of the most powerful explosives known. Detonation of nitroglycerin generates gases that would occupy more than 1,200 times the original volume at ordinary room temperature and pressure; moreover, the heat liberated raises the temperature to about 5,000° C (9,000° F). The overall effect is the instantaneous development of a pressure of 20,000 atmospheres; the resulting detonation wave moves at approximately 7,700 m per second (more than 17,000 miles/h). Nitroglycerin is extremely sensitive to shock and to rapid heating; it begins to decompose at 50°–60° C (122°–140° F) and explodes at 218° C (424° F).

The safe use of nitroglycerin as a blasting explosive became possible after the Swedish chemist Alfred B. Nobel developed dynamite in the 1860s by combining liquid nitroglycerin with an inert porous material such as charcoal or diatomaceous earth. Nitroglycerin plasticizes collodion (a form of nitrocellulose) to form blasting gelatin, a very powerful explosive. Nobel's discovery of this action led to the development of ballistite, the first double-base propellant and a precursor of cordite.

A serious problem in the use of nitroglycerin results from its high freezing point (13° C [55° F]) and the fact that the solid is even more shock-sensitive than the liquid. This disadvantage is overcome by using mixtures of nitroglycerin with other polynitrates; for example, a mixture of nitroglycerin and ethylene glycol dinitrate freezes at −29° C (−20° F).

nitromersol, disinfectant for application to the skin and mucous membranes and for sterilizing surgical instruments, sometimes marketed under the trade name Metaphen. It is an organic compound containing mercury and is related to merbromin (Mercurochrome) and thimerosal (Merthiolate). Nitromersol disinfects by the action of the mercury in the molecule, which precipitates the enzymes of microorganisms and disrupts their metabolism. Nitromersol occurs as a yellowish powder or granules, soluble in alkaline solutions. It is used as a 0.5-percent alcoholic tincture or as a 0.2-percent aqueous solution.

nitroso compound, any of a class of organic compounds having molecular structures in which the nitroso group ($-N{=}O$) is attached to a carbon or nitrogen atom. Substances in which this group is attached to an oxygen atom are called nitrites, that is, esters of nitrous acid; those in which the nitroso group is attached to a metal ion are called nitrosyls.

Nitroso compounds are usually prepared by the action of nitrous acid or a derivative of it upon a substance containing an easily replaced hydrogen atom. Certain members of the class are obtainable by oxidation of amines or by reduction of nitro compounds.

Examples of nitroso compounds are nitrosodimethylaniline and the nitrosophenols, used in the manufacture of dyes. The compounds are usually blue or green in colour. Nitroso derivatives of amides decompose upon heating with formation of nitrogen and can be used as foam-producing agents; if they are heated in the presence of alkalies, the decomposition takes a different course, yielding diazo compounds.

nitrous acid (HNO_2), an unstable, weakly acidic compound that has been prepared only in the form of cold, dilute solutions. It is useful in chemistry in converting amines into diazonium compounds, which are used in making azo dyes. It is usually prepared by acidifying a solution of one of its salts, the nitrites, which are more stable (*see* nitrite).

Nitrous acid decomposes into nitric oxide, NO, and nitric acid, HNO_3. It may react as either an oxidizing or a reducing agent; that is, its nitrogen atom may either gain or lose electrons in reactions with other substances. Nitrous acid, for example, oxidizes iodide ion to elemental iodine but reduces bromine to bromide ion.

nitrous oxide (N_2O), also called DINITROGEN MONOXIDE, or LAUGHING GAS, one of several oxides of nitrogen, a colourless gas with pleasant, sweetish odour and taste, which when inhaled produces insensibility to pain preceded by mild hysteria, sometimes laughter. Nitrous oxide was discovered by the English chemist Joseph Priestley in 1772; another English chemist, Humphry Davy, later named it nitrous oxide and showed its physiological effect. The principal use of nitrous oxide is as an anesthetic in surgical operations of short duration; prolonged inhalation causes death. The gas is also used as a propellant in food aerosols. It is prepared by the action of zinc on dilute nitric acid, by the action of hydroxylamine hydrochloride ($NH_2OH \cdot HCl$) on sodium nitrite ($NaNO_2$), and, most commonly, by the decomposition of ammonium nitrate (NH_4NO_3).

Nitta Yoshisada (b. 1301, Kōzuke province, Japan—d. Aug. 17, 1338, Echizen province), Japanese warrior whose support of the imperial restoration of the emperor Go-Daigo was crucial in destroying the Kamakura shogunate, the military dictatorship that governed Japan from 1192 until 1333. The ultimate defeat of Nitta resulted in the end of the imperial restoration and the rise to power of the Ashikaga family, which dominated Japan from 1338 to 1573.

When Go-Daigo first rebelled against the Kamakura shogunate in 1331, Nitta, as a Kamakura retainer, helped defeat the emperor's armies. The following year, however, Nitta switched allegiance and led the army that attacked and destroyed the Kamakura shogunate. He was one of the strongest men in the new court government, but he soon had a falling out with Ashikaga Takauji, another former Kamakura retainer who had also switched sides. Go-Daigo supported Nitta in the ensuing struggle, and in 1335 Takauji was driven from the capital, only to return a year later at the head of a large army and navy recruited from provincial warriors. The emperor's forces were crushed, and Nitta fled the capital, taking Go-Daigo with him.

Takauji established a new puppet emperor at Kyōto, while Nitta set up Go-Daigo at Yoshino-yama, in south-central Japan, thus establishing two rival imperial courts, a northern court at Kyōto and a southern court at Yoshino. Nitta regained power in 1338 but died a few months later when he was hit by a stray arrow in a surprise attack.

Nitti, Francesco Saverio (b. July 19, 1868, Melfi, Italy—d. Feb. 20, 1953, Rome), Italian statesman who was prime minister for a critical year after World War I.

After a career as a journalist and professor of economics, Nitti was elected deputy in 1904. A Left Liberal, he served as minister of agriculture, industry, and commerce in 1911–14 and as minister of the treasury in 1917–19. He succeeded Vittorio Emanuele Orlando, the wartime prime minister, in June 1919, in the midst of foreign and domestic crises involving Italian territorial claims disputed by other Allied countries and the economic and fiscal problems created by the war and demobilization. Nitti's adoption of the system of proportional representation (Aug. 15, 1919) resulted in large increases in the number of deputies elected by the Socialists (156) and the Christian Democrats, or Popolari (100), but he did not succeed in conciliating these parties, and an epidemic of strikes by industrial workers and disorders fomented by the new Fascist Party of Benito Mussolini undermined not only Nitti's government but the processes of democratic government itself. Nitti resigned on June 9, 1920. He was reelected to parliament in 1921 and served until 1924 but did not enter his name in the election of that year held by the new Fascist regime. For several years he remained in exile in France, devoting himself to writing.

Francesco Saverio Nitti
B. Pellegrini

During World War II Nitti was arrested by the Germans (August 1943) and interned in Austria but was freed by the Allied victory in 1945. He became a senator of Italy in June 1948.

Nitti, Frank, original name FRANCESCO RAFFELE NITTO, byname THE ENFORCER (b. 1896?, Naples, Italy—d. March 19, 1943, North Riverside, Ill., U.S.), American gangster in Chicago who was Al Capone's chief enforcer and inherited Capone's criminal empire when Capone went to prison in 1931.

Starting as a barber, Nitti became a fence for stolen goods and about 1920 joined Capone's gang. He was sent to prison for 18 months after pleading guilty in 1930 to income-tax evasion, but thereafter he nominally headed the syndicate that controlled Chicago's gambling, prostitution, and other rackets. In March 1943 he and eight others (including Paul "the Waiter" Ricca) were indicted for trying to extort $1,000,000 from four motion-picture companies (Loew's, Paramount, Twentieth Century–Fox, and Warner Brothers) under threat of "union trouble." Just hours before the New York federal grand jury handed down the indictment, Nitti shot himself as he wandered, drunken, along a railroad track in a Chicago suburb.

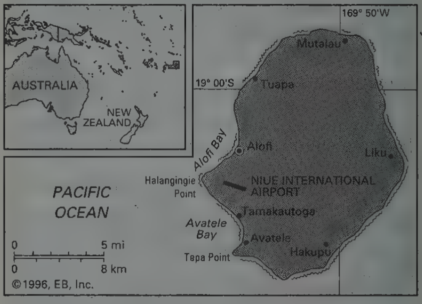
Niuafo'ou, northernmost island of Tonga, in the southwestern Pacific Ocean. The generally wooded land area of 19 square miles (49 square km) includes a volcanic peak 853 feet (260 m) high, a crater lake, and numerous hot springs. During a particularly violent eruption in 1946, the island's inhabitants were evacuated to 'Eua, several hundred miles to the south. They began returning to Niuafo'ou in 1958. Because of an unusual method of exchanging letters in cans with passing ships, Niuafo'ou gained the nickname "Tin Can Island." Pop. (1986) 763.

Niuatoputapu, also called KEPPEL ISLAND, one of the northernmost islands of Tonga, in the southwestern Pacific Ocean. Of volcanic origin, the island has an area of 7 square miles (19 square km) and rises to 350 feet (110 m). Although the island lacks an adequate anchorage, it serves as a regular port of call for interisland shipping between Tonga and Samoa. Copra and breadfruit are produced. Pop. (1986) 1,616.

Niue, internally self-governing island state in free association with New Zealand. It is the westernmost of the Cook Islands but is administratively separate from them. Niue lies 1,340 miles (2,156 km) northeast of Auckland and 240 miles (385 km) east of Vava'u, Tonga, in the south-central Pacific. The capital is Alofi. Area 100 square miles (260 square km). Pop. (1994 est.) 2,200.

Physical and human geography. Niue is a roughly oval, raised coral island that is about 40 miles (64 km) in circumference. The island has two distinct levels. The upper level, a central plateau 208 feet (63 m) high, slopes steeply down at its edges to the lower level, a coastal terrace about 0.3 miles (0.5 km) wide and 80–90 feet (25–27 m) high, which in turn slopes down to meet the sea in small cliffs. A fringing reef surrounds the island.

Rainfall on Niue averages 80 inches (2,000 mm) annually and falls mostly from December to April. The island's soil is extremely porous, so that water catchment from roofs is necessary to provide adequate water supply. The island's vegetation cover is scant but includes large trees, such as banyan and Tahiti chestnut; smaller species, such as coconut and fan palms and pandanus; shrubs, including hibiscus; and ferns and creepers.



Niue

The population is overwhelmingly Polynesian and speaks Niuean, a Polynesian dialect akin to Tongan and Samoan. English is also widely spoken. The inhabitants are predominantly Christian. Most of the population lives on the fertile coastal strip, which is intensively cultivated. The largest settlement on the island is Alofi.

Niue's economy is based mainly on agriculture. One-fourth of the land is arable and is held in traditional family patterns; Nieuans may not sell land to foreigners. Passion fruit, coconuts, pawpaw, and limes are cash crops. Subsistence crops include taro, yams, bananas, sugarcane, papaya, guava, and citrus fruits. Livestock includes pigs, chickens, and cattle, and fishing is conducted for domestic needs. About one-fifth of the land is forest. Manufacturing is centred on processing crops and includes lime juice, passion fruit, copra, honey, leather goods, and handicrafts for export. Some tourism has also developed. Alofi is the main port, and the island has a small airport as well. New Zealand is the major trading partner and source of financial aid.

Under the 1974 self-government constitution, Niueans remain New Zealand citizens. The British monarch is head of state, and the leader of the government is the premier, elected by the 20-member Legislative Assembly, itself elected by universal adult suffrage. The premier selects a four-member cabinet from the assembly.

History. Archaeological surveys in 1974 showed that Niue was settled approximately AD 900 by Samoans. Tradition recalls a second group, a war party from Tonga, that arrived sometime in the 16th century. Captain James Cook landed on Niue in 1774 and, because of hostility from the Niueans, named it Savage Island. London Missionary Society members began to arrive in the 1830s, and starting in 1852 the islanders were converted to Christianity.

In 1900 Great Britain annexed Niue as part of the Samoa partition. New Zealand annexed the island in 1901 as part of the Cook Islands, but in 1904 it was separated and given its own resident commissioner and island council. The first Niuean Legislative Assembly was elected in 1960, and in 1966 the resident commissioner's authority was partly delegated to the assembly and a Niuean leader of government was installed. In 1974 the people voted for a new constitution, choosing self-government in association with New Zealand, which agreed to provide defense and look after foreign affairs and to keep Niueans as New Zealand citizens.

Nivelle, Robert-Georges (b. Oct. 15, 1856, Tulle, France—d. March 23, 1924, Paris), commander in chief of the French armies on the Western Front for five months in World War I. His career was wrecked by the failure of his offensive in the spring of 1917.

Nivelle graduated from the École Polytechnique in 1878, served in Indochina, Algeria, and China as an artillery officer, and was made a general of brigade in October 1914 after World War I began. In 1915 he rose to command a division and then the 3rd Corps, which helped stem the German offensive at the Battle of Verdun early in 1916. In May 1916 he succeeded General Philippe Pétain as commander of the 2nd Army at Verdun. His use of creeping artillery barrages in two dazzlingly successful French counterattacks there (October, December 1916) enabled the French to retake nearly all the ground gained by the Germans over the previous six months.

That December, Nivelle was promoted over many senior officers to succeed General Joseph-Jacques Joffre as commander in chief of the French armies. He then proclaimed that his methods at Verdun could win the war. David Lloyd George, the British prime minister, heartily subscribed to Nivelle's advocacy of frontal assaults carried out in close coordination with massive artillery bombardments, and he placed the British armies in France under Nivelle's command for his great offensive. Nivelle, however, steadily lost the confidence of his own chief subordinates, and his final offensive on the Aisne front (April 1917) failed to break through German lines and cost France 120,000 casualties. The next month there were widespread mutinies in the French armies. On May 15, 1917, Nivelle was replaced by Pétain as commander in chief, and in December 1917 he was transferred to North Africa.

Niven, David, in full JAMES DAVID GRAHAM NIVEN (b. March 1, 1909, Kirriemuir, Angus, Scot.—d. July 29, 1983, Château-d'Oex, Switz.), British stage and motion-picture actor who personified dapper charm.

Born to a longtime military family, Niven attended Sandhurst Military Academy. He made his way to Hollywood in the mid-1930s and began performing as an extra. His first major roles were in *Dawn Patrol* (1938) and *Wuthering Heights* (1939). He rapidly became known as a steady, reliable actor who usually specialized in light comedy.

Niven served as an officer in the British army's commando unit during World War II, and following the war he returned to films. Though known for his sure touch with light comedy, he also proved to be a substantial dramatic actor, winning an Academy Award for his role in *Separate Tables* (1958). Among his best-known films are *The Moon Is Blue* (1953), *Around the World in 80 Days* (1956), *The Guns of Navarone* (1961), *The Pink Panther* (1964), and *Death on the Nile* (1978). He also appeared on stage and on two television series. He published a novel, *Go Slowly, Come Back Quickly* (1981), and two autobiographical volumes, *The Moon's a Balloon* (1971) and *Bring on the Empty Horses* (1975).

Niven performed in movies until the year of his death, even though he suffered in his later life from amyotrophic lateral sclerosis (also called Lou Gehrig's disease). His last film was *The Curse of the Pink Panther* (1983).

Nivernais, in France, the area administered from Nevers during the ancien régime, and until the French Revolution the last great fief still not reunited to the French crown. Bounded southwest by Bourbonnais, west by Berry, north by Orléanais, and east by Burgundy, Nivernais in 1790 became the *département* of Nièvre.

The *gouvernement* of Nivernais in 1789

Having formed part of the duchy of Burgundy, the county of Nevers (Nivernais) was given by Duke Henry I in 987 to his stepson, Otto William, who five years later handed it over to his son-in-law Landri. The first house of the hereditary counts of Nevers originated in this Landri and was brought to an end in 1192 by the death of Agnes, comtesse de Nevers. The county subsequently passed by successive marriages into the houses of Donzy, Châtillon, and Bourbon. Through marriages it passed to the duke of Burgundy and then the counts of Flanders and finally came to the house of Cleves (Kleve). The French king Francis I erected it into a duchy for Francis of Cleves in 1539. In 1565 Louis de Gonzaga (d. 1595), son of a duke of Mantua, married Henrietta of Cleves, duchesse de Nevers, and one of his descendants, Charles (d. 1665), sold the Nivernais to Cardinal Mazarin in 1659. The cardinal devised it to his nephew Philippe-Jules Mancini, whose descendants possessed it until the French Revolution. The last duc de Nivernais—Louis-Jules-Barbon Mancini-Mazarini—died in 1798.

Nivkh, formerly called GILYAK, east Siberian people who live in the region of the Amur River estuary and on nearby Sakhalin Island. They numbered about 4,600 in the late 20th century. Most speak Russian, though about 10 percent still speak Nivkh, a Paleo-Siberian language unaffiliated apparently with any other language. Their name for themselves, Nivkh, means "human."

The Nivkh economy was traditionally based on fishing (especially for salmon) and the hunting of sea lions and seals. Agriculture (the cultivation of potatoes) was started in the mid-19th century. Men's occupations included fishing, hunting, and making tools and means of transportation. Women processed animal skins, prepared birch bark for various uses, made clothing and utensils, gathered plants, did housework, and cared for the dogs. Until recently, when contact with the Evenk introduced the reindeer as a draft animal, dogs were the only domestic animals; they were used for pulling sleds and as a source of fur and meat. They were also a medium of exchange, an index of wealth, and an important part of religious rituals.

Villages generally included some 20 houses that were situated along the coast or near the mouths of rivers used by spawning salmon. The Nivkh were divided into exogamous clans. Clan members had mutual duties in payment of blood money, bride-price, and burial expenses; they observed a common cult that included the organization of a clan bear festival, usually held in honour of a dead clan kinsman.

Under Soviet administration economic activities were collectivized and small, scattered villages unified. Tillage, gardening, and cattle breeding were developed, and agriculture was introduced among the Sakhalin Nivkh.

Nivkh language, formerly called GILYAK LANGUAGE, isolated language with two main dialects spoken by some 400 Nivkh, roughly 10 percent of the ethnic group. The Nivkh live on Sakhalin Island and along the estuary of the Amur River in eastern Siberia. Nivkh is not known to be related to any other language, and it is usually included with the Luorawetlan languages and the Yeniseian languages in the catchall areal category of Paleo-Siberian languages.

Nixon, Richard M., in full RICHARD MILHOUS NIXON (b. Jan. 9, 1913, Yorba Linda, Calif., U.S.—d. April 22, 1994, New York, N.Y.), 37th president of the United States (1969–74), who, faced with almost certain impeachment, became the first U.S. president to resign from office. He also was vice president (1953–61) under President Dwight D. Eisenhower.

The son of a grocer, Nixon graduated from Whittier (Calif.) College in 1934 and from Duke University Law School, Durham, N.C., in 1937. He entered law practice in Whittier in 1937 and served briefly in the Office of Price Administration in Washington, D.C., soon after the outbreak of World War II. In August 1942 he joined the navy and served as an aviation ground officer in the Pacific. Following his return to civilian life in California, he was twice elected to the U.S. House of Representatives (1947, 1949). During this period, Nixon served on the House Un-American Activities Committee, taking a leading role in the investigation of Alger Hiss, a former State Department official who had been accused of spying for the Soviet Union.

In 1950 Nixon was elected to the U.S. Senate after a campaign in which he claimed his opponent had communist sympathies. Nixon's reputation as an anticommunist made him a desirable running mate for Eisenhower in the 1952 campaign, which emphasized that issue. Nixon served two terms as vice president under Eisenhower. He was narrowly defeated by the Democrat John F. Kennedy in the 1960 presidential election, and after losing the California gubernatorial election in 1962, Nixon announced his retirement from politics and moved to New York City to practice law.

Nixon reentered politics as a candidate in the 1968 presidential election. He initiated what came to be known as the "southern strategy," in which the Republican Party sought the support of conservative voters in southern and western states, often neglecting the interests of Americans—particularly blacks—in northern and northeastern cities. The campaign took place amid severe social and political turmoil; protests against U.S. participation in the Vietnam War were widespread. Nixon defeated the Democratic nominee, Hubert H. Humphrey, in a close vote.

Nixon, 1970
UPI

After his inauguration in January 1969, Nixon adjusted the U.S. strategy in Vietnam. A gradual withdrawal of U.S. forces was undertaken, and U.S. field commanders were ordered to minimize casualties. Under a policy known as "Vietnamization," the U.S. troops' combat role was progressively taken over by South Vietnamese troops, who nevertheless remained heavily dependent on American supplies and air support. This policy was part of the so-called Nixon Doctrine of reducing U.S. military forces abroad by assisting smaller nations to defend themselves through military and economic aid.

At the same time, Nixon escalated U.S. air attacks against North Vietnam. He also ordered secret bombing campaigns against North Vietnamese supply centres and staging areas in the neutral nations of Laos and Cambodia. In the spring of 1970, U.S. and South Vietnamese forces attacked North Vietnamese sanctuaries in Cambodia. This action caused widespread protest in the United States. In response, Nixon ordered government agencies to collect intelligence on prominent antiwar organizations and sought to discredit individuals who were critical of his Vietnam strategy.

Renominated in 1972, Nixon defeated his Democratic challenger, the liberal Senator George S. McGovern, in one of the largest landslide victories in U.S. presidential history. His second term began with the effective ending of U.S. participation in the Vietnam War in January 1973 after his national-security adviser, Henry Kissinger, had conducted intensive negotiations with the North Vietnamese. U.S. bombing raids on Cambodia continued, however, until August, and the administration was heavily criticized when the 1969–70 secret bombing of Laos and Cambodia was revealed and investigators discovered that the U.S. Air Force and the Department of Defense had falsified reports to conceal the bombing.

In domestic affairs, inflation was President Nixon's most persistent economic problem. Initially, he tried to cut federal expenditures; but the annual budget deficits of his administration grew to become the largest in history up to that time. In 1971 and 1973 the administration devalued the dollar in an attempt to achieve a balance of trade. Despite his well-known aversion to government controls, Nixon initiated (Aug. 15, 1971) his New Economic Policy, which included unprecedented peacetime controls on wages and prices. With the opportunity to appoint four Supreme Court justices, the president sought, with mixed success, to redirect the court toward the "strict constructionism" he espoused.

In foreign affairs, Nixon's most significant action may have been the reopening of direct communications with the People's Republic of China after a 21-year estrangement. In February 1972 he paid a state visit to China. This rapprochement in East Asia gave Nixon a stronger position during his visit to Moscow in May—the first by a U.S. president. At its conclusion the United States and the Soviet Union announced the SALT I nuclear arms limitation agreements as well as a bilateral-trade accord and plans for joint scientific and space ventures.

The president's second term, however, was dominated by the so-called Watergate Scandal (*q.v.*), which resulted from illegal activities by Nixon and his aides during the 1972 election campaign. On June 17, 1972, five men hired by the Republican Party's Committee to Re-elect the President had been arrested while burglarizing and wiretapping the national headquarters of the Democratic Party at the Watergate office complex in Washington, D.C. In the days following the break-in, Nixon had secretly directed the White House counsel, John Dean, to oversee a "cover-up" to conceal the administration's involvement. Nixon also obstructed the Federal Bureau of Investigation in its inquiry and authorized secret cash payments to the Watergate burglars in an effort to prevent them from implicating the administration.

Several major newspapers, led by *The Washington Post,* investigated the White House's possible involvement with the burglary, and in February 1973 a special Senate committee was established to investigate the affair. In televised public hearings, Dean accused the president of involvement in the cover-up, and others testified to illegal activity by the administration and the campaign staff. In July the committee learned that in 1969 Nixon had installed a recording system in the White House and that all of the president's conversations had been recorded; Nixon then began a long and ultimately futile effort to conceal these recordings from investigators.

By mid-1974, several of the president's closest aides, including two former Cabinet officers, had been indicted on criminal charges, and several had been convicted. The release during July 1974 of the audio tapes of Nixon's conversations—which demonstrated that Nixon had obstructed justice and had made false and misleading public statements after the break-in—resulted in a dissolving of support from his own party, both in Congress and throughout the country. In that month the Committee on the Judiciary of the House of Representatives voted three articles of impeachment against Nixon.

Nixon announced his resignation on the evening of August 8, effective August 9, and was succeeded by Vice President Gerald R. Ford. Nixon was not convicted for his alleged involvement in the Watergate scandal but was granted a pardon by President Ford in September 1974.

Nixon retired to the seclusion of his estate in San Clemente, Calif. He wrote *RN: The Memoirs of Richard Nixon* (1978) and several books on international affairs and U.S. foreign policy, claiming a modest role as an elder statesman and foreign-policy expert. Nixon spent his last years campaigning for American political support and financial aid for Russia and the other former Soviet republics.

BIBLIOGRAPHY. Biographies include David Abrahamsen, *Nixon vs. Nixon* (1977); Stephen E. Ambrose, *Nixon,* 3 vol. (1987–91); Roger Morris, *Richard Milhous Nixon* (1990), which focuses on his early life and career; Tom Wicker, *One of Us: Richard Nixon and the American Dream* (1991), a sympathetic portrait; and Jonathan Aitken, *Nixon* (1993). Robert Sam Anson, *Exile: The Unquiet Oblivion of Richard M. Nixon* (1984), covers Nixon's life during the decade following his resignation. Nixon's presidency is examined in Richard C. Thornton, *The Nixon-Kissinger Years: Reshaping America's Foreign Policy* (1989); Michael A. Genovese, *The Nixon Presidency* (1990); and Joan Hoff, *Nixon Reconsidered* (1994), which presents a positive evaluation of Nixon's presidency based on his domestic policy. Fred Emery, *Watergate: The Corruption of American Politics and the Fall of Richard Nixon* (1994), is an extensively researched treatment.

Niyamānanda (philosopher): *see* Nimbārka.

Niza, Marcos de, byname FRAY MARCOS (b. *c.* 1495, Nice, Savoy [now in France]—d. March 25, 1558, Mexico), Franciscan friar who claimed to have sighted the legendary "Seven Golden Cities of Cibola" in what is now western New Mexico.

Niza went to the Americas in 1531 and served in Peru, Guatemala, and Mexico. At Culiacán, Mex., he freed Indian slaves from regions to the north. Under orders from the viceroy Antonio de Mendoza, Niza and a Moor, Esteban, led an expedition across the desert to the cities of Cibola (1539). Esteban was killed; Niza claimed to have come within sight of large towns rich in precious stones, gold, and silver. The following year Francisco de Coronado found the "seven cities" to be small and poor Indian pueblos. Niza became provincial of his order for Mexico in 1541.

Niẓām al-Mulk (Arabic: "Order of the Kingdom"), original name ABŪ ʿALĪ ḤASAN IBN ʿALĪ (b. 1018/19, Ṭūs, Khorāsān, Iran—d. Oct. 14, 1092, near Nehāvand), Persian vizier of the Turkish Seljuq sultans (1063–92), best remembered for his large treatise on kingship, *Seyāsat-nāmeh* (*The Book of Government; or Rules for Kings*).

Early life. Niẓām al-Mulk was the son of a revenue official for the Ghaznavid dynasty. Through his father's position, he was born into the literate, cultured milieu of the Persian administrative class. In the years of confusion following the initial Seljuq Turk expansion, his father fled, eventually to Ghazna (now in Afghanistan), where Niẓām al-Mulk, too, in due course entered Ghaznavid service.

He soon returned to Khorāsān, however, and joined the service of Alp-Arslan, who was then the Seljuq governor of Khorāsān. When Alp-Arslan's vizier died, Niẓām al-Mulk was appointed to succeed him, and, when Alp-Arslan himself succeeded his father in 1059, Niẓām al-Mulk had the entire administration of Khorāsān in his hands. His abilities so pleased his master that, when Alp-Arslan became the supreme overlord of the Seljuq rulers in 1063, Niẓām al-Mulk was made vizier.

Influence in Seljuq policy. For the next 30 years, under two remarkable rulers, he occupied this position in an empire that stretched from the Oxus River (now Amu Darya) in the east to Khwārezm and the southern Caucasus and westward into central Anatolia. During these decades, the Seljuq empire was at its zenith; Niẓām al-Mulk's influence guided the sultan's decisions, sometimes even military ones, and his firm control of the central and provincial administration, through his numerous dependents and relatives, implemented those decisions. His aim, like that of other great Persian viziers, was to impress on his less-sophisticated Turkmen rulers, brought up in the rude tradition of the steppe, the superiority of Persian civilization and its political wisdom. His influence was especially felt in the rule of Sultan Malik-Shāh, who succeeded to the Seljuq throne when he was only 18. Such was Niẓām al-Mulk's reputation among contemporaries that he was compared to the Barmakids, viziers to the 8th-century caliph Hārūn al-Rashīd.

The Seyāsat-nāmeh. Shortly before his death and at Malik-Shāh's request, Niẓām al-Mulk wrote down his views on government in the *Seyāsat-nāmeh.* In this remarkable work, he barely refers to the organization of the dewan (administration) because he had been able, with the help of his well-chosen servants, to control and model it on traditional lines. But he never had the same power in the *dargāh* (court) and found much to criticize in the sultan's careless disregard for protocol, the lack of magnificence in his court, the decline in prestige of important officials, and the neglect of the intelligence service. The most severe criticisms in the *Seyāsat-nāmeh,* however, are of those with heterodox religious views, the Shīʿites in general and the Ismāʿīlītes in particular, to whom he devotes his last 11 chapters. His support of "right religion," Sunnī Islām, was not only for reasons of state but also a matter of passionate conviction.

Niẓām al-Mulk expressed his religious devotion in ways that contributed to the Sunnite revival. He founded Niẓāmīyah madrasahs (colleges of higher learning) in many major towns throughout the empire to combat Shīʿite propaganda, as well as to provide reliable, competent administrators, schooled in his own branch of Islāmic law. Less orthodox religious communities among the Ṣūfī orders also benefited from his generosity; hospices, pensions for the poor, and extensive public works related to the pilgrimage to Mecca and Medina were created or sustained by his patronage. Particularly in his last years, when the Ismāʿīlīte threat grew stronger and its partisans found a refuge in Alamūt, the castle of the Assassins, he set himself the task of combating their influence by every means possible.

On Alp-Arslan's death in 1073, Niẓām al-Mulk was left with wider powers, since the late sultan's successor, Malik-Shāh, was only a youth. By 1080, however, Malik-Shāh had become less acquiescent. Niẓām al-Mulk also antagonized the sultan's favourite courtier, Tāj al-Mulk, and he made an enemy of the sultan's wife Terkhen-Khatun by preferring the son of another wife for the succession.

Niẓām al-Mulk was assassinated in 1092, on the road from Eṣfahān to Baghdad, near Nehāvand. The murder was probably committed by an Ismāʿīlīte from Alamūt, possibly with the complicity of Tāj al-Mulk and Terkhen-Khatun, if not that of Malik-Shāh himself. Within a month, however, the sultan, too, was dead, and the disintegration of the great Seljuq empire had begun.

Assessment. As a great Iranian vizier, Niẓām al-Mulk conspicuously exemplifies the chief minister's role of mediator between a despot, in this instance an alien Turk, and his Persian subjects. Niẓām al-Mulk kept Turkmen immigrants, who had entered Iran with the Seljuqs, engaged in hostilities outside the country; and he tempered military harshness with lessons in judicious clemency and conciliation. He built up Seljuq power with the sultan as the keystone of an integrated administration, and he encouraged the recognition of local rulers as honourable vassals. Niẓām al-Mulk was, for contemporaries, as he has remained for successive generations who read his *Seyāsat-nāmeh,* the quintessential vizier—wise, prudent, resourceful and successful, and a devout Muslim.

The only complete English translation of Niẓām al-Mulk's *Seyāsat-nāmeh* is by Hubert Darke, *The Book of Government; or, Rules for Kings* (1960).

nizam-ı cedid (Turkish: "new order"), originally a program of westernizing reforms undertaken by the Ottoman sultan Selim III (reigned 1789–1807). Later the term came to denote exclusively the new, regular troops established under this program.

In 1792–93 Selim III, assisted by a committee, promulgated a series of reforms that included new regulations on provincial governorships and taxation, on land tenure, and on the control of grain trade. More significant, however, were military reforms. A new corps of regular infantry trained and drilled on Western lines was founded, and an attempt was made to introduce discipline into the decadent Janissary Corps (elite troops). New regulations were introduced into the artillery, bombardier, and miners corps; the fleet was reorganized; new military and naval schools provided training in gunnery, fortification, and navigation; and technical and scientific books were translated into Turkish from Western languages. To finance these projects a special treasury was established, collecting revenues from confiscated fiefs and taxes on liquor, tobacco, and coffee.

The reforms were inspired by Western models, and in their application Selim had to rely heavily on French assistance, particularly upon French instructors in the military schools. The growing French influence and the reforms, however, evoked a strong reaction from a conservative coalition of the Janissaries and the ulama (men of religious learning). In 1805 that coalition was joined by *aʿyān* (local notables) of the Balkan provinces to stop an attempt to organize *nizam-ı cedid* troops in Edirne. Finally in 1807 a mutiny of the *yamak*s (auxiliary levies) compelled Selim to abolish the *nizam-ı cedid* reforms and brought about his deposition.

Niẓām Shāhī DYNASTY, succession of rulers of the kingdom of Ahmadnagar in the Deccan of India from 1490 to 1633. The founder was Malik Aḥmad, who in 1490 fixed his capital on a new site called Ahmadnagar after himself. The kingdom lay in the northwestern Deccan, between the states of Gujarāt and Bijāpur. It secured the great fortress of Daulatābād in 1499 and added Berār in 1574.

The Niẓām Shāhī dynasty was engaged in constant warfare. Burhān Shāh (reigned 1509–53) allied with the Hindu state of Vijayanagar, but his successor Husain (reigned 1553–65) joined the alliance that overthrew it (1565). An attack by the Mughals from the north was gallantly resisted by Chānd Bībī, queen dowager of Bijāpur, but Berār was ceded (1596) and Ahmadnagar fell after the queen's death (1600). A part of the state of Ahmadnagar remained, and the dynasty survived until the fall of Daulatābād, in 1633.

Niẓām-ul-Mulk (Arabic: "Governor of the Kingdom"), title borne by various Indian Muslim princes. The term has also been translated as "Deputy for the Whole Empire." In 1713 it was conferred on Chīn Qilich Khān (Āṣaf Jāh) by the Mughal emperor Muḥammad Shāh and was held by his descendants, the rulers of the princely state of Hyderābād, until the mid-20th century. The head of a ruling family was commonly known as the Niẓām.

Nizāmābād, also called INDUR, city, northwestern Andhra Pradesh state, southern India. The city is located on the Hyderābād–Godāvari Valley line of the Central Railway, north-northwest of Hyderābād. Historical points of interest include a temple that now houses a water-supply tank and the fort of Indur. The city is also the site of several colleges affiliated with Osmania University in Hyderābād. Pop. (1991) city, 241,034.

Niẓāmī (Persian poet): *see* Neẓāmī.

Nizhegorod, formerly (1932–90) GORKY, *oblast* (province) in western Russia, in the middle of the Volga River basin. Nizhegorod *oblast* is bisected by the Volga River. The northern half of the *oblast* is a low plain, mostly in dense coniferous forest of spruce, pine, and fir, while lower parts are often swampy. Its soils are infertile. The southern half comprises rolling morainic hills, with deciduous trees, especially oaks, and open areas of forest-steppe. It has gray forest soils.

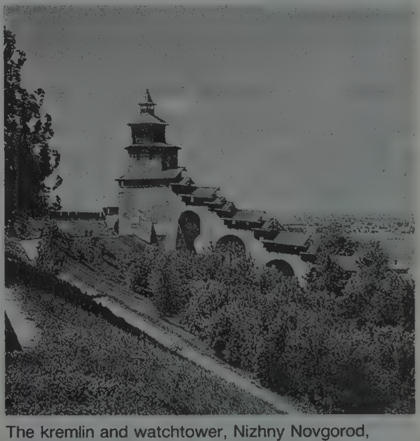
The highly industrialized area along the Volga and lower Oka rivers includes the metropolis of Nizhny Novgorod, the administrative headquarters, and its satellite towns, producing a great range of goods. Elsewhere there are only pockets of industry, *e.g.,* steel mills in Kulebaki and Vyksa. In the forested areas timber industries are highly developed. At Zavolzhye, above Nizhny Novgorod, is a hydroelectric station on the Volga. The main agricultural area lies south of the Volga; grains—rye, oats, spring wheat, and buckwheat—are dominant, though potatoes and flax are important as well. Area 28,900 square miles (74,800 square km). Pop. (1995 est.) 3,734,000.

Nizhnekamsk, city, Tatarstan, western Russia. It lies along the left bank of the Kama River, just southwest of Naberezhnye Chelny. It is an important petrochemical centre. Its synthetic-rubber plant, intended to become one of the world's largest, began operation in 1970. It also has a large tire plant and produces plastics. An oil refinery began operation there in 1979. Pop. (1995 est.) 209,500.

Nizhnevartovsk, city and port, Khanty-Mansi autonomous *okrug* (district), Tyumen *oblast* (province), west-central Russia. It lies along the right bank of the Ob River. The city grew rapidly, especially in the 1970s, as a result of the discovery of large oil fields nearby. Along with Surgut, Nizhnevartovsk is a major administrative centre of the middle Ob oil fields. It also has a gas-processing plant. Pop. (1995 est.) 237,900.

Nizhny Novgorod, formerly (1932–90) GORKY, city and administrative centre of Nizhegorod *oblast* (province), western Russia. The city lies at the confluence of the Volga and Oka rivers, 260 miles (420 km) east of Moscow.

Although some authorities give an earlier date, the city was founded, according to a major chronicle, in 1221 by Yury Vsevolodovich, prince of Vladimir, as Russian colonization was advancing to the Volga into lands formerly occupied by the Mordvinians. Nizhny Novgorod's strategic site on the great Volga route from the Baltic to Central Asia—with links via the navigable Oka River to the Vladimir-Moscow region and via the Kama River to the Ural Mountains and Siberia—ensured its importance. In 1392 the town was incorporated into the principality of Moscow and soon became a Russian stronghold against the Volga Tatars. From there, Ivan III the Great in 1469 and Ivan IV the Terrible in 1552 launched their expeditions against the Tatar capital of Kazan. The Russian conquest of the Volga in the mid-16th century brought about increased trade for Nizhny Novgorod. The annual fair that was established in that



The kremlin and watchtower, Nizhny Novgorod, Russia

Novosti Press Agency

city in 1817 became the largest and most important in Russia, attracting traders and goods from across Europe and Asia. The fair continued until the Russian Revolution of 1917. The well-known writer Maksim Gorky was born in Nizhny Novgorod in 1868, and in 1932 the town was renamed in his honour by the Soviet regime, although its original name was restored in 1990.

The great volume of trade passing through the city led to the early utilization of serf labour in manufacturing, causing an earlier onset of factory industrialization than in much of Russia, especially in heavy industry and engineering. The town's industrial importance grew steadily, stimulated in World Wars I and II by the destruction of plants to the west. Modern Nizhny Novgorod is one of the largest cities of Russia and the centre of a large metropolitan area strung out along the Volga and lower Oka rivers. The city itself produces motor vehicles, many types of ships and river craft, diesel engines, machinery and machine tools, and a wide range of chemical and consumer goods. Of its satellite towns, Bor, across the Volga, makes glass, notably safety glass for cars; Dzerzhinsk makes chemicals and fertilizers; Balakhna and Pravdinsk make paper; Bogorodsk produces leather goods and footwear; and Kstovo has a major oil refinery. Power for the metropolis comes from two thermal-electric plants in Nizhny Novgorod—the Balakhna peat-burning station and the hydroelectric station at Zavolzhye. Nizhny Novgorod is the focus of excellent communications by river, road, rail, and air. Railways connect it with Moscow, Kirov (on the Trans-Siberian line), and Arzamas, and electrified suburban lines serve the metropolitan area.

Nizhny Novgorod is the site of the N.I. Lobachevsky State University (founded 1918) and other institutions of higher education, including ones in agriculture, medicine, and engineering. There is also a state art museum and one of the oldest drama theatres in Russia (established 1798). The city's historic buildings include the 16th-century kremlin and the 17th-century Archangel Cathedral. Pop. (1995 est.) 1,382,500.

Nizhny Tagil, also spelled NIŽNIJ TAGIL, city, Sverdlovsk *oblast* (province), western Russia. Nizhny Tagil lies along the Tagil River. One of the oldest smelting centres of the Ural Mountains region, it was founded in 1725 in connection with the construction of a metallurgical factory that used the iron ore of Vysokaya Gora. It became a city in 1917 and is now an important iron and steel centre noted for metallurgy and engineering. The city's manufactures include machine tools, railway cars, and building materials. Teacher-training and mining colleges are located in the city, along with an applied-arts college and a regional museum. Pop. (1997 est.) 404,000.

Nizhnyaya Tunguska River, also spelled NIŽN'AJA TUNGUSKA, English LOWER TUNGUSKA RIVER, river in western Siberia that is a right-bank tributary of the Yenisey River, flowing through Irkutsk *oblast* (province) and Krasnoyarsk *kray* (region) of Russia. Its length is 1,857 miles (2,989 km), and the area of its basin is 187,900 square miles (471,300 square km). The river rises near the watershed between the Yenisey River basin and that of the Lena River and flows north and then west across the Central Siberian Plateau. In its upper course, the river has a broad valley with numerous sandbanks, but after turning west its valley narrows, and there are numerous gorges and rapids. In the river basin lies the extensive Tunguska coalfield.

Nizhyn, Russian NEZHIN, also spelled NEŽIN, city, Chernihiv *oblast* (province), north-central Ukraine. Nizhyn dates from the 11th century and was incorporated in 1781. It contains several buildings from the 17th and 18th centuries, including the cathedrals of St. Nicholas and of the Annunciation. A minor industrial centre before the 1917 Revolution, it now has engineering and food industries. The city's teacher-training institute is named for the novelist Nikolay Gogol, who studied in a Nizhyn lyceum. Pop. (1994 est.) 83,000.

Nizip, Battle of, Nizip also spelled NEZIB (June 24, 1839), battle between forces of the Ottoman Empire and those of Muḥammad ʿAlī, viceroy of Egypt, at Nizip (now in southeastern Turkey), in which the Ottomans were defeated. Their empire was spared only by the intervention of Great Britain, Austria, Russia, and Prussia.

The Convention of Kütahya (1833) that had awarded the Ottomans' Syrian provinces and Adana to Muḥammad ʿAlī was not satisfactory to either party, and a new war developed. The Ottoman army was decisively defeated at Nizip by Egyptian forces under Muḥammad ʿAlī's son Ibrāhīm, and the Ottoman fleet surrendered at Alexandria. The great powers, except France, intervened on behalf of the Ottomans, forcing the Egyptians to evacuate Syria in 1840. On Feb. 3, 1841, the Ottoman sultan Abdülmecid I signed a firman (official edict) appointing Muḥammad ʿAlī as hereditary governor of Egypt.

Njáls saga, also called NJÁLA, or BURNT NJÁLL, one of the longest and generally considered the finest of the 13th-century Icelanders' sagas. It presents the most comprehensive picture of Icelandic life in the heroic age and has a wide range of complex characters. The work has two heroes—Gunnar (Gunther) and Njáll. Gunnar is a brave, guileless, generous youth like Sigurd (Siegfried) of the heroic legends; Njáll is a wise and prudent man endowed with prophetic gifts. Both are men of peace, but in a society in which the ties of blood impose inescapable obligations and the memories of past injuries may always be rekindled, neither Gunnar's goodwill nor Njáll's wisdom can save them from their fate.

Gunnar meets death at the hands of his enemies when his wife, the beautiful but capricious Hallgerd, in retaliation for a blow he once gave her in anger, refuses him a strand of her hair to string his bow.

Njáll is drawn into a feud through the headstrong actions of his sons. He accepts the consequences stoically in a powerful scene in which he and his family are burned to death in their home by a reluctant "enemy," whose honour demands this vengeance. A third part of the saga deals with the vengeance of Njáll by his son-in-law Kári, the sole survivor of the family.

The characters of the *Njáls* saga are vividly drawn and range from comic to sinister. The high tide of Icelandic life is revealed in the meetings of the heroes at the Althing (Parliament) in times of peace and good fortune; but the high price for their unique style of life is always threatening in the background, and the overriding mood is one of tragic pessimism. The best English translation is by M. Magnusson and H. Pálsson, published in 1960.

Njemen River (Belarus and Lithuania): *see* Neman River.

Njǫrd, Old Norse NJǪROR, in Norse mythology, the god of the wind and of the sea and its riches. His aid was invoked in seafaring and in hunting, and he was considered the god of "wealth-bestowal," or prosperity. He was the father of Freyr and Freyja by his own sister. Traditionally, Njǫrd's native tribe, the Vanir, gave him as a hostage to the rival tribe of Aesir, the giantess Skadi choosing him to be her husband. The marriage failed because Njǫrd preferred to live in Nóatún, his home by the sea, while Skadi was happier in her father's mountain dwelling place. Several traditions hold that Njǫrd was a divine ruler of the Swedes, and his name appears in numerous Scandinavian place-names.

Nkayi, formerly JACOB, town (commune), southwestern Congo. It lies west of the capital, Brazzaville, and northeast of the port of Pointe-Noire, on the Brazzaville–Pointe-Noire railway; its airport has scheduled flights to both cities. Nkayi is the major sugar-producing centre in the Niari River valley agricultural region. It also has a flour mill, a sawmill, and plants that produce peanut (groundnut) oil and cattle feed. Pop. (1992 est.) 42,465.

NKK Corporation, formerly (until 1988) NIPPON KŌKAN KK, major Japanese industrial company and one of the country's largest steelmakers. Headquarters are in Tokyo.

Nippon Kōkan KK was founded in 1912 to make products using the steel from Japan's first steel mills. The company's innovative seamless steel pipe proved superior to conventional welded pipe, and Nippon Kōkan eventually also began producing raw steel from iron ore. Nippon Kōkan expanded greatly in the decades after World War II, with large steelmaking complexes at Fukuyama (in Hiroshima prefecture) and at Kawasaki and Yokohama (the Keihin Steel Works, near Tokyo). In the late 1970s the company expanded its Keihin complex by building an ultramodern steelworks on man-made Ōgi Island in Tokyo Bay.

The NKK Corporation is the second largest steelmaker in Japan (after the Nippon Steel Corporation). In addition to producing a great array of finished and semifinished steel products, the company designs and builds industrial plants, ships, and other large-scale steel structures; produces specialty metals, ceramics, plastics, and chemicals; and makes computer hardware and software.

Nkole, also spelled NKORE, ANKOLE, or ANKORE, also called NYANKOLE, or NYANKORE, a people of the Interlacustrine Bantu-speaking group who occupy the area of southwestern Uganda between Lakes Edward and George and the Tanzania border.

Numbering about 1,500,000 in the late 20th century, the Nkole were traditionally divided into two quite distinct social groups: the pastoral Hima, who made up about one-tenth of the population, and the agricultural Iru, who constituted the remainder. Both groups spoke a common Bantu language. Though marriage between Hima and Iru was traditionally prohibited, each borrowed extensively from the culture of the other. Both groups were traditionally divided into patrilineal clans and groups. Polygyny has been general.

The differing economic pursuits of Hima and Iru gave rise to different modes of life. The Hima lived traditionally in scattered kraals about a mile apart, each with a number of different families. They subsisted almost entirely on the products of their herds. The Iru were sedentary hoe cultivators, for whom the staple crop was millet. They lived in settlements of from 40 to 100 homesteads.

The Nkole maintained a despotic state, headed by the *mugabe* (king). Hima were bound to the *mugabe* by an oath of fealty. Iru headmen were appointed over communities of their fellows, and through them Hima chiefs collected tribute.

Nkomo, Joshua, in full JOSHUA MQABUKO NYONGOLO NKOMO (b. June 19, 1917, Semokwe Reserve, Matabeleland, Southern Rhodesia [now Zimbabwe]—d. July 1, 1999, Harare), black nationalist in Zimbabwe who, as leader of the Zimbabwe African People's Union (ZAPU), was Prime Minister Robert Mugabe's longtime rival.

Nkomo was the son of a cattle-owning teacher and lay preacher in Matabeleland. Although often regarded as of Ndebele (formerly called Matabele) descent, from the dominant ethnic group in the southern part of the country, he was in fact a member of the Karanga group of Shona peoples. After primary schooling in Rhodesia, he went to South Africa to complete his education in Natal and Johannesburg. Returning home in 1945, he worked for the Rhodesian Railways and by 1951 had become a leader in the trade union of the black Rhodesian railway workers. In 1951 he also obtained an external B.A. degree from the University of South Africa, Johannesburg.

Nkomo became increasingly political, and in 1957 he was elected president of the African National Congress (ANC), the leading black nationalist organization in Rhodesia. When the ANC was banned early in 1959, Nkomo went to England to escape imprisonment. He returned in 1960 and founded the National Democratic Party (NDP); in 1961, when the NDP was banned in turn, he founded ZAPU. The white-minority government of Rhodesia held Nkomo in detention from 1964 until 1974. After his release he traveled widely in Africa and Europe to promote ZAPU's goal of black majority rule in Rhodesia. Nkomo helped lead the guerrilla war that followed against white rule in Rhodesia, but his forces played a relatively minor role compared with those of Mugabe, who headed the Zimbabwe African National Union (ZANU). The two groups were joined in an uneasy alliance known as the Patriotic Front after 1976.

After white-ruled Rhodesia became black-ruled Zimbabwe in 1979–80, Nkomo and his Ndebele-supported ZAPU were increasingly eclipsed by Mugabe's ZANU, whose base of support was the majority Shona people. ZANU resoundingly defeated Nkomo's ZAPU in the 1980 parliamentary elections. Strain quickly arose between ZANU and ZAPU, and overt ethnic strife broke out between the Shona and the Ndebele peoples after Mugabe dismissed Nkomo from the Cabinet in 1982. After a complete breach between the two leaders for a few years, they agreed in 1987 to merge their respective parties in order to try to achieve ethnic unity in their country. In 1990 Nkomo became a vice president under Mugabe, who remained Zimbabwe's chief executive. An autobiography, *Nkomo, the Story of My Life,* was published in 1984.

Nkonde (people): *see* Nyakyusa.

Nkongsamba, also spelled N'KONGSAMBA, or NKONGSOMBA, town, western Cameroon. Nkongsamba lies at the foot of Mount Manengouba (7,861 feet [2,396 m]). It is the terminus of the railway from Douala and has road connections to Bamenda (north), Bafoussam (northeast), and Buea (southwest). Large palm-oil, banana, and coffee plantations in the area make Nkongsamba a commercial centre. Coffee and tobacco from the north are shipped by rail to Douala for export. The town has a sawmill, a food-processing plant, and a teacher-training school. Pop. (1987) 85,560.

Nkore (people): *see* Nkole.

Nkosi, Lewis (b. Dec. 5, 1936, Durban, Natal, S.Af.), South African author, critic, journalist, and broadcaster.

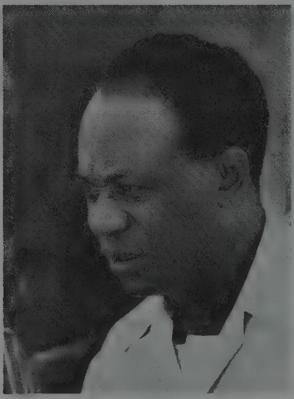
After attending a technical college in Durban for a year, Nkosi worked as a journalist, first in 1955 for the Zulu-English weekly paper *Ilanga lase Natal* ("Natal Sun") and then for the *Drum* magazine and as chief reporter for its Sunday newspaper, the *Golden City Post,* from 1956 to 1960.

In 1961 Nkosi accepted a fellowship to study journalism at Harvard University, and, consequently, he was exiled from South Africa. From that time Nkosi wrote for American, British, and African periodicals, including *The New Yorker*. Many of his critical essays were published in *Home and Exile* (1965), which became a standard source for students of African literature.

The Rhythm of Violence (1964), a drama set in Johannesburg in the early 1960s, handles the theme of race relations. Nkosi produced the British Broadcasting Corporation (BBC) radio series "Africa Abroad" from 1962 to 1965 and worked from 1965 to 1968 as literary editor of *The New African.*

Nkosi's later works included essays on South Africa in *The Transplanted Heart* (1975) and the collections *Tasks and Masks: Themes and Styles of African Literature* (1981) and *Home and Exile and Other Selections* (1983). His first novel, *Mating Birds* (1983), brought Nkosi to the attention of a wider audience for its subtle examination of an interracial affair.

Nkrumah, Kwame (b. September 1909, Nkroful, Gold Coast [now Ghana]—d. April 27, 1972, Bucharest, Romania), Ghanaian nationalist leader who led the Gold Coast's drive for independence from Britain and presided over its emergence as the new nation of Ghana. He headed the country from independence in 1957 until he was overthrown by a coup in 1966.



Nkrumah, 1962

Marc and Evelyne Bernheim—Woodfin Camp and Associates

Early years. Kwame Nkrumah's father was a goldsmith and his mother a retail trader. Baptized a Roman Catholic, Nkrumah spent nine years at the Roman Catholic elementary school in nearby Half Assini. After graduation from Achimota College in 1930, he started his career as a teacher at Roman Catholic junior schools in Elmina and Axim and at a seminary.

Increasingly drawn to politics, Nkrumah decided to pursue further studies in the United States. He entered Lincoln University in Pennsylvania in 1935 and, after graduating in 1939, obtained master's degrees from Lincoln and from the University of Pennsylvania. He studied the literature of socialism, notably Karl Marx and Vladimir I. Lenin, and of nationalism, especially Marcus Garvey, the black American leader of the 1920s. Eventually, Nkrumah came to describe himself as a "nondenominational Christian and a Marxist socialist." He also immersed himself in political work, reorganizing and becoming president of the African Students' Organization of the United States and Canada. He left the United States in May 1945 and went to England, where he organized the 5th Pan-African Congress in Manchester.

Meanwhile, in the Gold Coast, J.B. Danquah had formed the United Gold Coast Convention (UGCC) to work for self-government by constitutional means. Invited to serve as the UGCC's general secretary, Nkrumah returned home in late 1947. As general secretary, he addressed meetings throughout the Gold Coast and began to create a mass base for the new movement. When extensive riots occurred in February 1948, the British briefly arrested Nkrumah and other leaders of the UGCC.

When a split developed between the middle-class leaders of the UGCC and the more radical supporters of Nkrumah, he formed in June 1949 the new Convention Peoples' Party (CPP), a mass-based party that was committed to a program of immediate self-government. In January 1950, Nkrumah initiated a campaign of "positive action," involving nonviolent protests, strikes, and noncooperation with the British colonial authorities.

From prison to prime ministry. In the ensuing crisis, services throughout the country were disrupted, and Nkrumah was again arrested and sentenced to one year's imprisonment. But the Gold Coast's first general election (Feb. 8, 1951) demonstrated the support the CPP had already won. Elected to Parliament, Nkrumah was released from prison to become leader of government business and, in 1952, prime minister of the Gold Coast.

When the Gold Coast and the British Togoland trust territory became an independent state within the British Commonwealth—as Ghana—in March 1957, Nkrumah became the new nation's first prime minister. In 1958 Nkrumah's government legalized the imprisonment without trial of those it regarded as security risks. It soon became apparent that Nkrumah's style of government was to be authoritarian. Nkrumah's popularity in the country rose, however, as new roads, schools, and health facilities were built and as the policy of Africanization created better career opportunities for Ghanaians.

By a plebiscite of 1960 Ghana became a republic and Nkrumah became its president, with wide legislative and executive powers under a new constitution. Nkrumah then concentrated his attention on campaigning for the political unity of black Africa, and he began to lose touch with realities in Ghana. His administration became involved in magnificent but often ruinous development projects, so that a once-prosperous country became crippled with foreign debt. His government's Second Development Plan, announced in 1959, had to be abandoned in 1961 when the deficit in the balance of payments rose to more than $125 million. Contraction of the economy led to widespread labour unrest and to a general strike in September 1961. From that time Nkrumah began to evolve a much more rigorous apparatus of political control and to turn increasingly to the communist countries for support.

President of Ghana and afterward. The attempted assassination of Nkrumah at Kulugungu in August 1962—the first of several—led to his increasing seclusion from public life and to the growth of a personality cult, as well as to a massive buildup of the country's internal security forces. Early in 1964 Ghana was officially designated a one-party state, with Nkrumah as life president of both nation and party. While the administration of the country passed increasingly into the hands of self-serving and corrupt party officials, Nkrumah busied himself with the ideological education of a new generation of black African political activists. Meanwhile, the economic crisis in Ghana worsened and shortages of foodstuffs and other goods became chronic. On Feb. 24, 1966, while Nkrumah was visiting Peking, the army and police in Ghana seized power. Returning to West Africa, Nkrumah found asylum in Guinea, where he spent the remainder of his life. He died of cancer in Bucharest in 1972.

nō theatre, nō also spelled NOH, traditional Japanese theatrical form and one of the oldest extant theatrical forms in the world.

Nō, meaning "talent" or "skill," is unlike Western narrative drama. Rather than being actors or "representers" in the Western sense, nō performers are simply storytellers who use their visual appearances and their movements to suggest the essence of their tale rather than to enact it. Little "happens" in a nō drama, and the total effect is less that of a present action than of a simile or metaphor made visual. The educated spectators know the story's plot very well, so that what they appreciate are the symbols and subtle allusions to Japanese cultural history contained in the words and movements.

Nō developed from ancient forms of dance drama and from various types of festival drama at shrines and temples that had emerged by the 12th or 13th century. Nō became a distinctive form in the 14th century and was continually refined up to the years of the Tokugawa period (1603–1867). It became a ceremonial drama performed on auspicious occasions by professional actors for the warrior class—as, in a sense, a prayer for peace, longevity, and the prosperity of the social elite. Outside the noble houses, however, there were performances that popular audiences could attend. The collapse of the feudal order with the Meiji Restoration (1868) threatened the existence of nō, though a few notable actors maintained its traditions. After World War II, however, the interest from a large number of educated youth led to a revival of the form.

There are five types of nō plays. The first type, the *kami* ("god") play, involves a sacred story of a Shintō shrine; the second, *shura mono* ("fighting play"), centres on warriors; the third, *katsura mono* ("wig play"), has a female protagonist; the fourth type, varied in content, includes the *gendai mono* ("present-day play")—in which the story is contemporary and "realistic" rather than legendary and supernatural—and the *kyōjo mono* ("mad-woman play")—in which the protagonist becomes insane through the loss of a lover or child; and the fifth type, the *kiri,* or *kichiku* ("final," or "demon"), play, in which devils, strange beasts, and supernatural beings are featured. A typical nō play is relatively short. Its dialogue is sparse, serving as a mere frame for the movement and music. A standard nō program consists of three plays selected from the five types so as to achieve both an artistic unity and the desired mood; invariably, a play of the fifth type is the concluding work. *Kyōgen,* humourous sketches, are performed as interludes between plays. A program may begin with an *okina,* which is essentially an invocation for peace and prosperity in dance form.

Three major nō roles exist, the principal actor, or *shite;* the subordinate actor, or *waki;* and the *kyōgen* actors, one of whom is often involved in nō plays as a narrator. Each is a specialty having several "schools" of performers, and each has its own "acting place" on the stage. Subsidiary roles include those of attendant (*tsure*), of a "boy" (*kokata*), and of nonspeaking "walk-on" (*tomo*).

Accompaniment is provided by an instrumental chorus (*hayashi*) of four musicians—who play a flute (*Nōkan*), small hand drum (*ko-tsuzumi*), a large hand drum (*ō-tsuzumi*), and large drum (*taiko*)—and by a chorus (*jiutai*) consisting of 8–10 singers. The recitation (*utai*) is one of the most important elements in the performance. Each portion of the written text carries a prescription of the mode of recitation—as well as of accompanying movement or dance—although application of this may be varied slightly. Each type of dialogue and song has its own name: the *sashi* is like a recitative; the *uta* are the songs proper; the *rongi,* or debate, is intoned between chorus and *shite;* and the *kiri* is the chorus with which the play ends.

About 2,000 nō texts survive in full, of which about 230 remain in the modern repertoire. Zeami Motokiyo (1363–1443) and his father, Kan'ami Kiyotsugu (1333–84), wrote many of the most beautiful and exemplary of nō texts, including *Matsukaze* ("Wind in the Pines") by Kan'ami and *Takasago* by Zeami. Zeami also formulated the principles of the nō theatre that guided its performers for many centuries. His *Kakyō* ("The Mirror of the Flower," 1424) detailed the composition, the recitation, the mime and dance of the performers, and the staging principles of nō. These constituted the first major principle of nō, which Zeami described as *monomane,* or the "imitation of things." He advised on the selection of properly classical characters to be portrayed, from legend or life, and on the proper integration of the visual, the melodic, and the verbal to open the eye and ear of the mind to the supreme beauty he crystallized in the second main principle, *yūgen.* Meaning literally "dark" or "obscure," *yūgen* suggested beauty only partially perceived—fully felt but barely glimpsed by the viewer.

Two factors have allowed nō to be transmitted from generation to generation yet remain fairly close to earlier forms: first, the preservation of texts, containing detailed prescriptions of recitation, dance, mime, and music, and, second, the direct and fairly exact transmission of performing skills. On the other hand, nō was subject to changing preferences of new audiences, and new styles and patterns inevitably evolved. Further, there was constant refinement of received forms to express more clearly or intensely the objectives of nō, but these were always only minor deviations from traditional form. Even the differences between the five schools of *shite* performers represent only slight variations in the melodic line of the recitation or in the patterns of the *furi* or *mai* mime and dance.

In the 20th century some experimentation has taken place. Toki Zenmaro and Kita Minoru produced nō plays that had new content but adhered to traditional conventions in production. Mishima Yukio, on the other hand, took old plays and added new twists while retaining the old themes. Experiments to elaborate the humorous *kyōgen* interludes and the attempt to add (in the manner of Kabuki theatre) a long passage onto the stage through the audience and a strong spotlight on the *shite* received little public acceptance. Instead, nō has been sustained in the postwar period by theatregoers who have come to enjoy it not simply for its status as a "classic theatre" or because of innovations but as a perfected and refined contemporary stage art.

no-till agriculture: *see* till-less agriculture.

Noah's ark, 12th-century fresco in the nave of the church at Saint-Savin-sur-Gartempe, Fr.
Jean Roubier

Japheth, the representative head of a Semitic genealogical line. A synthesis of at least three biblical source traditions, Noah is the image of the righteous man made party to a covenant with Yahweh, the God of Israel, in which nature's future protection against catastrophe is assured.

Noah appears in Gen. 5:29 as the son of Lamech and ninth in descent from Adam. In the story of the Deluge (Gen. 6:11–9:19), he is represented as the patriarch who, because of his blameless piety, was chosen by God to perpetuate the human race after his wicked contemporaries had perished in the Flood. A righteous man, Noah "found favour in the eyes of the Lord" (Gen. 6:8). Thus, when God beheld the corruption of the earth and determined to destroy it, he gave Noah divine warning of the impending disaster and made a covenant with him, promising to save him and his family. Noah was instructed to build an ark, and in accordance with God's instructions he took into the ark male and female specimens of all the world's species of animals, from which the stocks might be replenished. Consequently, according to this narrative, the entire surviving human race descended from Noah's three sons. Such a genealogy sets a universal frame within which the subsequent role of Abraham, as the father of Israel's faith, could assume its proper dimensions.

The story of the Flood has close affinities with Babylonian traditions of apocalyptic floods in which Utnapishtim plays the part corresponding to that of Noah. These mythologies are the source of such features of the biblical Flood story as the building and provisioning of the ark, its flotation, and the subsidence of the waters, as well as the part played by the human protagonist. Tablet XI of the Gilgamesh epic introduces Utnapishtim, who, like Noah, survived cosmic destruction by heeding divine instruction to build an ark.

The religious meaning of the Flood is conveyed after Noah's heroic survival. He then built an altar on which he offered burnt sacrifices to God, who then bound himself to a pact never again to curse the earth on man's account. God then set a rainbow in the sky as a visible guarantee of his promise in this covenant. God also renewed his commands given at creation but with two changes: man could now kill animals and eat meat, and the murder of a man would be punished by men.

Despite the tangible similarities of the Mesopotamian and biblical myths of the flood, the biblical story has a unique Hebraic perspective. In the Babylonian story the destruction of the flood was the result of a disagreement among the gods; in Genesis it resulted from the moral corruption of human history. The primitive polytheism of the Mesopotamian versions is transformed in the biblical story into an affirmation of the omnipotence and benevolence of the one righteous God. Again, following their survival, Utnapishtim and his wife are admitted to the circle of the immortal gods; but Noah and his family are commanded to undertake the renewal of history.

The narrative concerning Noah in Gen. 9:20–27 belongs to a different cycle, which seems to be unrelated to the Flood story. In the latter, Noah's sons are married and their wives accompany them in the ark; but in this narrative they would seem to be unmarried, nor does the shameless drunkenness of Noah accord well with the character of the pious hero of the Flood story. Three different themes may be traced in Gen. 9:20–27: first, the passage attributes the beginnings of agriculture, and in particular the cultivation of the vine, to Noah; second, it attempts to provide, in the persons of Noah's three sons, Shem, Ham, and Japheth, ancestors for three of the races of mankind and to account in some degree for their historic relations; and third, by its censure of Ham, it offers a veiled justification for the later Israelite conquest and subjugation of the Canaanites. Noah's drunkenness and the disrespect it provokes in his son Ham, (or Canaan) result in Noah's laying of a curse on Ham and his descendants. This incident may symbolize the ethnic and social division of Palestine: the Israelites (from the line of Shem) will separate from the pre-Israelite population of Canaan (which is depicted as licentious), who will live in subjection to the Hebrews.

The symbolic figure of Noah was known in ancient Israel, before the compilation of the Pentateuch. Ezekiel (14:14;20) speaks of him as a prototype of the righteous man who, alone among the Israelites, would be spared God's vengeance. In the New Testament, Noah is mentioned in the genealogy of the Gospel According to Luke (3:36) that delineates Jesus' descent from Adam. Jesus also uses the story of the Flood that came on a worldly generation of men "in the days of Noah" as an example of Baptism, and Noah is depicted as a preacher of repentance to the men of his time, itself a predominant theme in Jewish apocryphal and rabbinical writings.

Noahide Laws, also called NOACHIAN LAWS, a Jewish Talmudic designation for seven biblical laws given to Adam and to Noah before the revelation to Moses on Mt. Sinai and consequently binding on all mankind.

Beginning with Genesis 2:16, the Babylonian Talmud listed the first six commandments as prohibitions against idolatry, blasphemy, murder, adultery, and robbery and the positive command to establish courts of justice (with all that this implies). After the Flood a seventh commandment, given to Noah, forbade the eating of flesh cut from a living animal (Gen. 9:4). Though the number of laws was later increased to 30 with the addition of prohibitions against castration, sorcery, and other practices, the "seven laws," with minor variations, retained their original status as authoritative commandments and as the source of other laws. As basic statutes safeguarding monotheism and guaranteeing proper ethical conduct in society, these laws provided a legal framework for alien residents in Jewish territory. Maimonides thus regarded anyone who observed these laws as one "assured of a portion in the world to come." Throughout the ages scholars have viewed the Noahide Laws as a link between Judaism and Christianity, as universal norms of ethical conduct, as a basic concept in international law, or as a guarantee of fundamental human rights for all.

Noailles, DUKES AND VISCOUNTS OF, titled nobility of a great French family, the Noailles, tracing back to the 13th century, grouped below chronologically and indicated by the symbol •.

• Noailles, Anne, 1er duc de (1st duke of) (d. Feb. 15, 1678, Paris), count of Noailles (grandson of the first count, Antoine of Noailles) who was created the first duc de Noailles and a peer of France in 1663. He had played an important part in the Fronde and had become a protégé of Cardinal Mazarin. He was made premier captain of Louis XIV's bodyguard in 1648 and became captain general (governor) of the newly won province of Roussillon, to which his descendants were usually appointed thereafter.

• Noailles, Anne-Jules, 2^{e} duc de (2nd duke of) (b. Feb. 5, 1650, Paris—d. Oct. 2, 1708, Versailles, Fr.), duke of Noailles, marshal of France, son of Anne of Noailles, the first duke. He was made field marshal at the age of 23 and was named lieutenant general and commander in chief of Languedoc in 1682. By then he had become one of the greatest generals of France, and, after raising the regiment of Noailles in 1689, he commanded in Spain during the War of the Spanish Succession. In 1693 he was made marshal of France.

His wife, Marie-Françoise de Bournonville, bore him 21 children.

• Noailles, Adrien-Maurice, 3^{e} duc de (3rd duke of) (b. Sept. 29, 1678, Paris—d. June 24, 1766, Paris), the third duc de Noailles, son of Anne-Jules of Noailles; he served in all the most important wars of the reign of Louis XV in Italy and Germany and became a marshal in 1734. His last command was in the War of the Austrian Succession, when he was beaten by the English at the Battle of Dettingen in 1743. He married Françoise d'Aubigné, a niece of Mme de Maintenon, Louis XIV's mistress and later wife; and two of his sons also attained the rank of marshal of France.

• Noailles, Louis, 4^{e} duc de (4th duke of) (b. April 21, 1713—d. Aug. 22, 1793, Saint-Germain-en-Laye, Fr.), duc d'Ayen until the death of his father (Adrien-Maurice) in 1766, when he became the duc de Noailles. He served in most of the wars of the 18th century without particular distinction but was nevertheless made a marshal of France, as the marshal of Noailles, in 1775. He refused to emigrate during the Revolution but escaped the fate of most noblemen by dying in August 1793 before the Terror reached its height.

On the 4th Thermidor (July 22), 1793, his wife, the aged Duchesse de Noailles, was executed, along with her daughter-in-law, the Duchesse d'Ayen, and her granddaughter, the Vicomtesse de Noailles.

• Noailles, Jean-Paul-François, 5^{e} duc de (5th duke of) (b. Oct. 26, 1739, Paris—d. Oct. 20, 1824, Fontenay-Trésigny, Fr.), son of Louis of Noailles, lieutenant general, and member of the French Académie des Sciences. Though he served in the army, his tastes were scientific, and for his eminence as a chemist he was elected to the Académie des Sciences in 1777. He became duc d'Ayen in 1766 on his grandfather's death and duc de Noailles on his father's death in 1793. After emigrating in 1792 to escape the Revolution, he lived in Switzerland until the Restoration in 1814, when he took his seat as a peer of France.

• Noailles, Louis-Marie, vicomte de (viscount of) (b. April 17, 1756, Paris—d. Jan. 9, 1804, at sea near Cuba), second son of the Marshal of Mouchy and one of the most distinguished members of the Noailles family.

He served brilliantly under Lafayette in the U.S. War of Independence and was the officer who concluded the capitulation of Yorktown. He was elected to the States General in 1789. He began the "orgie," as Mirabeau called it, on August 4, when all privileges were abolished, and with d'Aiguillon he proposed the abolition of titles and liveries in June 1790. When the French Revolution became more pronounced, he emigrated to the United States and became a partner in Bingham's Bank at Philadelphia. He was very successful but left the bank to accept a command against the English in San Domingo, under Rochambeau. He made a brilliant defense of the Môle Saint-Nicolas and escaped with the garrison to Cuba; but in making for Havana his ship was attacked by an English frigate, and after a long engagement he was severely wounded and died of his injuries.

Noailles, Anna de, in full ANNA-ÉLISABETH DE NOAILLES, PRINCESS BRANCOVAN, COUNTESS (comtesse) MATHIEU (b. Nov. 15, 1876, Paris, France—d. April 30, 1933, Paris), poet, a leading literary figure in France in the pre-World War I period.

The daughter of a Romanian prince and granddaughter of a Turkish pasha, she adopted France and its language for her life and writings even before her marriage to a French count. Her friends included the novelists Marcel Proust and Colette and the poets Paul Valéry and Jean Cocteau. In her literary salon she kept most of the writers of her time under the spell of her artful conversation. Her volumes of poems, *Le Coeur innombrable* (1901; "The Numberless Heart"), *Les Éblouissements* (1907; "Resplendence"), and *L'Honneur de souffrir* (1927; "The Honour of Suffering"), are vibrant with a sensual love of nature. Her lyricism draws from the Romantic themes of the 19th-century poets Alfred de Vigny and Alphonse de Lamartine. Her later works reflect her fear of the thought of the inevitable collapse of her physical powers. She was made a commander of the Légion d'Honneur and elected to the Royal Academy of French Language and Literature of Belgium.

Noailles, Louis-Antoine de (b. May 27, 1651, Château de Tessières, near Aurillac, France—d. May 4, 1729, Paris), cardinal and archbishop of Paris, who, with his brother, the second duc de Noailles, made the name Noailles one of the most honoured in France.

Educated in Paris and receiving a doctorate in theology from the Sorbonne, he became successively bishop of Cahors (1679), bishop of Châlons (1680–95), and archbishop of Paris (from 1695); he was named cardinal in 1700.

He was involved in the controversies over Jansenism, mildly approving the Jansenism of Pasquier Quesnel's *Reflexions morales* and, by 1713, demonstrating intense opposition to the most resolute anti-Jansenists, the Jesuits. His opposition to Pope Clement XI's anti-Jansenist bull *Unigenitus* ended ambiguously in 1728, when he accepted it unconditionally after signing a preliminary protest against any such acceptance. He died the following year.

Noākhāli, port city, southern Bangladesh, on the Noākhāli Watercourse near the Meghna Estuary as it empties into the Bay of Bengal. The port is connected by road and rail with Comilla and by steamer with Barisāl. Industries include cotton weaving. Formerly called Sudhārām, the city was constituted a municipality in 1876 and contains several government colleges affiliated with the University of Dhākā.

Around Noākhāli on three sides is an alluvial plain that is annually inundated and fertilized by silt deposits from the Meghna Estuary; the area is broken only by a hilly tract in the northeast known as Bāraiyādhāla. Rice, jute, oilseeds, pulses, betel nuts, chilies, and sugarcane are the chief local crops. Pop. (1991 prelim.) city, 73,766.

Nōami, original name NAKAO SHINNŌ (b. 1397, Japan—d. 1494), Japanese poet, painter, and art critic, the first nonpriest who painted in the *suiboku* ("water-ink"), or Chinese, style.

Nōami was in charge of the art collection of Ashikaga Yoshimitsu, the military dictator who ruled Japan from 1368 to 1394, and was perhaps the first great art expert in Japan. His catalog of Yoshimitsu's collection, *Kundaikan sayū chōki* (1476; "A Treatise on the Scrolls in the Lord's Watchtower"), is invaluable as an early Japanese appraisal of Chinese artists.

Many of Nōami's paintings have been preserved. Among the best known are "The Pines of Miho," a landscape executed on a screen in the soft ink-wash technique associated with Mu-ch'i Fa-ch'ang, the 13th-century Chinese priest-painter whose work Nōami admired, and "The White-Robed Kannon," a portrait in ink of the Buddhist goddess of mercy painted for his child's memorial service. Nōami's son, Geiami (d. 1485), and grandson, Sōami, also served the Ashikaga court as painters and art advisers; together they are known as the San Ami (Three Amis).

Noatak National Preserve, formerly NOATAK NATIONAL MONUMENT, national preserve in Alaska, U.S., adjoining Gates of the Arctic National Park to the east and Kobuk Valley National Park to the south. Proclaimed a national monument in 1978, the area underwent boundary and name changes in 1980. The entire area is located north of the Arctic Circle and contains the largest untouched river basin in the United States. Landforms of scientific interest include the Grand Canyon of the Noatak (65 miles [105 km] long), a transition zone and migration route for flora and fauna between subarctic and Arctic environments. The preserve has hundreds of archaeological sites, and wildlife includes caribou, grizzly bears, Dall sheep, moose, and wolves, and waterfowl, raptors, and other bird species. The total area is 10,273 square miles (26,607 square km).

Nobel, Alfred Bernhard (b. Oct. 21, 1833, Stockholm, Sweden—d. Dec. 10, 1896, San Remo, Italy), Swedish chemist, engineer, and industrialist who invented dynamite and other, more powerful, explosives and founded the Nobel Prizes.

Through his mother he was descended from the Swedish naturalist Olof Rudbeck, noted for his description of the lymphatic vessels (*c.* 1653). From his father, Immanuel Nobel, he learned the fundamentals of engineering, and, like his father, he had a talent for invention. The Nobel family left Stockholm in 1842 to join the father in St. Petersburg. Educated mainly by tutors, young Nobel was a competent chemist at 16 and was fluent in English, French, German, Russian, and Swedish. He left Russia in 1850 to spend a year in Paris studying chemistry and four years in the United States working under the direction of John Ericsson, builder of the ironclad warship *Monitor*. Upon his return to St. Petersburg, Nobel worked in his father's factory until it went bankrupt in 1859.

Alfred Nobel, detail of a portrait (from a photograph) by Emil Österman, 1915; in the Nobel Foundation, Stockholm

By courtesy of the Svenska Portrattarkivet

Returning to Sweden, Nobel began the manufacture of the liquid explosive nitroglycerin. Shortly after production was under way in 1864, the factory blew up, causing the death of his youngest brother, Emil, and four other persons. Forbidden by the Swedish government to rebuild the factory, Nobel, who had become stereotyped as a "mad scientist," began experimenting on a barge to find a way to minimize the danger of handling nitroglycerin. A chance discovery that nitroglycerin was absorbed to dryness by kieselguhr, a siliceous packing material, and that the mixture could be handled safely led him to perfect dynamite and a detonating cap. Granted patents for dynamite in Britain (1867) and the United States (1868), he further experimented and developed a more powerful form of dynamite, blasting gelatin, patented in 1876. About a decade later, he produced ballistite, one of the first nitroglycerin smokeless powders and a precursor of cordite. Nobel's claim that his patent covered the latter was the occasion of vigorously contested lawsuits between him and the British government in 1894 and 1895, which he eventually lost. An accomplishment of importance equal to that of his explosives was his construction and perfection of detonators for such explosives as could not be made to explode by simple firing.

His worldwide interests in explosives, in addition to large holdings in the Baku oil fields of Russia, brought him an immense fortune but required him to travel almost constantly. He had the inclinations of a recluse, however, and he never married. Though he was essentially a pacifist and hoped that the destructive powers of his inventions would help bring an end to wars, his view of mankind and nations was pessimistic. He had an abiding interest in literature, and in his youth he had written poetry in English. The beginnings of a novel were found among his papers.

Generous in humanitarian and scientific philanthropies, he left the bulk of his fortune in trust to establish what came to be the most highly regarded of international awards, the Nobel Prize.

Nobel Prize, any of the prizes (five in number until 1969, when a sixth was added) that are awarded annually by four institutions (three Swedish and one Norwegian) from a fund established under the will of Alfred Bernhard Nobel. Distribution was begun on Dec. 10, 1901, the fifth anniversary of the death of the founder, whose will specified that the awards should annually be made "to those who, during the preceding year, shall have conferred the greatest benefit on mankind." The five prizes established by his will are: the Nobel Prize for Physics (Nobelpriset i Fysik); the Nobel Prize for Chemistry (Nobelpriset i Kemi); the Nobel Prize for Physiology or Medicine (Nobelpriset i Fysiologi eller Medicin); the Nobel Prize for Literature (Nobelpriset i Litteratur); and the Nobel Prize for Peace (Nobels Fredspris). An additional award, the Prize for Economic Sciences in Memory of Alfred Nobel (Priset i Ekonomisk Vetenskap till Alfred Nobels Minne), was set up in 1968 by the Bank of Sweden, and the first award was given in 1969.

The institutions cited as prize awarders by Alfred Nobel in his will are the Royal Swedish Academy of Sciences (physics and chemistry), the Royal Caroline Medico-Chirurgical Institute (physiology or medicine), and the Swedish Academy (literature)—all in Stockholm—and the Norwegian Nobel Committee (peace), located in Oslo and appointed by the Norwegian Storting (parliament). The Academy of Sciences also supervises the economics award. The Nobel Foundation, established in pursuance of the provisions of the will, is the legal owner and functional administrator of the funds and serves as the joint administrative body of the prize awarders, but it is not concerned with the prize deliberations or decisions, which rest exclusively with the four institutions. Each award consists of a gold medal, a diploma bearing a citation, and a sum of money; the amount depending on the income of the foundation.

The selection of the prizewinners starts in the early autumn of the year preceding the awards, with the prize-awarding institutions sending out invitations to nominate candidates to those competent under the Nobel statutes to do so. The basis of selection is professional competence and international range; self-nomination automatically disqualifies a person. Prize proposals must reach the proper committee in writing before February 1 of the year of the prize decision.

On February 1, six Nobel committees—one for each prize group—start their work on the nominations received. If necessary, the committees may call in experts, irrespective of nationality. During September and early October the committees submit recommendations to their respective prize-awarding bodies—only in rare cases has the question been left open. The final decision by the awarders must be made by November 15. A committee recommendation is usually but not invariably followed. The deliberation and the voting are secret at all stages. Prizes may be given only to individuals, except the Peace Prize, which may also be given to an institution. An individual may not be nominated posthumously, but a prize duly proposed may be so awarded, as with Dag Hammarskjöld (for peace; 1961) and Erik A. Karlfeldt (for literature; 1931). The awards may not be appealed against. Official support, diplomatic or political, for a certain candidate has no bearing on an award because the prize awarders, as such, are independent of the state.

A prize is either given entire to one person, divided equally between at most two works, or shared jointly by two or three persons. Sometimes a prize is withheld until the following year; if not then awarded it is paid back into the funds, which happens also when a prize is neither awarded nor reserved. Two prizes in the same field can thus be awarded in one year—*i.e.,* the prize withheld from the previous year and the current year's prize. If a prize is declined or not accepted before a set date, the prize money goes back to the funds. Prizes have been declined, and in some instances governments have forbidden their nationals to accept Nobel Prizes. Those who win a prize are nevertheless entered into the list of Nobel laureates with the remark "declined the prize." Motives for nonacceptance may vary, but the real reason has mostly been external pressure; *e.g.,* Hitler's decree of 1937 forbade Germans to accept Nobel Prizes because the Peace Prize to Carl von Ossietzky in 1935 was taken as an affront. In some cases, the refuser has later explained his situation and on application received the Nobel gold medal and the diploma—but not the money, which had reverted to the funds.

Prizes are withheld or not awarded when no worthy candidate in the meaning of Nobel's will can be found or when the world situation prevents the gathering of information required to reach a decision, as happened during World Wars I and II. The prizes are open to all, irrespective of nationality, race, creed, or ideology. They can be awarded more than once to the same recipient. The ceremonial presentations for physics, chemistry, physiology or medicine, literature, and economics take place in Stockholm; and that for peace takes place in Oslo, on December 10, the anniversary of Nobel's death. The laureates usually receive their prizes in person; each presents a lecture in connection with the award ceremonies.

The general principles governing awards were laid down by Alfred Nobel in his will. In 1900 supplementary rules of interpretation and administration were agreed upon between the executors, representatives of the prize awarders, and the Nobel family and were confirmed by the king in council. These statutory rules have on the whole remained unchanged but have been somewhat modified in application; *e.g.,* the will's ambiguous words "idealistic tendency," as qualification for the prize for literature, were in the beginning interpreted strictly but have gradually been interpreted more flexibly, as the list of laureates shows. The basis for the economics award was scientific—*i.e.,* mathematical or statistical, rather than political or social. The first two laureates, economist Ragnar Frisch (Norway) and Jan Tinbergen (The Netherlands), were given the prize for their work in econometrics, the analysis of economic activity by means of mathematical expression.

The scientific and medical prizes have proved to be the least controversial, while those for literature and peace by their very nature have been the most exposed to critical differences. The Peace Prize has been most frequently reserved. For Nobel Prize winners, *see* Table, pages 740–747.

nobelium (No), synthetic chemical element of the actinide series in Group IIIb of the periodic table, atomic number 102. Not occurring in nature, nobelium (as the isotope nobelium-254) was discovered (April 1958) by Albert Ghiorso, T. Sikkeland, J.R. Walton, and Glenn T. Seaborg at the University of California, Berkeley, as a product of the bombardment of curium (atomic number 96) with carbon ions (atomic number 6) accelerated in a heavy-ion linear accelerator. An international team of scientists working at the Nobel Institute of Physics in Stockholm had claimed less than a year before that they had synthesized the same element, which they named nobelium (for Alfred Nobel); but experiments performed in the Soviet Union (at the I.V. Kurchatov Institute of Atomic Energy, Moscow, and at the Joint Institute for Nuclear Research in Dubna) and in the United States (University of California, Berkeley) failed to confirm the discovery. The Berkeley and Dubna teams have subsequently produced more than a half dozen isotopes of nobelium; nobelium-255 (three-minute half-life) is the stablest. Using traces of this isotope, radiochemists have shown nobelium to exist in aqueous solution in both the +2 and +3 oxidation states. The +2 state is very stable, an effect more pronounced than was anticipated in comparison with the homologous lanthanide element ytterbium (atomic number 70).

atomic number	102
stablest isotope	255
valence	2,3
electronic config.	2-8-18-32-32-8-2 or (Rn)$5f^{14}7s^2$

Nobeoka, city, Miyazaki *ken* (prefecture), Kyushu, Japan, on the delta of the Gokase River (Gokase-gawa). It developed as a castle town in the 12th century and has been a fishing port since the mid-18th century. Nobeoka is now the largest industrial city of the prefecture. Several large chemical plants produce fertilizer, medicines, and fibres. Pearls are cultivated along the coast, and sweet potatoes, cereals, and tobacco are grown. Pop. (1983 est.) 136,255.

Nobile, Umberto (b. Jan. 21, 1885, Lauro, near Salerno, Italy—d. July 30, 1978, Rome), Italian aeronautical engineer and pioneer in Arctic aviation who in 1926, with the Norwegian explorer Roald Amundsen and Lincoln Ellsworth of the United States flew over the North Pole in the dirigible *Norge,* from Spitsbergen (now Svalbard), north of Norway, to Alaska.

As a general in the Italian air force and a professor of aeronautical engineering at the University of Naples in 1928, Nobile began a new series of flights over unexplored Arctic regions with a craft similar to the *Norge.* On the third flight the airship crashed on the ice north-northeast of Spitsbergen. Though Nobile and 7 companions were rescued, 17 lives were lost. When an Italian commission of inquiry found him responsible for the disaster, he resigned his commission. In 1931 he took part in a Soviet voyage to the Arctic. After World War II the commission's report was discredited, and he was reinstated in the air force. He resumed teaching at Naples and was a deputy in the Italian Constituent Assembly (1946). Nobile's own account of his Arctic adventures is given in *Gli italiani al Polo Nord* (1959; *My Polar Flights*).

Nobility, Charter to the (Russian history): *see* Gentry, Charter to the.

Noble, Sir Andrew, 1ST BARONET (b. Sept. 13, 1831, Greenock, Renfrew, Scot.—d. Oct. 22, 1915, Argyll), Scottish physicist and gunnery expert, considered a founder of the science of ballistics. His pioneering research on fired gunpowder, often in conjunction with the British chemist Frederick Abel, contributed greatly to the progress of gunnery.

Noble was educated at Edinburgh Academy and the Royal Military Academy, Woolwich, London, and then entered the Royal Artillery in 1849. During the 1850s, in a study of the relative merits of smoothbore and rifled cannon, he devised a method of comparing their accuracy of fire. He became assistant inspector of artillery in 1859 but later left the service to join the engineering and ordnance firm of Sir William (later Lord) Armstrong, of which he became chairman in 1900.

About 1862 he applied his invention, the chronoscope, a device for measuring very small time intervals, to determine the velocity of shot in gun barrels. His experiments helped establish the science of ballistics and also led to new types of gunpowder, the redesigning of guns, and new methods of loading. Noble was elected a fellow of the Royal Society (1870), knighted (1893), and created a baronet (1902).

noble gas, any of the six chemical elements that make up Group O of the periodic table. The elements are helium (He), neon (Ne), argon (Ar), krypton (Kr), xenon (Xe), and radon (Rn).

A brief treatment of the noble gases follows. For full treatment, *see* MACROPAEDIA: Chemical Elements. *See also* MICROPAEDIA for entries on each of the individual noble gases.

All of the noble gases are present in the Earth's atmosphere. With the exception of hydrogen, helium is the most plentiful element in the universe, comprising almost 25 percent of its total mass. Under ordinary conditions, the noble gases are colourless, odourless, and nonflammable. Their atoms have stable electron configurations; thus they do not easily gain or lose electrons and rarely share them with other elements. The term "noble" alludes to the extraordinarily limited reactivity of the gases. They also are sometimes called inert gases for the same reason. It was, however, discovered in 1962 that the heavier noble gases—krypton, xenon, and radon—can form chemical compounds with fluorine, the strongest electron attracting of all elements. The outer electrons of the atoms of these three gases, screened from the nucleus by intervening electrons, are held less firmly and can be removed more readily from the atoms than can the electrons of helium, neon, and argon.

1908	Gabriel Lippmann	Fr.	photographic reproduction of colours	Ernest Rutherford	U.K.	investigations into the disintegration of elements and the chemistry of radioactive substances	Rudolf Eucken; philosopher	Ger.
1909	Guglielmo Marconi Ferdinand Braun	Italy Ger.	development of wireless telegraphy	Wilhelm Ostwald	Ger.	pioneer work on catalysis, chemical equilibrium, and reaction velocities	Selma Lagerlöf; novelist	Swed.
1910	Johannes van der Waals	Neth.	research concerning the equation of state of gases and liquids	Otto Wallach	Ger.	pioneer work in alicyclic combinations	Paul von Heyse; poet, novelist, dramatist	Ger.
1911	Wilhelm Wien	Ger.	discoveries regarding laws governing heat radiation	Marie Curie[2]	Fr.[3]	discovery of radium and polonium; isolation of radium	Maurice Maeterlinck; dramatist	Belg.
1912	Nils Gustaf Dalén	Swed.	invention of automatic regulators for lighting coastal beacons and light buoys	Victor Grignard Paul Sabatier	Fr. Fr.	discovery of the Grignard reagents method of hydrogenating organic compounds	Gerhart Hauptmann; dramatist	Ger.
1913	Heike Kamerlingh Onnes	Neth.	investigation into the properties of matter at low temperatures; production of liquid helium	Alfred Werner	Switz.[3]	work on the linkage of atoms in molecules	Rabindranath Tagore; poet	India
1914	Max von Laue	Ger.	discovery of diffraction of X rays by crystals	Theodore Richards	U.S.	accurate determination of the atomic weights of numerous elements	(no award)	—
1915	William Bragg Lawrence Bragg	U.K. U.K.	analysis of crystal structure by means of X rays	Richard Willstätter	Ger.	pioneer researches in plant pigments, especially chlorophyll	Romain Rolland; novelist	Fr.
1916	(no award)	—	—	(no award)	—	—	Verner von Heidenstam; poet	Swed.
1917	Charles Barkla	U.K.	discovery of characteristic X-radiation of elements	(no award)	—	—	Karl Gjellerup; novelist Henrik Pontoppidan; novelist	Den. Den.
1918	Max Planck	Ger.	discovery of the elemental quanta	Fritz Haber	Ger.	synthesis of ammonia	Erik Axel Karlfeldt (declined)	Swed.
1919	Johannes Stark	Ger.	discovery of Doppler effect in positive ion rays and division of spectral lines in electric field	(no award)	—	—	Carl Spitteler; poet, novelist	Switz.
1920	Charles Guillaume	Switz.	discovery of anomalies in alloys	Walther Nernst	Ger.	work in thermochemistry	Knut Hamsun; novelist	Nor.
1921	Albert Einstein	Switz.[3]	work in theoretical physics	Frederick Soddy	U.K.	chemistry of radioactive substances; occurrence and nature of isotopes	Anatole France; novelist	Fr.
1922	Niels Bohr	Den.	investigation of atomic structure and radiation	Francis Aston	U.K.	work with mass spectrograph; whole-number rule	Jacinto Benavente y Martínez; dramatist	Spain
1923	Robert Millikan	U.S.	work on elementary electric charge and the photoelectric effect	Fritz Pregl	Austria	method of microanalysis of organic substances	William Butler Yeats; poet	Ire.
1924	Manne Siegbahn	Swed.	work in X-ray spectroscopy	(no award)	—	—	Władysław Reymont; novelist	Pol.
1925	James Franck Gustav Hertz	Ger. Ger.	discovery of the laws governing the impact of an electron upon an atom	Richard Zsigmondy	Austria	elucidation of the heterogeneous nature of colloidal solutions	George Bernard Shaw; dramatist	Ire.
1926	Jean Perrin	Fr.	work on discontinuous structure of matter	The Svedberg	Swed.	work on disperse systems	Grazia Deledda; novelist	Italy
1927	Arthur Holly Compton C.T.R. Wilson	U.S. U.K.	discovery of wavelength change in diffused X rays method of making visible the paths of electrically charged particles	Heinrich Wieland	Ger.	researches into the constitution of bile acids	Henri Bergson; philosopher	Fr.[3]
1928	Owen Richardson	U.K.	work on electron emission by hot metals	Adolf Windaus	Ger.	constitution of sterols and their connection with vitamins	Sigrid Undset; novelist	Nor.

Nobel Prize winners[1] (continued)

	physiology or medicine			peace		economic science
1901	Emil von Behring	Ger.	work on serum therapy	Jean-Henri Dunant Frédéric Passy	Switz. Fr.	prize not awarded until 1969
1902	Ronald Ross	U.K.	discovery of how malaria enters an organism	Élie Ducommun Charles-Albert Gobat	Switz. Switz.	
1903	Niels R. Finsen	Den.	treatment of skin diseases with light	Randal Cremer	U.K.	
1904	Ivan Pavlov	Russia	work on the physiology of digestion	Institute of International Law	(founded 1873)	
1905	Robert Koch	Ger.	tuberculosis research	Bertha von Suttner	Austria	
1906	Camillo Golgi Santiago Ramón y Cajal	Italy Spain	work on the structure of the nervous system	Theodore Roosevelt	U.S.	
1907	Alphonse Laveran	Fr.	discovery of the role of protozoa in diseases	Ernesto Teodoro Moneta Louis Renault	Italy Fr.	
1908	Paul Ehrlich Élie Metchnikoff	Ger. Russia	work on immunity	Klas Pontus Arnoldson Fredrik Bajer	Swed. Den.	
1909	Emil Kocher	Switz.	physiology, pathology, and surgery of thyroid gland	Baron d'Estournelles de Constant Auguste Beernaert	Fr. Belg.	
1910	Albrecht Kossel	Ger.	researches in cellular chemistry	International Peace Bureau	(founded 1891)	
1911	Allvar Gullstrand	Swed.	work on dioptrics of the eye	Tobias Asser Alfred Fried	Neth. Austria	
1912	Alexis Carrel	Fr.	work on vascular suture; transplantation of organs	Elihu Root	U.S.	
1913	Charles Richet	Fr.	work on anaphylaxis	Henri-Marie Lafontaine	Belg.	
1914	Robert Bárány	Austria	work on vestibular apparatus	(no award)	—	
1915	(no award)	—	—	(no award)	—	
1916	(no award)	—	—	(no award)	—	
1917	(no award)	—	—	International Red Cross Committee[4]	(founded 1863)	
1918	(no award)	—	—	(no award)	—	
1919	Jules Bordet	Belg.	work on immunity factors in blood serum	Woodrow Wilson	U.S.	
1920	August Krogh	Den.	discovery of capillary motor-regulating mechanism	Léon Bourgeois	Fr.	
1921	(no award)	—	—	Karl Branting Christian Lous Lange	Swed. Nor.	
1922	A.V. Hill	U.K.	discoveries concerning heat production in muscles	Fridtjof Nansen	Nor.	
	Otto Meyerhof	Ger.	work on metabolism of lactic acid in muscles			
1923	F.G. Banting J.J.R. Macleod	Can. U.K.	discovery of insulin	(no award)	—	
1924	Willem Einthoven	Neth.	discovery of electrocardiogram mechanism	(no award)	—	
1925	(no award)	—	—	Sir Austen Chamberlain Charles G. Dawes	U.K. U.S.	
1926	Johannes Fibiger	Den.	contributions to cancer research	Aristide Briand Gustav Stresemann	Fr. Ger.	
1927	Julius Wagner-Jauregg	Austria	work on malaria inoculation in dementia paralytica	Ferdinand Buisson Ludwig Quidde	Fr. Ger.	
1928	Charles Nicolle	Fr.	work on typhus	(no award)	—	

Nobel Prize winners[1] (continued)

	physics			chemistry			literature	
1929	Louis-Victor de Broglie	Fr.	discovery of the wave nature of electrons	Arthur Harden Hans von Euler-Chelpin	U.K. Swed.[3]	investigations in the fermentation of sugars and the enzyme action involved	Thomas Mann; novelist	Ger.
1930	Sir Chandrasekhara Raman	India	work on light diffusion; discovery of Raman effect	Hans Fischer	Ger.	hemin, chlorophyll research; synthesis of hemin	Sinclair Lewis; novelist	U.S.
1931	(no award)	—	—	Carl Bosch Friedrich Bergius	Ger. Ger.	invention and development of chemical high-pressure methods	Erik Axel Karlfeldt; poet (posthumous award)	Swed.
1932	Werner Heisenberg	Ger.	creation of quantum mechanics	Irving Langmuir	U.S.	discoveries and investigations in surface chemistry	John Galsworthy; novelist	U.K.
1933	P.A.M. Dirac Erwin Schrödinger	U.K. Austria	introduction of wave-equations in quantum mechanics	(no award)	—	—	Ivan Bunin; poet, novelist	U.S.S.R.
1934	(no award)	—	—	Harold Urey	U.S.	discovery of heavy hydrogen	Luigi Pirandello; dramatist	Italy
1935	James Chadwick	U.K.	discovery of the neutron	Frédéric Joliot-Curie Irène Joliot-Curie	Fr. Fr.	synthesis of new radioactive elements	(no award)	—
1936	Victor Hess Carl Anderson	Austria U.S.	discovery of cosmic radiation discovery of the positron	Peter Debye	Neth.	work on dipole moments and diffraction of X rays and electrons in gases	Eugene O'Neill; dramatist	U.S.
1937	Clinton Davisson George Paget Thomson	U.S. U.K.	experimental demonstration of the interference phenomenon in crystals irradiated by electrons	Norman Haworth Paul Karrer	U.K. Switz.	research on carbohydrates and vitamin C research on carotenoids, flavins, and vitamins	Roger Martin du Gard; novelist	Fr.
1938	Enrico Fermi	Italy	disclosure of artificial radioactive elements produced by neutron irradiation	Richard Kuhn (declined)[5]	Ger.	carotenoid and vitamin research	Pearl Buck; novelist	U.S.
1939	Ernest Lawrence	U.S.	invention of the cyclotron	Adolf Butenandt (declined)[5] Leopold Ružička	Ger. Switz.[3]	work on sexual hormones work on polymethylenes and higher terpenes	Frans Eemil Sillanpää; novelist	Fin.
1943[6]	Otto Stern	U.S.[3]	discovery of the magnetic moment of the proton	George de Hevesy	Hung.	use of isotopes as tracers in chemical research	(no award)	—
1944	Isidor Rabi	U.S.[3]	resonance method for registration of various properties of atomic nuclei	Otto Hahn	Ger.	discovery of the fission of heavy nuclei	Johannes V. Jensen; novelist	Den.
1945	Wolfgang Pauli	Austria	discovery of the exclusion principle of electrons	Artturi Virtanen	Fin.	invention of fodder preservation method	Gabriela Mistral; poet	Chile
1946	P.W. Bridgman	U.S.	discoveries in the domain of high-pressure physics	James Sumner John Northrop Wendell Stanley	U.S. U.S. U.S.	discovery of enzyme crystallization preparation of enzymes and virus proteins in pure form	Hermann Hesse; novelist	Switz.[3]
1947	Sir Edward Appleton	U.K.	discovery of Appleton layer in upper atmosphere	Sir Robert Robinson	U.K.	investigation of alkaloids and other plant products	André Gide; novelist, essayist	Fr.
1948	Patrick Blackett	U.K.	discoveries in the domain of nuclear physics and cosmic radiation	Arne Tiselius	Swed.	researches in electrophoresis and adsorption analysis; serum proteins	T.S. Eliot; poet, critic	U.K.[3]
1949	Yukawa Hideki	Japan	prediction of the existence of mesons	William Giauque	U.S.	behaviour of substances at extremely low temperatures	William Faulkner; novelist	U.S.
1950	Cecil Powell	U.K.	photographic method of studying nuclear processes; discoveries concerning mesons	Otto Diels Kurt Alder	Ger. Ger.	discovery and development of diene synthesis	Bertrand Russell; philosopher	U.K.
1951	Sir John Cockcroft E.T.S. Walton	U.K. Ire.	work on transmutation of atomic nuclei by accelerated particles	Edwin McMillan Glenn Seaborg	U.S. U.S.	discovery of and research on transuranium elements	Pär Lagerkvist; novelist	Swed.
1952	Felix Bloch E.M. Purcell	U.S.[3] U.S.	discovery of nuclear magnetic resonance in solids	A.J.P. Martin R.L.M. Synge	U.K. U.K.	development of partition chromatography	François Mauriac; poet, novelist, dramatist	Fr.
1953	Frits Zernike	Neth.	method of phase-contrast microscopy	Hermann Staudinger	Ger.	work on macromolecules	Sir Winston Churchill; historian, orator	U.K.
1954	Max Born Walther Bothe	U.K.[3] Ger.	statistical studies of atomic wave functions invention of coincidence method	Linus Pauling[7]	U.S.	study of the nature of the chemical bond	Ernest Hemingway; novelist	U.S.
1955	Willis Lamb, Jr. Polykarp Kusch	U.S. U.S.[3]	discoveries in the hydrogen spectrum measurement of magnetic moment of electron	Vincent Du Vigneaud	U.S.	first synthesis of a polypeptide hormone	Halldór Laxness; novelist	Ice.
1956	William Shockley John Bardeen[9] Walter H. Brattain	U.S. U.S. U.S.	investigations on semiconductors and invention of the transistor	Nikolay Semyonov Sir Cyril Hinshelwood	U.S.S.R. U.K.	work on the kinetics of chemical reactions	Juan Ramón Jiménez; poet	Spain
1957	Tsung-Dao Lee Chen Ning Yang	China China	discovery of violations of the principle of parity	Sir Alexander Todd	U.K.	work on nucleotides and nucleotide coenzymes	Albert Camus; novelist, dramatist	Fr.
1958	Pavel A. Cherenkov Ilya M. Frank Igor Y. Tamm	U.S.S.R. U.S.S.R. U.S.S.R.	discovery and interpretation of the Cherenkov effect	Frederick Sanger[10]	U.K.	determination of the structure of the insulin molecule	Boris Pasternak; novelist, poet (declined)	U.S.S.R.

Nobel Prize winners[1] (continued)

	physiology or medicine			peace		economic science
1929	Christiaan Eijkman Sir Frederick Hopkins	Neth. U.K.	discovery of antineuritic vitamin discovery of growth-stimulating vitamins	Frank B. Kellogg	U.S.	
1930	Karl Landsteiner	U.S.[3]	grouping of human blood	Nathan Söderblom	Swed.	
1931	Otto Warburg	Ger.	discovery of nature and action of respiratory enzyme	Jane Addams Nicholas Murray Butler	U.S. U.S.	
1932	Edgar D. Adrian Sir Charles Sherrington	U.K. U.K.	discoveries regarding function of neurons	(no award)	—	
1933	Thomas Hunt Morgan	U.S.	heredity transmission functions of chromosomes	Sir Norman Angell	U.K.	
1934	George R. Minot William P. Murphy George H. Whipple	U.S. U.S. U.S.	discoveries concerning liver treatment for anemia	Arthur Henderson	U.K.	
1935	Hans Spemann	Ger.	organizer effect in embryo	Carl von Ossietzky	Ger.	
1936	Sir Henry Dale Otto Loewi	U.K. Ger.	work on chemical transmission of nerve impulses	Carlos Saavedra Lamas	Arg.	
1937	Albert Szent-Györgyi	Hung.	work on biological combustion	Viscount Cecil of Chelwood	U.K.	
1938	Corneille Heymans	Belg.	discovery of role of sinus and aortic mechanisms in respiration regulation	Nansen International Office for Refugees	(founded 1931)	
1939	Gerhard Domagk (declined)[5]	Ger.	antibacterial effect of prontosil	(no award)	—	
1943[6]	Henrik Dam Edward A. Doisy	Den. U.S.	discovery of vitamin K discovery of chemical nature of vitamin K	(no award)	—	
1944	Joseph Erlanger Herbert S. Gasser	U.S. U.S.	researches on differentiated functions of nerve fibres	International Red Cross Committee[4]	(founded 1863)	
1945	Sir A. Fleming Ernst Boris Chain Sir Howard Florey	U.K. U.K.[3] Austl.	discovery of penicillin and its curative value	Cordell Hull	U.S.	
1946	Hermann J. Muller	U.S.	production of mutations by X-ray irradiation	Emily Greene Balch John R. Mott	U.S. U.S.	
1947	Carl F. Cori Gerty T. Cori Bernardo Houssay	U.S.[3] U.S.[3] Arg.	discovery of how glycogen is catalytically converted pituitary hormone function in sugar metabolism	American Friends Service Committee Friends Service Council	U.S. U.K.	
1948	Paul Müller	Switz.	properties of DDT	(no award)	—	
1949	Walter Rudolf Hess António Egas Moniz	Switz. Port.	discovery of function of interbrain therapeutic value of leucotomy in psychoses	Lord Boyd-Orr	U.K.	
1950	Philip S. Hench Edward C. Kendall Tadeus Reichstein	U.S. U.S. Switz.[3]	research on adrenal cortex hormones, their structure and biological effects	Ralph Bunche	U.S.	
1951	Max Theiler	S.Af.	yellow fever discoveries	Léon Jouhaux	Fr.	
1952	Selman A. Waksman	U.S.[3]	discovery of streptomycin	Albert Schweitzer	Alsace	
1953	Fritz A. Lipmann Hans A. Krebs	U.S.[3] U.K.[3]	discovery of coenzyme A citric acid cycle in metabolism of carbohydrates	George C. Marshall	U.S.	
1954	John F. Enders Thomas H. Weller Frederick Robbins	U.S. U.S. U.S.	cultivation of the poliomyelitis virus in tissue cultures	Office of the United Nations High Commissioner for Refugees[8]	(founded 1951)	
1955	Axel Hugo Theorell	Swed.	nature and mode of action of oxidation enzymes	(no award)	—	
1956	Werner Forssmann Dickinson Richards André F. Cournand	Ger. U.S. U.S.[3]	discoveries concerning heart catheterization and circulatory changes	(no award)	—	
1957	Daniel Bovet	Italy[3]	production of synthetic curare	Lester B. Pearson	Can.	
1958	George W. Beadle Edward L. Tatum Joshua Lederberg	U.S. U.S. U.S.	genetic regulation of chemical processes genetic recombination	Dominique Georges Pire	Belg.	

Nobel Prize winners[1] (continued)

	physics			chemistry			literature	
1959	Emilio Segrè Owen Chamberlain	U.S.[3] U.S.	confirmation of the existence of the antiproton	Jaroslav Heyrovský	Czech.	discovery and development of polarography	Salvatore Quasimodo; poet	Italy
1960	Donald Glaser	U.S.	development of the bubble chamber	Willard Libby	U.S.	development of radiocarbon dating	Saint-John Perse; poet	Fr.
1961	Robert Hofstadter Rudolf Mössbauer	U.S. Ger.	determination of shape and size of atomic nucleons discovery of the Mössbauer effect	Melvin Calvin	U.S.	study of chemical steps that take place during photosynthesis	Ivo Andrić; novelist	Yugos.
1962	Lev D. Landau	U.S.S.R.	contributions to the understanding of condensed states of matter	John C. Kendrew Max F. Perutz	U.K. U.K.[3]	determination of the structure of hemoproteins	John Steinbeck; novelist	U.S.
1963	J. Hans D. Jensen Maria Goeppert Mayer Eugene Paul Wigner	Ger. U.S.[3] U.S.[3]	development of shell model theory of the structure of atomic nuclei principles governing interaction of protons and neutrons in the nucleus	Giulio Natta Karl Ziegler	Italy Ger.	structure and synthesis of polymers in the field of plastics	George Seferis; poet	Greece
1964	Charles H. Townes Nikolay G. Basov Aleksandr M. Prokhorov	U.S. U.S.S.R. U.S.S.R.	work in quantum electronics leading to construction of instruments based on maser-laser principles	Dorothy M.C. Hodgkin	U.K.	determining the structure of biochemical compounds essential in combating pernicious anemia	Jean-Paul Sartre; philosopher, dramatist (declined)	Fr.
1965	Julian S. Schwinger Richard P. Feynman Tomonaga Shin'ichirō	U.S. U.S. Japan	basic principles of quantum electrodynamics	R.B. Woodward	U.S.	synthesis of sterols, chlorophyll, and other substances	Mikhail Sholokhov; novelist	U.S.S.R.
1966	Alfred Kastler	Fr.	discovery of optical methods for studying Hertzian resonances in atoms	Robert S. Mulliken	U.S.	work concerning chemical bonds and the electronic structure of molecules	Shmuel Yosef Agnon; novelist Nelly Sachs; poet	Israel[3] Swed.[3]
1967	Hans A. Bethe	U.S.[3]	discoveries concerning the energy production of stars	Manfred Eigen Ronald G.W. Norrish George Porter	Ger. U.K. U.K.	studies of extremely fast chemical reactions	Miguel Ángel Asturias; novelist	Guat.
1968	Luis W. Alvarez	U.S.	work with elementary particles, discovery of resonance states	Lars Onsager	U.S.[3]	work on theory of thermodynamics of irreversible processes	Kawabata Yasunari; novelist	Japan
1969	Murray Gell-Mann	U.S.	classification of elementary particles and their interactions	Derek H.R. Barton Odd Hassel	U.K. Nor.	work in determining actual three-dimensional shape of molecules	Samuel Beckett; novelist, dramatist	Ire.
1970	Hannes Alfvén Louis Néel	Swed. Fr.	work in magnetohydrodynamics and in antiferromagnetism and ferrimagnetism	Luis F. Leloir	Arg.[3]	discovery of sugar nucleotides and their role in the biosynthesis of carbohydrates	Aleksandr Solzhenitsyn; novelist	U.S.S.R.
1971	Dennis Gabor	U.K.[3]	invention of holography	Gerhard Herzberg	Can.[3]	research in the structure of molecules	Pablo Neruda; poet	Chile
1972	John Bardeen[9] Leon N. Cooper John R. Schrieffer	U.S. U.S. U.S.	development of the theory of superconductivity	Christian B. Anfinsen Stanford Moore William H. Stein	U.S. U.S. U.S.	fundamental contributions to enzyme chemistry	Heinrich Böll; novelist	Ger.
1973	Leo Esaki Ivar Giaever Brian D. Josephson	Japan U.S.[3] U.K.	tunneling in semiconductors and superconductors	Ernst Fischer Geoffrey Wilkinson	Ger. U.K.	organometallic chemistry	Patrick White; novelist	Austl.
1974	Sir Martin Ryle Antony Hewish	U.K. U.K.	work in radio astronomy	Paul J. Flory	U.S.	studies of long-chain molecules	Eyvind Johnson; novelist Harry Martinson; novelist, poet	Swed. Swed.
1975	Aage N. Bohr Ben R. Mottelson L. James Rainwater	Den. Den.[3] U.S.	work on the atomic nucleus that paved the way for nuclear fusion	John W. Cornforth Vladimir Prelog	U.K. Switz.	work in stereochemistry	Eugenio Montale; poet	Italy
1976	Burton Richter Samuel C.C. Ting	U.S. U.S.	discovery of new class of elementary particles (psi, or J)	William N. Lipscomb	U.S.	structure of boranes	Saul Bellow; novelist	U.S.[3]
1977	Philip W. Anderson Sir Nevill F. Mott John H. Van Vleck	U.S. U.K. U.S.	contributions to understanding of the behaviour of electrons in magnetic, noncrystalline solids	Ilya Prigogine	Belg.	widening the scope of thermodynamics	Vicente Aleixandre; poet	Spain
1978	Pyotr L. Kapitsa Arno A. Penzias Robert W. Wilson	U.S.S.R. U.S.[3] U.S.	invention and application of helium liquefier discovery of cosmic microwave background radiation, providing support for the big-bang theory	Peter D. Mitchell	U.K.	formulation of a theory of energy transfer processes in biological systems	Isaac Bashevis Singer; novelist	U.S.[3]
1979	Sheldon Glashow Abdus Salam Steven Weinberg	U.S. Pak. U.S.	establishment of analogy between electromagnetism and the "weak" interactions of subatomic particles	Herbert C. Brown Georg Wittig	U.S.[3] W.Ger.	introduction of compounds of boron and phosphorus in the synthesis of organic substances	Odysseus Elytis; poet	Greece
1980	James W. Cronin Val Logsdon Fitch	U.S. U.S.	demonstration of simultaneous violation of both charge-conjugation and parity-inversion symmetries	Paul Berg Walter Gilbert Frederick Sanger[10]	U.S. U.S. U.K.	first preparation of a hybrid DNA development of chemical and biological analyses of DNA structure	Czesław Miłosz; poet	U.S.[3]

Smith	U.S.-Israel U.S.	integration of psychological research into economic science establishment of laboratory experiments as ■ tool in empirical economic analysis

---

[1] Nationality given is the citizenship of recipient at the time award was made. [2] Awarded two Nobel Prizes: physics (1903); chemistry (1911). [3] Naturalized citizen. [4] Awarded three Nobel Prizes for peace (1917, 1944, and 1963). [5] Adolf Hitler forbade Germans to accept Nobel Prizes (January 1937). [6] No awards made, 1940–42. [7] Awarded two Nobel Prizes: chemistry (1954); peace (1962). [8] Awarded two Nobel Prizes for peace (1954 and 1981). [9] Shared two Nobel Prizes for physics (1956 and 1972). [10] Awarded two Nobel Prizes for chemistry (1958 and 1980). [11] Award announced a year late, in 1977.

The noble gases absorb and give off electromagnetic radiation in a much less complex manner than do other substances. This absorption and emission behaviour is exploited in the use of the gases (with the exception of highly radioactive radon) in fluorescent lighting devices and discharge lamps. If any of the noble gases is confined at low pressure in a glass tube and an electrical charge is passed through it, the gas glows. The noble gases also have very low boiling points and melting points, which make them useful as refrigerants in the study of matter at extremely low temperatures.

noble metal, any of several metallic chemical elements that have outstanding resistance to oxidation, even at high temperatures; the grouping is not strictly defined but usually is considered to include rhenium, ruthenium, rhodium, palladium, silver, osmium, iridium, platinum, and gold; *i.e.,* the metals of groups VIIb, VIII, and Ib of the second and third transition series of the periodic table.

Silver and gold, which with copper are often called the coinage metals, and platinum, iridium, and palladium comprise the so-called precious metals, which are used in jewelry.

noble savage, in literature, an idealized concept of uncivilized man, who symbolizes the innate goodness of one not exposed to the corrupting influences of civilization.

The glorification of the noble savage is a dominant theme in the Romantic writings of the 18th and 19th centuries, especially in the works of Jean-Jacques Rousseau. For example, *Émile, ou, De l'education,* 4 vol. (1762), is a long treatise on the corrupting influence of traditional education; the autobiographical *Confessions* (written 1765–70) reaffirms the basic tenet of man's innate goodness; and *Dreams of a Solitary Walker* (1776–78) contains descriptions of nature and man's natural response to it. The concept of the noble savage, however, can be traced to ancient Greece, where Homer, Pliny, and Xenophon idealized the Arcadians and other primitive groups, both real and imagined. Later Roman writers such as Horace, Virgil, and Ovid gave comparable treatment to the Scythians. From the 15th to the 19th centuries, the noble savage figured prominently in popular travel accounts and appeared occasionally in English plays such as John Dryden's *Conquest of Granada* (1672), in which the term noble savage was first used, and in *Oroonoko* (1696) by Thomas Southerne, based on Aphra Behn's novel about a dignified African prince enslaved in the British colony of Surinam.

François-René de Chateaubriand sentimentalized the North American Indian in *Atala* (1801), *René* (1802), and *Les Natchez* (1826), as did James Fenimore Cooper in the Leatherstocking Tales (1823–41), which feature the noble chief Chingachgook and his son Uncas. The three harpooners of the ship *Pequod* in Melville's *Moby Dick* (1851), Queequeg, Daggoo, and Tashtego, are other examples.

noblesse de robe (French: "Nobility of the Robe"), in 17th- and 18th-century France, a class of hereditary nobles who acquired their rank through holding a high state office. Their name was derived from the robes worn by officials. The class was already in existence by the end of the 16th century, but it was only in the 17th century that its members acquired the right to transmit noble status to their heirs. The period of the 1640s and '50s was pivotal in the development of the *noblesse de robe.* In an attempt to bargain for political support during the troubled minority of Louis XIV, the crown granted detailed charters of nobility to judicial officials. At the summit of this newly created privileged class were the officers of such sovereign courts as the Parlement of Paris.

Because of their bourgeois background, the families of the *noblesse de robe* were at first disdained by nobles who derived their rank from military service (*noblesse d'épée*) and from long-standing possession (*noblesse de race*). The distinction between the old and the new aristocracies, between the sword and robe, gradually blurred during the 18th century as both groups worked to defend privilege against attempts at reform by the king. In fact, it was the *noblesse de robe* that, because of its wealth, its rising social status, and its control of official positions, took the lead in opposition to reform.

Noboribetsu, city, Hokkaido, Japan, on the Pacific coast of southwestern Hokkaido, northeast of Muroran. Since the discovery of hot springs during the late Tokugawa era (1603–1867), the city has been one of the most visited hot-spring resorts in Japan. After World War II, industries replaced agriculture as the major economic activity, influenced by the urbanization and expansion of Muroran's suburbs in the west. Products include cement, pottery, chemicals, and processed foods. The city is a tourist base for the Shikotsu-Tōya National Park. Pop. (1990) 55,575.

Nobre, António (b. Aug. 16, 1867, Porto, Port.—d. March 18, 1900, Foz do Douro), Portuguese poet whose verse marked a departure from objective realism and social commitment to subjective lyricism and an aesthetic point of view.

Nobre was a member of a wealthy family. He studied law unsuccessfully at Coimbra and, from 1890 to 1895, studied political science in Paris, where he was influenced by the French Symbolist poets. There he wrote the greater part of the only book he published in his lifetime, *Só* (1892; "Alone"), inspired by nostalgic memories of a childhood spent in the company of peasants and sailors in northern Portugal. *Só* combines the simple lyricism of Portuguese traditional poetry with the more refined perceptiveness of Symbolism.

At first *Só* met with a mixed reception, but it became one of the most popular and most imitated works of poetry in Portugal. A final version appeared in 1898. A generation of poets who followed and imitated him was called the Sósino Generation.

Ill with tuberculosis, Nobre spent his remaining years in travel, seeking a favourable climate. Two more volumes of poetry were published after his death: *Despedidas* (1902; "Farewells") and *Primeiros Versos* (1921; "First Poems").

Nóbrega, Manuel da (b. Oct. 18, 1517, Portugal—d. Oct. 18, 1570, Rio de Janeiro), founder of the Jesuit mission of Brazil and leader of the order's activities there from 1549 to 1570.

Father Nóbrega with five other Jesuit missionaries sailed from Lisbon to Bahia (modern Salvador, Braz.) in 1549. His first concern there was the protection and conversion of the Indians. He established a school in 1553 on the site that later became São Paulo, and he resisted the hostility of planters seeking Indians for slaves. He also condemned African slavery, though Jesuits finally accepted the institution and even owned black slaves themselves. He was named the first provincial of the Society of Jesus in Brazil (1553–59), and, although he was again named provincial in 1570, he died before news of the appointment reached him.

When the French under Nicolas Durand de Villegaignon, including many Huguenots, settled in Rio de Janeiro (1555), Nóbrega worked earnestly for their expulsion. The Protestants were in fact forced out (1563), in part because Nóbrega won the Tamôio Indians over to the Portuguese side. In this and in other ways he shaped the destiny of southern Brazil into remaining both Catholic and Portuguese.

nocardiosis, chronic systemic bacterial disease of humans and many other animals originating in the respiratory tract and disseminated by way of the blood to other organs, especially the brain. It is caused either by introduction into the skin or by inhalation of *Nocardia asteroides,* a normal inhabitant of soil and compost heaps. The disease usually begins with malaise, loss of weight, fever, and night sweats. Most often it causes a cough productive of purulent and blood-tinged sputum (pseudotuberculosis). An uncommon disease, nocardiosis is found worldwide in persons of all ages. Chronic lung disease or immunosuppressive therapy can render an individual more susceptible.

Prolonged treatment with sulfonamide drugs, especially when begun before the disease has spread, has reduced mortality from nocardiosis greatly. If the organism has reached the brain, however, the outlook is still very poor. Amikacin is another drug that is used with patients who do not respond to sulfa drugs.

Nocera Inferiore, Latin NUCERIA ALFATERNA, also called NOCERA DEI PAGANI, town and episcopal see, Salerno *provincia,* Campania *regione,* southern Italy, in the Sarno River valley, northwest of Salerno. It originated as the Oscan and Roman town of Nuceria Alfaterna, which was sacked by the Carthaginian general Hannibal in 216 BC but was rebuilt by the emperor Augustus. In the old castle, ruins of which are extant, Helen, widow of King Manfred of Sicily, died in captivity (1271) five years after Manfred's death in the Battle of Benevento. The origin of the epithet *dei Pagani* ("of the Pagans") is not historically established and is sometimes attributed to a nearby medieval settlement of Saracen colonists or to Pagano, the name of an important local medieval family. Although there are several old churches and convents, the town is primarily modern in appearance. In the nearby village of Nocera Superiore is the 5th-century circular domed church of Santa Maria Maggiore.

Nocera Inferiore is economically one of the most important centres in the province because of its agricultural exports, lumber mills, food processing, and textile plants. Pop. (1991 prelim.) mun., 49,021.

noctilucent cloud, rare cloud form, probably composed of ice crystals and meteoric dust, that occurs at a higher altitude than any other cloud form (about 82 km [50 miles]). It is silvery or bluish white and is visible only on summer nights in high latitudes. The ice crystals form because this level is the coldest in the entire upper atmosphere; even the minute amounts of water vapour present in this thin, dry air freeze. The cloud often exhibits a tenuous, wavy pattern that indicates the existence of strong winds at that altitude.

noctule (*Nyctalus*), any of about nine species of bats of the common bat family, Vespertilionidae, found in Europe and Asia. Noctules are yellowish to dark brown and 5–10 cm (2–4 inches) long without the 3.5–6.5-centimetre tail. They are swift, erratic fliers and commonly leave their roosts (generally in caves or buildings) at or before sunset. They eat insects and apparently are fond of beetles. The best known and most widely distributed species is the Eurasian *N. noctula,* a reddish brown, migratory inhabitant of wooded regions.

nocturne (French: "Nocturnal"), in music, a composition inspired by, or evocative of, the night, and cultivated in the 19th century primarily as a character piece for piano. The form originated with the Irish composer John Field, who published the first set of nocturnes in 1814, and reached its zenith in the 19 examples of Frédéric Chopin. In Germany the nocturne, or *Nachtstück,* attracted composers from Robert Schumann to Paul Hindemith (*Suite for Piano*, 1922). At the turn of the century Claude Debussy most successfully transferred the genre to the orchestra with his three brilliant pieces so entitled. Later in the 20th century Béla Bartók developed a very personal night-music style of distinctly macabre quality, for example, in *Out of Doors* (fourth movement) and in the *Fourth String Quartet* (third movement).

The late 18th-century Italian notturno, a collection of lightweight pieces for chamber ensemble, bore little relation to the lyrical 19th-century nocturne. Like the serenades and cassations of Haydn and Mozart, however, it was intended, at least originally, for nocturnal, usually outdoor, performance.

Noda, city, Chiba Prefecture (*ken*), Honshu, Japan, between the Edo-gawa (Edo River) and the Tone-gawa. The city served as an important river port during the Tokugawa era (1603–1867), when it first became known for its production of soy sauce. The central area of Noda now contains numerous soy sauce factories and other factories related to its production. Since World War II Noda has gradually developed as a residential suburb of the Tokyo–Yokohama Metropolitan Area, to which it is connected by rail. Pop. (1995) 119,790.

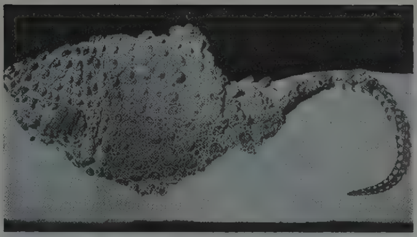
node, in astronomy, the intersection of the orbit plane of some celestial body, such as the Moon, a planet, or comet, with the plane of the ecliptic (the apparent path of the Sun among the stars) as projected on the celestial sphere. The ascending node is the one where the body crosses from the south to the north side of the ecliptic, the opposite one being the descending node. An eclipse of the Sun or Moon can occur only when the Moon is at or near a node; similarly, only when one of the inner planets is at or near a node can it appear in transit across the Sun. *See also* orbit.

Nodier, Charles (b. April 29, 1780, Besançon, Fr.—d. Jan. 27, 1844, Paris), writer more important for the influence he had on the French Romantic movement than for his own writings.

Nodier had an eventful early life, in the course of which he fell foul of the authorities for a skit on Napoleon. In 1824 he settled in Paris after his appointment as director of the Bibliothèque de l'Arsenal (Arsenal Library) and soon became one of the leaders of the literary life of the capital. In his drawing room at the Arsenal, Nodier drew together the young men who were to be the leading lights of the Romantic movement: Victor Hugo, Alfred de Musset, and Charles-Augustin Sainte-Beuve.

An ardent admirer of Goethe and Shakespeare, he did much to encourage the French Romantics to look abroad for inspiration. Nodier wrote a great deal, but the only works of his that are still read are his fantastic, masterfully written short stories, rather in the style of the German Romantic E.T.A. Hoffmann. By his revelation of the creative power of the dream and by his equation of a state of innocence with certain conditions normally called mad, Nodier was rebelling against the tyranny of "common sense" and opening up a new literary territory for later generations. His election to the Académie Française in 1833 virtually constituted official recognition that Romanticism had become a significant and respectable literary movement.

Nodosaurus, extinct genus of Late Cretaceous armoured dinosaurs of North America (the Cretaceous Period began 136,000,000 years ago and lasted 71,000,000 years). *Nodosaurus,* a heavy animal about 6 metres (20 feet) long, had a long tail but a very small head and minuscule brain. For protection against predators, *Nodosaurus* relied upon a heavy coat of thick bony plates and knobs that covered its back. The front legs were much smaller than the hind legs, and the back was strongly arched.



Nodosaurus, external skeleton

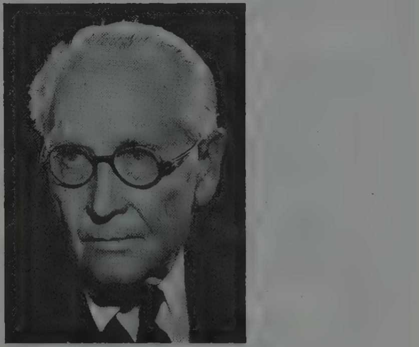
nodule, rounded mineral concretion that is distinct from, and may be separated from, the formation in which it occurs. Nodules commonly are elongate with a knobby irregular surface; they usually are oriented parallel to the bedding.

Chert and flint often occur as dense and structureless nodules of nearly pure silica in limestone or chalk, where they seem to be replacements of the carbonate rock by silica. Clay ironstone, a mixture of clay and siderite (iron carbonate), sometimes occurs as layers of dark-gray to brown, fine-grained nodules overlying coal seams. Phosphorites, massive phosphate rocks, often occur in phosphate deposits, in some limestones and chalks, and on the present sea bottom as black, fine-grained, and dense nodules with an elliptical shape and no structure.

Noe: *see* Noah.

Noël, Alexandre: *see* Natalis, Alexander.

Noel-Baker (of the City of Derby), Philip John Noel-Baker, Baron, original name PHILIP JOHN BAKER (b. Nov. 1, 1889, London—d. Oct. 8, 1982, London), British statesman and advocate of international disarmament, who received the Nobel Prize for Peace in 1959. Fluent in seven languages, he campaigned widely for 40 years for peace through multilateral disarmament.



Noel-Baker

Camera Press

The son of Canadian-born Quakers, Baker added his wife's surname, Noel, to his own about 1926. He studied at Haverford College in Pennsylvania, at King's College, Cambridge, and at the Universities of Munich and Paris. A noted athlete, he ran in the 1912 and 1920 Olympic Games, and as captain of the British team at Antwerp in 1920 he won the silver medal in the 1,500 metres. He also competed in the 1924 Olympics at Paris. As a Quaker, Noel-Baker could not enlist in World War I but served with bravery in an ambulance unit and received several medals. From 1924 to 1929 he was professor for International Relations at London University.

A member of the British delegation to the Paris Peace Conference in 1919, Baker (as he then was) subsequently joined the League of Nations secretariat. He assisted Fridtjof Nansen, the Norwegian explorer and humanitarian who received the Nobel Prize for Peace in 1922. At the League of Nations assembly in 1923–24, Baker served as personal assistant to Lord Robert Cecil (later Viscount Cecil of Chelwood), promoter of the League and recipient of the Nobel Prize for Peace in 1937. He also was principal assistant to Arthur Henderson, president of the disarmament conference at Geneva, in 1932–33.

Noel-Baker sat in the House of Commons as a Labour member from 1929 to 1931 and from 1936 to 1970. Between 1945 and 1961, he was successively minister of state, secretary of state for air and for Commonwealth relations, and minister of fuel and power. He helped to draft the UN charter and was a member of the British delegation to the General Assembly in 1946–47. From 1960 to 1982 he was president of the International Council on Sport and Physical Recreation of UNESCO. His survey of the disarmament problem was published as *The Arms Race: A Programme for World Disarmament* (1958).

Other works include *Disarmament* and *The League of Nations at Work,* both published in 1926, and *The Arms Race* (1960), for which Noel-Baker was awarded the Albert Schweitzer Prize in 1960. A retrospective study, *The First World Disarmament Conference, 1932–33, and Why It Failed,* was published in 1979. Noel-Baker was made a life peer in 1977 and spent his retirement working for the cause of world disarmament. In 1981, at the age of 91, he wrote and recorded a popular song on the subject.

Noether, (Amalie) Emmy (b. March 23, 1882, Erlangen, Ger.—d. April 14, 1935, Bryn Mawr, Pa., U.S.), German mathematician whose innovations in higher algebra gained her recognition as the most creative abstract algebraist of modern times.

Noether received the Ph.D. degree from the University of Erlangen in 1907, with a dissertation on algebraic invariants. From 1913 she lectured occasionally at Erlangen, substituting for her father, Max Noether (1844–1921). In 1915 she went to the University of Göttingen and was persuaded by the eminent mathematicians David Hilbert and Felix Klein to remain there over the objections of some faculty members; she won formal admission as an academic lecturer in 1919.

The appearance of "Moduln in nichtkommutativen Bereichen, insbesondere aus Differential- und Differenzen-Ausdrücken" (1920; "Concerning Moduli in Noncommutative Fields, Particularly in Differential and Difference Terms"), written in collaboration with a Göttingen colleague, Werner Schmeidler, and published in *Mathematische Zeitschrift,* marked the first notice of Noether as an extraordinary mathematician. For the next six years her investigations centred on the general theory of ideals (special subsets of rings), for which her residual theorem is an important part. On an axiomatic basis she developed a general theory of ideals for all cases. Her abstract theory helped draw together many important mathematical developments.

From 1927 Noether concentrated on noncommutative algebras (algebras in which the order in which numbers are multiplied affects the answer), their linear transformations, and their application to commutative number fields. She built up the theory of noncommutative algebras in a newly unified and purely conceptual way. In collaboration with Helmut Hasse and Richard Brauer, she investigated the structure of noncommutative algebras and their application to commutative fields by means of cross product (a form of multiplication used between two vectors). Important papers from this period are "Hyperkomplexe Grössen und Darstellungstheorie" (1929; "Hypercomplex Number Systems and Their Representation") and "Nichtkommutative Algebra" (1933; "Noncommutative Algebra").

Noether
Bryn Mawr College Archives

In addition to research and teaching, Noether helped edit the *Mathematische Annalen.* From 1930 to 1933 she was the centre of the strongest mathematical activity at Göttingen. The extent and significance of her work cannot be accurately judged from her papers. Much of her work appeared in the publications of students and colleagues; many times a suggestion or even a casual remark revealed her great insight and stimulated another to complete and perfect some idea.

When the Nazis came to power in Germany in 1933, Noether and many other Jewish professors at Göttingen were dismissed. In October she left for the United States to become visiting professor of mathematics at Bryn Mawr College and to lecture and conduct research at the Institute for Advanced Study, Princeton, N.J.

Nofretete (Egyptian queen): *see* Nefertiti.

Nogal Valley (Somalia): *see* Nugaaleed Valley.

Nogales (Mexico): *see* Heroica Nogales.

Nogales, city, seat (1899) of Santa Cruz county, southern Arizona, U.S. A port of entry on the Mexican border, it adjoins Heroica Nogales, Sonora. Divided by International Avenue, the two communities are known as Ambos Nogales. Originally called Issaac-town (for Jacob Issaacson, who built an inn at Nogales Pass before the arrival of the Southern Pacific Railroad in 1882), it was renamed Nogales for its walnut (*nogal*) trees. It was the scene of fighting between Pancho Villa's forces and U.S. national guardsmen (1916) and between town militia of the two communities (1918). Nearby are the Tumacacori Mission (since 1908 a national monument) and the ruins of the first white settlements in Arizona. Cattle raising, mining, and border trade are the economic mainstays. Pop. (1990) 19,489.

Nogaret, Guillaume de (b. 1260/70, Saint-Félix-de-Caraman, Toulouse [now in France]—d. April 1313), magistrate under King Philip IV the Fair of France, who became one of the most vigorous of the *légistes,* or expositors, of the royal power, especially in ecclesiastical affairs; in the conflict between Philip and Pope Boniface VIII, he played a direct role in carrying out the king's retribution against the pope.

Nogaret, the son of a bourgeois, began his career as a teacher of jurisprudence in 1291, entered the royal service about 1294, and was soon a member of the king's council. In March 1303 Nogaret denounced Pope Boniface VIII as irregularly installed and as a heretic, a simonist, and a notorious sinner and demanded the summoning of a general council of the church to try him. Authorized by Philip IV to go to Italy, Nogaret contacted Italian factions hostile to Boniface and, with these, on Sept. 7, 1303, entered Anagni, where he seized the person of the pope (who had intended to publish a bull excommunicating Philip IV the next day). Faced by popular hostility, however, he abandoned Anagni two days later, leaving the pope behind.

Nogaret had acted as a sincere Christian desirous of freeing the church from a pope whom he thought unworthy, but, unsurprisingly, he was excommunicated by Boniface's successor, Benedict XI, in 1304. Philip IV showed him increased favour, however, and, after Nogaret had greatly aided him in his measures against the Templars, managed to procure his minister's absolution. The proviso that he should journey to the Holy Land as a pilgrim had not been fulfilled at the time of his death two years later.

Nogaret de la Valette, Jean-Louis de: *see* Épernon, Jean-Louis de Nogaret de la Valette, duc d' (duke of).

Nōgata, city, Fukuoka *ken* (prefecture), Kyushu, Japan, at the confluence of the Onga River and the Hikosan River. Formed as a castle town in 1626, it declined about 100 years later, barely maintaining its importance as a trade and distribution centre of agricultural products. With the exploitation of the nearby Chikuhō Coalfield in the late 19th century, Nōgata revived. After World War II, however, the mines were gradually closed, and the city is now a commercial centre producing machinery and other industrial goods. Included in the northern Kyushu Industrial Region, which is centred on Kita-Kyūshū, Nōgata is gradually becoming a suburb of Kita-Kyūshū. Pop. (1990) 62,532.

Noginsk, city, Moscow *oblast* (province), western Russia, on the Klyazma River east of Moscow. Originally Yamskaya village, it became the town of Bogorodsk in 1781 and was renamed Noginsk in 1930. It is one of the largest Russian textile centres; cotton forms most of its production. Pop. (1991 est.) 122,700.

Nógrád, *megye* (county), Hungary, occupying an upland area of 982 square miles (2,544 square km) dominated by the Cserhát Hills, a continuation of the Transdanubian Mountains. A few monadnocks (hills of resistant rock surmounting a peneplain) and isolated volcanic intrusions stand out from a sandy, clayey terrain. To the north the Cserhát region is drained into the Nógrád River basin along the Ipoly River. Original forest cover has been cleared where possible for plowland. Agriculture is not so prominent as elsewhere in Hungary, but poppy seeds and lentils are important. There are several clay pits in the vicinity of Romhány. Around the town of Hollókő is the Palóc (people of northeastern Hungary) country, noted for traditional weaving, embroidery, wood carving, and ornate peasant costumes. Salgótarján (*q.v.*), the *megye* seat, lies in the Tarján River valley. Pop. (1990 prelim.) 227,180.

Noguchi, Hideyo, original name NOGUCHI SEISAKU (b. Nov. 24, 1876, Inawashiro, Japan—d. May 21, 1928, Accra, Gold Coast colony [now Ghana]), Japanese bacteriologist who first discovered *Treponema pallidum,* the causative agent of syphilis, in the brains of persons suffering from paresis. He also proved that both Oroya fever and verruga peruana could be produced by *Bartonella bacilliformis;* they are now known to be different phases of Carrion's disease, or bartonellosis.

Hideyo Noguchi
Boyer—H. Roger-Viollet

Noguchi graduated in 1897 from a proprietary medical school in Tokyo and then went in 1900 to the University of Pennsylvania, in Philadelphia, where he worked on snake venoms under Simon Flexner. In 1904 he went to the Rockefeller Institute for Medical Research, New York City, which sponsored his work for almost a quarter of a century. Noguchi devised means of cultivating microorganisms that had never before been grown in the test tube. He studied poliomyelitis and trachoma and worked on a vaccine and serum for yellow fever. He died of yellow fever, which he contracted during research on the disease in Africa.

Noguchi, Isamu (b. Nov. 17, 1904, Los Angeles, Calif., U.S.—d. Dec. 30, 1988, New York, N.Y.), American sculptor and designer, one of the strongest advocates of the expressive power of organic abstract shapes in 20th-century American sculpture.

Noguchi spent his early years in Japan, and, after studying in New York City with Onorio Ruotolo in 1923, he became Constantin Brancusi's assistant for two years in Paris. There he met Alberto Giacometti and Alexander Calder and became an enthusiast of abstract sculpture. He was also influenced by the Surrealist works of Pablo Picasso and Joan Miró. Noguchi's first exhibition was in New York City in 1929.

Much of his work, such as his "Bird C(MU)" (1952–58), consists of elegantly abstracted, rounded forms in highly polished stone. Such works as "Euripides" (1966) employ massive blocks of stone, brutally gouged and hammered. To his terra-cotta and stone sculptures Noguchi brought some of the spirit and mystery of early art, principally Japanese earthenware, which he studied under the Japanese potter Uno Jinmatsu on his first trip to Japan made in 1930–31.

Noguchi, who had premedical training at Columbia University, sensed the interrelatedness of bone and rock forms, the comparative anatomy of existence, as seen in his "Kouros" (1945). On another trip to Japan, in 1949, Noguchi experienced a turning point in his aesthetic development: he discovered "oneness with stone." The importance to him of a closeness to nature was apparent in his roofless studio.

Recognizing the appropriateness of sculptural shapes for architecture, he created a work in low relief (1938) for the Associated Press Building in New York City and designed a fountain for the Ford Pavilion at the New York World's Fair of 1939. He also made many important contributions toward the aesthetic reshaping of physical environment. His garden for the United Nations Educational, Scientific, and Cultural Organization (UNESCO) in Paris (1958), his playground in Hawaii, his furniture designs, and his fountain for the Detroit Civic Center Plaza (1975) won international praise. Noguchi also designed sculptural gardens for the Chase Manhattan Bank and the John Hancock Building, both in New York City, and stage sets for Martha Graham, George Balanchine, and Merce Cunningham. In 1982 he was awarded the Edward MacDowell Medal for outstanding lifelong contribution to the arts. In 1985 Noguchi opened the Isamu Noguchi Garden

"Black Sun," black tamba granite sculpture by Isamu Noguchi, 1960–63; in a private garden

Lee Boltin

Museum in Long Island City, N.Y. The museum and outdoor sculpture garden contain some 500 sculptures, models, and photographs.

noiade, in Lapp (Saami) religion, a shaman who mediated between the people that he served and the supernatural beings and forces that he either confronted or made use of for the benefit of his clients.

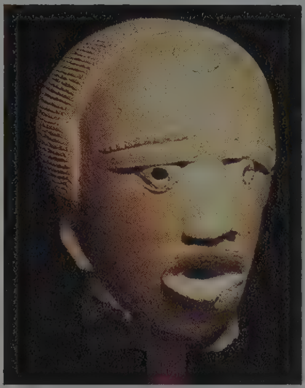
The shamanic practices of the Finno-Ugric peoples have been best preserved among the Khant (Ostyak) and Mansi (Vogul), as well as the Lapps. Basically they consist of the manipulation of the supernatural by a specially trained, usually naturally gifted, sensitive person in order to aid people in various serious troubles, of which illness was probably the most common. On being asked to help, the *noiade* performs a dramatic séance with a traditional sequence of steps, including divinatory procedures, falling into trance, confrontation of supernatural beings either to fight them or to receive aid from them, and the actual ritual treatment of the patient, in the case of illness. The *noiade*s can perform both good and evil and formerly were much feared owing to their powers, which they also used to political and economic advantage. In Finland the term *noita* survives mainly in the sense of an evil-working sorcerer, with another term, *tietäjä* (*q.v.*), applied to the specialist in beneficial mediation with the supernatural.

The word *noiade* is genetically related to several other terms used by the Finno-Ugric peoples for their religious specialists. Finnish *noita,* Mansi *nait,* and Estonian *noit* belong together linguistically, and their origin may be traced back to the common Finno-Ugric period before 2500 BC.

noise, in acoustics, any undesired sound, either one that is intrinsically objectionable or one that interferes with other sounds that are being listened to. In electronics and information theory, noise refers to those random, unpredictable, and undesirable signals, or changes in signals, that mask the desired information content. Noise in radio transmission is known as static, and in television it is called snow. White noise is a complex signal or sound that covers the entire range of component frequencies, or tones, all of which possess equal intensity.

Nok culture, also called NOK FIGURINE CULTURE, ancient Iron Age culture that existed on the Benue Plateau of Nigeria between about 500 BC and AD 200.

First discovered in 1928 in the small tin-mining village of Nok, artifacts of similar features were found over an area that stretched about 300 miles (480 km) east to west and 200 miles (320 km) north to south. The most characteristic Nok artifacts are clay figurines of animals and stylized human beings, usually heads; perforated eyes of an elliptical or triangular shape are typical of the style. Other artifacts of the Nok culture include iron tools, stone axes and other stone tools, and stone ornaments.



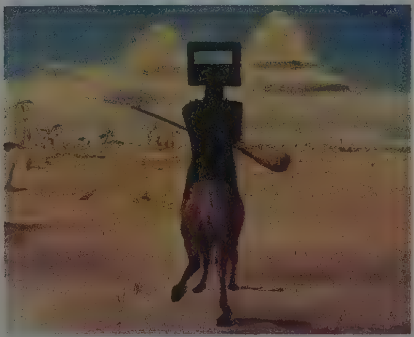
Terra-cotta head of the Nok culture, found at Tsauni, near Jemaa, Nigeria; in the Nigerian Museum, Lagos

André Held

Nola, town and episcopal see, Napoli *provincia,* Campania *regione,* southern Italy. It lies in the fertile and highly cultivated Campanian plain, just east-northeast of Naples. It originated as a city of the Aurunci, Oscans, Etruscans, and Samnites (ancient Italic peoples) and was known as Novla ("New Town") before it passed to the Romans in 313 BC. The emperor Augustus died there in AD 14. Sacked by Gaiseric, king of the Vandals, in 455 and later by the Saracens, Nola was captured by King Manfred of Sicily in the 13th century and later belonged to the Orsini family before passing to the Kingdom of Naples in 1528. There are traces of a Roman amphitheatre and a necropolis with frescoed tombs and of later basilicas and other constructions of the 4th and 5th centuries. The Gothic cathedral (1395–1402) is believed to occupy the site of a church erected by the town's patron, St. Paulinus (elected bishop of Nola in 410), in honour of St. Felix of Nola, the city's first bishop. Other notable landmarks are the Palazzo Orsini (1461) and a monument to the philosopher Giordano Bruno, who was born in Nola in 1548.

Nola is now an agricultural and commercial centre on the Naples-Avellino-Foggia railway. Its products include vegetables, fruit, corn (maize), and hemp. Pop. (1991 prelim.) mun., 32,573.

Nolan, Sir Sidney (Robert) (b. April 22, 1917, Melbourne, Australia—d. Nov. 27, 1992, London, Eng.), artist known for his paintings based on Australian folklore.



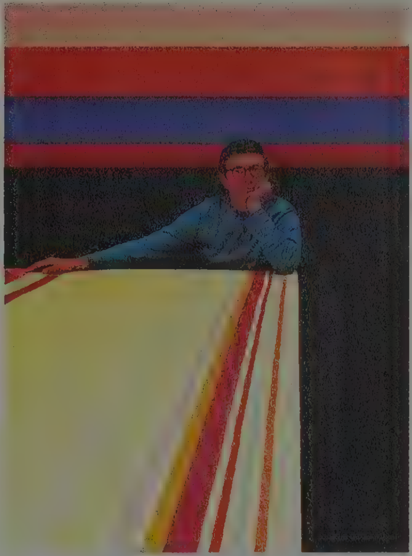
"Kelly," oil painting by Sir Sidney Nolan, 1954; in a private collection

By courtesy of the owner

With little formal art training, Nolan turned to painting at 21 after varied experiences as a racing cyclist, cook, and gold miner. His early works show the influences of Paul Klee and László Moholy-Nagy and include the controversial abstract work "Boy and the Moon" (1940)—a splash of yellow against a raw blue background. He developed a more representational style over the years, however. Apart from his landscapes, most of his works deal with Australian historical or legendary characters and events—notably, the bushranger Ned Kelly. His style is highly individual, as are many of the mediums he employed, such as ripolin and polyvinyl acetate on masonite, glass, paper, or canvas.

Nolan moved to England in 1955. He designed stage sets for Serge Lifar's ballet *Icarus* in 1941, for Kenneth Macmillan's version of *The Rite of Spring* at Covent Garden in 1962, and for Camille Saint-Saën's opera *Samson et Dalila,* also at Covent Garden, in 1981. His work has been exhibited internationally, and permanent exhibitions are at the Tate Gallery in London and the Museum of Modern Art in New York City. He was knighted in 1981 and became a member of the Order of Merit in 1983.

Noland, Kenneth (b. April 10, 1924, Asheville, N.C., U.S.), American painter of the Abstract Expressionist school. He was one of the first to use the technique of staining the canvas with thinned paints and of deploying his colours in concentric rings and parallels, shaped and proportioned in relation to the shape of the canvas.



Noland, photograph by Arnold Newman, 1967

© Arnold Newman

Noland attended Black Mountain College in North Carolina and studied under the French sculptor Ossip Zadkine in Paris (1948–49). He presented his first one-man show there in 1949. He and Morris Louis, influenced by the work of Helen Frankenthaler, worked together on the technique of staining with thinned paints. This method presented pure, saturated colour as an integral part of the canvas. Noland arrived at his characteristic style in the late 1950s.

Noland taught at the Institute of Contemporary Arts (1950–52) and at Catholic University (1951–60), both in Washington, D.C., and at Bennington (Vt.) College in 1968. His work has been exhibited internationally, and permanent collections of his paintings are housed at the Museum of Modern Art in

New York City, the Tate Gallery of London, and the Zürich Kunsthaus.

Nolde, Emil, original name EMIL HANSEN (b. Aug. 7, 1867, Nolde, near Bocholt, Ger.—d. April 15, 1956, Seebüll, near Niebüll, W.Ger.), German expressionist painter, printmaker, and watercolourist known for his violent religious works and his foreboding landscapes.

Born of a peasant family, the youthful Nolde made his living as a wood-carver. He was able to study art formally only when some of his early works were reproduced and sold as postcards. In Paris Nolde began to paint works that bear a superficial affinity to Impressionistic painting. In 1906 he was invited to join Die Brücke, an association of Dresden-based Expressionist artists who admired his "storm of colour." But Nolde, a solitary and intuitive painter, dissociated himself from that tightly knit group after a year and a half.

"Dance Around the Golden Calf," oil painting by Emil Nolde, 1910; in the Bayerische Staatsgemäldesammlungen, Munich

By courtesy of the Nolde-Foundation; photograph, Bayerische Staatsgemaldesammlungen, Munich

Fervently religious and racked by a sense of sin, Nolde created such works as "Dance Around the Golden Calf" (1910) and "In the Port of Alexandria" from the series depicting "The Legend of St. Maria Aegyptica" (1912), in which the erotic frenzy of the figures and the demonic, masklike faces are rendered with deliberately crude draftsmanship and dissonant colours. In the "Doubting Thomas" from the nine-part polyptych "The Life of Christ" (1911–12), the relief of Nolde's own religious doubts may be seen in the quiet awe of St. Thomas as he is confronted with Jesus' wounds. During 1913 and 1914 Nolde was a member of an ethnological expedition that reached the East Indies. There he was impressed with the power of unsophisticated belief, as is evident in his lithograph "Dancer" (1913).

Back in Europe, Nolde led an increasingly reclusive life on the Baltic coast of Germany. His almost mystical affinity for the brooding terrain led to such works as his "Marsh Landscape" (1916), in which the low horizon, dominated by dark clouds, creates a majestic sense of space. Landscapes done after 1916 were generally of a cooler tonality than his early works. But his masterful realizations of flowers retain the brilliant colours of his earlier works. He was a prolific graphic artist especially noted for the stark black and white effect that he employed in crudely incised woodcuts.

Although Nolde was an early advocate of Germany's National Socialist Party, when the Nazis came to power, they declared his work "decadent" and forbade him to paint. After World War II he resumed painting but often merely reworked older themes. His last "Self-Portrait" (1947) retains his vigorous brushwork but reveals the disillusioned withdrawal of the artist in his 80th year.

Nöldeke, Theodor (b. March 2, 1836, Harburg, Hanover [Germany]—d. Dec. 25, 1930, Karlsruhe, Ger.), German Orientalist noted for his Semitic and Islāmic studies, which included a history of the Qurʾān (1859).

After holding several academic posts, Nöldeke became professor of Oriental languages at the University of Strasbourg (1872–1906), then within the German Empire. His large contribution to the history of Semitic languages included the publication of several grammars. His other scholarly works included *Geschichte der Perser und Araber zur Zeit der Sasaniden* (1879; "History of the Persians and Arabs to the Sāsānid Period"), a version of the Arabic chronicle of aṭ-Ṭabarī. Among his works intended for a general readership were *Orientalische Skizzen* (1892; *Sketches from Eastern History*, 1892) and a life of Muḥammad (1863).

Nolichucky River, river rising in the Blue Ridge Mountains in western North Carolina, U.S., and flowing northwest into Tennessee, then west to join the French Broad River after a course of 150 miles (241 km). A dam on the Nolichucky just south of Greeneville, Tenn., impounds Davy Crockett Lake, named for the frontiersman, who was born (1786) on the river near Limestone. John Sevier, first governor of Tennessee, lived on the riverbank (1783–90) and was nicknamed "Nolichucky Jack." The river was named for a Cherokee village, and the word probably means "spruce tree place."

Noll, Chuck, byname of CHARLES H. NOLL (b. Jan. 5, 1932, Cleveland, Ohio, U.S.), American professional football player and coach, who as coach of the National Football League (NFL) Pittsburgh Steelers (1969–91) led them to four Super Bowl victories (1975–76, 1979–80).

At Benedictine High School (Cleveland) Noll played guard on the football team and also competed in wrestling and track and field. At Dayton (Ohio) University he played offensive tackle and defensive back. He played right guard for the NFL Cleveland Browns (1953–59) and was on the Browns NFL championship teams (1954–55). He became a defensive line coach for the American Football League (AFL) Los Angeles (later San Diego) Chargers (1960–65), ultimately taking on all the defensive coaching, as he did for the NFL Baltimore Colts (1966–68).

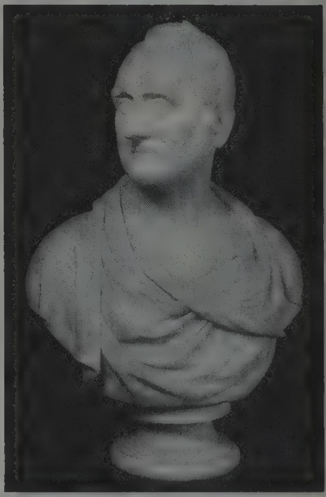
After he became the Steelers' coach, they were in the championship playoffs several years from 1972 on.

nolle prosequi (Latin: "to be unwilling to pursue"), plural NOLLE PROSEQUIS, in Anglo-American law, request by a plaintiff in a civil suit, or by a prosecutor in a criminal action, that the prosecution of the case should cease, either on some or all of the counts or with respect to some or all of the defendants. It is usually used when there is insufficient evidence to ensure successful prosecution or when there has been a settlement between the parties out of court.

In English criminal law, the power to enter a nolle prosequi is vested in the attorney general and is rarely used. In the United States the power is generally exercised at the discretion of the prosecuting officer, typically the district attorney, and is an important adjunct to the administration of criminal justice. Particularly in large cities, many more criminal prosecutions are initiated than it is feasible to try. The nolle prosequi thus serves as a screening device that enables the district attorney to exercise a measure of control over the criminal docket. It is also used to effect an informal settlement, as where a thief agrees to make restitution to his victim. In some states the common-law rule that the entry of a nolle prosequi is within the sole discretion of the district attorney still exists; in others, his discretion is subject to the will of the court. When entered before trial, the nolle prosequi does not bar a subsequent prosecution on the basis of a new indictment or new information.

Nollekens, Joseph (b. Aug. 11, 1737, London, Eng.—d. April 23, 1823, London), Neoclassical sculptor whose busts made him the most fashionable English portrait sculptor of his day.

At 13 Nollekens entered the studio of the noted sculptor of tombs and busts Peter Scheemakers, from whom Nollekens learned to appreciate the sculpture of antiquity. In 1760 he went to Rome, where David Garrick and Laurence Sterne were among the English visitors who sat for him. After his return to England in 1770 he became a member of the Royal Academy (1772) and was patronized by George III. Among his famous likenesses are those of George III, William Pitt, Charles James Fox, and Benjamin West. Many of his works were influenced by ancient Roman busts of the late Republic style. He personally preferred sculpturing mythological works based on ancient prototypes, especially genteel but erotic Venuses delicately modeled in an almost Rococo manner.



William Wellesley-Pole, 3rd Earl of Mornington, marble bust by Joseph Nollekens, 1811; in the National Portrait Gallery, London

National Portrait Gallery, London

Noma Hiroshi (b. Feb. 23, 1915, Kōbe, Hyōgo *ken* [prefecture] Japan—d. Jan. 2, 1991, Tokyo), Japanese novelist who wrote *Shinkū chitai* (1952; *Zone of Emptiness*), which is considered to be one of the finest war novels produced after World War II.

Noma was brought up to succeed his father as head priest of a Buddhist sect, but as a youth he was increasingly drawn to Marxist ideology. He became interested in French Symbolist poetry, showing strong influences of James Joyce, André Gide, and Marcel Proust, and before entering the University in 1935 he studied under the Symbolist poet Takeuchi Katsutarō. He graduated from Kyōto Imperial University in 1938 with a specialty in French literature and was heavily involved in the Kerun, the underground student movement, and the Kansai labour movement. During World War II he was drafted and sent to the Philippines and northern China but later was imprisoned (1943–44), on charges of subversive thought, in Ōsaka Military Prison.

Noma attracted attention after the war with the novels *Kurai e* (1946; "Dark Painting") and *Kao no naka no akai tsuki* (1947; *A Red Moon in Her Face*), both of which present a protagonist's conflict between self-image and carnal desire. The novel *Kurai e* combined the techniques of Symbolism and the Proletarian Literature Movement, using stream-of-consciousness prose. *Shinkū chitai* conveys a broad view of the Japanese wartime army by tracing the parallel fate of two soldiers—a cultured middle-class idealist and a bewildered peasant youth.

After 1950 Noma's work employed more straightforward prose. In 1949 he published the first of a multivolume work completed in 1971, *Seinen no wa* ("Ring of Youth"), which won the Tanizaki Prize in 1971. Other later works include the autobiographical *Waga tō wa soko ni tatsu* (1961; "My Tower Stands There"), *Shinran* (1973), and *Sayama saiban* (1976; "The Sayama Trial"). These works, while conveying a deepening interest in Buddhism, also show Noma's continued concern for social causes. He also wrote many critical essays, including discussions of André Gide and Jean-Paul Sartre.

Noma joined the Communist Party in 1947 but was expelled in 1964.

nomadism, way of life of peoples who do not live continually in the same place but move cyclically or periodically. It is distinguished from migration, which is noncyclic and involves a total change of habitat. Nomadism does not imply unrestricted and undirected wandering; rather, it is based on temporary centres whose stability depends on the availability of food supply and the technology for exploiting it. The term nomad encompasses three general types: nomadic hunters and gatherers, pastoral nomads, and tinker or trader nomads.

Although hunting and gathering generally imposes a degree of nomadism on a people, it may range from daily movements, as among some Kalahari San, to monthly, quarterly, or semiannual shifts of habitat. In areas where resources are abundant or where there are storage facilities, populations may be more or less stable. Nomadic hunters and gatherers are usually organized into small, isolated bands that move through a delimited territory where they know the water holes, the location of plants, and the habits of game.

Pastoral nomads, who depend on domesticated livestock, migrate in an established territory to find pasturage for their animals. Most groups have focal sites that they occupy for considerable periods of the year. Pastoralists may depend entirely on their herds or may also hunt or gather, practice some agriculture, or trade with agricultural peoples for grain and other goods. Some seminomadic groups in Southwest Asia and North Africa cultivate crops between seasonal moves. The patterns of pastoral nomadism are many, often depending on the type of livestock, the topography, and the climate. *See also* transhumance.

Some nomadic groups are associated with a larger society but maintain their mobile way of life. These groups include tinker or trader nomads, who may also make and sell simple products, hunt, or hire out as labourers. The diverse groups that are loosely termed Gypsies are the best-known example of this type of nomadism.

Other nomadic peoples practice a limited kind of agriculture, moving periodically from place to place in order to find new areas in which to raise their crops. They often combine agriculture with hunting and gathering. Anthropologists may refer to such groups as horticultural peoples, to distinguish them from settled agricultural peoples.

Nomadism has declined in the 20th century for economic and political reasons, including the spread of systematic agriculture, the growth of industry, and the policies of governments that view nomadism as incompatible with modern life.

nomarch, governor of the ancient Egyptian administrative division called the nome (*q.v.*).

Nome, city, western Alaska, U.S., port on the south Seward Peninsula shore of the Bering Sea. The discovery (September 1898) of gulch gold at nearby Anvil Creek resulted in a remarkable mining stampede. The miners' camp, known as Anvil City, had an estimated population of 20,000 in 1900, which by 1903 had greatly decreased and was 852 at the 1920 census. The settlement was renamed for Cape Nome, as given on a chart dated 1849 and said to be a British naval draftsman's misinterpretation of the query "?Name." Gold mining remained the chief occupation until the dredge fields were closed in 1962. Transportation, tourism, government construction, fishing, reindeer herding, and Eskimo handicrafts are now the economic mainstays. Nome is served by airlines, freight steamers (in summer), and roads radiating into the tundra. Inc. 1901. Pop. (1990) 3,500.

nome, administrative division of ancient Egypt. The system of dividing the country into nomes was definitely in force by the time of the Old Kingdom (*c.* 2575–*c.* 2130 BC) and persisted with modifications until the Muslim conquest (AD 640). In late times there were 42 nomes, or provinces, 22 in Upper and 20 in Lower Egypt. In Ptolemaic times, a *heptanomis* of seven nomes was formed in Middle Egypt. The Nile valley south of Ombos was sometimes regarded as one with the province of Nubia, although in the Old Kingdom Elephantine was considered the "door of the south."

Each nome during the Old and Middle Kingdoms was administered by a nomarch, or district governor, who levied taxes, administered justice, and maintained an army.

nomenclature, in biological classification, system of naming organisms. The species to which the organism belongs is indicated by two words, the genus and species names, which are Latinized words derived from various sources. This system, which is called the Linnaean system of binomial nomenclature, was established in the 1750s by Carolus Linnaeus. Subsequent to the work of Linnaeus, a proliferation of binomial names took place as new species were established and higher taxonomic categories were formed, with the result that by the late 19th century there was much confusion in the nomenclature of many groups of organisms. In the 20th century, the establishment of rules by international committees in the fields of zoology, botany, bacteriology, and virology has done much to clarify the situation.

Contrary to the widely held view that scientific names, once assigned, are fixed and universal in their use, continuing research on the relationships of organisms and probing into the history of names, coupled with disagreements among scientists on the validity of certain names, results in multiple names being applied to some well-known species. The international rules, however, are gradually bringing stability to the taxonomy of many groups through the minimizing of name changes, the use of standard methods of establishing new names, and the functioning of respected committees to arbitrate controversies.

nominalism, in philosophy, position taken in the dispute over universals—words that can be applied to individual things having something in common—that flourished especially in late medieval times. Nominalism denied the real being of universals on the ground that the use of a general word (*e.g.,* "humanity") does not imply the existence of a general thing named by it. The nominalist position did not necessarily deny, however, that there must be some similarity between the particular things to which the general word is applied. Thoroughgoing nominalists would withhold this concession, as Roscelin, a medieval nominalist, is said to have done. But unless such similarity is granted, the application of general words to particulars is made to appear entirely arbitrary. Such stricter forms of nominalism as existed in the Middle Ages can perhaps be viewed as reactions against Platonic realism, on which some enthusiasts, such as Guillaume de Champeaux, based the opinion that universals had real being. The realist position invited a defensive alliance between empiricism and nominalism; the most notable medieval example of such a synthesis was the work of William of Ockham.

In the Middle Ages, when Platonic and Aristotelian realisms were associated with orthodox religious belief, nominalism could be interpreted as heresy. But religious implications aside, nominalism does indeed reject Platonic realism as a requirement for thinking and speaking in general terms; and though it seems to deny also Aristotelian realism, such moderate nominalists as the 17th-century philosopher Thomas Hobbes affirm that some similarity exists between particulars and the general word applied to them—otherwise thought and speech would be impossible. By explaining thought and speech through the use of symbols, such as mental images or linguistic terms, nominalism seems to imply some form of conceptualism that involves more than the mere correct use of symbols and thus is not clearly distinguishable from conceptualism.

In modern logic a nominalistic concern is reflected in the form that is given to the universal quantifier. Instead of saying "man is mortal," or even "all men are mortal," the modern logician circumvents the universal by saying "for any *x,* if *x* is a man it is mortal." Neopositivism, in repudiating metaphysics, has often been explicitly nominalistic, insisting that there exist only "the facts" of observation and experiment. In the mid-20th century, Nelson Goodman, a philosopher of science and of language, and Willard Van Orman Quine, a logician, have championed a modern nominalism that specifically rejects classes—Goodman for their being "nonindividuals" and Quine for their being "abstract entities."

nomocanon, Byzantine collection of ecclesiastical legislation (canons) and civil laws (Greek *nomoi*) related to the Christian church. The nomocanon in its various redactions served as legal text in the Eastern church until the 18th century. In form and content it reflected a tight alliance between church and state and met the requirements of judges and lawyers obliged to use simultaneously the ecclesiastical canons and the imperial laws. In the 6th century, two main forms of the nomocanon were accepted simultaneously: the *Nomocanon 50 titulorum* and the *Nomocanon 14 titulorum.* The latter, compiled by the patriarch Johannes Scholasticus (565–577), was later updated by the patriarch Photius (*c.* 820–891) and published anew in 883. A Slavic adaptation of the Byzantine nomocanons was compiled by Sava, the first archbishop of Serbia (1219), under the title of *Kormchaya kniga* ("Book of the Helmsman"), which was adopted by all the Slavic Orthodox churches. In the 18th century the need for collections of imperial laws having disappeared, new compilations, including only the ecclesiastical canons, replaced both the nomocanons and the *Kormchaya kniga.* The most important of these new compilations, excerpts from the nomocanon, were the *Pēdalion* ("Rudder"), for the Greeks, and the

Kniga pravil ("Book of Rules"), for the Russians.

nomograph, also called ALIGNMENT CHART, calculating chart with scales that contain values of three or more mathematical variables, widely used in engineering, industry, and the natural and physical sciences.

In the most common form, a nomograph consists of three parallel graduated lines, known values on any two scales determining a straight index line (transversal) that passes through the solution value on the third. Some chart forms employ one or more curved graduated lines; or if straight, they may be arranged in the shape of the letter N.

nomos, plural NOMOI, in music, class of traditional melodies used by ancient Greek epic singers, often with lyre accompaniment. The nomos was an important art form for professional soloists, especially in musical competitions. Nomoi were in three, five, or seven movements and originally in a single harmonia. There were no strophic repetitions.

Nomoi were also performed on the kithara (lyre) and the aulos (double-piped oboe). Best known is the five-movement nomos depicting Apollo's victory over the dragon, played on an aulos at Delphi in 586 BC.

nomos (Greek: "law," or "custom"), plural NOMOI, in law, the concept of law in ancient Greek philosophy. The problems of political authority and the rights and obligations of citizens were a major concern in the thought of the leading Greek Sophists of the late 5th and early 4th centuries BC. They distinguished between nature (physis) and convention (nomos), putting laws in the latter category. Law generally was thought to be a human invention arrived at by consensus for the purpose of restricting natural freedoms for the sake of expediency and self-interest. This view of law as arbitrary and coercive was not conducive to social stability, however, and thus was amended by Plato and other philosophers, who asserted that nomos was, or at least could be, based upon a process of reasoning whereby immutable standards of moral conduct could be discovered, which could then be expressed in specific laws. The dichotomy between the negative and positive views of law was never actually resolved.

non expedit (Latin: "it is not expedient"), a late 19th- and early 20th-century policy of the Roman Catholic church that prohibited its Italian members from participating in politics. The *non expedit* dramatically emphasized that Pope Pius IX and his successors refused to recognize the newly formed Italian state, which had deprived the papacy of its lands in central Italy.

In the early 1860s a Turin journalist, Giacomo Margotti, had coined the phrase *nè eletti nè elettori* ("neither elected nor electors") in launching a campaign urging that devout Roman Catholics protest the seizure of papal land by not voting. This policy of nonparticipation, the *non expedit,* was officially adopted by the Holy See in 1868 and was confirmed on successive occasions through the 19th century (notably by Pius IX in 1874).

Enough Roman Catholics observed the *non expedit* to cause a significant political absenteeism and preclude the formation of a strong conservative party in Italian national politics. Local government was exempted from the ban out of fear for the growing power of the left. Seeking better relations with the Italian government, Pope Pius X virtually ended the *non expedit* in 1904–05. Benedict XV formally ended it in 1919, giving his approval to the Italian Popular Party (PPI). This marked the entrance of Italian Roman Catholics into political life as an organized force.

Non-proliferation of Nuclear Weapons, Treaty on the, also called NUCLEAR NON-PROLIFERATION TREATY, agreement of July 1, 1968, signed by the United Kingdom, the United States, the Soviet Union, and 59 other states, under which the 3 major signatories agreed not to assist states not possessing nuclear explosives in obtaining or producing them. The treaty became effective in March 1970 and was to remain so for a 25-year period. Additional nations later ratified the treaty, including the world's two other major nuclear powers, France and China, in 1992. The treaty was extended indefinitely in 1995 by a consensus vote of 174 countries at the United Nations headquarters in New York.

nonalignment (international relations): *see* neutralism.

nonbiting midge (insect): *see* midge.

Nonconformist, also called DISSENTER, or FREE CHURCHMAN, any English Protestant who does not conform to the doctrines or practices of the established Church of England. The word Nonconformist was first used in the penal acts following the Restoration of the monarchy (1660) and the Act of Uniformity (1662) to describe the conventicles (places of worship) of the congregations that had separated from the Church of England (Separatists). Nonconformists are also called dissenters (a word first used of the five Dissenting Brethren at the Westminster Assembly of Divines in 1643–47). Because of the movement begun in the late 19th century by which Nonconformists of different denominations joined together in the Free Church Federal Council, they are also called Free Churchmen.

The term Nonconformist is generally applied in England and Wales to all Protestants who have dissented from Anglicanism—Baptists, Congregationalists, Presbyterians, Methodists, and Unitarians—and also to independent groups such as the Quakers, Plymouth Brethren, English Moravians, Churches of Christ, and the Salvation Army. In Scotland, where the established church is Presbyterian, members of other churches, including Anglicans, are considered Nonconformists.

Noncooperation Movement (September 1920–February 1922), unsuccessful attempt, organized by Mohandas Gandhi, to induce the British government of India to grant self-government, or swaraj, to India. It arose from the outcry over the massacre at Amritsar in April 1919, when the British killed about 400 Indians, and from later indignation at the government's alleged failure to take adequate action against those responsible. Gandhi strengthened the movement by supporting (on nonviolent terms) the contemporaneous Muslim campaign against the dismemberment of Turkey after World War I.

The movement was to be nonviolent and to consist of the resignations of titles; the boycott of government educational institutions, the lawcourts, government service, foreign goods, and elections; and the eventual refusal to pay taxes. Noncooperation was agreed to by the Indian National Congress at Calcutta in September 1920 and launched that December. In 1921 the government, confronted with a united Indian front for the first time, was visibly shaken, but a revolt by the Muslim Moplahs of Kerala (southwestern India) in August 1921 and a number of violent outbreaks alarmed moderate opinion. After an angry mob murdered police officers at Chauri Chaura (February 1922), Gandhi himself called off the movement; the next month he was arrested without incident. The movement marks the transition of Indian nationalism from a middle-class to a mass basis.

nondirective psychotherapy, also called CLIENT-CENTRED PSYCHOTHERAPY, an approach to the treatment of mental disorders that aims primarily to foster the patient's general personality growth by helping him gain insight into his feelings and behaviour. The function of the therapist is to extend consistent, warm "unconditional positive regard" toward the "client" (avoiding the negative connotations of "patient") and, by repeating and restating the client's own verbalized concerns, to enable the client to see himself more clearly and react more openly with the therapist and others. Pace, direction, and termination of therapy are controlled by the client; the therapist merely acts as a facilitator. The nondirective approach was originated by the American counseling psychologist Carl Rogers in the 1940s and influenced later individual and group psychotherapeutic methods. *See* psychotherapy.

nonfiction novel, story of actual people and actual events told with the dramatic techniques of a novel. The American writer Truman Capote claimed to have invented this genre with his book *In Cold Blood* (1965). A true story of the brutal murder of a Kansas farm family, the book was based on six years of exacting research and interviews with neighbours and friends of the victims and the two captured murderers. The story is told from the points of view of different "characters," and the author attempts not to intrude his own comments or distort fact. Critics pointed out earlier precedents for this type of journalistic novel, such as John Hersey's *Hiroshima* (1946), an account of the World War II atomic bombing of the Japanese city told through the histories of six survivors. Norman Mailer's *The Executioner's Song* (1979) is another notable example of the genre.

Nong Khai, also spelled NONGKHAI, town, northeastern Thailand. Nong Khai is a Mekong River port and the main Thai port of entry for traffic to and from nearby Vientiane, the capital of Laos. In 1994 the Thai-Lao Friendship Bridge, the first bridge across the lower reaches of the Mekong River, was opened; it links Nong Khai by road with Vientiane. Nong Khai is the northern terminus of a railway from Bangkok and lies on the Bangkok-Vientiane highway. Pop. (1992 est.) 26,381.

Temple at Nong Khai, Thailand

Shostal

Nong Sa Rai, Battle of (1593), in Southeast Asian history, military encounter between the Tai (Thai) kingdom of Ayutthaya and the Toungoo dynasty of Myanmar (Burma) which put an end to the aggression that had been waged intermittently by Myanmar.

In 1569 the Toungoo conquered Ayutthaya and reduced it to a vassal state. After the great Toungoo conqueror King Bayinnaung was succeeded by his son Nanda Bayin (reigned 1581–99), it soon became apparent that the Toungoo empire was in less able hands. Although then-prince Naresuen, the actual ruler of Ayutthaya, performed vassal military service to Nanda Bayin against the rebel king of Ava in late 1583, he recognized that the time was ripe to pursue Tai independence. His renunciation of vassalage to Myanmar in 1584 was followed in the next two years by four unsuccessful Toungoo invasions of Ayutthaya.

Despite the bloodshed, misery, and resources exhausted by continual warfare, Nanda Bayin continued to attempt to crush Tai independence, launching further offensives in 1586 and 1587. Again, Naresuen was able to withstand the Myanmar onslaught. From 1587 to 1590, the kingdom of Ayutthaya experienced three years of relative peace. War had devastated the countryside, however, and earthquakes and famine created additional hardships.

At the end of 1592, the last Toungoo invasion was launched by Nanda Bayin in a final effort to subjugate Ayutthaya. A huge army commanded by the inept Crown Prince Minkyi-zwa invaded the Tai kingdom. The decisive battle took place at Nong Sa Rai, where Naresuen (who had become king in 1590) commanded the superior field position. After Naresuen slew the Toungoo crown prince in a man-to-man combat, the Toungoo forces, confused and demoralized, abandoned the expedition. The Battle of Nong Sa Rai marked the end of years of warfare and misery for both kingdoms. Myanmar did not pose a threat to Tai independence for the next 150 years.

Nonimportation Agreements (1765–75), in U.S. colonial history, attempts to force British recognition of political rights through application of economic pressure. In reaction to the Stamp Act (1765) and the Townshend Acts (1767), colonial nonimportation associations were organized by Sons of Liberty and Whig merchants to boycott English goods. In each case, British merchants and manufacturers suffered curtailed trade with the colonies and exerted the anticipated pressure on Parliament. When the acts were subsequently repealed, the boycotts collapsed. After the Intolerable Acts of 1774, the first Continental Congress immediately provided for both nonimport and nonexport committees. Britain had developed new markets in Europe, however, and the expected influence on Parliament did not materialize. For 10 years nonimportation was the main weapon employed by the colonists in an attempt to win their demands from the mother country by peaceful means. When it failed, they resorted to armed resistance.

Nonjuror, in British history, any of the beneficed clergy of the Church of England and the Episcopal Church in Scotland who refused to take the oaths of allegiance to William III and Mary II after the deposition of James II in the Revolution of 1688. They numbered about 400 in England, including eight bishops and some of the most devout and learned men in the Anglican church. Among the most prominent of the Nonjurors were: the archbishop of Canterbury, William Sancroft; the saintly hymn writer Thomas Ken; the ecclesiastical polemicist Jeremy Collier; the historian Henry Dodwell; and Henry Hyde, 2nd earl of Clarendon. They considered William and Mary to be usurpers, adhered to their oaths to James II, but adopted a policy of nonresistance to the established authorities. From 1694 they maintained a separate ecclesiastical succession, but they were divided over liturgical usages, and their numbers dwindled in the 18th century; the last Nonjuror bishop died in 1805.

In Scotland the disestablishment of the Episcopal church in 1690 resulted in the defection of the greater part of the clergy. Unlike their Church of England counterparts, the Scottish Nonjurors actively supported the Stuart cause, participated in the Jacobite uprisings of 1715 and 1745, and suffered severe reprisals. In 1788, with the death of Charles Edward, the Young Pretender, the bishops agreed to recognize King George III.

A large number of Presbyterians in Scotland, principally among the Cameronians, also refused to take the oaths of allegiance to William and Mary, but as their refusal was on different grounds, they are not usually referred to as Nonjurors.

nonliterate society, a people or culture without a written language. The term nonliterate is distinguished from "illiterate," which indicates a member of a literate society who has not learned to read or write. Although the term is not entirely satisfactory because it distinguishes by the sole criterion of written language, it has several advantages over the loosely equivalent terms primitive, preliterate, preurban, savage, and others. For a further treatment of terminology and a list of MACROPAEDIA articles on nonliterate societies, *see* primitive culture.

nonmetal, substance that does not exhibit such characteristic properties of metals as hardness, mechanical adaptability, or the ability to conduct electricity. This classification is generally applied to the chemical elements carbon, nitrogen, phosphorus, oxygen, sulfur, selenium, fluorine, chlorine, bromine, iodine, and the noble-gas elements. These elements have few physical properties in common; most are gases, one (bromine) is liquid, and others are solids.

The atoms of nonmetals generally are small and contain relatively large numbers of electrons in their outermost shells. In the noble-gas atoms, the electron shells are completely filled; thus, the elements are almost completely inert. The other nonmetals have nearly filled electron shells, requiring only a few additional electrons to assume the stable, noble-gas configuration. Therefore, in the presence of other atoms, these nonmetallic atoms have pronounced tendencies to attract electrons to themselves (high electronegativities). They form chemical compounds by attracting electrons away from other atoms of lower electronegativities or by sharing electrons with atoms of comparable electronegativities.

Although there are only a few nonmetallic elements, they constitute a large portion of the Earth's crust and are essential for the growth and existence of living things.

Nonnus (fl. 5th century AD; b. Panopolis, Egypt), the most notable Greek epic poet of the Roman period.

His chief work is the *Dionysiaca,* a hexameter poem in 48 books; its main subject, submerged in a chaos of by-episodes, is the expedition of the god Dionysus to India. Nonnus' fertile inventiveness and felicitous descriptive fantasy, which are well served by a unique command of the language and his vast literary knowledge, made him the often-imitated leader of the last Greek epic school. His style, with its ever-recurring, often daring metaphors and unremittingly bombastic tone, appealed to the taste of the time. Later in life he was converted to Christianity and composed a hexameter paraphrase of St. John's Gospel (*Metabole*), which shows all his earlier stylistic faults without his compensatory descriptive ability.

Nono, Luigi (b. Jan. 29, 1924, Venice, Italy—d. May 8, 1990, Venice), leading Italian composer of electronic, aleatoric (chance), and serial music.

Nono began his musical studies in 1941 at the Venice Conservatory. He then studied law at the University of Padua, receiving a doctorate there, while at the same time studying with the prominent avant-garde composer Bruno Maderna and the noted conductor Hermann Scherchen. He came to public attention in 1950 with his work *Variazioni Canoniche,* orchestral variations on a 12-tone theme of Arnold Schoenberg, whose daughter Nuria he married in 1955. He continued to explore avant-garde techniques and lectured widely in Europe and the United States. He also taught at the New Music Summer School at the Kranichsteiner Music Institute in Darmstadt, Ger., from 1957.

Nono

Cameraphoto, Venice

Nono's music is distinguished by its clarity of form. Polyphony (simultaneous melodic lines), monophony (melody without harmony), and rhythm are explored in a straightforward manner in his *Polifonica-monodia-ritmica* (1951) for seven instruments. *The Suspended Song* (1955–56), a serial setting for voices, chorus, and orchestra of letters written by victims of Nazism, passes its melody among the instruments and voices with each performer rarely playing more than a single note at a time. Nono also adopted this technique of fragmentation in several works involving voices and percussion. *Per Bastiana Tai-yang Cheng* (1967), based on a Chinese folk song and celebrating the birth of the Nonos' daughter, is somewhat aleatoric and calls for three instrumental groups playing in quarter tones and for magnetic tape.

An avowed Communist, Nono often produced works of political substance, many of which sparked controversy and reaction. When his opera *Intolleranza 1960,* which Nono referred to as a "mural," premiered in Venice in 1961, the performance was stormed by neofascists, causing a riot with the communists. The work attacked fascism, the atom bomb, and segregation and ended in a symbolic fashion in which the world is flooded and destroyed. The opera was later revised as *Intolleranza 1970.*

La Scala in Milan commissioned a new opera from Nono in the early 1970s. *Al Gran Sole Carico d'Amore* (1972–75; "In the Great Sun of Blooming Love") took its title from a poem by Arthur Rimbaud, "Les Mains de Jeanne-Marie," and is about the Paris Commune of 1871. Its theme was devoted to the class struggle, with no conventional plot or characters, and showed the influence of Arnold Schoenberg's pre-World War I Expressionism. The opera did not, however, premier at La Scala but at Teatro Lirico. La Scala produced a revised version in 1978.

Nono was greatly inspired by the Spanish poet Federico García Lorca and wrote *Der Rote Mantel* (1954; "The Red Overcoat") based on one of his poems. His *Epitaffio per Federico García Lorca* (1952) was hailed as a major work and is a set of three pieces in memory of Lorca. Other politically inspired works include the dramatic cantata *Sul ponte di Hiroshima* (1962; "On the Bridge of Hiroshima"), dealing with the implications of nuclear warfare; *Ein Gespenst geht um in der Welt* (1971; "A Spirit Haunts the World"), a setting for voice and orchestra of *The Communist Manifesto;* and *Canto per il Vietnam* (1973; "A Song for Vietnam").

A longtime member of the Italian Communist Party, Nono was elected to its Central Committee in 1975.

Nonomura Seisuke (Japanese potter): *see* Ninsei.

Nonpartisan League, also called FARMERS' NONPARTISAN LEAGUE, or (after 1917) NATIONAL NONPARTISAN LEAGUE, in U.S. history, alliance of farmers to secure state control of marketing facilities by endorsing a pledged supporter from either major party. It was founded in North Dakota by a Socialist, Arthur C. Townley, in 1915, at the height of the Progressive movement in the Northwest. To protect the farmer from alleged wheat trade monopolies by speculators and officials, the league demanded state-owned mills, grain elevators, banks, and hail insurance companies.

In 1916 the league candidate, Lynn J. Frazier, won the North Dakota gubernatorial election, and in 1919 the state legislature enacted the entire league program. The league gradually declined in the 1920s and after 1932 became a rigid political machine. It affiliated with the Democrats in 1956.

nonsense verse, humorous or whimsical verse that differs from other comic verse in its resistance to any rational or allegorical interpretation. Though it often makes use of coined, meaningless words, it is unlike the ritualistic gibberish of children's counting-out rhymes in that it makes these words sound purposeful.

Skilled literary nonsense verse is rare; most of it has been written for children and is modern, dating from the beginning of the 19th century. The cardinal date could be considered 1846, when *The Book of Nonsense* was published; this was a collection of limericks composed and illustrated by the artist Edward Lear, who first created them in the 1830s for the children of the earl of Derby. This was followed by the inspired fantasy of Lewis Carroll, whose *Alice's Adventures in Wonderland* (1865) and *Through the Looking-Glass* (1872) both contain brilliant nonsense rhymes. "Jabberwocky," from *Through the Looking-Glass,* may be the best-known example of nonsense verse. It begins thus:

> 'Twas brillig, and the slithy toves
> Did gyre and gimble in the wabe;
> All mimsy were the borogoves,
> And the mome raths outgrabe.

Another of Carroll's poems, *The Hunting of the Snark* (1876), has been called the longest and best sustained nonsense poem in the English language.

Hilaire Belloc's volume *The Bad Child's Book of Beasts* (1896) holds an honoured place among the classics of English nonsense verse, while, in the United States, Laura E. Richards, a prolific writer of children's books, published verses in *Tirra Lirra* (1932) that have been compared to those of Edward Lear.

nonstoichiometric compound, any solid chemical compound in which the numbers of atoms of the elements present cannot be expressed as a ratio of small whole numbers; sometimes called berthollide compounds in distinction from daltonides (in which the atomic ratios are those of small integers), nonstoichiometric compounds are best known among the transition elements. Several of them are important as components of solid-state electronic devices, such as rectifiers, thermoelectric generators, photodetectors, thermistors, and magnets useful in high-frequency circuits.

The existence of nonstoichiometric compounds is related to the presence of defects in the lattice structures of crystalline substances, such as the absence of ions from sites that would normally be occupied. For example, a sodium chloride crystal that lacks a sodium ion and a chloride ion is defective, but still stoichiometric because the numbers of sodium ions and chloride ions are the same; if the sodium ion site, however, is filled by a neutral sodium atom, which then gives up its valence electron to fill the chloride ion site, the crystal defect is remedied, but the crystal is now nonstoichiometric because it contains more sodium ions than chloride ions.

Most nonstoichiometric compounds have compositions that are close to those of stoichiometric compounds and can be expressed by such formulas as WO_{3-x}, $Co_{1-x}O$, or $Zn_{1+x}O$, in which x is a positive quantity much smaller than 1. In certain cases apparent nonstoichiometry has been shown to result from the existence of homologous series of stoichiometric compounds, such as the series of molybdenum oxides having the formulas Mo_nO_{3n-1}, in which the compounds corresponding to $n = 8, 9, 10, 11, 12$, and 14 are known; a true nonstoichiometric compound MoO_{3-x} would show a continuous variation of x within some range of values, and no discrete species would be detectable.

Nonthaburi, city, south-central Thailand, just north of Bangkok. The city, a northern, fast-growing suburb of Bangkok, lies on the east (left) bank of the Chao Phraya River and is linked to the metropolis by riverboats and major roads. Nonthaburi has a lively market near the river and is the site of national job-training centres, the Sukhothai Thammathirat Open University (founded 1978), and a large prison. Across the river from the city is the Chalerm Phra Kiat Temple, which was built during the reign (1824–51) of Rama III of Siam and is partly decorated in multicoloured ceramic tiles. Rice growing and fruit and vegetable cultivation are important in the surrounding area. Pop. (1993 est.) 261,335.

nontropical sprue: *see* celiac disease.

noodle, a cooked egg-and-flour paste prominent in European and Oriental cuisine, generally distinguished from other pasta (*q.v.*) by its elongated, ribbonlike form. Noodles are commonly used to add body and flavour to broth soups. They are commonly boiled or sautéed and served with sauces and meats or baked in casseroles.

Oriental noodles are made primarily from starch ingredients other than flour, although the recipes for some Oriental pan-fried and stir-fried dishes allow the substitution of wheat-flour noodles for the Chinese *mein.* Noodles made from rice flour or the starch of the mung bean are softened in water, then boiled and drained, in preparation for being fried or added to soups.

Noord-Brabant, English NORTH BRABANT, *provincie* (province), second largest of The Netherlands, extending northward from the Belgium border, between the provinces of Zeeland (west) and Limburg (east), to the Maas (Meuse) and Merwede rivers. It is drained by the Mark (Merk) and Dommel rivers and the Zuidwillemsvaart and Wilhelmina canals. Its capital is 's Hertogenbosch. Neolithic, Bronze, and Iron Age remains attest to early occupation of the area; there were ancient Roman camps along the Maas. After the Middle Ages, the division between east and west (discernible in two different Iron Age groups) was continued in political divisions: the barony of Breda to the west and the Meierij van 's Hertogenbosch (Bois-le-Duc) to the east, both subject to the duchy of Brabant. The affinities of the west still lie with Belgium and France, and those of the east with the Rhineland. Nearly all the inhabitants are Roman Catholic.

The province's fertile coastal lands, flooded in 1953, support wheat and sugar beets; the more acid, poorly drained riverine lands are mostly pasture. The southern heaths contain woods, many recently planted conifers, small lakes, and peat bogs. The poor soils support restricted mixed farming, including the raising of sheep. Extensive heathlands were reclaimed in the 19th century, and several new settlements were established in the raised bogs of De Peel (southeast of Deurne), where the sale of peat was combined with horticulture and cattle raising. Reclamation slackened after 1900; immigration from rural areas has been heavy, and more than half the population now is urban. Formerly, Bergen op Zoom was the centre of the marshlands, Breda of the riverlands, and 's Hertogenbosch of the inner sandy areas, but the largest provincial communities now also include the industrial centres at Tilburg and Eindhoven. Area 1,910 square miles (4,947 square km). Pop. (1994 est.) 2,259,779.

Noord-Holland, English NORTH HOLLAND, coastal *provincie* (province), northwestern Netherlands, comprising a peninsula (area 1,030 square miles [2,667 square km]) surrounded by the North Sea (west), the Waddenzee (north), and the IJsselmeer (Lake IJssel; east). It includes the west Frisian island of Texel, off its northern tip. The island of Marken in the IJsselmeer has been connected by embankment with the mainland since 1957; the former island of Wieringen, now united after drainage with the mainland, is the starting point of the Afsluitdijk, the 19-mile (31-kilometre) dam that encloses the IJsselmeer and links Noord-Holland and Friesland. The province, drained by the Zaan, Amstel, and Vecht rivers, is mainly low fenland, with dunes, and sea and river clays. Formed by the division (1840) of Holland into North and South, its capital is Haarlem. The province contains Amsterdam, the chief city of The Netherlands.

Along the shore, sand dunes form a smooth, unbroken protection for the inland regions. Coastal resorts include Zaandvoort, Bergen aan Zee, Egmond aan Zee, and Wijk aan Zee. Of the fishing ports, IJmuiden, the foreport of Amsterdam at the western end of the North Sea Canal, is most important. This canal area has developed into an important industrial district (IJmond) centred on IJmuiden, Velsen, and Beverwijk and manufacturing steel products, paper, fertilizer, and chemicals. Haarlem is an industrial town and flower-bulb trading centre. Petten, on the western coast, is the centre of Dutch nuclear research.

Sandy geest soils, behind the inner dunes, support the famous Dutch bulb fields of hyacinths, tulips, narcissus, and crocuses that continue southward from Haarlem into Zuid-Holland. North of the North Sea Canal, market gardening dominates on the geest.

Most of the province lies at or below sea level, consisting of peat in the older parts and clay in the considerable reclaimed areas (polders). To the north of the North Sea Canal (cut 1865–76, after the drainage of the IJ inlet of the IJsselmeer), the Wormer, Schermer, Purmer, and Beemster lakes were drained in the 17th century; several sea polders farther north were added to the mainland in the early 19th century. Wieringermeer was reclaimed by 1930. This part of the province is traversed by the 46-mile North Holland Canal (1819–25) between Amsterdam and Den Helder. South of the North Sea Canal, the Haarlemmermeer polder was reclaimed between 1840 and 1852. This region is typically Dutch, with canals and windmills. There is market gardening, and the northern polders, especially the Wieringermeer, produce grains and sugar beets; but the main occupations are cattle raising and dairy farming. There are cattle and cheese markets at Purmerend and Alkmaar. The province's economy is centred on Amsterdam, the chief commercial centre, and the Zaanstreek industrial area, particularly at Zaandam.

Once heath-covered, with small rural villages, the Gooi region of lakes and woods to the southeast has grown into a considerable resort, residential, and industrial area that is centred on Hilversum (site of many powerful radio stations, including Radio Nederland) and Bussum. Pop. (1992 est.) 2,421,700.

noösphere (from Greek *noös,* "mind"), in theoretical biology, that part of the world of life that is strongly affected by man's conceptual thought; regarded by some as coextensive with the anthroposphere. The noösphere, as proposed by scientific theorists Pierre Teilhard de Chardin, Vladimir Ivanovich Vernadsky, and Édouard Le Roy, is the level of the intellect, as opposed to the geosphere, or nonliving world, and the biosphere, or living world.

Noot, Henri van der (b. Jan. 7, 1731, Brussels, Austrian Netherlands [now in Belgium]—d. Jan. 12, 1827, Strombeek, Neth.), Belgian lawyer and political activist who, along with Jean-François Vonck, led the Belgian revolt of 1789 against the regime of the Austrian Habsburg Holy Roman emperor Joseph II. He failed to maintain national support, however, and yielded to an Austrian invasion the following year.

Van der Noot served as an advocate in Brabant and in 1787 began to organize against the sweeping religious and political reforms of Joseph II, which violated traditional local privileges. After influencing the guilds of Brabant to form a militia, he escaped arrest in August 1788 by fleeing to Breda in the United Provinces (Dutch Republic). There and in London he offered sovereignty over Belgium to the Dutch House of Orange and won a promise of support from Prussia. In 1789 he joined forces with J.-F. Vonck's army led by Jean-André van der Meersch at Breda. After the rebels' victory over the Austrians, he returned triumphantly to Brussels in December 1789.

Van der Noot and his supporters, the "Statist party," who sought a return to oligarchic rule, were able to force Vonck's democratic faction out of the government. He was unable to unify the country, however, and went into exile (where he remained until 1792) after the Austrians took Belgium in December 1790, defeating a Belgian army weakened by the statists' arrest of van der Meersch. Van der Noot was imprisoned in 1796 by the French Directory and was never again prominent in public life except for a brief emergence in 1814, when he argued for the return of Belgium to Austrian rule.

Consult the INDEX *first*

Noot, Jan Baptista van der, byname JONKER JAN (b. *c.* 1540, Brecht, near Antwerp [now in Belgium]—d. *c.* 1595, Antwerp), the first Dutch poet to realize fully the new French Renaissance poetic style in Holland. He also influenced the English and German poets of his time.

Van der Noot went into political exile in 1567, and his first work was published in England—*Het bosken* (1570 or 1571; "The Little Wood"), a collection of his earliest poetry in the style and form of the Italian poet Petrarch and the French poet Pierre de Ronsard. In 1568 one of his main works had appeared, *Het theatre oft toon-neel* ("Theatre for Voluptuous Worldlings"), a prose defense of the virtues of Calvinism and a condemnation of the worldliness of Dutch society. It is prefaced by sonnets and epigrams that were translated by Edmund Spenser for an English version.

In van der Noot's unique Renaissance production and main poetical work, the *Olympiados* epic, he described in clear, unadorned language his dream of an allegorical journey toward his divine love, Olympia. Van der Noot interpolated numerous sonnets in the work, and their German translations are the earliest known instances of the pure sonnet in that language.

Nootka, Indians of the Northwest Pacific Coast of North America, located on the southwest coast of Vancouver Island and on Cape Flattery, the northwest tip of the state of Washington. The groups on the southeast end of the island were the Nitinat, those on Cape Flattery, the Makah. The Nootka were culturally related to the Kwakiutl (*q.v.*).

In the central and southern Nootka regions, local groups were socially and politically independent; in northern areas they usually formed larger tribes with common winter villages. There were also several confederacies of tribes, dating to prehistoric times, that shared summer villages near the coast and the fishing and hunting grounds. The Nootka moved seasonally to areas of economic importance, returning to their principal homesites during the winter when subsistence activity slowed.

The Nootka were specialized whale hunters, employing special equipment such as large dugout canoes and harpoons with long lines and sealskin floats. The whale harpooner was a person of high rank, and families passed down the magical and practical secrets that made for successful hunting. There was also a whale ritualist who, by appropriate ceremonial procedures, caused whales that had died of natural causes to drift ashore. Many features of this whaling complex suggest ancient ties with Eskimo and Aleut cultures.

The most important Nootkan ceremony was the shamans' dance, a reenactment of the kidnapping of an ancestor by supernatural beings who gave him supernatural gifts and released him. The ceremony served to define each individual's place in the social order. The public performance ended with a potlatch (*q.v.*), a ceremonial distribution of property.

Nootka Sound, an inlet of the Pacific Ocean, on the western coast of Vancouver Island, British Columbia, Canada, some 168 miles (270 km) northwest of Victoria. The sound, which forms a good harbour, is 6 miles (10 km) wide and has three arms, one of which separates Nootka Island from Vancouver Island.

Captain James Cook visited the sound in 1778. He called it King George's Sound, then renamed it Nootka Sound, believing that to be its Indian name.

Nootka Sound controversy (1790), dispute over the seizure of vessels at Nootka Sound, an inlet on the western coast of Vancouver Island, that nearly caused a war between Great Britain and Spain. Its settlement ended the Spanish claim to a monopoly of trade and settlement on the western coast of North America and made possible the eventual expansion of the Canadian provinces to the Pacific.

The dispute arose as a result of the seizure by the Spaniards in 1789 of four British trading vessels owned by Captain John Meares and his associates. In April 1790, Meares appealed to the British government for redress, and a major dispute quickly developed with Spain. The Spaniards claimed possession of the whole northwestern coast of America on the basis of a papal grant of 1493, confirmed when their explorers had formally taken possession of the area. Great Britain, however, contended that rights of sovereignty could be established only by actual occupation of the land.

The British threatened war over the Nootka Sound incident, but because of Spain's military weakness and because of Prussian diplomatic support on behalf of Great Britain, Spain yielded to the British demands in the Nootka Sound Convention, signed on Oct. 28, 1790. The convention acknowledged that each nation was free to navigate and fish in the Pacific and to trade and establish settlements on unoccupied land.

Nora, ancient site about 22 miles (35 km) southwest of Cagliari (Caralis) on the island of Sardinia. Although tradition ascribes its foundation to Iberians from Tartessus, the site, which lies on a triangular promontory ending in a steep cliff, is characteristically Phoenician. Apart from remains of ■ Sardinian *nuraghe,* or towerlike monument, the earliest antiquities discovered at Nora are Phoenician, dating from the 7th century BC. After the Roman annexation of Sardinia, Nora was its capital in the republican period and later became a municipium (Romanized community) under the empire (after 27 BC).

Ruins of the Roman theatre at Nora, Sardinia

© Mairani—CLICK/Chicago

Excavations in 1952–54 revealed a wealthy imperial Roman city overlying a typical Phoenician port. The Phoenician town had narrow irregular streets and buildings of typical Carthaginian construction. The violence during the time of the First Punic War (264–241 BC) is evidenced by a *tophet,* where the ashes and burned bones of children were buried in great jars under stelae carved with a temple facade and an image of the goddess Tanit. The Roman city dates from the late 1st century AD; a fine theatre, an aqueduct, a temple of Juno, a nymphaeum, baths, and private villas have been uncovered.

Norbert OF XANTEN, SAINT (b. *c.* 1080, Xanten, Duchy of Lower Lorraine [Germany]—d. June 6, 1134, Magdeburg, Saxony; canonized 1582; feast day June 6, among Premonstratensians July 11), archbishop of Magdeburg and founder of the Premonstratensians (Norbertines, or White Canons), a congregation of priests.

Norbert was ordained in 1115. Failing to reform his peers at the collegiate church of Xanten, he traveled throughout France and Belgium, preaching moral reform. In 1119 Pope Calixtus II asked him to found a religious institute at Prémontré, Fr. With such notable disciples as Hugh of Fosses and St. Evermod, he established his community, the Premonstratensians, in 1120. The congregation was dedicated to preaching, pastoral work, and education. Norbert adopted the rule of Bishop St. Augustine of Hippo for his new order, and he modeled its constitutions after that of the Cistercians, an austere group of cloistered, vegetarian monks practicing perpetual silence. His monastery at Prémontré became the motherhouse of the Premonstratensians.

Norbert was chosen archbishop of Magdeburg in 1126. He became an important church figure four years later when he defended Pope Innocent II, whose claim to the papacy was threatened by Antipope Anacletus II. Norbert won the German church for Innocent's cause and influenced the German king Lothair II/III to defend Innocent.

Norbertine (religious order): *see* Premonstratensian.

Norcross, John (American author): *see* Conroy, Jack.

Nord, *département,* Nord-Pas-de-Calais *région,* northern France. It extends for 200 miles (320 km) along the Belgian frontier and borders the Strait of Dover for 20 miles (32 km). Nord is the most populous *département* of France and one of the most productive in agriculture and industry. Created mainly from French portions of the historical provinces of Flanders and Hainaut, Nord occupies a low-lying land over which many battles, including some of those of World Wars I and II, have been fought throughout the history of Europe. From northwest to southeast it comprises a coastal plain reclaimed from the sea and including Dunkirk; the Flanders plain extending to Armentières, where the *département* is at its narrowest; the densely populated industrial area of Lille, Roubaix, and Tourcoing; the coal basin around Douai, Denain, and Valenciennes through which the Schelde (Escaut) River flows; the territory around Cambrai; the valley of the Sambre River flowing through Maubeuge; and the area of Avesnes-sur-Helpe on the western approaches of the Ardennes plateau. The entire *département* is laced with an intricate network of canalized rivers, canals, and roads, including the highway linking Lille, the departmental capital, with Paris. One of France's largest coalfields crosses the *département* as a narrow strip running from east of Valenciennes to west of Douai.

The climate is mild and humid. Cereals, potatoes, sugar beets, flax, and hops are cultivated intensively. Dairy farming and market gardening have been highly developed, and an exceptionally heavy density of livestock is maintained. The traditional textile industry of Roubaix and Tourcoing remains important in the *département* and produces woolen, cotton, and synthetic fabrics. Besides coal mining (which has declined) and coking and distilling plants, the *département* has several major concentrations of iron- and steelworks. The concentration around Valenciennes, in the east of the coal basin, began production in 1834; another group is located nearby at Denain. The huge complex at Dunkirk includes four furnaces that entered service between 1933 and 1973 and is modern in both conception and production methods. Other industrial activities include engineering, chemical works, food processing, glassworks, and marble cutting. Oil refineries and mineral works have been developed in the area of Dunkirk, which is one of the main French seaports and has an important shipbuilding yard.

Although the fighting of World Wars I and II took its toll of the *département*'s old buildings, some fine *hôtels de ville* (city halls) and several of the *département*'s noted belfries miraculously survived, as did the elaborate but outdated fortifications of several of the old towns of French Flanders. The *département* has six *arrondissements*—Lille, Cambrai, Douai, Dunkirk, Valenciennes, and Avesnes-sur-Helpe. It is in the educational division of Lille. Area 2,217 square miles (5,742 square km). Pop. (1992 est.) 2,532,900.

Nord-du-Québec, English NORTH OF QUEBEC, formerly NOUVEAU-QUÉBEC, administrative region constituting the northern half of Quebec province, Canada. The name Nouveau-Québec ("New Quebec") once was used synonymously with Ungava for that part of the Labrador-Ungava peninsula between Hudson Bay and the Labrador Sea, north of the Eastmain and Churchill (Hamilton) rivers, which was, at the time, a part of the Northwest Territories. In 1912, however, when the territory was annexed by Quebec, the term Nouveau-Québec generally replaced Ungava. Following the establishment of the Quebec-Newfoundland boundary in 1927, use of the name was limited to a territory in northern Quebec province, which in 1967 became a political subdivision of the province; during the 1980s the region's name was changed to Nord-du-Québec. Governed from the city of Quebec, Nord-du-Québec is the largest but least populous of Quebec province's regions. Pop. (1991) 20,284.

Nord-Norge, English NORTHERN NORWAY, geographic region of Norway. It reaches from Nordland about 575 miles (925 km) northward to the North Cape (Nordkapp), the northernmost point in Europe. It includes the *fylker* (counties) of Nordland, Troms, and Finnmark. An arm of the Gulf Stream, the North Atlantic Current, which flows past its coast, provides a relatively mild maritime climate. Commonly known as the "Land of the Midnight Sun," it has a five-month summer, from May through September; in the far north the sun does not set from mid-May to late July. The northeastern section, in which herds of reindeer range across the tundra, is part of Lapland. The remainder of the region is extremely mountainous, with dense forests and many rivers. The entire region is dotted with thousands of lakes, while the coastline is indented by numerous fjords. Adjacent to the coast are hundreds of islands, the most important group being the Lofoten-Vesterålen near Narvik.

Nord-Norge is connected to southern Norway via coastal shipping and passenger ferries and by highways and a railroad that runs as far north as Bodø in the middle of the region. Principal economic activities include fishing, farming (as far north as 70° N), shipping (especially Swedish iron ore through Narvik), and tourism. Bodø, Narvik, Tromsø, Hammerfest, Harstad, Vardø, and Kirkenes are the main towns and ports. Area 43,598 square miles (112,918 square km). Pop. (1992 est.) 465,089.

Nord-Ostsee-Kanal (Germany): *see* Kiel Canal.

Nord-Pas-de-Calais, *région,* encompassing the northernmost French *départements* of Nord and Pas-de-Calais. The capital is Lille. The *région* is bounded by the *départements* of Somme and Aisne to the south. The English Channel lies to the northwest and Belgium to the northeast. Flatlands predominate in the north, with much of the land lying below sea level. The hills of Cambrais and Avesnois rise to the southwest and southeast, respectively, but elevations rarely exceed 650 feet (200 m). Nord-Pas-de-Calais is drained by the Canche and Schelde (Escaut) and Sambre rivers. A mild and humid climate prevails.

The *région* is densely populated. The population increased by nearly 140 percent between 1801 and 1911, representing one of the few *régions* of France to show such a trend during the period; immigrants from Belgium accounted for much of the increase. Later immigrants have come from Poland and southern Europe. Population growth has lagged behind the national average since 1950, reflecting the relative stagnation of industry, and the migratory balance has become negative. Though most of the population is urban, the countryside also is densely populated.

The *région*'s agriculture is highly mechanized and employs only a small percentage of the workforce. Farmland in the north tends to be enclosed, while that in the south tends to be open. The leading crops are wheat, barley, and potatoes. Industrial crops are also grown and include flax and hops. The *région* is a leading producer of pork.

Textiles, whose production centres on Lille, Roubaix, Tourcoing, and Armentières, are the *région*'s leading manufactured product. Automation has sharply reduced the workforce employed in weaving. Declining coal production has seriously undermined the *région*'s metalworking industries and has been only partially offset by imported natural gas. Area 4,793 square miles (12,413 square km). Pop. (1992 est.) 3,969,300.

Nord-Trøndelag, *fylke* (county), central Norway. It extends from the Norwegian Sea (west) to the Swedish border (east), with the southern boundary running in a general northwest-southeast direction south of Trondheims Fjord. The *fylke* has an area of 8,673 square miles (22,463 square km); the county seat is at Steinkjer (*q.v.*). The major road and rail links between Trondheim and northern Norway pass through the narrow Nam Valley (Namdalen) in the north-central section. The low, hilly areas in the south are one of the best agricultural areas of Norway and produce grains, hay, and potatoes. Fishing and fish processing are carried on from the many small coastal ports and offshore islands. Pyrite is mined in the Nam Valley and near the Swedish border, and iron ore is extracted west of Trondheims Fjord. The towns of Steinkjer, Namsos, Grong, and Levanger are manufacturing centres. Area 8,673 square miles (22,463 square km). Pop. (1993 est.) 127,450.

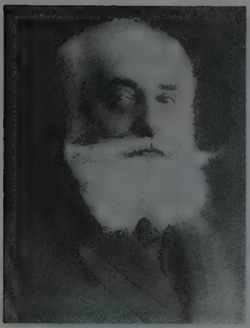
Nordal, Sigurdur Jóhannesson (b. Sept. 14, 1886, Eyjólfsstadir, Vatnsdalur, Húnavatnssýsla, Iceland—d. Sept. 21, 1974, Reykjavík), Icelandic philologist, critic, and writer.

Nordal received his doctorate in Old Norse philology from the University of Copenhagen in 1914. He studied philosophy in Berlin and at the University of Oxford. Upon his return to Iceland in 1918, Nordal was appointed professor of Icelandic Language and Literature at the University of Iceland. He lectured extensively there and abroad on Icelandic language, literature, and philology. From 1951 to 1957 he was Iceland's ambassador to Denmark, and later he taught at several universities in Europe and the United States.

Nordal published fundamental studies of the Eddic poem *Völuspá* (1922–23) and many of the Icelandic sagas. He was instrumental in altering the critical approach to the sagas, showing by careful internal analysis that they are to be regarded more as literary works written by individual writers than as historically accurate products of an oral folk tradition. Nordal also wrote many notable historical works, including a life of the medieval writer Snorri Sturluson (1920) and *Íslenzk menning* (1942; *Icelandic Culture*). He also published essays, novels, short stories, and poems. His short-story collection *Fornar ástir* (1919; "Old Loves") played a significant role in the development of the modern Icelandic short story, and his Icelandic anthology, *Íslenzk lestrarbók 1400–1900* (1924), was also influential.

Nordau, Max, original name MAX SIMON SÜDFELD (b. July 29, 1849, Pest [now Budapest], Hung.—d. Jan. 23, 1923, Paris, France), physician, writer, and early Jewish nationalist who was instrumental in establishing recognition of Palestine as a potential Jewish homeland to be gained by colonization.

In 1880, after serving as Viennese correspondent for a Budapest newspaper and traveling extensively in Europe, Nordau settled permanently in Paris, where he established a medical practice. A prolific writer of travel books, plays, poems, and essays, he achieved his greatest success in 1883 with *Die conventionellen Lügen der Kulturmenschheit* (*The Conventional Lies of Our Civilization*), a vitriolic attack on the inadequacy of 19th-century institutions to meet human needs; he took a



Nordau
Keystone

particularly harsh look at organized religion. Banned in Russia and Austria, the book nevertheless was translated into numerous languages and went into some 73 editions.

After he met the charismatic Jewish nationalist Theodor Herzl in Paris in 1892, Nordau became deeply interested in Zionism and served as vice president of the Zionist congresses under Herzl, delivering a number of brilliant addresses on the condition of world Jewry. Following Herzl's death in 1904, Nordau broke with the "practical Zionists" (younger men advocating colonization of Palestine without guarantees of political sovereignty), who gained control of the Zionist congresses; Nordau refused to participate in these meetings after 1911.

Nordenflycht, Hedvig Charlotta (b. Nov. 28, 1718, Stockholm, Sweden—d. June 29, 1763, Lugnet, near Stockholm), Swedish poet considered to be Sweden's first feminist. Though influenced by Enlightenment ideas, she was largely self-educated and had a distinct pietistic and sentimental side; both the intellectual and the highly emotional strain are evident in her work.

Hedvig Nordenflycht, detail of an oil painting by Johan Henrik Scheffel, 1754; in the Svenska Porträttarkivet, Stockholm
By courtesy of the Svenska Portrattarkivet, Stockholm

The deaths of a fiancé in 1737 and of her husband in 1741 (seven months after their marriage) inspired her earliest poems, some of which were published in *Den sörjande turturduvan* (1743; "The Mourning Turtledove"). She settled in Stockholm and became a leading literary figure, publishing four volumes of poetry in the next six years. During the 1750s she formed a literary society, Tankarbyggarorden ("Order of the Thought Builders"), with Finnish-born Gustav Philip Creutz and Gustaf Fredrik Gyllenborg. Their literary collaboration resulted in two anthologies, the first (in three volumes) was entitled *Våra försök* (1753, 1754, 1756; "Our Attempts"), the second (in two volumes) *Witterhetsarbeten* (1759, 1762; "Literary Works"). In 1761 she fell in love with a man much younger than herself. This love was unrequited, and Nordenflycht's poems of this period are tender and controlled and are considered to be her highest achievement. Her collected works were edited by Hilma Borelius in three volumes (1924–38).

Nordenskiöld, Adolf Erik, Baron (Friherre), in full NILS ADOLF ERIK, BARON NORDENSKIÖLD (b. Nov. 18, 1832, Helsinki, Fin.—d. Aug. 12, 1901, Dalbyö, Sweden), Swedish geologist, mineralogist, geographer, and explorer who sailed from Norway to the Pacific across the Asiatic Arctic, completing the first successful navigation of the Northeast Passage.

In 1858 Nordenskiöld settled in Stockholm, joined an expedition to the Arctic island of Spitsbergen, between Norway and Greenland, and became professor and curator of mineralogy at the Swedish State Museum. He returned to Spitsbergen again in 1861 and led his own expeditions there in 1864, 1868, and 1872–73, adding to geologic knowledge of the area. In 1870 he also led an expedition to western Greenland to study the inland ice.

Adolf Erik Nordenskiöld, detail of an oil painting by Georg von Rosen, 1886; in the National Museum, Stockholm
By courtesy of the Nationalmuseum, Stockholm

Before attempting to cross the Northeast Passage, Nordenskiöld made preliminary voyages in 1875 and 1876, on which he penetrated the Kara Sea, north of Siberia, to the mouth of the Yenisey River. Sailing from Tromsø, Nor., aboard the steam vessel *Vega* on July 21, 1878, he reached Cape Chelyushkin, Siberia, roughly the midpoint of his journey, on August 19. From the end of September until July 18, 1879, the ship was frozen in near the Bering Strait. Resuming its course, the *Vega* reached Port Clarence, Alaska, on July 22 and returned to Europe by way of Canton (China), Ceylon (now Sri Lanka), and the Suez Canal. When Nordenskiöld reached Stockholm on April 24, 1880, he was created a baron by King Oscar. In 1883, while returning from western Greenland, where he penetrated far into the inland ice, he became the first to break through the great sea ice barrier of the southeast Greenland coast.

Nordenskiöld also made notable contributions in the field of cartography.

Nordenskiöld, Erland, in full NILS ERLAND HERBERT NORDENSKIÖLD (b. July 19, 1877, Strömm, Sweden—d. July 5, 1932, Stockholm), Swedish ethnologist, archaeologist, and a foremost student of South American Indian culture.

Son of the scientist-explorer Adolf Erik Nordenskiöld and cousin of explorer-geographer Otto Nordenskjöld, he made zoological expeditions to Patagonia (1899) and Argentina and Bolivia (1901–02) but turned to archaeological research in the mountains of Peru and Bolivia (1904–05). He made two subsequent expeditions to the forestlands bordering Bolivia and Brazil, one noteworthy result being his paper (1912) dealing with mounds and urn burials in Bolivia. In 1913 he became principal curator of ethnology at the Göteborg Museum. His final expedition took him to the Chocó and Cuna Indians of Colombia and Panama (1927). Pioneering in methods of mapping the distribution of many elements of South American culture, he succeeded in developing a remarkably clear reconstruction of cultural history in an area of considerable complexity.

In addition to accounts of his travels written in a semipopular vein, Nordenskiöld wrote many scientific articles and books, including the richly illustrated work *L'Archéologie du bassin de l'Amazone* (1930; "Archaeology of the Amazon Basin"). His major work is *Comparative Ethnographical Studies,* 10 vol. (1918–38), in which he analyzed the material culture of Bolivian tribes and sought to relate natural environment and other influences on cultural patterns. He was skeptical of the theory of *Kulturkreis* ("culture sphere"), which postulates early diffusion of cultural elements from a primeval area of human development. He suggested that if there were Oceanian influences in South America, they dated from an extremely remote antiquity and that impetus to high civilization of America was Indian.

Erland Nordenskiöld
Nordiska Museet, Stockholm

Nordenskjöld, Otto, in full NILS OTTO GUSTAF NORDENSKJÖLD (b. Dec. 6, 1869, Småland, Sweden—d. June 2, 1928, Göteborg), Swedish geographer and explorer.

A nephew of the scientist-explorer Adolf Erik Nordenskiöld, he became a lecturer in mineralogy and geology at the University of Uppsala, Sweden, in 1894 and led a geologic expedition to southern South America (1895–97). His findings in Patagonia and Tierra del Fuego formed an important contribution to world glacial geology. On Oct. 16, 1901, he sailed aboard the *Antarctic* from Göteborg and the following February established an Antarctic station on Snow Hill Island off Graham Coast, where he wintered with five companions. Their ship, which had wintered at the island of South Georgia, 54° S and due east of Tierra del Fuego, was crushed in the pack ice when it returned to relieve them in February 1903. Nordenskjöld's party was again forced to winter in the Antarctic until rescued by the Argentine vessel *Uruguay* in November 1903.

Otto Nordenskjöld
Nordiska Museet, Stockholm

Nordenskjöld published his extensive findings in *Wissenschaftliche Ergebnisse der schwedischen Südpolar-expedition 1901–1903* (1905–20; "Scientific Results of the Swedish South Polar Expedition 1901–1903"). He subsequently became professor of geography (1905) and first rector of advanced commercial studies (1923) at the University of Göteborg.

Norderney, island off the North Sea coast of Germany, one of the East Frisian Islands. A part of Lower Saxony *Land* (state), the island is 8 miles (13 km) long and up to 1.25 miles (2 km) wide, with dunes rising to 68 feet (21 m). The northern coast is exposed to the sea, but the more sheltered water of the Wattenmeer (shoals produced by tidal water that floods wide mud flats) lies to the south between the island and the mainland. Most of the population lives in Norderney, a small fishing port and the oldest German seaside resort (1797), which was formerly frequented by fashionable international society and is noted for its fine beach and mild climate. There are ferry connections to Norden on the mainland. Pop. (1989 est.) town, 6,187.

Nordfriesische Inseln (German), Danish NORDFRISISKE ØER, English NORTH FRISIAN ISLANDS (Europe): *see* Frisian Islands.

Nordhausen, city, Thuringia *Land* (state), central Germany, lying on the Zorge River, at the southern slopes of the Harz Mountains, in the fertile lowland known as the Goldene Aue ("Golden Meadow"). First mentioned in 927 as the site of a royal castle near the older Frankish settlement of Northusen (Nordhusa), it was made a free imperial city in 1290 and accepted the Reformation in 1522. It lost its independence in 1802, when it was annexed by Prussia, forming part of Prussian Saxony (except for the period 1807–13, when it was Westphalian) until 1945. It incorporated the neighbouring villages of Salza and Krimderode in 1950. Historic buildings that survived heavy air attacks in World War II include the 17th-century town hall with the oaken statue of Roland (1717), a symbol of civic liberty; the late Gothic cathedral with a Romanesque crypt; and the 13th-century Church of St. Blasius, which contains works by Lucas Cranach the Elder and the Younger. The city has a civic museum, a theatre, a teachers' training college, an institute of agricultural technology, and a sports school.

Industries include brewing; distilling; the manufacture of chewing tobacco, machinery, clothing, chemicals, and wood products; and shaft-sinking processes. Pop. (1989 est.) 48,734.

Nordheim, Sondre (b. *c.* 1825, Morgedahl, Telemark, Norway—d. 1897), Norwegian skier who revolutionized ski design and ski equipment and helped to standardize certain aspects of the sport.

Nordheim in 1860 was the first to use bindings of willow, cane, and birch root around the heel from each side of the toe strap to fasten the boot to the ski, thus revolutionizing skiing and making ski jumping possible. He himself won the first known jumping competition, held at Telemark in 1866. He also designed skis with incurving sides, the prototype for modern skis. He developed basic skiing turns, which became standard as the stem turn, the Christiania, and the stem Christiania. In 1850 he had been the first skier to perform parallel turns. In 1868 Nordheim and some friends skied 322 km (200 miles) from Telemark to Christiania (later Oslo), where he made a jump of 18 m (59 feet). He is credited with developing in 1870 the first modern sidecut in skis, producing a ski narrower in the middle and wider at the ends.

Nordhorn, town, Lower Saxony *Land* (state), northwestern Germany, on the Vechte River at the junction of the Almelo-Nordhorn, Ems-Vechte, and Süd-Nord canals, 4 miles (6 km) from the Dutch border. First mentioned about 1000 and chartered in 1379, the city suffered heavily from plague, fire, and war in the 15th and 16th centuries. Part of the Augustinian Frenswegen Abbey (founded 1394) and the 15th-century Protestant church survive. Modern Nordhorn is a textile centre, with oil wells nearby. Its area was expanded in the 1920s by the addition of neighbouring communities. Pop. (1989 est.) 48,556.

Nordic Council of Ministers, organization of the Nordic states of Denmark, Finland, Iceland, Norway, and Sweden for the purpose of consultation and cooperation on matters of common interest. The Council was established in February 1971 under an amendment to the Helsinki Convention (1962) between the Nordic countries. It consists of the ministers of state of the member countries, as well as other ministers with responsibility for the subject under discussion. Formal decisions are usually binding on the member governments. The Council of Ministers provides funds for a large number of joint Nordic institutions and projects in such fields as investment finance, scientific research and development, culture, education, and social welfare and health. A related organization, the Nordic Council, serves as an advisory body.

Nordic skiing, also called CLASSIC SKIING, techniques and events that evolved in the hilly terrain of Norway and the other Scandinavian countries. The modern Nordic events are the cross-country races (including a relay race) and ski-jumping events. The Nordic combined is a separate test consisting of a 15-kilometre cross-country race and special ski-jumping contest, with the winner determined on the basis of points awarded for performance in both. Cross-country racing is sometimes called Nordic racing. Nordic events were included in the first winter Olympic program in 1924; the Alpine events (downhill and slalom) were not added until 1936. A Nordic World Cup for cross-country events has been awarded since 1979. The governing body is the Fédération Internationale de Ski.

See Sporting Record: *Skiing. See also* Olympic Games.

Nordica, Lillian, original name LILIAN NORTON (b. May 12, 1857, Farmington, Maine, U.S.—d. May 10, 1914, Batavia, Java, Dutch East Indies [now Jakarta, Indon.]), American soprano, acclaimed for her opulent voice and dramatic presence, especially in Wagnerian roles.

Nordica studied at the New England Conservatory, Boston, then gave recitals in the United States and London before resuming study in Milan. In 1879 she made her debut in Milan as Donna Elvira in W.A. Mozart's *Don Giovanni* and in Brescia as Violetta in Giuseppe Verdi's *La traviata.* After singing in many Italian, German, and Russian cities, she made her Paris Opéra debut in 1882 as Marguerite in Charles Gounod's *Faust.*

In 1887 Nordica first appeared in London at Covent Garden and until 1893 performed there and at Drury Lane in such parts as Lucia, Donna Elvira, and Aida. In 1894 she was engaged at Bayreuth, Ger.—the first American to be so honoured—as Elsa in Richard Wagner's *Lohengrin,* and such was her tumultuous reception that she thereafter concentrated on Wagnerian parts. In 1895 she sang Isolde at the Metropolitan Opera in New York City, where she remained until 1909, excelling especially as Brünnhilde and Kundry. After retiring from the Metropolitan, she launched a world farewell tour that ended in 1913 with a shipwreck near Java, where she died.

Nordica as Selika in Giacomo Meyerbeer's *L'Africaine,* 1892

The Bettmann Archive

Nordjylland, *amtskommune* (county commune), northern Jutland, Denmark, created in 1970 from the former counties of Ålborg and Hjørring, with an area of 2,383 square miles (6,173 square km). It comprises most of the Himmerland region between Mariager Fjord and Lim Fjord and extends to the northernmost tip of the Jutland peninsula at Skagen. It has soil of generally poor quality with large areas of moorland in the south and extensive dunes in the north. Its economy depends largely on dairying and agriculture; there are also coastal resorts and some fishing in the north. The port of Ålborg serves as the administrative seat; other important centres include Hjørring, Frederikshavn, and Skagen. Pop. (1989 est.) 483,754.

Nordland, *fylke* (county), northern Norway, bordering the Norwegian Sea. Its many offshore islands include most of the Lofoten Islands and the Vesterålen archipelago. With an area of 14,798 square miles (38,327 square km), including the northern islands, Nordland extends for about 300 miles (500 km) along the coast; about two-thirds of the *fylke* is north of the Arctic Circle. The coastline is rugged and indented by fjords. Most residents live on the coastal lowlands and in narrow inland valleys. Narvik and Bodø (the county seat) are cities; other towns are Svolvær and Mo. The economy is based on fishing (especially cod), stock raising (cattle and goats), some farming (rye and potatoes), and mining. The port of Narvik has a direct rail connection to the rich Kiruna-Gällivare iron-ore fields in Sweden. The chief pyrite deposits are near Mo and Sulitjelma, while iron ore is mined in Dunderlands Valley. Hydroelectric power has been extensively developed, providing a base for metal-processing industries (steel at Mo and aluminum at Mosjøen). Pop. (1990 est.) 239,571.

Nördlingen, city, Bavaria *Land* (state), southern Germany, on the Eger River. A seat of the bishop of Regensburg in 898, it became a free imperial city in 1215. Several battles in the Thirty Years' War (17th century) and the French Revolutionary Wars (18th century) were fought outside the medieval walls that still surround the old city. Notable buildings include the late-Gothic town hall, the Church of St. George (1427–1505), and the Church of St. Salvator (1381–1422). The oldest horse race in Germany is held annually in Nördlingen. Industries include the manufacture of clothing, precision instruments, and paper. Pop. (1989 est.) 18,278.

Nördlingen, Battle of (Sept. 5–6, 1634), battle fought near Nördlingen in southern Germany in the Thirty Years' War. Ending in a decisive victory for the forces of the Holy Roman Empire and Spain over the Swedes, it led to the dissolution of the Heilbronn alliance (1633), ended Swedish domination in southern Germany, and forced Cardinal de Richelieu to bring France into active participation in the war.

Led by Matthias Gallas, the combined imperial and Spanish forces fought the Swedish army, which, under the dual command of Gustav Karlsson Horn and Bernhard of Saxe-Weimar, was weakened by the absence of large contingents that had been sent to fight the Poles. Although the Swedes gained an advantage on the first day of the battle, they could not overcome the incompatibility of their two leaders; Horn was captured, and the Swedish army was completely routed.

Nordraak, Rikard, Nordraak also spelled NORDRAACH (b. June 12, 1842, Christiania [now Oslo], Nor.—d. March 20, 1866, Berlin [Germany]), Norwegian composer perhaps best known as the composer of the music for the Norwegian national anthem, "Ja, vi elsker dette landet" (1864; "Yes, We Love This Land").

Nordraak began composing music as a child. He was sent at age 15 to Copenhagen, Den., for training in business, but he also studied music while there. In 1859 he gave up the study of business and went to Berlin for six months to continue his music training, returning to Norway for two further years of study. During this period he became involved in the Nye Norske Selskab ("New Norwegian Society"), met Ole Bull, and immersed himself in the nationalistic movement then popular in literature and the other arts. His *Four Dances* for piano was published in 1859–60. After working in Berlin for two more years, Nordraak went to Copenhagen and, with Edvard Grieg and others, founded Euterpe, a musical society dedicated to the performance of works by young Scandinavian composers. In 1864 Nordraak's music for the national anthem, with words by his cousin Bjørnstjerne Bjørnson, was published. In May 1865, Nordraak once again traveled to Berlin to work and study. While there, he contracted tuberculosis and died.

His works—which include the incidental music *Maria Stuart i Skotland* and *Sigurd Slembe,* several pieces for a capella male chorus, and a number of songs and instrumental pieces—are characterized by simplicity and economy. His compositions were much influenced by Norwegian folk music, which he collected.

Nordrhein-Westfalen (Germany): *see* North Rhine–Westphalia.

Nordström, Ludvig Anselm (b. Feb. 25, 1882, Härnösand, Swed.—d. April 15, 1942, Stockholm), Swedish writer whose realistic, socially conscious works are set in the Norrland region in which he matured.

Born of a Swedish father and an English mother, Nordström was much influenced by English writers, especially Charles Dickens, Thomas Carlyle, Laurence Sterne, H.G. Wells, and G.K. Chesterton. He most delighted his readers with such freshly observed, idiomatic, and lively short stories as those found in *Fiskare* (1907; "Fishermen"), *Borgare* (1909; "Burghers"), *Herrar* (1910; "Gentlemen"), and *Lumpsamlaren* (1910; "The Junk Collector"). His three-volume *Petter Svensks historia* (1923–27; "The Story of Peter Svensk") is the chief work in which he expounds his vision (which he called "totalism") of an anti-individualistic, industrial society in which group and communal values are stressed. In this and other long works of fiction, his sociopolitical views were often put forward at the expense of his art, and most of his long fiction is not memorable. He was able to achieve a certain measure of political influence, however, with two journalistic essays: *Bonde-nöden* (1933; "The Distress of the Peasantry") and *Lort-Sverige* (1938; "Dirt-Sweden"), dealing with the limits of common rural existence and with the filth of the supposedly "clean" Swedish countryside. Both aroused widespread discussion and, together with the contemporaneous economic studies of Gunnar and Alva Myrdal, helped to prompt subsequent reforms. Only two of Nordström's novels, *Landsorts-bohème* (1928; "Small-town Bohemia") and *Planeten Markatten* (1937; "The Monkey Planet"), are considered to be of value.

Nore, The, sandbank in the Thames Estuary, extending between Shoeburyness (north) and Sheerness (south), county of Kent, southeastern England. The Nore Lightship, anchored 4 miles (6 km) southeast of Shoeburyness, was the first to be established in English waters (1732). The Nore anchorage was much-used by the English fleet in the wars of the 17th and 18th centuries. In 1797 sailors at The Nore mutinied against their conditions, and their leader, Richard Parker, was hanged from the yardarm of his ship. Until 1961 The Nore gave its name to a naval command for the eastern area of England. The name is used also for the estuarine area that roughly coincides with the naval port of Sheerness.

norepinephrine (hormone): *see* epinephrine and norepinephrine.

Norfolk, county of eastern England, bounded by Suffolk (south), Cambridgeshire and Lincolnshire (west), and the North Sea (north and east). It comprises seven districts—Breckland, Broadland, Great Yarmouth, North Norfolk, Norwich, South Norfolk, and King's Lynn and West Norfolk—over an area of 2,073 square miles (5,368 square km).

Norfolk is low-lying, and a large part is drained by the Rivers Wensum, Yare, and Bure and their tributaries into the North Sea. The northwest corner of the county is drained by the Ouse into The Wash, a shallow North Sea inlet. There are chalk outcrops in western Norfolk, and, in the eastern half of the county, chalk is overlain by later deposits. Along the northwest edge of the county, clays and sandstones older than the chalk are exposed. Norfolk is a rich farming county, but regions of natural or seminatural vegetation survive. Around parts of the 90-mile (145-kilometre) coastline there are sand dunes, as at Blakeney Beach on the northern coast. There are also salt marshes, as at Scolthead Island. Along the valleys of the Yare and Bure are a number of shallow expanses of water and reed swamp—the famous Broads that resulted from medieval peat cutting and a subsequent change in sea level. In the southwest of the county and extending into Suffolk are the sandy heathlands of Breckland, which have been planted with conifers in many places.

Paleolithic, Mesolithic, and Neolithic artifacts have been found in the county. The most impressive Stone Age monuments are the flint mines, such as Grime's Graves, in Breckland. Long barrows (mounds) and Bronze Age round barrows are also found. In the 3rd century BC the early British Iceni people, of whom later the famous Boudicca (Boadicea) was a queen, entered the area from the European continent. During the Roman period, there were two towns in Norfolk, Caister St. Edmund and Caister next Yarmouth. After the ensuing Anglo-Saxon invasions, Norfolk became part of the kingdom of East Anglia. Town life in Norwich and Thetford started at this time, the former town having a mint from 920. Subsequently the area was subjected to Danish raids, and it eventually became part of the administrative entity called the Danelaw.

By the time of Domesday Book (1086), the record of the land survey ordered by William I the Conqueror, Norfolk was one of the most heavily populated and wealthiest regions in England, and it remained so throughout the medieval period. The region's prosperity depended largely on wool. Little Walsingham, in the north of the county, was a famous shrine in the Middle Ages, attracting pilgrims from far and wide. During the English Civil Wars of the mid-17th century, Norfolk saw little action because the county was strongly behind Cromwell and the Parliamentary cause. There are several surviving castles in the area, as at Norwich, Caister next Yarmouth, and Oxborough; there are also large private mansions, as at Sandringham (the Norfolk home of the royal family).

Norfolk's economy is predominantly agricultural, with barley, wheat, sugar beets, oats, and vegetables as the major crops. Barley is grown for the distilling industry and for animal feed. Large areas of peas and beans are grown for canning and freezing at such centres as Great Yarmouth. Most types of livestock are raised, but the county is especially noted for its turkeys. Fishing is important at many points around the coast. Norwich has developed an important boot and shoe industry and, together with most other major towns in the county, has attracted some light industry. Catering for tourists is also important, especially at points along the coast (Cromer and Great Yarmouth) and on the Broads. Pop. (1989 est.) 748,500.

Norfolk, city, Madison county, northeastern Nebraska, U.S., on the north fork of the Elkhorn River. Settled in 1866 by German farmers from Xonia and Watertown, Wis., its name, originally proposed as North Fork, was abbreviated to Norfork and then changed by the post office to Norfolk. The economy depends primarily on agriculture (grain and livestock) and food processing, augmented by manufacturing (medical equipment and electronic resistors and circuits). Nebraska Christian College was founded there in 1932 and Northeast Technical Community College in 1973. Gavins Point Dam and Nebraska Sand Hills Recreation Area are nearby. Inc. village, 1881; city, 1886. Pop. (1990 est.) 21,476.

Norfolk, independent city and port of entry, in the Tidewater region of southeastern Virginia, U.S., at the mouth of Chesapeake Bay. It is part of an urban complex that includes the cities of Portsmouth (west), Chesapeake (south), Virginia Beach (east), and, northward across the harbour of Hampton Roads, Newport News and Hampton.

Laid out as a town in 1682 following an act of the Virginia General Assembly (1680) that each county should establish a trade centre, it was named for Norfolk county, Eng. The land was bought from Nicholas Wise, a carpenter, for 10,000 pounds (4,500 kg) of tobacco. For many years Norfolk was a trade outlet for eastern North Carolina (tar, lumber, hides, and tobacco). Later, shipbuilding and ship repairing became important. A lucrative trade developed with Britain and the West Indies, and, in recognition of its commercial importance, Norfolk was presented a silver mace by Lieutenant Governor Robert Dinwiddie in 1753.

The harbour at Norfolk, Va.

© Ann Purcell

During the American Revolution, the royal governor, Lord Dunmore, made it his headquarters (December 1775), declared martial law, and defeated the Virginia militiamen at nearby Kempsville. Later in the month Colonel William Woodford and his Virginia riflemen routed the British at Great Bridge and occupied Norfolk, which on Jan. 1, 1776, was bombarded by Dunmore's fleet anchored in the Elizabeth River. The Virginians later burned what was left of the town except for St. Paul's Church (which still has a cannonball in its wall) to prevent its use by the British. Norfolk's recovery was hampered by the stifling of West India trade by Britain, restriction on shipping and privateering by the European powers during the Napoleonic Wars, a disastrous fire in 1799, and intercity rivalry. During the War of 1812 it was twice saved from the British—when a local militia beat off a land attack on Portsmouth and when General Robert B. Taylor's defense of Craney Island prevented a barge invasion.

With subsequent canal and railroad construction, prosperity returned until a yellow-fever epidemic struck in 1855 (killing 10 percent of the population). During the American Civil War, Norfolk fell (May 1862) to Union forces under General John E. Wool and was occupied for the rest of the war. Its prosperity resumed after 1870 with the converging of railways on the port and was stimulated during World Wars I and II with the installation of a huge naval and naval-air complex. Norfolk, with Portsmouth, is now headquarters of the U.S. Atlantic Fleet and the Supreme Allied Command, Atlantic (Saclant), of the North Atlantic Treaty Organization (NATO).

Shipping, shipbuilding, and light industry are the major economic activities. Old Dominion University (1930), Norfolk State College (1968), and Virginia Wesleyan College (1966; partly in Virginia Beach) are located there. A botanical garden, the burial site and memorial for U.S. general Douglas MacArthur, and the Cultural and Convention Center are notable landmarks. The annual International Azalea Festival is dedicated to NATO. Inc. borough, 1736; city, 1845. Pop. (1990) city, 261,229; Norfolk–Virginia Beach–Newport News MSA 1,396,107.

Norfolk, EARLS AND DUKES OF, titled English nobility of several creations, notably in the families Mowbray and Howard, grouped below chronologically and indicated by the symbol •. Norfolk is the premier English nonroyal dukedom.

•**Norfolk, Thomas of Brotherton, Earl of** (b. June 1, 1300, Brotherton, near Pontefract, Yorkshire, Eng.—d. August 1338), half brother of King Edward II of England and of Edmund of Woodstock, Earl of Kent.

He was created Earl of Norfolk in 1312 and was given vast lands in England, Wales, and Ireland; Edward II further distinguished him by creating him marshal of England. However, although he at first sided with the king, he was one of the first to join Queen Isabella when she landed in England in 1326 and was one of the group of nobles who brought about the deposition of Edward II. Thomas, more fortunate than the executed Edmund of Woodstock, however, provided no opportunity for the jealousy of the ruler Roger de Mortimer, and he survived to welcome Edward III's seizure of power, becoming a close ally of the young king.

•**Norfolk, Thomas Mowbray, 1st Duke of,** Earl of Nottingham, Earl Marshal (b. *c.* 1366—d. Sept. 22, 1399, Venice [Italy]), English lord whose quarrel with Henry of Bolingbroke, Duke of Hereford (later King Henry IV, reigned 1399–1413), was a critical episode in the events leading to the overthrow of King Richard II (reigned 1377–99) by Bolingbroke. The quarrel dominates the first act of William Shakespeare's play *Richard II.*

The son of John, 4th Lord Mowbray, Thomas was made Earl of Nottingham in 1383. Several years later he joined the group of powerful nobles—known as the lords appellant—who from 1387 to 1389 forced Richard II to submit to their authority. Nevertheless, after Richard regained power, he employed Mowbray on military and diplomatic missions. In 1397 Richard arrested three leading appellants, including Thomas of Woodstock, Duke of Gloucester. Committed to Mowbray's charge, Gloucester was mysteriously murdered, possibly on orders from Richard.

Although Mowbray was then created Duke of Norfolk in 1397, he feared that the king would have him arrested for his earlier disloyalty. He confided these fears to Bolingbroke, who immediately denounced him to Richard as a traitor. Mowbray denied the charges and, as the two men were about to decide the dispute by duel, Richard intervened and banished them both (Sept. 16, 1398). Norfolk died in Italy shortly before Bolingbroke forced Richard to abdicate.

•**Norfolk, John Howard, 1st Duke of,** Earl Marshal, Lord Howard (b. *c.* 1430—d. Aug. 22, 1485, near Market Bosworth, Warwickshire, Eng.), English lord who supported the Yorkist kings in the Wars of the Roses.

John Howard was the son of Sir Robert Howard by his wife, Margaret, daughter of Thomas Mowbray, the 1st Duke of Norfolk of that family. In 1455 John Howard was sent to Parliament as member for Norfolk; in 1461 he was knighted; and in 1470, although he appears to have been a consistent Yorkist, he was created a baron by Henry VI. He was treasurer of the royal household from 1467 to 1474 and went to France with Edward IV in 1475. After Edward's death, however, Howard supported Richard III, who created him Duke of Norfolk and made him earl marshal of England in June 1483. He was killed at Bosworth Field while fighting for this king, and the title thus suffered attainder.

John Howard, 1st Duke of Norfolk, detail of an anonymous portrait, mid-15th century; at Arundel Castle, Sussex

By courtesy of the Duke of Norfolk, Arundel Castle

•**Norfolk, Thomas Howard, 2nd Duke of,** Earl of Surrey, Earl Marshal (b. 1443—d. May 21, 1524, Framlingham, Suffolk, Eng.), noble prominent during the reigns of Henry VII and Henry VIII of England.

Son of the 1st Duke of Norfolk, Thomas Howard early shared his father's fortunes; he fought at Barnet for Edward IV and was made steward of the royal household and created Earl of Surrey in 1483 (at the same time that his father was created duke). Taken prisoner at Bosworth Field while fighting for Richard III, he was attainted and remained in captivity until January 1489, when he was released and restored to his earldom of Surrey but not to the dukedom of Norfolk. He was then entrusted with the maintenance of order in Yorkshire and with the defense of the Scottish borders; he was made lord treasurer and a privy councillor in 1501, and he helped to arrange the marriage between Margaret, the daughter of Henry VII, and James IV of Scotland. Henry VIII, too, employed him on public business, but the earl grew jealous of Thomas Wolsey, and for a short time he absented himself from court. He commanded the army that defeated the Scots at Flodden in September 1513, and he was created Duke of Norfolk in February of the following year, with precedency as of the creation of 1483.

In his later years Norfolk worked more harmoniously with Wolsey. He was guardian of England during Henry's absence in France in 1520, and he acted as lord high steward at the trial of his friend Edward Stafford, Duke of Buckingham, in 1521.

•**Norfolk, Thomas Howard, 3rd Duke of,** Earl of Surrey, Earl Marshal (b. 1473—d. Aug. 25, 1554, Kenninghall, Norfolk, Eng.), powerful English noble who held a variety of high offices under King Henry VIII. Although he was valuable to the King as a military commander, he failed in his aspiration to become the chief minister of the realm.

Howard was the brother-in-law of King Henry VII and the son of Thomas Howard, 2nd Duke of Norfolk. In May 1513 he became lord high admiral, and on September 9 he helped rout the Scots at Flodden Field near Branxton, Northumberland. He became lord deputy of Ireland in 1520 but soon left this post to command a fleet against the French.

Succeeding his father as Duke of Norfolk in 1524, he headed the faction opposed to Henry's chief minister, Thomas Wolsey. Upon Wolsey's fall in 1529, Norfolk became president of the royal council. He supported the marriage of his niece Anne Boleyn to Henry in 1533, but, by the time of Anne's fall in 1536, his relationship to Henry had already been weakened by the rise of Thomas Cromwell. As lord high steward, Norfolk was assigned to preside at her trial and execution. He momentarily regained royal favour by skillfully suppressing the rebellion of Roman Catholics in northern England known as the Pilgrimage of Grace (1536). A conservative in religion, Norfolk became a leading opponent of two influential church reformers: the king's chief adviser, Thomas Cromwell, and the archbishop of Canterbury, Thomas Cranmer. Upon Cromwell's execution (1540) Norfolk emerged as the second most powerful man in England, but his position was again weakened when Henry's fifth wife, Catherine Howard—another of Norfolk's nieces—was put to death in 1542.

By courtesy of Castle Howard; photograph, Courtauld Institute of Art

In December 1546 Norfolk was accused of being an accessory to the alleged treasonable activities of his son, Henry Howard, Earl of Surrey. Surrey was executed and Norfolk condemned, but before the sentence could be carried out Henry VIII died (January 1547). Norfolk remained in prison during the reign of the Protestant king Edward VI (reigned 1547–53); in August 1553, following the accession of Queen Mary (reigned 1553–58), a Roman Catholic, he was released and restored to his dukedom. He died in 1554 after failing to suppress the uprising, led by Sir Thomas Wyat, protesting the marriage of Mary I to King Philip of Spain.

•**Norfolk, Thomas Howard, 4th Duke of,** Earl of Surrey, Earl Marshal (b. March 10, 1538, Kenninghall, Norfolk, Eng.—d. June 2, 1572, London), English nobleman executed for his intrigues against Queen Elizabeth I on behalf of Mary Stuart, Queen of Scots, a Roman Catholic claimant to the English throne.

He was the son of Henry Howard, Earl of Surrey, who was put to death for alleged treasonable activities in 1547. Restored to his father's title on the accession of Queen Mary Tudor in 1553, he succeeded his grandfather as Duke of Norfolk in 1554. Norfolk was in favour with both Queen Mary and her successor, Elizabeth I. He commanded the English forces that invaded Scotland in 1559–60, and he presided over the commission that inquired in 1568 into the quarrel between Mary Stuart and Scotland's Protestant nobility.

Mary had just fled to England, where she became Elizabeth's prisoner. Norfolk listened readily to suggestions from the Scottish statesman William Maitland and others that the difficulties between England and Scotland could be resolved if Norfolk would wed Mary and have her declared Elizabeth's successor. Norfolk, however, was neither bold enough to ask Elizabeth's consent for the match nor disloyal enough to raise an insurrection against her.

Thomas Howard, 4th Duke of Norfolk, detail of a portrait by Sir Anthony More; in a private collection

Courtauld Institute of Art, London

Instead, several Roman Catholic nobles in northern England revolted in an attempt to free the Queen of Scots, marry her to Norfolk, and restore Roman Catholicism to England. The uprising was suppressed, and in October 1569 Elizabeth had Norfolk arrested. He was released the following August, but he soon allowed himself to be drawn into the plot of Roberto Ridolfi, an Italian merchant living in London, for a Spanish invasion of England and installation of Mary on the English throne. Discovery of the plot led to Norfolk's imprisonment and execution.

Norfolk and Western Railway Company, major American railroad that dates back to an eight-mile single-track predecessor line opened in 1838 to connect Petersburg and City Point (now Hopewell), Va.

In 1870 the City Point Rail Road and others were consolidated as the Atlantic, Mississippi and Ohio Railroad. In 1881 the system was reorganized as the Norfolk and Western Railroad, and in 1896 it was incorporated under its current name.

Expansion took it to Chicago, St. Louis, Kansas City, Omaha, Detroit, and Montreal with lines running chiefly east and west to 16 states and two Canadian provinces. The rival Virginian Railroad was absorbed in 1959, and in 1964 it acquired three more lines, including the New York, Chicago and St. Louis Railroad Company (the Nickel Plate). It merged with Southern Railway Company in 1982, both railways becoming subsidiaries of the newly created holding company Norfolk Southern Corporation.

The main source of traffic results from carrying the immense coal output of the West Virginian coalfields. Other sources of freight revenue are grain, chemicals, and automobiles and automotive parts. The road held out against converting from steam to diesel power for a decade longer than other railroads, but it finally converted in 1960.

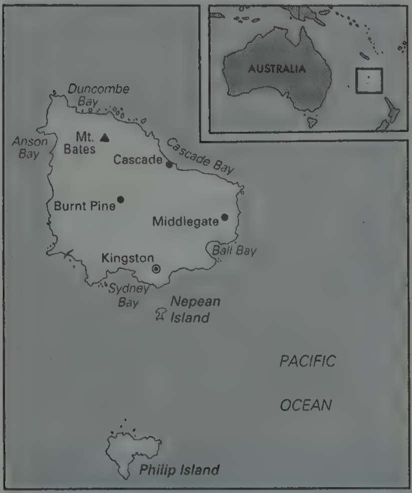
Norfolk four-course system, method of agricultural organization established in Norfolk county, England, and in several other counties before the end of the 17th century; it was characterized by an emphasis on fodder crops and by the absence of a fallow year, which had characterized earlier methods.

In the Norfolk four-course system, wheat was grown in the first year, turnips in the second, followed by barley, with clover and ryegrass undersown, in the third. The clover and ryegrass were grazed or cut for feed in the fourth year. The turnips were used for feeding cattle and sheep in the winter. This new system was cumulative in effect, for the fodder crops eaten by the livestock produced large supplies of previously scarce animal manure, which in turn was richer because the animals were better fed. When the sheep grazed the fields, their waste fertilized the soil, promoting heavier cereal yields in following years.

The system became fairly common on the newly enclosed farms by 1800, remaining almost standard practice on most British farms for the best part of the following century. During the first three quarters of the 19th century, it was adopted in much of continental Europe.

Norfolk Island, external territory of Australia, in the southwestern Pacific Ocean, 1,041 miles (1,676 km) northeast of Sydney. The island, with an area of 13 square miles (35 square km), is about 5 miles (8 km) long and 3 miles (5 km) wide. It is volcanic in origin, and its generally rugged terrain, with a mean elevation of 360 feet (110 m) above sea level, rises to Mount Bates (1,047 feet [319 m]) and Mount Pitt (1,043 feet [318 m]). Kingston, in the south, is the main settlement and administrative centre.

Physical and human geography. The island, composed of flows of basalt lava lying horizontally and overlaid in most places by lateritic soil, rises precipitously (with some cliffs reaching heights of more than 300 feet [90 m] above sea level) from an extensive submarine ridge. Kingston and the landing place at Cascade on the northern side of the island are among the few points where the coast is not bound by cliffs. The soil, although fertile, is easily eroded if stripped of its vegetation cover. Temperatures average 60° F (15° C), and rainfall exceeds 50 inches (1,300 mm) annually. Two smaller islands, Philip (a volcanic pinnacle rising to 900 feet [275 m]) and Nepean (a limestone formation), lie off the southern shore. Although much of the land has been cleared for cropping and pasture, the once-dominant Norfolk Island pines (species *Araucaria excelsa,* or *A. heterophylla*) remain a notable feature of the landscape. The island has a wide variety of flora; fauna includes geckos, bats, turtles, plentiful fishes, and numerous seabirds.



Norfolk Island

The island's population includes the descendants of mutineers from the HMS *Bounty* who were transferred from Pitcairn Island in 1856, as well as descendants of later settlers, mostly from Australia and New Zealand. About one-third of the present population may claim lineal descent from the Pitcairners. Strong Polynesian characteristics and residual traits and customs persist on the island, and a distinctive society has developed, based on neighbourliness, self-help, barter, and respect for authority. Immigration is now strictly controlled.

Since the mid-1960s the major economic activity of Norfolk Island has been tourism; many of the islanders are employed in the operation of hotels, duty-free stores, and other aspects of the industry. About 30,000 or more tourists (many of them from New Zealand) visit the island annually. Subsistence farming produces Kentia palm seed, cereals, fruits, and vegetables. Livestock grazing and fishing are also important locally. Foodstuffs are imported from Australia and New Zealand, mainly for the tourist trade; fuels and consumer goods are also imported. Seed of the Norfolk Island pine is exported, and there is a forestry program to increase the island's resource of pines. Budgetary revenue comes mostly from the sale of stamps and from customs duty and liquor sales (a government monopoly). The island has about 50 miles (80 km) of motor roads and an airport for passenger and air freight service with Australia and New Zealand.

The administrator of Norfolk Island is appointed by the governor-general of Australia. Under the Norfolk Island Act of 1979, the territory has an elected nine-member legislative assembly. An executive council is composed of the executive members of the legislative assembly who have ministerial-type responsibilities. The act continues Australia's responsibility for the island as a territory under its authority and provides that consideration will be given to an extension of the powers of the legislative assembly. The judiciary consists of the island's Supreme Court and a Court of Petty Sessions. Education is free and compulsory for children between 6 and 15 years of age. Teachers for the island's school are provided by the New South Wales Department of Education. There is a small hospital on Norfolk Island.

History. The English navigator Captain James Cook discovered the uninhabited island in 1774 and, impressed by the abundance of local flax (species *Phormium tenax*) and the potential of the indigenous pines to provide ships' masts, named the island for the Duke of Norfolk. It became the second British possession in the Pacific when it was claimed by the Australian colony of New South Wales in 1788 and settled by a small party, including 15 convicts. After 26 years as a British penal colony, with a maximum of 1,100 convicts and free settlers, the island was abandoned in 1814 and the population removed mostly to Van Diemen's Land (now Tasmania).

Ruined officers' quarters of the former penal settlement at Kingston on Norfolk Island

Photographic Library of Australia

Reestablished as a penitentiary (1825–55) for the reception of the most desperate criminals from the British convict settlements in Australia, Norfolk Island became notorious as a place of merciless discipline and punishment. The evacuation again of all convicts to Tasmania resulted as much from the difficulty of supervising administrators as from the difficulty of supervising the prisoners. In 1856 the population of Pitcairn Island, descendants of the mutineers from the HMS *Bounty*, was resettled on Norfolk. Not all of the islanders settled happily on Norfolk; two small parties returned to Pitcairn. Norfolk Island was originally made "a distinct and separate settlement" from the mainland colonies on June 24, 1856. Rapidly the islanders established their own systems of land tenure and society generally. In 1897 Britain conferred administrative status on the governor of New South Wales, though the island remained a separate British colony.

In 1913, under the Norfolk Island Act (effective 1914), the colony became a territory of the commonwealth, but the precise constitutional relationship with Australia was never the subject of complete agreement. An airfield constructed on the island during World War II gave Norfolk a link with the outside world. A royal commission in 1975 undertook clarification of the status of Norfolk Island, and the present administrative system was established in 1979. Pop. (1992 est.) 1,900.

Norfolk Island pine (species *Araucaria excelsa,* or *A. heterophylla*), evergreen timber and ornamental conifer of the family Araucariaceae, native to Norfolk Island, situated in the South Pacific Ocean between New Caledonia and New Zealand. In nature this pine grows to a height of 60 m (200 feet), with a trunk sometimes reaching 3 m (10 feet) in diameter.

Norfolk Island pine (*Araucaria excelsa*)

Robert C. Hermes from The National Audubon Society Collection/Photo Researchers

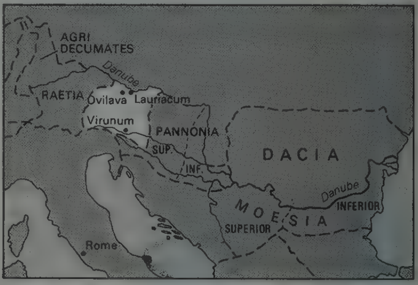
The wood of large trees is used in construction, furniture, and shipbuilding. The sapling stage is grown throughout the world as a houseplant and as an outdoor ornamental in regions with a Mediterranean climate.

Norge: *see* Norway.

nori (algae): *see* laver.

Noric Alps, German NORISCHE ALPEN, segment of the Eastern Alps extending across southern Austria between the Hohe Tauern range and Katschberg Pass (west) and the city of Graz on the Mur River (east). With the Drava River to the south and the upper Mur River to the north, the mountains rise to Eisenhut (8,008 feet [2,441 m]) and consist of several subranges, the highest of which are the Gurkthaler Alpen in the west. Summer resorts and some skiing centres are within the range.

Noricum, region of Europe north of what is now Italy, roughly comprising modern central Austria and parts of Bavaria, Ger. Noricum was originally a kingdom controlled by a Celtic confederacy that dominated an earlier Illyrian population. It reached its greatest extent during the early period: on the east it included Carnuntum (about 20 miles [32 km] east of Vindobona [now Vienna]), Savaria (Szombathely, Hung.), Poetovio (Ptuj, Slovenia), and Emona (Ljubljana, Slovenia), together with the portion of the tribe of the Taurisci that lived near the source of the Sava River. Noricum was annexed by Rome, apparently as a bloodless conquest, about 15 BC, and the new province was placed under an equestrian governor, first called a *praefectus* but from Claudius' time a *procurator.* As a Roman province its western boundary, against Raetia, was approximately the Inn River; in the south it met Italy at the summit of the Carnic Alps; and in the east, at least by Tiberius' time, the frontier with Pannonia was a line running south from a point west of Vindobona. Noricum received Roman protection in the late 2nd century BC and, with wealth derived from its mineral resources (iron and gold), was able to develop a markedly Romanized culture (evident from Latin legends on coins and other Latin inscriptions. Five of its communities were made into Roman *municipia* by the emperor Claudius (reigned AD 41–54), and the province supplied many soldiers for legions and the Praetorian Guard. Crude iron was exported to Italy, especially to Aquileia, and there were also steel manufactures in the province.



Noricum in the time of Augustus

Adapted from R. Treharne and H. Fullard (eds.), *Muir's Historical Atlas: Ancient, Medieval and Modern*, 9th ed. (1965); George Philip & Son Ltd., London

After the barbarian invasion of 167, the frontier was reorganized. Under the later empire Noricum suffered severely from raids by Alamanni and other tribes. Franks and Rugi settled Noricum before the end of the 5th century AD.

Noriega (Morena), Manuel (Antonio) (Feb. 11, 1938, Panama City, Pan.), Panamanian military leader, commander of the Panamanian Defense Forces (1983–89), who, for the years of his command, was the actual power behind the civilian president.

Noriega was born into a poor family of Colombian extraction. Educated at one of the top high schools in Panama, he took a scholarship to the Military School de Chorrios in Lima, Peru. Upon his return to Panama, he was commissioned a sublieutenant in the National Guard (Guardia Nacional) and stationed in Colón, where he became acquainted with Captain Omar Torrijos. Noriega was promoted to first lieutenant and was instrumental in the military coup that brought down the government of Arnulfo Arias and in a later coup attempt to unseat Torrijos. For his loyalty, Noriega was promoted to lieutenant colonel and was named chief of military intelligence, in which position he established contact with the U.S. intelligence service. His service to Richard Nixon's administration—helping, for example, to obtain the release of two American freighter crews from Havana, Cuba—was coloured by persistent reports of his involvement in drug trafficking. As the head of the Panamanian intelligence service, Noriega also was known for the tactics of intimidation and harassment that he used against opposition groups and their leaders; by the late 1970s he was considered to be the most feared man in Panama. When in 1981 Torrijos died in a plane crash, military and civilian leaders struggled to gain the upper hand. In 1983 Noriega succeeded to the command of the National Guard, unified the armed forces into the Panamanian Defense Forces, and promoted himself to the rank of general.

Charges against Noriega mounted in the mid-1980s over events connected with the blatant and brutal murder of Hugo Spadafora, a vocal opponent. Further evidence of the laundering of drug money and the sale of restricted American technology and information brought an inevitable conflict with the U.S. government to a head, particularly in light of the imminent transfer of power agreed upon in the Panama Canal Treaty. When in 1989 an attempted military coup against Noriega failed, the United States invaded Panama, chiefly for the purpose of capturing Noriega (which it succeeded in doing on Jan. 3, 1990) and bringing him to trial in the United States. In 1992, in a U.S. federal court, he was convicted of cocaine trafficking, racketeering, and money laundering.

Norilsk, city, Krasnoyarsk *kray* (region), central Russia, in the Rybnaya Valley amid the Putoran Mountains. Founded in 1935, Norilsk lies north of the Arctic Circle and is one of the world's leading producing centres for nickel and platinum. Copper is also mined. Power is supplied to Norilsk by hydroelectric plants on the Khantayka and Kureyka rivers, and natural gas is piped from northern Tyumen *oblast* (province). A railway links Norilsk to the port of Dudinka, situated on the Yenisey River. Pop. (1991 est.) 169,000.

norito, in the Shintō religious practices of Japan, words, or prayer, addressed by worshipers to a deity. The efficacy of prayer is founded on the concept of *koto-dama,* the spiritual power that resides in words. According to ancient belief, beautiful, correct words bring about good, whereas ugly, coarse language can cause evil. Accordingly, *norito* are expressed in elegant, classical language, typified by that found in the *Engi-shiki* ("Institutes of the Engi Period"), a 50-volume work compiled in the 10th century. Prayers usually include words of praise for the deities, lists of offerings, and petitions. During the period when State Shintō was under the control of political authorities, the wording of prayers recited at public shrines was determined by the government. At present, the chief priest of a shrine pronounces the *norito* on behalf of the worshipers, and the contents and wordings of the prayer may vary.

norm, also called SOCIAL NORM, rule or standard of behaviour shared by members of a social group. Norms may be internalized—*i.e.,* incorporated within the individual so that there is conformity without external rewards or punishments, or they may be enforced by positive or negative sanctions from without. The social unit sharing particular norms may be small (*e.g.,* a clique of friends) or may include all adult members of a society. Norms are more specific than values or ideals: honesty is a general value, but the rules defining what is honest behaviour in a particular situation are norms.

There are two schools of thought regarding why people conform to norms. The functionalist school of sociology maintains that norms reflect a consensus, a common value system developed through socialization, the process by which an individual learns the culture of his group. Norms contribute to the functioning of the social system and are said to develop to meet certain assumed "needs" of the system. The conflict school holds that norms are a mechanism for dealing with recurring social problems. The Marxian variety of conflict theory states that norms reflect the power of one section of a society over the other sections and that coercion and sanctions maintain these rules. Norms are thought to originate as a means by which one class or caste dominates or exploits others. Neither school adequately explains differences between and within societies.

Norm is also used to mean a statistically determined standard or the average behaviour, attitude, or opinion of a social group. In this sense it means actual, rather than expected, behaviour.

Normal, town, McLean county, central Illinois, U.S. It adjoins Bloomington (south) and was called North Bloomington until 1857, when the Illinois State Normal (now Illinois State) University was established. The town grew up around the school. Normal is in one of the world's richest corn- (maize-) producing areas, and, in addition to the university, agriculture is an economic factor. There is some manufacturing, notably of tires. Normal is the site of the Illinois Soldier's and Sailor's Children's School (1869). Inc. 1865. Pop. (1990) town, 40,023; Bloomington-Normal MSA, 129,180.

normal distribution, also called GAUSSIAN DISTRIBUTION, the distribution function that is the indefinite integral of the normal density function, the graph of which is the typical bell-shaped normal curve. The specific form of the normal density function is a constant, k, times the exponential of the negative quadratic $-(x - x_0)^2/2\sigma^2$. The quantity x_0 is the mean, or average, of the distribution and also corresponds to the point at which the distribution function is a maximum. The quantity sigma (σ) is the standard deviation and characterizes the width of the distribution; the probability is about 68 percent that a given value will be found within the interval $x_0 - \sigma$ to $x_0 + \sigma$. The constant, $k = 1/\sigma\sqrt{2\pi}$, is called the normalizing coefficient and has the effect that the sum or integral of the distribution over all possible values of x will give a total probability of unity.

normal school, also called TEACHERS' COLLEGE, or TEACHER-TRAINING COLLEGE, institution for the training of teachers. One of the first schools so named, the École Normale Supérieure ("Normal Superior School"), which was established in Paris in 1794, was intended to serve as a model for other teacher-training schools; that institution later became affiliated with the University of Paris. The first public normal school in the United States was founded in Lexington, Mass., in 1839.

Normal schools were established chiefly to train elementary-school teachers. They were commonly state-supported and offered a two-year course beyond the secondary level. In the 20th century the tendency has been to extend teacher-training requirements to at least four years and, especially after World War II, for the schools to broaden their programs. Thus, by the 1960s most former normal schools had been absorbed into colleges or universities as departments or schools of education.

This assimilation of the normal school parallels the halting elevation of teaching to the status of a profession over the last 150 years. The normal school represented a forward step over the practice of assigning teaching responsibilities to the most deserving eighth-grade graduate in the early 1800s. In the 20th century, licensing requirements have stiffened considerably in public education, and salary increases and advancement often depend on the earning of advanced degrees.

Norman, member of those Vikings, or Norsemen, who settled in northern France (or the Frankish kingdom), together with their descendants. The Normans founded the duchy of Normandy and sent out expeditions of conquest and colonization to southern Italy and Sicily and to England, Wales, Scotland, and Ireland.

The Normans (from *Nortmanni:* "Northmen") were originally pagan barbarian pirates from Denmark, Norway, and Iceland who began to make destructive plundering raids on European coastal settlements in the 8th century. During the later 9th century their raids on the northern and western coastlands of France grew in scale and frequency, and the Vikings had secured a permanent foothold on Frankish soil in the valley of the lower Seine River by about 900. A Viking named Rollo, who had already won a reputation as a great leader of Viking raiders in Scotland and Ireland, soon emerged as the outstanding personality among the new settlers. In 911 the Frankish king Charles III the Simple made the Treaty of St. Clair-sur-Epte with Rollo, ceding him the land around the mouth of the Seine and what is now the city of Rouen. Within a generation the Vikings, or Normans, as they came to be known, had extended their rule westward to the districts of Lower Normandy. From then on until the mid-11th century, the history of the Normans in Normandy (*q.v.*) was marked by a line of ruthless and forceful rulers calling themselves counts, or dukes, of Normandy and struggling to establish political hegemony over the indigenous Frankish population of the region.

Despite their eventual conversion to Christianity, their adoption of the French language, and their abandonment of sea-roving for Frankish cavalry warfare in the decades following their settlement in Normandy, the Normans retained many of the traits of their piratical Viking ancestors. They displayed an extreme restlessness and recklessness, a love of fighting accompanied by almost foolhardy courage, and a craftiness and cunning that went hand in hand with outrageous treachery. In their expansion into other parts of Europe, the Normans compiled a record of astonishingly daring exploits in which often a mere handful of men would vanquish an enemy many times as numerous. An unequaled capacity for rapid movement across land and sea, the use of brutal violence, a precocious sense of the use and value of money—all these traits characterized the Normans.

From their settlements in Normandy the adventurous Normans embarked on several major expansionary campaigns in Europe. The most important of these was the invasion of England in 1066 by William, duke of Normandy, who became king of England upon the success of what is now known as the Norman Conquest (*q.v.*). Early in the 11th century, Norman adventurers also began a somewhat more prolonged and haphazard migration to southern Italy and Sicily, where they served the local nobility as mercenaries fighting the Arabs and the Byzantines. As more Normans arrived they carved out small principalities for themselves from their former employers. Among the most remarkable of these Norman adventurers were the sons of Tancred de Hauteville, who established their rule over the southern Italian regions of Calabria and Puglia (Apulia) in the 1050s and over Sicily in the following decades. Their possessions were amalgamated by Roger II, a grandson of Tancred, in the early 12th century as the kingdom of Sicily, whose rulers retained a basically Norman character until the last decades of that century.

Among the Norman traits regarded by their contemporaries as specially characteristic were their utterly unbridled character and their capacity for quick and fruitful imitation and adaptation. The former characteristic contributed to the production, by a process akin to natural selection, of lines of outstandingly able and ruthless rulers wherever a Norman state came into being. Many of the early Norman rulers of Normandy, England, and Sicily were among the most powerful and successful secular potentates of their age in western Europe in their ability to create political institutions that were both stable and enduring.

The Normans' capacity for imitation and adaptation was even more significant for the history of Europe. The Normans began as pagan destroyers bent upon plundering and slaughter. Forced to come to terms with the Carolingian and Capetian dynasties and to adopt French as their language and Christianity as their religion, they quickly became missionaries and proselytizers of the civilization that they had attacked and that had ultimately absorbed them. They quickly grasped the principles of Carolingian feudalism, and Normandy became in the 11th century one of the most highly feudalized states in western Europe.

The art of building castles was not a Norman invention, but the Normans became masters in the use of the simple yet enormously effective motte-and-bailey castle—a mound (motte) topped by a timber palisade and tower, surrounded by a ditched and palisaded enclosure (bailey). These little fortifications, which were complementary to the warfare conducted in open country by small units of cavalry, became the hallmark of Norman penetration and conquest. Again, although the Normans were at first novices and imitators in the practice of fighting on horseback, they soon became masters of cavalry warfare as it was then practiced in continental Europe. Mounted on much the same breed of war horse as his Frankish, Angevin, or Breton opponent, wearing the heavy mail hauberk that was standard among the warriors of northwestern Europe, protected by a conical helmet and a kite-shaped shield, and armed with a long, broad-bladed sword and a slender lance, the Norman cavalryman proved on countless occasions that he could outfight and overwhelm the most powerful forces brought against him. To some extent, no doubt, this was due to the importance which the Norman knightly class attached to the training of young warriors. They eagerly adopted the carefully fostered cult of knighthood which had grown up in the old Carolingian empire in the 10th and 11th centuries. But Norman knights were also fierce and brutal soldiers who had received an arduous training that left little room for the feelings of humanity and mercy with which Christian teaching was later to endow the concept of chivalry.

Just as the Normans became the typical exponents of Carolingian feudalism and of cavalry and castle warfare, so they also became in part the exponents and champions of religious orthodoxy. Under the patronage of the ducal house of Normandy, religious life in the province flourished, and a number of Norman monasteries became renowned centres of Benedictine life and learning. This was chiefly due to the encouragement given to non-Norman scholars and reformers to make their home in Normandy. The great religious and ecclesiastical revival that marks 11th-century Normandy found another expression in the popularity among the Normans of pilgrimages to Rome and to the Holy Land. This yearning for pilgrimages was one of the factors responsible for the Norman conquest of southern Italy. Many Norman nobles journeyed to the Mediterranean inspired by a naive mixture of religious devotion, a love of adventure, and a desire for fresh conquests. Surprisingly, though, the part played by the Normans in the early Crusades was relatively slight, consisting chiefly of the erection of the short-lived principality of Antioch by Norman nobles in the 12th century.

The Normans were quick to imitate whatever they saw, and this faculty of imitation is evident in all the different countries where the Normans settled. But Norman imitation was never slavish, and is certainly not the whole story of Norman achievement. A truer explanation of Norman success would be that they combined a boundless self-confidence with a marked capacity for adapting to their own purposes the institutions they found in newly won territories. Thus, in Puglia and Sicily their control was based on faith in their own military superiority, their strategic use of castles and harbours, and their importation of feudalism to govern the relations of the count or king with his more important subjects. In government, however, they adopted the highly advanced and largely literate techniques already developed by the Byzantine Greeks and the Muslims.

In England the Normans similarly brought their own brand of feudalism and their own ideas of strong personal government and fiscal institutions. But there too they adopted many of the existing institutions and customs. Even at the end of Henry I's reign (1135) in England the whole structure of royal government remained fundamentally Anglo-Saxon—monarchy, king's council, royal seal and writing office, the shire system and the sheriffs, the twofold revenue system consisting of the produce of royal estates compounded into annual cash payments and a direct tax levied on the landowning class, all originated before the Norman Conquest. But under Norman direction, and with a number of Norman innovations such as the exchequer, the itinerant justices, and the sworn inquest, this system worked much more efficiently after 1066 than before, and, a fact of equal importance, England was made safe from foreign invasion. Norman influence on the church in England also worked powerfully in the direction of better organization and discipline. The role of the Normans in Europe in the 11th and 12th centuries may be summarized in saying that by their fierce energy and enterprise, they extended the practice of centralized authoritarian rule, feudalism, cavalry warfare, and religious reform.

Norman, city, seat (1907) of Cleveland county, central Oklahoma, U.S. The city is located on the South Canadian River, immediately southeast of Oklahoma City. Beginning as a tent city in April 1889 when Oklahoma was opened to white settlement, it was named for Abner Norman, a Santa Fe Railway engineer. Its development was assured when the University of Oklahoma was established there in 1892 on land donated by its citizens. A marketing and distribution point for an extensive agricultural area, the city also has some light industry; there are oil and gas wells in the vicinity. The Central Oklahoma Mental Health Institute and the nearby Tinker Air Force Base are additional economic assets. Inc. 1891. Pop. (1990) 80,071.

The Bizzell Memorial Library, University of Oklahoma, Norman

Bob Taylor—EB Inc.

Norman, Jessye (b. Sept. 15, 1945, Augusta, Ga., U.S.), American operatic and concert singer.

Having sung informally since childhood, Norman won a scholarship to Howard University (Washington, D.C.) to study voice. She graduated in 1967 and received further musical training at the University of Michigan. After winning the Bavarian Radio Corp. International Music Competition in 1968, Norman made her operatic debut as Elisabeth in Wagner's *Tannhaüser* in 1969 in Berlin. The beauty, range, and flexibility of Norman's vibrant soprano voice assured her further operatic engagements, the most notable being the title role in *Aïda* in productions in Berlin and at La Scala in Milan and the role of Cassandra in Berlioz' *Les Troyens* (*The Trojans;* Covent Garden, 1972). Besides her operatic performances, she toured throughout the 1970s, giving recitals of works by Wagner, Schubert, Mahler, and other composers at music festivals and in concerts with major orchestras. Norman gradually achieved increased control over her voice, and by the mid-1980s she was one of the most popular and highly regarded dramatic soprano singers in the world.

Norman Conquest, the military conquest of England by William, duke of Normandy, primarily effected by his decisive victory at the Battle of Hastings (Oct. 14, 1066), and resulting ultimately in profound political, administrative, and social changes in the British Isles.

Edward the Confessor, last king of the Old English royal line, had almost certainly in 1051 designated William as his successor. Although on Edward's death (Jan. 5, 1066) Harold, the powerful earl of Wessex, had himself crowned king, his position was far from secure. On the Continent the political situation favoured William's enterprise; and by August 1066 he had assembled a force of about 5,000 knights ready for embarkation.

Harold had kept his militia on guard throughout the summer; in early September, with supplies exhausted, it was dismissed. Harold had then to hasten to Yorkshire, where at Stamford Bridge (September 25) he defeated an invading army led by Harold III Sigurdsson, king of Norway.

The northerly wind, which for eight weeks had penned William's transports in harbour, changed on September 27. William crossed the Channel immediately, landing in Pevensey Bay on September 28 and moving directly to Hastings. Harold made a forced march southward and by October 13 was approaching Hastings with about 7,000 men, many poorly armed and untrained. He was almost certainly unwise in thus forcing an early engagement. Surprised by William at dawn on October 14, he drew up his army on a ridge 10 miles (16 km) northwest of Hastings. Throughout the day William attacked with cavalry charges interspersed with flights of arrows. The English were gradually worn down; late in the afternoon Harold was killed by a chance arrow, and by nightfall the remaining English had scattered and fled.

William then made a sweeping advance to isolate London, and at Berkhamstead the major English leaders submitted to him. He was crowned in Westminster Abbey on Christmas Day 1066. Sporadic native revolts continued until 1071. The most serious, in Northumbria (1069–70), William suppressed in person, proceeding thereafter to devastate vast tracts of the North. The subjection of the country was completed by the rapid building of a great number of castles.

The extent and desirability of the changes brought about by the Conquest have long been disputed among historians. Certainly in political terms William's victory destroyed England's links with Scandinavia, bringing the country instead into close contact with western Europe. Inside England the most radical change was the introduction of military feudalism. While tenure of land in return for services had existed before the Conquest, William's establishment of a system that would provide him with upward of 4,000 knights for his feudal host revolutionized the upper ranks of society. England was parceled out among about 180 Norman tenants in chief and innumerable mesne tenants, all holding their fiefs by knight service. The resultant almost total replacement of an English with a Norman aristocracy was paralleled by a similar change of personnel among the upper clergy and administrative officers.

Anglo-Saxon England had developed a highly organized central and local government and an effective judicial system. All these were retained and utilized by William, whose coronation oath showed his intention of continuing in the English royal tradition. The old administrative divisions were not superseded by the new fiefs; nor did feudal justice normally usurp the customary jurisdiction of shire and hundred courts. In them, and in the king's court, the common law of England continued to be administered. Innovations included the new but restricted body of "forest law" and the introduction in criminal cases of the Norman trial by combat alongside the old Saxon ordeals. Increasing use was made of the inquest procedure—the sworn testimony of neighbours, both for administrative purposes and in judicial cases. A major change was William's removal of ecclesiastical cases from the secular courts, which allowed the subsequent introduction into England of the then rapidly growing canon law.

Apart from the tragedy of the dispossessed Old English aristocracy, probably the most regrettable effect of the Conquest was the total eclipse of the English vernacular as the language of literature, law, and administration. Superseded in official documents and other records by Latin and then increasingly in all areas by Norman-French, written English hardly reappeared until the 13th century.

Consult the INDEX *first*

Norman River, river rising in the Gregory Range of the Eastern Highlands of Queensland, Australia, and flowing for 260 miles (420 km) northwest through level country to the Gulf of Carpentaria at Karumba, a centre for the prawning industry. For long stretches the river flows through tropical forests with many cattle stations. About 55 miles (88 km) from its mouth is the township of Norman, which can be reached by small ships. The Norman is fed by the Carron, Yappar, and Clara rivers and may be perennial only in its lowest reaches.

Norman style, Romanesque architecture that developed in Normandy and England between the 11th and 12th century and during the general adoption of Gothic architecture in both countries. Because only shortly before the Norman Conquest of England (1066) did Normandy become settled and sophisticated enough to produce an architecture, the Norman style developed almost simultaneously in the two countries; early buildings, erected soon after the Conquest, are extremely similar. Eventually, however, the styles of the two countries diverged, and the architecture of Normandy drew closer in form to typical French Romanesque, whereas that of England (called Anglo-Norman architecture) became a much more distinctive national tradition.

The common early Norman style followed the general Romanesque features of massive construction based on the rounded arch and on additive spatial compartmentalization; the building type was a Romanesque elaboration of the Early Christian basilica plan (longitudinal with side aisles and an apse, or semicircular projection of the eastern, or sanctuary, end of the centre aisle)—a raised nave (centre aisle) with windows piercing the upper walls (clerestory), a tripartite interior articulation of the nave into a lower arcade (separating nave from side aisles), a triforium arcade (separating the upper nave from galleries above the side aisles), and the clerestory, transepts (forming a transverse aisle crossing the nave in front of the sanctuary), and a western facade completed by two towers. The definitive example of the early Norman style is the Church of Saint-Étienne at Caen (begun in 1067), which provided a close model for the later English cathedrals of Ely (*c.* 1090), Norwich (*c.* 1096), and Peterborough (*c.* 1118), all of which, however, show the peculiarly English characteristic of increased scale. Later Norman architecture in Normandy was characterized by careful structural articulation and elaboration of tower and spire.

Nave of Saint-Étienne, Caen, Fr., Norman style, begun 1067

Jean Roubier

Later Anglo-Norman architecture, though basically an extension of the earlier Norman style, was also affected by influences from other areas and by an increasingly distinct indigenous approach to construction. The chief characteristics of this English architecture are enormously long church plans, massive, dignified appearance (particularly in the frequent use of great round columns sometimes as wide as the spaces between them in the lower nave arcade), and a relative indifference to structural logic. This indifference was expressed in a wide variation of nonessential structural detail (as in the varying proportions of the three stories of the nave and the occasional addition of a fourth story) and in a tendency to encrust masonry surfaces with shallow geometric and interlaced ornamentation that obscured rather than elucidated basic structure.

With the exception of smaller parish churches, which preserved the Saxon decorative tradition, figural sculpture was rare. Most Anglo-Norman churches had timber roofs instead of the usual Romanesque rounded stone vaults; the notable exception is Durham Cathedral, the nave and choir of which (*c.* 1104) are supported by the first known examples of pointed ribbed vaults (which cross at the top and carry the weight of the building to a skeletal structure of vertical shafts), anticipating by nearly a century the general adoption of what was to become the characteristic feature of Gothic construction. A squared-off eastern end instead of a rounded apse is standard in English Gothic architecture. In addition to the cathedrals of Ely, Norwich, Peterborough, and Durham, the major churches begun in the Anglo-Norman style are Canterbury (*c.* 1070), Lincoln (*c.* 1072), Rochester (*c.* 1077), St. Albans (*c.* 1077), Winchester (*c.* 1079), Gloucester (*c.* 1089), and Hereford (*c.* 1107) cathedrals, Southwell Minster (11th century), and the abbey church at Tewkesbury (*c.* 1088). Less closely related to the main Anglo-Norman tradition but important in their own right are the many Cistercian abbeys built during the Romanesque period in England—among them, Rievaulx (*c.* 1132), Fountains Abbey (*c.* 1135), Kirkstall (*c.* 1152), Buildwas (*c.* 1155), Byland Abbey (*c.* 1175), and Furness (*c.* 1175).

Normanby Island, one of the D'Entrecasteaux Islands, 10 miles (16 km) across Goschen Strait from the eastern tip of Papua New Guinea, in the Solomon Sea, southwestern Pacific Ocean. Normanby Island lies southwest across Dawson Strait from Fergusson Island. Volcanic Normanby, measuring 45 miles (72 km) by 12–15 miles (19–24 km), has a total land area of 400 square miles (1,000 square km) and rises to 3,600 feet (1,100 m) in the Prevost Range. Sewa Bay deeply creases the west coast and Sewataitai Bay the east. The island was visited in 1873 by British Captain John Moresby, who named it after the Marquess of Normanby, governor of Queensland (1871–74) in Australia. It may have been a secret British military base during World War II. Having once produced gold, Normanby now exports copra and some timber.

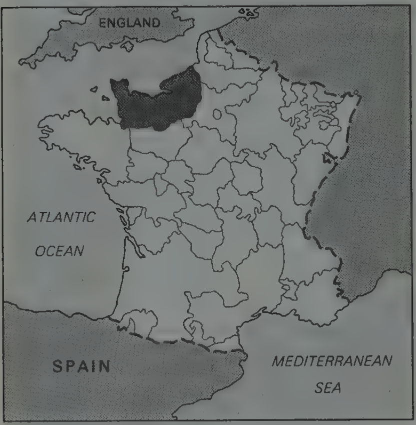
Midway between Normanby and Fergusson Island to the north is Dobu Island, whose inhabitants have been the subject of several anthropological studies. Pop. (1980 prelim.) Normanby and Dobu, 12,817.

Normandes, Îles: *see* Channel Islands.

Normandie, Louis-Charles, duc de (duke of): *see* Louis XVII *under* Louis (France).

Normandy, French NORMANDIE, historic and cultural region encompassing the northern French *départements* of Manche, Calvados, Orne, Eure, and Seine-Maritime and coextensive with the former province of Normandy.

Ancient history. The Seine and Eure valleys were inhabited from paleolithic times. Their Celtic inhabitants were conquered by Julius Caesar in 56 BC, and the region eventually became the Roman province of Gallia Lugdunensis Secunda. Its inhabitants were Christianized in the 3rd and 4th centuries AD and passed under Merovingian Frankish rule in the late 5th century, becoming part of the Frankish kingdom of Neustria.



The *gouvernement* of Normandy in 1789

The Normandy coast was repeatedly devastated by raids of the Vikings, or Northmen, from the 8th century on, and as its Carolingian rulers became weaker, the Vikings penetrated farther inland in the course of their depredations. Finally the French king Charles III the Simple ceded the territory around Rouen and the mouth of the Seine River to Rollo, the chief of the largest band of Vikings, in the Treaty of St. Clair-sur-Epte (911). Rollo's Scandinavian countrymen immigrated in large numbers to settle the country, and they adopted the French language, customs, and religion. These Vikings became known as Normans, and the region they settled became known as Normandy. Rollo's Christianized successors to the dukedom of Normandy acquired neighboring territories in a series of wars, becoming so powerful that the control they exercised over their domains was practically independent of the French crown. William, duke of Normandy and a distant successor to Rollo, mounted an invasion of England in 1066, becoming William I of England (William the Conqueror) and thus uniting the rule of England and Normandy in himself. When William died in 1087, the personal union of Normandy and England was broken as his sons disputed the succession. Their fraternal quarrels ended in 1106, when one son, Henry I, king of England, defeated his brother, Robert, duke of Normandy, in the Battle of Tinchebrai, after which the succession in Normandy temporarily passed to the English kings. However, in 1144 Geoffrey Plantagenet, count of Anjou, conquered Normandy. In 1150 he ceded the duchy to his son Henry, who later became king of England as Henry II in 1154.

In this way Normandy became part of the so-called Angevin (from Anjou) empire, which was a series of far-flung territories ruled by Henry II and succeeding English kings. But Normandy thus also became a primary objective for the Capetian kings of France in their struggle against the Plantagenet Angevins of England. The military and diplomatic struggles of the French Capetian monarchs Louis VII and Philip II Augustus to gain control of the region from its English Angevin rulers culminated in the complete conquest and annexation of Normandy by Philip in 1204. However, it was only with the Treaty of Paris (1259) that the English crown in the person of Henry III formally surrendered its claim to Normandy, thus acknowledging the loss of the duchy to France. The English subsequently reconquered Normandy in the early 15th century during the Hundred Years' War, but the French again recovered it, achieving permanent control in 1450 after their victory in the Battle of Formigny.

The French province. Louis XI of France gave the duchy of Normandy to his brother Charles in 1465 but soon took it back and finally persuaded the French estates-general at Tours in 1468 to declare Normandy inalienable from the French crown. Thereafter Normandy was governed as a province.

Louis XIV's intendants worked to assimilate Normandy's institutions to those of France and to promote its commerce and its maritime activity. The revocation of the Edict of Nantes (1685) led to a mass emigration of Huguenots, who had contributed greatly both to the economy and to the navy, but even so Normandy soon recovered its prosperity in the 18th century. In 1791 the French Revolutionary government divided the old province of Normandy into the *départements* of Manche, Calvados, Orne, Eure, and Seine-Inférieure (now Seine-Maritime). The name Normandy occurs in the history of World War II as the site of the Allied invasion of German-occupied France in June of 1944.

Normandy is a region of flat grasslands and farmlands interrupted by gentle hills and the hedges that commonly serve to demarcate fields. The principal economic activities are farming, cattle raising, fishing, and tourism. The historic capital of Rouen produces textiles, while the ports of Cherbourg and Le Havre are shipbuilding and trading centres supplemented by textile and oil-refining industries. Much of the rural populace of the plains of eastern Normandy tends to be concentrated in large villages. Farms are ordinarily small, though emigration from the countryside has increased the consolidation of farmland.

Roman Catholicism predominates, though there were many converts to Protestantism after 1528. Protestant enclaves remain in Rouen, Caen, and the village of Luneray in Seine-Maritime. The influence of the Roman Catholic Church is still highly visible in the traditional life of the region, particularly in the activities of the brotherhoods of charity sponsored by many country churches. Normandy has many historic fairs and festivals, including an international festival of music and folklore in the town of Gisors in early July.

The names of Norman places and families show Nordic, Anglo-Saxon, and Frankish influences. The Norman patois, which incorporates a number of English expressions and words of Nordic derivation, is in decline.

Norman cuisine relies heavily on cream, which is served with eggs, fish, poultry, and vegetables. Calvados produces superlative apple cider, which is aged with nuts in small oaken barrels or distilled into the celebrated apple brandy that bears its name.

Normandy, HOUSE OF, English royal dynasty that provided three kings of England: William I the Conqueror (reigned 1066–87) and his sons, William II Rufus (reigned 1087–1100) and Henry I Beauclerc (reigned 1100–35). During their reigns and the reigns of their immediate successors, England bore the aspect of a conquered country, administered largely by men whose political conceptions were French, under kings whose personal interests were centred in France.

William, the only (and bastard) son of Robert I the Devil, duke of Normandy, succeeded to the dukedom in 1035 and sometime later, perhaps in 1051, received from his English kinsman, King Edward the Confessor, a promise of the English succession. Two years later he strengthened the claims that he had thus established by marrying Matilda of Flanders, who traced her descent in the female line from King Alfred the Great. About 1064, another possible claimant, Harold, visited the Norman court and added another link to William's connection by promising to support William's claims upon the English succession. However, upon the Confessor's death in 1066, Harold secured his own coronation. William mounted an invasion force, delivered a crushing defeat on Harold at the Battle of Hastings (October 14), and on Christmas Day was crowned at Westminster.

The succession proceeded in order to William's two sons, but, after Henry I's only son, William the Aetheling, was drowned in the White Ship (1120), Henry declared his daughter, the empress Matilda, to be his heir. At his death in 1135, however, Stephen of Blois, grandson of William I through his daughter Adela, claimed the throne. Stephen's reign (constituting that of the English royal House of Blois) was occupied by his wars with the supporters of Matilda. Finally, by the Treaty of Wallingford (1153), Stephen was allowed to retain his kingship for life, but the succession was designated for Matilda's son, Henry of Anjou, who in 1154 became Henry II, first of the House of Plantagenet, or Anjou.

Normandy Invasion, also called OPERATION OVERLORD, the Allied invasion of northern Europe that began on June 6, 1944.

As the tide of battle in World War II began to turn in favour of the Allies, the U.S. Gen. Dwight D. Eisenhower had the task of forming the largest invasion fleet in history in order to effect an amphibious landing on the northern coast of France. If successful, the landing would be the starting point for a massive Allied thrust eastward through France and on into the heart of Nazi Germany. While the invasion plans were being formed by American and British commanders in England, Field Marshal Erwin Rommel, the German commander charged with resisting the expected invasion, was strengthening the German defensive fortifications on the coastline of France by the construction of underwater obstacles, bombproof bunkers. and minefields.

The invasion of northern France from England was launched not in May, as its planners had initially prescribed, but on June 6, the famous "D-Day" of World War II. A huge armada had been assembled, including 1,200 fighting ships, 10,000 planes, 4,126 landing craft, 804 transport ships, and hundreds of amphibious and other special purpose tanks; 156,000 troops (73,000 U.S. and 83,000 British or Canadian) were landed in Normandy, 132,500 of them seaborne across the Channel, 23,500 airborne. The beaches chosen for the landings stretched from the estuary of the Orne to the southeastern edge of the Cotentin Peninsula, the British, with the Canadians, taking the eastern beaches, the Americans the western. The ground forces for the initial assault, under British Gen. Sir Bernard Montgomery's direction, comprised: (1) the Canadian 1st Army under Lieut. Gen. H.D.G. Crerar, the British 2nd Army under Lieut. Gen. Sir Miles Dempsey, and the British 1st and 6th Airborne divisions; and (2) the U.S. 1st Army and the U.S. 82nd and 101st Airborne divisions under Lieut. Gen. Omar N. Bradley.

Delayed 24 hours by the worst Channel weather in 25 years, the invasion began before dawn on June 6 with units of the U.S. 82nd and 101st Airborne divisions making night landings near the town of Saint-Mère-Église, while British commando units captured key bridges and knocked out Nazi communications. In the morning, the assault troops of the combined Allied armies landed at five beaches along the Normandy coast code-named Utah, Omaha, Gold, Juno, and Sword. While four beaches were taken easily and quickly, the forces landing at "Bloody Omaha" encountered stiff German resistance. By nightfall, sizable beachheads had been secured on all five landing areas, and the final campaign to defeat Germany was under way.

The Allies' supremacy in the air was pivotal.

Their air forces destroyed most of the bridges over the Seine to the east and the Loire to the south, thus preventing the Germans from quickly reinforcing their beleaguered forward units at the beachheads.

In the original plan, the British forces were to take Caen on the first day of the landing. The coastal defenses were overcome by 9 AM, but the advance inland to Caen did not start until afternoon, partly because of a paralyzing traffic jam on the beaches and partly because of the excessive caution of the commanders on the spot. When they eventually pushed on toward Caen, a Panzer division—the only one in the invasion area—arrived and checked their progress. A second Panzer division came up next day. More than a month of heavy fighting passed before Caen was at last secured and cleared on July 9. In the western sector, meanwhile, the Americans faced serious resistance in the Cotentin but finally took the crucial port of Cherbourg on June 26.

The Germans' main handicap was that they had 3,000 mi of western European coastline to cover, and half of The Netherlands to the Italian mountain frontier. Their 59 divisions in Western Europe were of a static type and were anchored to sectors of that long coastline. But the other half were field divisions, and of these the ten Panzer divisions were highly mobile. Thus the Germans had the possibility of concentrating overwhelming superiority to throw the invaders back into the sea before they became established. However, any such strong and prompt counterstroke was frustrated by discord in the German high command, both about the probable site of the invasion and about the best method of meeting it. Before the event, Hitler's intuition proved better than his generals' calculation in gauging where the Allies would land. After the landing, his continual interference and rigid control deprived his generals of the chance of retrieving the situation and eventually enabled the Allied forces to break out of their initially confined position and begin their rapid sweep across France.

normative ethics, that part of moral philosophy, or ethics, concerned with criteria of what is morally right and wrong. It includes the formulation of moral rules that have direct implications for what human actions, institutions, and ways of life should be like.

The central question of normative ethics is determining how basic moral standards are arrived at and justified. The answers to this question fall into two broad categories—deontological and teleological. The principal difference between them is that deontological theories do not appeal to value considerations in establishing ethical standards, while teleological theories do. Deontological theories use the concept of their inherent rightness in establishing such standards, while teleological theories consider the goodness or value brought into being by actions as the principal criterion of their ethical value. In other words, a deontological approach calls for doing certain things on principle or because they are inherently right, whereas a teleological approach advocates that certain kinds of actions are right because of the goodness of their consequences. Deontological theories thus stress the concepts of obligation, ought, duty, and right and wrong, while teleological theories lay stress on the good, the valuable, and the desirable. Deontological theories set forth formal or relational criteria such as equality or impartiality; teleological theories, by contrast, provide material or substantive criteria, as, for example, happiness or pleasure.

The application of normative theories and standards to practical moral problems is the concern of applied ethics. This subdiscipline of ethics deals with many major issues of the contemporary scene, including human rights, social equality, and the moral implications of scientific research, particularly in the area of genetic engineering.

Norn, in Germanic mythology, any of a group of supernatural beings who corresponded to the Greek Moirai; they were usually represented as three maidens who spun or wove the fate of men. Some sources name them Urd, Verdandi, and Skuld, perhaps meaning "past," "present," and "future." They were depicted as living by Yggdrasill, the world tree, under Urd's well and were linked with both good and evil. Being frequently attendant at births, they were sometimes associated with midwifery. The name Norn appears only in Scandinavian sources, but the cult of Nornlike beings occurs in several European folklores. In Norse literature the Norns are sometimes called *dísir.*

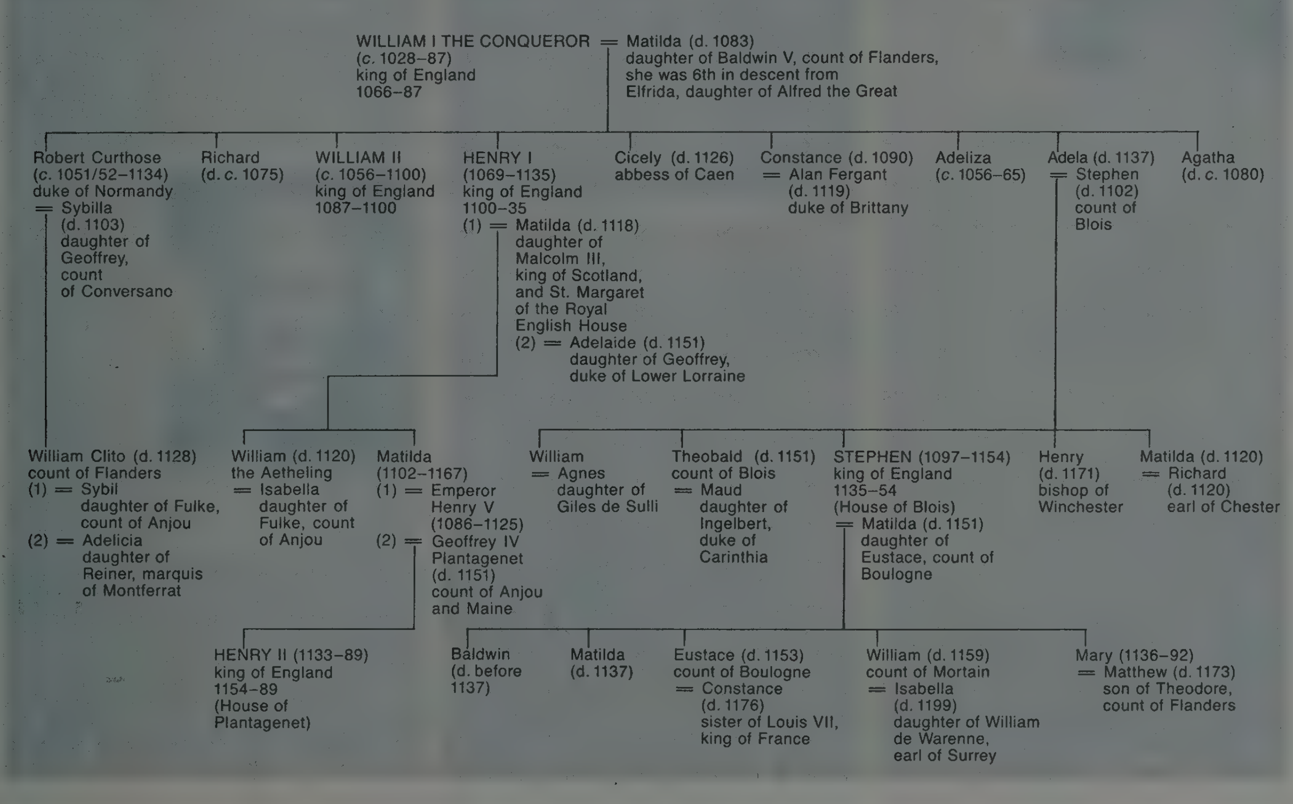
Norodom, also spelled NAROTTAMA, original name VODY (b.1834, Cambodia—d. April 24, 1904, Phnom Penh), king of Cambodia (1860–1904) who, under duress, placed his country under the control of the French in 1863.

Norodom was the eldest son of King Duong. He was educated in Bangkok, capital of the Thai kingdom, where he studied Pāli and Sanskrit Buddhist scriptures and the sacred canons of Theravāda Buddhism. The purpose of his early training was to strengthen ties between Siam (Thailand) and Cambodia.

Cambodia had been under the joint vassalage of Vietnam and Siam since 1802. According to established protocol, Cambodian kings were crowned jointly, with representatives of the two suzerains attending. When Duong died in 1860, Norodom was chosen the successor, but he remained uncrowned. The Thais, who held the symbols of Cambodian royalty—the crown, the sacred sword, and the royal seal—refused to release them, insisting that the newly elected king was their deputy and denying the Vietnamese the right to crown Norodom; thus the Siamese sought to undermine Vietnamese claims to Cambodia and to assert their own private domination of the vassal state.

An attempted coup d'etat, led in 1861 by Norodom's half brother Si Votha, was put down with the aid of Thai troops. At this

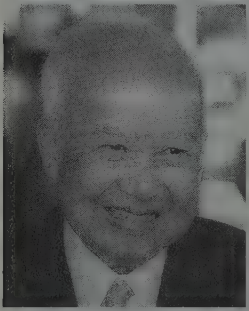
House of Normandy



WILLIAM I THE CONQUEROR (c. 1028–87) king of England 1066–87
= Matilda (d. 1083) daughter of Baldwin V, count of Flanders, she was 6th in descent from Elfrida, daughter of Alfred the Great
Robert Curthose (c. 1051/52–1134) duke of Normandy = Sybilla (d. 1103) daughter of Geoffrey, count of Conversano
Richard (d. c. 1075)
WILLIAM II (c. 1056–1100) king of England 1087–1100
HENRY I (1069–1135) king of England 1100–35
(1) = Matilda (d. 1118) daughter of Malcolm III, king of Scotland, and St. Margaret of the Royal English House
(2) = Adelaide (d. 1151) daughter of Geoffrey, duke of Lower Lorraine
Cicely (d. 1126) abbess of Caen
Constance (d. 1090) = Alan Fergant (d. 1119) duke of Brittany
Adeliza (c. 1056–65)
Adela (d. 1137) = Stephen (d. 1102) count of Blois
Agatha (d. c. 1080)
William Clito (d. 1128) count of Flanders
(1) = Sybil daughter of Fulke, count of Anjou
(2) = Adelicia daughter of Reiner, marquis of Montferrat
William (d. 1120) the Aetheling = Isabella daughter of Fulke, count of Anjou
Matilda (1102–1167)
(1) = Emperor Henry V (1086–1125)
(2) = Geoffrey IV Plantagenet (d. 1151) count of Anjou and Maine
William = Agnes daughter of Giles de Sulli
Theobald (d. 1151) count of Blois = Maud daughter of Ingelbert, duke of Carinthia
STEPHEN (1097–1154) king of England 1135–54 (House of Blois) = Matilda (d. 1151) daughter of Eustace, count of Boulogne
Henry (d. 1171) bishop of Winchester
Matilda (d. 1120) = Richard (d. 1120) earl of Chester
HENRY II (1133–89) king of England 1154–89 (House of Plantagenet)
Baldwin (d. before 1137)
Matilda (d. 1137)
Eustace (d. 1153) count of Boulogne = Constance (d. 1176) sister of Louis VII, king of France
William (d. 1159) count of Mortain = Isabella (d. 1199) daughter of William de Warenne, earl of Surrey
Mary (1136–92) = Matthew (d. 1173) son of Theodore, count of Flanders

point the French, who had been ceded much of Cochinchina (southern Vietnam), sought to assert Vietnamese claims to Cambodian tribute, seeing the adjacent Cambodian provinces as future colonial possessions. The French forced Norodom to accept French protection early in 1863, but, before the agreement was ratified in Paris, Norodom signed a clandestine treaty with Siam on Aug. 11, 1863, which was ratified on Jan. 22, 1864. It made Norodom the viceroy of Siam and governor of Cambodia; Siam acquired the Cambodian provinces of Bătdâmbâng and Siĕmréab. The French moved to stop Siam from asserting further claims over Cambodia and forced Siam to return the royal regalia, and Norodom was finally crowned at Oudong, Cambodia, in June 1864, with both French and Siamese officials attending. He was installed as king in Phnom Penh in 1866, and in 1867 Siam officially acknowledged the French protectorate over Cambodia. The French imposed land reforms, a reorganization of Cambodian military forces, and the abolition of slavery. Throughout Norodom's reign the French increased their domination of Cambodian affairs.

Norodom Sihanouk, in full PREAH BAT SAMDECH PREAH NORODOM SIHANOUK (b. Oct. 31, 1922, Phnom Penh, Camb.), king of Cambodia from 1941 to 1955; thereafter he was prime minister, head of state, and president, and in 1993 he became king again. He attempted to steer a neutral course for Cambodia in its civil and foreign wars of the late 20th century.



Norodom Sihanouk, 2000
Andy Eames/AP Wide World

Sihanouk was, on his mother's side, the grandson of King Monivong (reigned 1927–41), whom he succeeded on the throne at age 18. During World War II the young king, encouraged by the Japanese, first attempted to declare Cambodia's independence from France; but, when French military forces moved back into the region, he decided to wait until France's retreat from Indochina, which occurred in 1954. He founded the Sangkum Reastr Niyum ("People's Socialist Community") in January 1955, won a referendum in February approving its program, and on March 2 abdicated in favour of his father, Norodom Suramarit, becoming the new monarch's prime minister, foreign minister, and subsequently permanent representative to the United Nations. Five years later, after the death of his father (April 3, 1960), he accepted the role of head of state (June 13).

Sihanouk steered a neutralist course in his foreign policy. In return for North Vietnamese nonsupport of the Khmer Communist Party (Khmer Rouge), he let Vietnamese communists operate covertly from bases inside eastern Cambodia. He steered clear of U.S. aid and assistance, relying on his immense popularity with the Cambodian people to keep radicals of both the right and the left under control. Under Sihanouk's benign rule, Cambodia experienced 15 years of fragile peace and mild prosperity while much of Southeast Asia was in a state of upheaval.

Sihanouk's maintenance of Cambodian neutrality in the Vietnam War ended in 1970 when he was ousted in a U.S.-supported coup led by General Lon Nol. He then lived in Peking, campaigning on behalf of the Khmer Rouge underground.

Following the Khmer Rouge takeover of Cambodia in 1975, Sihanouk returned home, only to be put under house arrest by the Khmer Rouge government. He was released in January 1979 because the Khmer Rouge regime was falling to Vietnamese military forces and needed an advocate in the United Nations. After denouncing the Vietnamese invasion, he dissociated himself from the Khmer Rouge as well. In 1982 Sihanouk became president of an uneasy coalition government-in-exile made up of the three principal anti-Vietnamese Khmer forces—the Khmer Rouge, the anticommunist Khmer People's National Liberation Front, and Sihanouk's neutralist party. He retained his role as resistance leader until 1991, when he was elected president of Cambodia's Supreme National Council, an interim administrative body.

In September 1993, following UN-sponsored elections in May 1993, Cambodia's National Assembly voted to restore the monarchy, and Sihanouk once again became king. His son, Norodom Ranariddh, served as first prime minister until 1997, when he was overthrown in a coup by Hun Sen, who nevertheless left Sihanouk on the throne.

In later years Sihanouk retreated from politics to work as a filmmaker and composer.

Norrbotten, *län* (county) of northern Sweden, touching upon the Gulf of Bothnia, Finland, and Norway. It is Sweden's largest *län,* as well as the northernmost, extending above the Arctic Circle. It comprises the traditional *landskap* (province) of Norrbotten in the east and part of Lappland *landskap* in the west. From the coast the land rises to the barren, mountainous frontier with Norway; this area contains the highest point in Sweden, Mount Kebne (6,926 feet [2,111 m]).

Few crops can mature in the short summer, and timber grows only slowly; but the region's vast iron deposits are worked at Kiruna, Gällivare, and Malmberget, and iron is smelted at Luleå, the capital. Area 38,191 square miles (98,913 square km). Pop. (2000) 256,238.

Norris, Frank, byname of BENJAMIN FRANKLIN NORRIS (b. March 5, 1870, Chicago, Ill., U.S.—d. Oct. 25, 1902, San Francisco, Calif.), American novelist who was the first important naturalist writer in the United States.

Norris studied painting in Paris for two years but then decided that literature was his vocation. He attended the University of California in 1890–94 and then spent another year at Harvard University. He was a news correspondent in South Africa in 1895, an editorial assistant on the *San Francisco Wave* (1896–97), and a war correspondent in Cuba for *McClure's Magazine* in 1898. He joined the New York City publishing firm of Doubleday, Page, and Company in 1899. He died after an operation for appendicitis.

Norris' first important novel, *McTeague* (1899), is a naturalist work set in San Francisco. It tells the story of a stupid and brutal dentist who murders his miserly wife and then meets his own end while fleeing through Death Valley. With this book and those that followed, Norris joined Theodore Dreiser in the front rank of American novelists. Norris' masterpiece, *The Octopus* (1901), was the first novel of a projected trilogy, *The Epic of the Wheat,* dealing with the economic and social forces involved in the production, distribution, and consumption of wheat. *The Octopus* pictures with bold symbolism, the raising of wheat in California and the struggle of the wheat growers there against a monopolistic railway corporation. The second novel in the trilogy, *The Pit* (1903), deals with wheat speculation on the Chicago Board of Trade. The third novel, *Wolf,* unwritten at Norris' death, was to have shown the American-grown wheat relieving a famine-stricken village in Europe. *Vandover and the Brute,* posthumously published in 1914, is a study of degeneration. *McTeague* was filmed by Erich von Stroheim in 1924 under the title *Greed* and staged as an opera by composer William Bolcom and director Robert Altman in 1992.

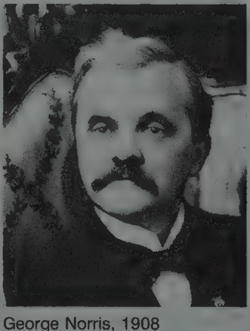
After the example of Émile Zola and the European naturalists, Norris in *McTeague* sought to describe with realistic detail the influence of heredity and environment on human life. From *The Octopus* on he adopted a more humanitarian ideal and began to view the novel as a proper agent for social betterment. In *The Octopus* and other novels he strove to return American fiction, which was then dominated by historical romance, to more serious themes. Despite their romanticizing tendencies, his novels present a vividly authentic and highly readable picture of life in California at the turn of the century.

Norris' writings were collected (10 vol.) in 1928, and *The Letters of Frank Norris* was edited by Franklin Walker in 1956.

Norris, George W., in full GEORGE WILLIAM NORRIS (b. July 11, 1861, Sandusky, Ohio, U.S.—d. Sept. 2, 1944, McCook, Neb.), U.S. senator noted for his advocacy of political reform and of public ownership of hydroelectric-power plants.

Largely self-educated, Norris taught school and studied law at Northern Indiana Normal School (now Valparaiso University). He was admitted to the bar in 1883 and two years later moved to Nebraska to begin practice. In 1902 he was elected to Congress as a Republican and was reelected four times in succession, becoming leader of an insurgent group that in 1910 forced reforms in the House rules to reduce the autocratic control of the speaker.

Elected in 1912 to the Senate, where he served until 1943, Norris became known as an independent, saying he "would rather be right than regular." His strong antiwar convictions led him to vote against U.S. entry into World War I, and he denounced the Treaty of Versailles that followed it. He was the author of the 20th Amendment to the Constitution, which abolished the so-called lame-duck sessions of Congress. He fought for the introduction of presidential primaries and for direct election of U.S. senators. One of his most significant contributions was his introduction of the bill establishing the Tennessee Valley Authority. He was coauthor of the Norris–La Guardia Act, which restricted the use of injunctions in labour disputes.

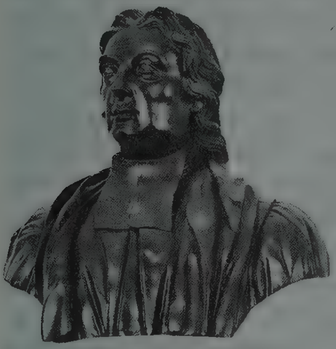


George Norris, 1908
By courtesy of the Library of Congress, Washington, D.C.

Though always a Republican, Norris felt his party ties lightly; he endorsed Progressives Theodore Roosevelt in 1912 and Robert M. La Follette in 1924 and Democrats Alfred E. Smith in 1928 and Franklin D. Roosevelt in each of his campaigns for the presidency. In 1945 his book *Fighting Liberal* was published.

BIBLIOGRAPHY. Richard Lowitt, *George W. Norris,* 3 vol. (1963–78); and Norman L. Zucker, *George W. Norris: Gentle Knight of American Democracy* (1966).

Norris, John (b. 1657, Collingbourne-Kingston, Wiltshire, Eng.—d. 1711, Bemerton, Wiltshire), Anglican priest and philosopher remembered as an exponent of Cambridge Platonism, a 17th-century revival of Plato's ideas, and as the sole English follower of the French Cartesian philosopher Nicolas Malebranche (1638–1715).



John Norris, bronze sculpture by Sir Henry Cheers, 1756
Thomas Photos, Oxford

Norris was elected a fellow of All Souls College, Oxford, in 1680. In 1689 he was named vicar of Newton St. Loe in Somerset, and two years later he was transferred to the rectory of Bemerton, near Salisbury, where he spent the remainder of his life.

Norris wrote numerous theological and philosophical works. It is in his moral and mystical writings that the influence of Cambridge Platonism is clearest. His first major philosophical work was *Reflections upon a Late Essay Concerning the Human Understanding* (1690), in which he anticipated many later criticisms of John Locke's theory contained in *An Essay Concerning Human Understanding;* he did, however, agree with Locke in dismissing the doctrine of innate ideas (which asserts that humans hold their mental ideas at birth). Norris' *An Account of Reason and Faith in Relation to the Mysteries of Christianity* (1697) was one of the best contemporary responses to *Christianity Not Mysterious,* by the English deist John Toland. Norris' most significant work, *An Essay Towards the Theory of the Ideal or Intelligible World* (1701–04), treats the intelligible world in two parts: first, in itself, and second, in relation to human understanding. This work is a complete exposition of the views of Malebranche and refutes the assertions of Locke and others who emphasized the importance of sense experience in arriving at knowledge.

Norris–La Guardia Act (1932), in the history of the United States, legislative act that removed certain legal and judicial barriers against the activities of organized labour. The act declared that the members of labour unions should have "full freedom of association" unmolested by employers, and it made illegal the "yellow-dog" contracts by which employers had forced workers to state that they would not join a union. It barred the federal courts from issuing injunctions to sustain such contracts or to prevent strikes, picketing, or boycotts by labour groups.

The Norris–La Guardia Act was cosponsored in Congress by George Norris and Fiorello La Guardia. It was passed during the depths of the Great Depression, when public opinion had shifted both against employers who sought to prevent workers from joining unions and against judges who were willing to proscribe normal union activities. The act was a precursor to the more sweeping Wagner Act of 1935.

Norrish, Ronald George Wreyford (b. Nov. 9, 1897, Cambridge, Cambridgeshire, Eng.—d. June 7, 1978, Cambridge), British chemist who was the corecipient, with fellow Englishman Sir George Porter and Manfred Eigen of West Germany, of the 1967 Nobel Prize for Chemistry. All three were honoured for their studies of very fast chemical reactions. Norrish and Porter, who worked together between 1949 and 1955, were able to stop chemical reactions at intervals approaching one-thousandth of a millionth of a second and to study the intermediate stages of the progressive changes.

Norrish did his undergraduate and doctoral work at the University of Cambridge, served as research fellow at Emmanuel College, Cambridge, and directed the university's physical chemistry department for 28 years. He achieved emeritus status in 1963, though he continued to work with individual students and as an industrial consultant.

Norristown, borough, seat of Montgomery county, southeastern Pennsylvania, U.S. It lies on the north bank of the Schuylkill River, 17 miles (27 km) northwest of Philadelphia and near the eastern terminus of the Pennsylvania Turnpike.

The site was purchased in 1704 by Isaac Norris and William Trent from William Penn, Jr. (son of the state's founder), and was organized as a township in 1730. The land was acquired in 1776 by the College and Academy of Philadelphia. During the American Revolution the school was suspected of disloyalty, and the state assembly revoked its charter and transferred its assets to the newly created University of Pennsylvania. When Montgomery county was created in 1784, Norristown (then The Town of Norris) became the county seat. Canalization of the Schuylkill and Delaware rivers and completion of a railroad link (1834) to Philadelphia spurred the borough's development as an industrial centre.

Borough Hall, Norristown, Pa.
Camerique

Norristown's manufactures include chemicals, machinery, metal products, plastics, steel, rubber, and textiles. Valley Forge National Historical Park, the encampment site for George Washington's army during the winter of 1777–78, is nearby. Mill Grove, early home of the naturalist-artist John James Audubon, has been developed as a wildlife sanctuary. Inc. borough, 1812. Pop. (1990) 30,749.

Norrköping, town and port, *län* (county) of Östergötland, Sweden. It lies along the Motala River southwest of Stockholm. *Hällristningar,* or rock carvings, from the Late Bronze Age are found in the area.

The town was founded about 1350 and received its charter in 1384. Medieval churches remain at Östra Eneby and Tingstad. Frequent fires, notably in 1719 during the Northern War, cleared the way for the town to be rebuilt on modern lines. The falls in the river provided power for the textile industry, which dominated the town from the 1660s to the 1950s.

Since 1950 engineering has been Norrköping's principal industry. The Lindö Canal, completed in 1961, permits the harbour to take vessels of up to 30-foot (9-metre) draft. Norrköping is a focus for both rail and road transport between Stockholm and the south and west of Sweden, and there is an airport on the outskirts. Pop. (1993 est.) mun., 120,798.

Norrland, region, northern Sweden, encompassing the traditional *landskap* (provinces) of Gästrikland, Hälsingland, Medelpad, Ångermanland, Västerbotten, Norrbotten, Härjedalen, Jämtland, and Lappland. Its land area constitutes about 60 percent of Sweden's total territory. Its most striking features are extensive forests; mountains, notably Mount Kebne (the highest in Sweden) and Mount Sarjek; and great rivers—Ångerman, Ljusn, Ljung, Indals, Ume, Vindel, Skellefte, Pite, Lule, and Kalix—which formerly were used for transporting timber down to the sawmills near the coast and are now a source of hydroelectric power. Beginning about the mid-19th century, the region was torn by the so-called Norrlandsfrågan ("Norrland Question") over the acquisition of land by the lumber companies at the expense of small landholders and farmers; the issue was not resolved until 1901–04.

There is some agriculture, but the region's vast resources of timber, iron ore, and waterpower have made forestry, mining, and the production of hydroelectric power of prime importance. The region is accessible by road, rail, or air. Area 93,720 square miles (242,733 square km). Pop. (1993 est.) 1,207,518.

Norse language, Old: *see* Old Norse language.

Norseman: *see* Viking.

Norske folkeeventyr (1841–44; "Norwegian Folktales"), collection of folktales and legends, by Peter Christen Asbjørnsen and Jørgen Engebretsen Moe, that had survived and developed from Old Norse pagan mythology in the mountain and fjord dialects of Norway. The authors, stimulated by a revival of interest in Norway's past, gathered the tales of ghosts, fairies, gods, and mountain trolls and compiled them into a brilliant narration that preserved the oral feeling and distinctively Norwegian characteristics of the tales while rendering them in standard Norwegian.

Asbjørnsen's vivid prose sketches of folklife and Moe's poems recaptured the folk heritage of Norway for the modern age. The *Norske folkeeventyr* stimulated further research into folktales and ballads and reawakened a sense of national identity.

Norske Kirke (Norwegian Lutheran church): *see* Norway, Church of.

Norskehavet (Europe): *see* Norwegian Sea.

Norstad, Lauris (b. March 24, 1907, Minneapolis, Minn., U.S.—d. Sept. 12, 1988, Tucson, Ariz.), U.S. Air Force general, commander of the North Atlantic Treaty Organization (NATO) forces in Europe during the Berlin crisis of 1961, when East Germany erected the Berlin Wall.

Norstad grew up in Red Wing, Minn., and graduated from the U.S. Military Academy at West Point, N.Y., in 1930. He was commissioned as a cavalry officer but transferred to the Air Corps in 1931. He served in various command posts during World War II: in 1943 he was appointed director of operations for the Mediterranean Allied Air Forces. In 1944 he became chief of staff of the 20th Air Force. Promoted to major general, he was responsible for planning the two atomic bomb missions against Japan.

Norstad transferred to the newly created Air Force in 1947 and became a four-star general in 1952. In 1956 he was appointed supreme commander of NATO military forces in Europe, retiring in 1963 to become president of the Owens-Corning Fiberglass Corporation; from 1967 to 1972 he was the company's chief executive and chairman.

Norte de Santander, *departamento,* northeastern Colombia, bounded east by Venezuela and located where the Andean Cordillera Oriental bifurcate, one arm continuing northward as the Sierra de Ocaña and Serranía (mountains) de los Motilones, the other bending eastward to form the Venezuelan Andes. Cedar and pine are the principal forest trees. The *departamento* was created in 1910.

The Catatumbo River region, near the Venezuelan border, is an important oil-producing area with a refinery at Tibú and pipelines running west and southwest from the fields. In the cooler uplands, grains, potatoes, and horsebeans are the principal crops. Coffee and sugarcane are cultivated on the middle slopes and lower valleys, as in the vicinity of Cúcuta (*q.v.*), the capital of the *departamento.* The highway network is well developed, and Cúcuta has an airport. Area 8,362 square miles (21,658 square km). Pop. (1993 est.) 1,022,816.

North, Douglass C., in full DOUGLASS CECIL NORTH (b. Nov. 5, 1920, Cambridge, Mass., U.S.), American economist, recipient, with Robert W. Fogel, of the 1993 Nobel Memorial Prize for Economic Science. The two were recognized for their pioneering work in cliometrics—also called "new economic history"—the application of economic theory and statistical methods to the study of history.

North studied economics at the University of California at Berkeley (B.A., 1942; Ph.D., 1952). From 1950 he taught economics at the University of Washington, leaving in 1983 to join the faculty of Washington University (St. Louis, Mo.). From 1960 to 1966 he was director of the Institute for Economic Research, and from 1967 to 1987 he was director of the National Bureau of Economic Research. He also acted as economic consultant to the governments of Russia, Argentina, Peru, and the Czech Republic.

North's work was primarily theoretical. He argued that technical innovations alone are insufficient to propel economic development: in order for a market economy to flourish, certain legal and social institutions, such as property rights, must be in place. His ideas were expressed in a number of books, including *Structure and Change in Economic History* (1981) and *Institutions, Institutional Change, and Economic Performance* (1990).

North, Sir Dudley (b. May 16, 1641, Westminster, Eng. [now in London]—d. Dec. 31, 1691, London), English merchant, civil servant, and economist, an early advocate of what later came to be called laissez-faire.

North entered the eastern Mediterranean trade at an early age and spent many years residing in Smyrna and Constantinople (now İzmir and Istanbul), finally returning to England, a wealthy man, in 1680. He then served under Charles II as one of the sheriffs of the City of London and received a knighthood; under James II he was appointed a commissioner of customs. A confirmed Tory, he retired from public affairs shortly after the Revolution of 1688.

His fame rests on the contribution to political economy made in his *Discourses Upon Trade: Principally Directed to the Case of the Interest, Coynage, Clipping, Increase of Money,* published anonymously in 1691 or possibly 1692. This work attracted little attention until reprinted in 1822, after James Mill had hailed the importance of North's ideas as summarized in the biography by his brother, Roger North, published in 1744.

The *Discourses,* though brief and aphoristic, are probably the most thoroughgoing statement of free-trade theory made in the 17th century. Although the older mercantilist view was that trade was the exchange of goods not needed by the producing country, the *Discourses* insisted "that the whole world as to trade, is but as one nation or people, and therein nations are as persons." Sumptuary laws and legal restrictions on interest rates are denounced as harmful and ineffective. Subsequent monetary doctrines are anticipated in the insistence that the supply of money can be left to free market forces "without any aid of politicians."

North (of Kirtling), Frederick North, Lord, also called (from 1790) 2ND EARL OF GUILFORD, BARON GUILFORD (b. April 13, 1732, London, Eng.—d. Aug. 5, 1792, London), prime minister from 1770 to 1782, whose vacillating leadership contributed to the loss of Great Britain's American colonies in the American Revolution (1775–83).

The son of a Tory nobleman, the 1st earl of Guilford, North was educated at Eton and Trinity College, Oxford. Elected member of Parliament for Banbury at the age of 22, he represented the town (of which his father was high steward) for nearly 40 years. The Duke of Newcastle, when prime minister, made him a lord of the treasury in 1759, and North held this office under the succeeding prime ministers, the Earl of Bute and George Grenville, until 1765. On the fall of the Marquess of Rockingham's first ministry in 1766, North was sworn a member of the Privy Council and made paymaster general by the next prime minister, the Duke of Grafton. On the death of Charles Townshend in September 1767 North became chancellor of the exchequer.

North succeeded Grafton as prime minister in February 1770 and continued in office for 12 of the most eventful years in English history. George III had at last clinched the defeat of the Whiggish Newcastle-Rockingham connection and found in North a congenial Tory and chief minister. The path of the minister in Parliament was a hard one; he was popular and an able debater, but at times he had to defend measures which he had not designed and of which he had not approved, and this too in the House of Commons in which the oratorical ability of Edmund Burke and Charles James Fox was ranged against him.

Lord North, detail of a portrait by Sir Nathaniel Dance-Holland; in the National Portrait Gallery, London

By courtesy of the National Portrait Gallery, London

During peacetime North's financial administration was sound, but he lacked the initiative to introduce radical fiscal reforms. The most important events of his ministry were those concerned with the American Revolution. He cannot be accused of causing it, but one of the first acts of his ministry was the retention of the tea duty, and his ministry responded to the Boston Tea Party with the Coercive Acts of 1774. Underestimating the colonists' powers of resistance, he attempted to combine severity and conciliation. He faced war halfheartedly and was easily depressed by reverses; after 1777 it was only George III's repeated entreaties not to abandon his sovereign to the mercy of the Rockingham Whigs that induced North to defend a war that at times he felt to be hopeless and impolitic. In March 1782 he insisted on resigning, after the news of Cornwallis' surrender at Yorktown made defeat in the House of Commons imminent.

North had been rewarded for his assistance to the king by honours for himself and sinecures for his relatives, but in April 1783 he formed a famous coalition with the prominent Whig Fox (much to George III's disgust) and became secretary of state with Fox under the nominal premiership of the Duke of Portland. The coalition went out of office on Fox's India bill in December 1783. For about three years North continued to act with Fox in opposition, but failing eyesight then caused his retirement from politics. He succeeded to the earldom of Guilford on his father's death in 1790.

North, Simeon (b. July 13, 1765, Berlin, Conn., U.S.—d. Aug. 25, 1852, Middletown, Conn.), American pistol and rifle manufacturer who, about the same time that the American inventor Eli Whitney was doing so, developed the use of interchangeable parts in manufacturing.

After spending his early youth as a farmer, North at age 16 tried but failed to enlist in the Continental Army during the American Revolution. In 1795 he opened a small scythe-making business in an old mill next to his farm and four years later was awarded his first government contract, to deliver 500 horse pistols within a year. His excellent craftsmanship brought more contracts, including one dated April 16, 1813, for 20,000 pistols. To fulfill the contract, he suggested that the specifications call for identical construction of each firearm, so that pistols could be mass assembled. On Dec. 10, 1823, he received his first rifle contract, for 6,000 rifles to be delivered in five years; he supplied rifles and carbines to the U.S. government until 1850. In 1825 he devised a repeating rifle that could fire 10 rounds without reloading.

North, the, region, northern United States, historically identified as the free states that opposed slavery and the Confederacy during the Civil War. This struggle against slavery and secession obscured the reality that the North was actually four separate and not so similar areas: New England, the Middle Atlantic states, the Old Northwest (East North Central States in federal terms), and the Great Plains (West North Central States). Recognized as these four areas, the North includes Connecticut, Illinois, Indiana, Iowa, Kansas, Maine, Massachusetts, Michigan, Minnesota, Missouri, Nebraska, New Hampshire, New Jersey, New York, North Dakota, Ohio, Pennsylvania, Rhode Island, South Dakota, Vermont, and Wisconsin. Of these, Nebraska, North Dakota, and South Dakota were not states at the time of the Civil War, and Missouri, though part of the Union, was a slave state; thus, regional lines were, and remain, unclear. Regional distinctions, however, did exist. As early as 1796 President George Washington used the terms North and South, warning against the danger of basing political differences upon geographic lines. The most critical sectional distinction, however, had already been recognized in 1787, when slavery was banned in the Northwest Territory. Soon after the United States War of Independence, slavery disappeared in all states north of the Mason and Dixon Line, the boundary between Pennsylvania and Maryland.

The North's development was characterized by a common system of free labour, commercial vigour, and agricultural diversity. In the 19th century transportation developed markedly along east-west lines; *e.g.,* the Erie Canal opened up the Great Lakes in 1825, and New York City was connected to Chicago by rail in 1852. Thus, both immigration and trade bound northern sections together, creating a remarkable homogeneity of ideology, political and educational institutions, cultural ties, and economic patterns.

By the 1850s the question of the extension of slavery into the western territories was the central issue uniting the North and bringing it into conflict with the South. On the eve of the American Civil War (1861), there were 19 free and 15 slave states, the boundary between them following the Mason and Dixon Line, the Ohio River, and latitude 36°30′ (except for Missouri). The North attained its highest self-consciousness as a region during the war, when its name became synonymous with the Union. Including the four border states that fought with the Union, the North at this time had a population of 22 million, produced 75 percent of the nation's wealth, and possessed 81 percent of its factories.

The North attempted, largely unsuccessfully, to ensure the political enfranchisement and socioeconomic equality of blacks in the South during the Reconstruction period (1865–77). Meanwhile, the North itself was experiencing an unprecedented period of economic growth as it underwent industrialization. As the 19th century progressed, the North, particularly the Middle Atlantic states and the Great Lakes area of the Middle West, became more and more typified by big cities, big business, and big industrial complexes. Its ample natural resources, excellent inland-waterway system, and proliferating railways confirmed the North as the economic hub of the country, while the vast expanse of prairie and plain on both sides of the Mississippi gave the western reaches of the North the agricultural dominance that would make it America's breadbasket.

This dominance, however, was not without its costs. Immigration brought millions of southern and eastern Europeans to northern cities, swelling their populations and providing a cheap source of industrial labour but also causing problems of housing, health, and education. When this wave of immigration slowed dramatically after 1920, it was replaced in the second half of the 20th century by another wave made up of Southern blacks, Latin Americans, and East Asians. During the late 1950s the South was the initial locus of the civil-rights movement, but by the late 1960s and '70s the inclusion of minorities in the political and economic mainstream of the nation was as much a challenge in the North as in the South.

Continuing heavy industrialization had affected the environment, causing water- and air-pollution problems, while the concentration of blacks in Northern inner-city ghettos spawned tension and violence and severely affected patterns of housing, education, employment, and public health. These difficulties, coupled with the decay of the North's industrial base owing to foreign competition and other factors, contributed to further demographic shifts, notably a significant migration of people from the North to southern and western states. In 1939 the North had 70 percent of the country's manufacturing establishments within its borders. By the late 1970s this figure had fallen to barely more than half. Likewise, the North accounted for 58 percent of the total population of the United States in 1940, but only 45 percent in the mid-1980s. Efforts at renewal and revitalization were undertaken by many Northern cities, with varying effect.

North, Sir Thomas (b. May 28, 1535, London, Eng.—d. 1603?), English translator whose version of Plutarch's *Parallel Lives* was the source for many of William Shakespeare's plays.

North may have been a student at Peterhouse, Cambridge, and, in 1557, he was entered at Lincoln's Inn, London, where he joined a group of young lawyers interested in translating. In 1574 North accompanied his brother on a diplomatic mission to France. Thomas North had an extensive military career: he fought twice in Ireland as captain (1582 and 1596–97), served in the Low Countries in defense of the Dutch against the Spanish (1585–87), and trained militia against the threatened invasion of England by the Spanish Armada in 1588. He was knighted about 1596–97, was justice of the peace for Cambridge, and was pensioned by Queen Elizabeth in 1601.

In 1557 North translated, under the title *Diall of Princes,* a French version of Antonio de Guevara's Spanish translation of the *Meditations* of Marcus Aurelius. Although North retained Guevara's mannered style, he was also capable of quite a different kind of work. His translation of Oriental beast fables from the Italian, *The Morall Philosophie of Doni* (1601), for example, was a rapid and colloquial narrative. His *Lives of the Noble Grecians and Romanes,* translated in 1579 from Jacques Amyot's French version of Plutarch's *Parallel Lives,* has been described as one of the earliest great masterpieces of English prose. Shakespeare borrowed from North's *Lives* for his plays *Antony and Cleopatra, Julius Caesar, Timon of Athens,* and *Coriolanus,* and, in fact, he put some of North's prose directly into blank verse, with only minor changes.

North Adams, city, Berkshire county, northwestern Massachusetts, U.S. It lies along the Hoosic River, at the western end of the Hoosac Tunnel (extending 5 miles [8 km] under the Hoosac Range) and the Mohawk Trail, 18 miles (29 km) north of Pittsfield. It was the site of Fort Massachusetts, built by the Massachusetts Bay Colony in 1745 (later burned by the French and Indians). The site's permanent settlement dates from the 1770s, when a Quaker group arrived from Rhode Island. Originally part of Adams, it was set off and incorporated as the town of North Adams in 1878. Waterpower from the Hoosic and the completion of the Hoosac Tunnel in the mid-1870s led to early industrialization. The city's manufactures now include leather products, textiles, paper, and electrical machinery.

North Adams State College was opened as a normal school in 1894, and Williams College (1793) is 6 miles (10 km) west. A natural rock bridge crosses Hudson Creek within the city limits, and Mount Greylock (3,491 feet [1,064 m], highest peak in the state, within Greylock State Reservation) and Savoy Mountain State Forest lie just to the south and southwest. Inc. city, 1895. Pop. (1990) 16,797.

North Africa, region of the northern African Mediterranean littoral, stretching from the Atlantic Ocean on the west to the Egyptian desert on the east and comprising, according to usual definitions, the countries of (east to west) Libya, Tunisia, Algeria, and Morocco. Areas directly peripheral to these countries are often included in discussions of the region, but Egypt, because of the distinct cultural and political history that it enjoys with respect to the other countries of the region, is treated separately in the *Encyclopædia Britannica.*

A brief treatment of North Africa follows. For full treatment, *see* MACROPAEDIA: North Africa.

The four countries constituting the North African region occupy an area of about 1,835,000 square miles (4,753,000 square km) that may be divided into several broad geographic regions (from west to east): Morocco's Atlantic Ocean littoral; the Atlas Mountains, trending southwest-northeast, extending from Morocco to Tunisia and divided into a number of smaller, often discontinuous ranges, the High (or Haut) Atlas and Saharan Atlas (Atlas Saharien) being the chief topological features; and easternmost, a low plateau of unremarkable relief, constituting most of Libya. All of these regions are backed to the south by the vast stony pavements (reg) and sand seas (erg) of the Sahara.

The population in all countries of North Africa is predominantly Arabic and Muslim with strong admixtures of Berber or other smaller ethnic groups, most of which give distinct cultural flavour to the regions they inhabit. European colonists settled in Morocco, Algeria, Tunisia, and Libya in the 19th and early 20th centuries, but many departed when independent sovereign states were created from the former French and Italian territories after World War II.

North Africa's inhabitants are confined chiefly in the narrow Mediterranean coastal belt and in scattered Saharan oases with their characteristic date palms. Most of North Africa has a marked dry season, and cultivation depends on frequent intensive irrigation. Wheat, barley, potatoes, olives, tomatoes, oranges, dates, and grapes are grown, although crop yields tend to be low. Sheep and goats are the region's principal livestock.

There are important mineral deposits, including iron ore, phosphates, petroleum, and natural gas; Algeria and Libya are major world producers of oil and natural gas. Manufacturing industries, which generally are not well developed in the region's rapidly expanding towns, mostly process agricultural commodities and produce building materials and crude steel. Tourism is an important source of foreign exchange, primarily in Morocco and Tunisia.

Algeria, Libya, and Tunisia are republics, and each was governed by a single political party throughout most of their independent existence. Morocco is a constitutional monarchy. Pop. (1991 est.) 64,205,000.

North America, third in size among the world's continents, lying for the most part between the Arctic Circle and the Tropic of Cancer, extending for more than 5,000 miles (8,000 km) to within 500 miles of both the North Pole and the Equator, and covering an area of 9,355,000 square miles (24,230,000 square km).

A brief treatment of North America follows. For full treatment, *see* MACROPAEDIA: North America.

For current history and for statistics on society and economy, *see* BRITANNICA BOOK OF THE YEAR.

Except where the relatively narrow Isthmus of Panama extends southeastward to connect with Colombia in South America, the continent, shaped like an inverted triangle, is completely surrounded by water. The Pacific Ocean extends the length of its western coast, the narrow Bering Strait separates it from Russia and Asia to the northwest, the Arctic Ocean and several of the continent's major islands lie to the north, the Atlantic Ocean lies to the east, and the Caribbean Sea and the Gulf of Mexico are situated in the southeast. The population in 1990 for the entire continent was estimated to be 424,523,000, or about one-twelfth of the world's population.

The land. North America was the first continent to achieve its current approximate size and shape. Its geologic structure is built around a stable platform of Precambrian rock called the Canadian (Laurentian) Shield. To the southeast of this rose the ancient Appalachian Mountains; to the west rose the younger and considerably taller Cordilleras.

The Cordilleras extend the length of the continent, from the Aleutian Islands in the northwest through Panama in the south and into South America, and occupy about one-third of the continent's total land area. A complex mountain system, the Cordilleras comprise two major branches: the Western Cordillera (or the coastal ranges) and the Eastern Cordillera. The coastal ranges contain some of the continent's highest mountains; its highest, Mount McKinley, rises to 20,320 feet (6,194 m) above sea level in Alaska. Stretches of the coastal ranges are geologically very active, dramatically so along an east-west extension located in southern Mexico and much of Central America, an area that periodically experiences severe earthquakes and volcanic eruptions.

The Rocky Mountains, which join the Mackenzie Mountains in the Yukon to the north and form a chain southward with Mexico's Sierra Madre Oriental range and the nonvolcanic ranges of Central America, constitute the continent's Eastern Cordillera. Even though the Eastern Cordillera has no peaks that reach as high as some of those in the coastal ranges, several do exceed 14,000 feet (4,270 m). The eastern ranges form a drainage divide that separates the Pacific drainage to the west from the watersheds of the Arctic to the north and those of the Atlantic and Caribbean to the east.

Interspersed within the North American Cordillera system are several plateaus, basins, troughs, and valleys. The large plateau region of the western United States and northern Mexico consists of the Columbia Plateau, the Colorado Plateau, the Basin and Range Province, and the Central Mexican Plateau. The region also possesses an extensive interior drainage basin (the Great Basin) containing the Great Salt Lake, spectacular canyons cut by the Colorado River watershed, and the continent's major desert areas.

The eastern two-thirds of the continent is dominated by four major lowland regions: the Canadian Shield to the northeast; the Great Plains and the Interior Lowlands, extending westward and southward from the shield region; and the Coastal Plain, extending the length of much of the continent's eastern seaboard from New England in the United States through Mexico's Yucatán Peninsula. The bowl-shaped Canadian Shield, occupying the entire northeastern portion of the continent, is partially submerged at its centre, forming Hudson Bay. The southern and western boundaries of the shield are marked by the Great Lakes and smaller bodies of water; southward, the Laurentide Scarp drops precipitously by as much as 2,000 feet (610 m) along the length of the St. Lawrence River and the northern coasts of Lakes Huron and Superior; westward are a series of smaller lakes, dominated by the Great Bear Lake to the north. West of the lake systems lie the Great Plains, which extend south from the Arctic to the Rio Grande. Lying south of the Great Lakes are the Interior Lowlands, which extend eastward from the Great Plains to the Appalachian Mountains. The Great Plains, rising gradually from east to west, are terminated abruptly by the Rocky Mountains, which rise along the entire westernmost extent of the plains. The Interior Lowlands occupy the remaining lowlying terrain west of the Appalachian Mountains; this includes both the "Corn Belt" of the United States and the Ontario Lowlands of Canada, two of the most productive agricultural areas in the world.

The Coastal Plain, generally submerged along the eastern seaboard of the United States, is characterized by inundated river basins and extensive sand formations and rises gradually along the Piedmont Uplands to meet the Appalachian escarpment. The remaining plains include the Florida Peninsula and continue westward to meet the lower extensions of the Great Plains and the Interior Lowlands before turning southward along the entire eastern seaboard of Mexico. The Appalachians extend southwestward from Newfoundland in Canada to Alabama in the United States. The Caribbean Islands (Antilles Arc) make up the remainder of the continent's land area and essentially comprise partly submerged mountain chains that extend eastward from Central America and northward from South America.

The Mississippi River basin, including its major tributaries, the Missouri and Ohio rivers, has an area of about 1,250,000 square miles (3,250,000 square km), occupies more than one-eighth of North America's total area, and accounts for about one-fifth of the continent's total runoff. Three major rivers, the Mackenzie, the Yukon, and the Nelson, have outlets north of 55° N latitude and combine to drain an area larger than that of the Mississippi; their combined runoff is nearly equal to the Mississippi's. The inland waterways provided by the Mississippi and its tributaries, together with that of the Great Lakes and the St. Lawrence River, are unequaled in the world. Roughly following the perimeter of the Canadian Shield, a chain of lakes, including the Great Bear, Great Slave, and Winnipeg lakes to the west and the five Great Lakes to the south, contains an immense quantity of fresh water; their combined area, including Lake Superior's 31,700 square miles (the largest surface area of any freshwater lake), is nearly equal to the total land area of Germany. The Columbia and Colorado rivers in the western United States have been harnessed for irrigation and hydroelectric power. The Rio Grande forms part of the boundary between Mexico and the United States.

Between the extreme climatic conditions of the humid tropical regimes in Central America and the bitterly cold Arctic deserts, generally temperate climatic conditions prevail from Hudson Bay through much of Mexico. While average annual temperatures vary primarily with latitude and elevation, precipitation patterns generally are more critical in determining regional climatic variations. The wet regions, with more than 65 inches (1,600 mm) of average precipitation (though this is often seasonal), are located for the most part along the northwestern Pacific coast, throughout much of Central America, and in the Dominican Republic among the Caribbean Islands. Extreme aridity (characterized by annual precipitation averaging less than 10 inches [250 mm] but often much less) is found in the western deserts stretching through the Great Basin region of the western and southwestern United States into northern Mexico (including Baja California) and in the extreme northern stretches of the continent, including most of the Arctic islands. Relatively humid regions (those experiencing between 50 and 65 inches [1,300 and 1,600 mm] of annual precipitation) lie in the southeastern United States and in much of the Caribbean. The Interior Lowlands and much of the Canadian Shield receive between 20 and 50 inches (500 and 1,300 mm). The Great Plains and most of northern Canada receive between 10 and 20 inches; much of this precipitation falls as snow and varies from year to year. Frost-free periods range from about 90 to 120 days along much of the U.S.-Canadian frontier and from about 240 to 270 days along the Mexican-U.S. frontier. Throughout most of Mexico and the Florida Peninsula, frost occurs in intermittent years (and then for only brief periods).

Across the far northern reaches of Canada and Alaska is found a vast marshy region of tundra vegetation. To the south of this, one of the world's largest areas of coextensive forests—the North American boreal forest (taiga)—stretches across northern Canada from Newfoundland to Alaska. Other forested regions include the Pacific coniferous forest along the Pacific coast from California to Alaska, containing immense redwoods and firs; the largely coniferous Cordilleran forest in the montaine regions of western North America; a variety of mixed broadleaved and coniferous forests in the east-central and southeastern parts of the continent; and the tropical rain forests of southern Mexico and Central America. The Great Plains and western Interior Lowlands, once covered by vast grassland prairies, now consist largely of farms and rangeland. Cacti, sagebrush, and mesquite grasses are typical of the western desert regions, while mangrove swamps are found along much of the Gulf Coast from Mexico to the well-known Everglades of Florida.

North American wildlife includes huge herds of caribou and packs of timber wolves in the far north; elk, mountain goats, and grizzly bears in the Mackenzie and Rocky mountains; moose and beaver throughout much of the Canadian Shield; such reptiles as alligators and snakes in the southeastern United States; and a variety of species in the Central American rain forests, including parrots, monkeys, exotic reptiles and amphibians, and leopards.

The people. Originally inhabited by Indians, North America long remained a sparsely settled and economically undeveloped land in global terms, but, with the coming of the Europeans (particularly the Spanish, French, and British) and the Africans they introduced as slaves, the continent underwent a profound transformation. The European colonizers regarded much of the continent as empty and waiting to be developed; hence, they bought out or pushed out the Indians and took over the country. The process of removing the Indians from their lands in the United States led to bitter disputes and to the creation of Indian "territories" that were eventually reduced to relatively small, isolated "reservations," most of which were located west of the Mississippi River. In Canada the system of reservations was adopted early and protected Indian settlements throughout the eastern part of the country, even in rich agricultural areas. Intermarriage between whites and Indians was much more common in Mexico than in the United States and Canada; mestizos, of mixed Indian and white descent, now account for some three-fifths of the Mexican population. European immigration to Central America has been negligible since the Spanish conquest, and Indians make up much of the population there (as high as 50 percent in Guatemala).

Canada's share of the total continental population is about 6 percent, and its overall population density is relatively low. A member of the Commonwealth, Canada's population is nearly half British in ancestry and more than three-fifths English-speaking. About one-fourth of the people can speak French, and about one-fifth habitually speak only French. Most of Canada's population is native-born, but immigration continues, with more non-British than British now settling there.

The United States dominates the continent with more than half of the total continental population. English is the official language, and, of the total U.S. population, about 12 percent is of predominantly African ancestry and about 9 percent is of Hispanic origin. The average population density is higher than that of Canada but is low in comparison with that of western Europe.

Mexico, the Caribbean, and Central America together have more than one-third of the continent's total population (Mexico alone has about one-fifth) and are growing rapidly. Birth rates have remained high, while death rates have dropped dramatically. Thus, the annual rate of population growth for most countries of the region is at least twice—and frequently more than three times—that of the United States.

The degree of health care varies from country to country. The continent's best health and sanitary conditions are found in Canada and the United States. Elsewhere, health conditions range from good in Bermuda, Costa Rica, Cuba, Grenada, Guadeloupe, Jamaica, and Martinique to extremely poor in Guatemala, Haiti, and Nicaragua. The leading cause of death in Canada and the United States is heart disease; in undeveloped countries such as Guatemala and Haiti, infectious and parasitic diseases continue to be the most crucial health problems. Because of a severe shortage of doctors, many of the sick in El Salvador, Guatemala, Haiti, and Honduras receive little or no modern medical care. Infant mortality is highest in Haiti, Nicaragua, Guatemala, and the Dominican Republic and lowest in Canada, Cuba, and the United States. Life expectancy in North America ranges from more than 75 years in Canada, Cuba, Costa Rica, Dominica, and the United States to less than 65 years in Guatemala, Haiti, and Nicaragua.

The economy. North America has a mixture of developed economies (Canada and the United States), partly developed economies (Mexico, much of Central America, and the larger Caribbean islands), and developing economies (the remaining nations). This range of economic development is reflected in a comparable range of gross national products (GNPs) per capita: included in the continent are countries with some of the world's highest rates (Bermuda, the United States, and Canada) and countries with rates among the world's lowest (Haiti, Nicaragua, and Honduras). The GNPs of the developed nations stem mainly from manufacturing and services, while in the partly developed and developing nations, mining or agriculture are the principal components. The economy of the United States is larger than those of all the other countries of North America combined.

North America has adequate reserves of most metallic resources and the world's largest reserves of cadmium, copper, lead, molybdenum, silver, and zinc. The continent almost totally lacks chromite, manganese, platinum, rutile, tantalium, and tin, all necessary for technologically advanced industries. North America's estimated reserves of petroleum and natural gas each represent about one-tenth of estimated global reserves. It is also estimated to have about one-fourth of the world's economically recoverable coal and a substantial proportion of its uranium. North America's installed hydroelectric capacity represents about one-third of the world total.

North America's arable land accounts for about one-eighth of the continent's total land area. Favoured with excellent soils and relatively stable weather patterns, much of the continent's cropland is among the world's most productive.

North America is the world's leading food producer, largely because of mechanized and scientific farming that predominates in the United States and Canada. Irrigation is important in the western United States, Mexico, and Cuba. The continent produces about one-fifth of the world's cereal crops and leads in corn (maize), soybeans, and grapefruit. It also ranks high in the production of wheat, barley, oats, rice, sorghum, sugarcane and sugar beets, potatoes, tomatoes, cotton, bananas and plantains, grapes, oranges, lemons, limes, dry beans, sunflower seeds, and peanuts (groundnuts). Processing of other important agricultural products yields raw and refined sugar, wine, and tobacco products.

Pastures occupy approximately one-sixth of the continent's total land area and are found principally in Canada, the United States, and Mexico. Dairying is an important industry in Canada and the United States, which are exporters of dairy products; beef and pork production is important in Canada, the United States, and Mexico. In the smaller nations, dairying and meat production are mainly domestic subsistence enterprises and often fail to meet domestic needs, thereby necessitating imports.

Although North America's forests are greatly diminished from their presettlement extent, they still cover about one-third of the total land surface. Canada, the United States, Mexico, Guatemala, Honduras, Nicaragua, Costa Rica, El Salvador, Cuba, and Haiti are timber producers. The continent accounts for about one-fifth of the world's annual lumber production and is a net exporter of roundwood. The United States and Canada are major world producers of pulpwood, sawed wood, wood paneling, plywood, and paper products.

Every North American nation has a maritime coast, and fishing is important throughout the continent. The United States, Canada, and Mexico rank among the world's leading fishing nations. Many of the smaller Caribbean nations depend on fish and shellfish for export income.

Mining and quarrying are important throughout most of the continent. Fossil-fuel production includes coal, natural gas, and petroleum and is concentrated in Canada, the United States, Mexico, Guatemala, and Trinidad and Tobago; the remaining nations lack these minerals and must import their energy fuels. The continent outranks the rest of the world combined in (among other minerals) lithium, molybdenum, uranium, and magnesium output and mines one-fifth or more of the world's total production of phosphates, selenium, potash, nickel, silver, ilmenite (titanium ore), bismuth, lead, zinc, tellurium, copper, fluorspar, and cadmium. Nearly all of these are produced by the United States, Canada, and Mexico; the only other significant mineral producers on a global scale are Jamaica (bauxite) and Cuba (cobalt and nickel).

Manufacturing is of major importance in developed North America, where the heavy and technologically complex industries are concentrated, while lighter industries and agricultural industries predominate in most of the smaller countries. In the late 20th century, Canada and the United States—while remaining important manufacturers of basic metals, machinery, transportation equipment, petrochemicals, plastics, consumer appliances, and cotton textiles and clothing—increasingly shifted toward aerospace, electronics, communications, and computer and software manufacture. Financial services, insurance, and legal services also grew rapidly, while some traditional heavy industries such as shipbuilding and steelmaking stagnated or declined. The developing countries expanded their traditional manufacturing industries as markets opened in the developed nations.

Tourism from both abroad and within the continent is an important source of income, especially to the smaller Caribbean nations. Most of the Caribbean islands, Mexico, Hawaii, Florida, and California all draw winter visitors from the United States, Canada, and Europe. The mainland United States and Canada have fine winter sports facilities and numerous historic sites, scenic national parks, and natural wonders.

The continent's transportation network is well developed in most of the United States and Canada and fairly well-developed in most of Central America and the Caribbean. The continent's inland waterways are found mainly in the United States, Canada, Mexico, and Nicaragua. The most important waterways are the St. Lawrence–Great Lakes system, which serves Canada and the United States, and the Panama Canal, which connects the Atlantic and Pacific oceans.

The continent has a widely contrasting trade pattern, involving Canada, a major exporter of food, raw materials, and manufactured goods; the United States, an important food and manufactured-product exporter but also a major importer of fuels, raw materials, and manufactured goods; and the oil-exporting nations of Mexico and Trinidad and Tobago and the bauxite exporter, Jamaica. The Bahamas and Panama are major international centres for banking and financial services. The remaining nations of Central America and the Caribbean depend heavily on specialized tropical crops, timber, textiles, and fish exports and must import many of their manufactured goods. There is significant regional trade and development aid between the smaller nations and Canada and the United States. Membership in the Caribbean Community and Common Market (Caricom) or the Commonwealth or overseas departmental status with France opens wider markets for the smaller nations and places them in a better position to compete with the large, developed nations.

Cultural background. North America can be divided into five cultural regions (north to south): Canadian, American (U.S.), Mexican, Caribbean, and Central American. In Canada the English Canadian culture dominates life in all the provinces except Quebec, where a separate French culture has remained active. In the United States a distinctively American culture has developed from the admixture of British and other European influences, the country's own frontier heritage, and cultural strains from Latin America, Africa, and Asia. In Mexico the arts have been shaped by both Spanish and Indian cultural heritages. In spite of the divergencies in ancestry, language, and history, the island countries of the Caribbean share many elements of a common culture, the result of their often parallel experiences as plantation colonies of African and Asian labourers dominated by distant European economic and political powers. Central America's cultural life has been largely shaped by Indian, Spanish, and black African cultures.

Education is compulsory in all North American countries. Enrollment ratios for primary-school-age children exceed 95 percent in The Bahamas, Canada, Cuba, Jamaica, Mexico, and the United States, and at the secondary level in these same countries (except Mexico), the enrollment ratios exceed 60 percent. The lowest ratios for primary-school-age children in North America are found in Guatemala, El Salvador, and Haiti, which have a shortage of teachers and school facilities. The continent has many major institutions of higher learning; among the best known are the National Autonomous University of Mexico, the University of Toronto and McGill University in Canada, and Harvard, Yale, Princeton, and Stanford universities and the University of Chicago, as well as major state university systems, such as the University of California, in the United States.

Freedom of the press in North America is confined to democratically governed states such as Canada, Costa Rica, and the United States. The freest and most influential press (including the broadcast media) operates in the United States, where freedom of the press is guaranteed by the Constitution and where the news media often serve as a check upon government power. Canada's press, including its government-owned broadcast media, also is free. By contrast, the press in Cuba generally espouses the policies and positions of the government. In El Salvador, Guatemala, and Mexico, the media, though privately owned, seldom criticize government actions.

History. North America's first inhabitants, the American Indians, are believed to have come from Asia, mostly by way of the Bering Strait land bridge, out of eastern Siberia. Their migrations probably originated anywhere from 35,000 to 20,000 years ago, during the last interglacial period. These migrants remained Stone Age hunters and fishermen for millennia; indeed, a number of them were still in this state when the first Europeans saw them.

The greatest North American pre-Columbian civilizations were in Meso-America. The Olmec were the earliest, dating from about 1150 BC. Olmec civilization developed in what is now southern Veracruz and Tabasco states, Mexico, and became best known for its sculpture. The Maya of Guatemala and the Yucatán Peninsula (300 BC–AD 900) possessed one of the greatest civilizations of the Western Hemisphere. They built large stone buildings and pyramid temples, worked gold and copper, developed a precise calendar, and used hieroglyphic writing. The Toltec (*c.* 10th to 12th century) are believed to have built a large empire in north-central Mexico, which by the 14th century had become the empire of the Aztec, centred on the city of Tenochtitlán (now Mexico City). All of these Meso-American peoples had highly developed cultures. The Aztec, however, were no match for the technologically superior Spaniards, who by the mid-16th century had conquered all of Meso-America.

The population of pre-Columbian Mexico and Central America has been estimated at between 5,000,000 and 10,000,000, that of North America north of Mexico at between 1,000,000 and 4,000,000. The Indians north of Mexico did not develop intensive agriculture or an urban way of life, but various semisedentary peoples had established villages; and, among the Cherokee and the Iroquois, powerful federations of tribes had arisen by the time of European contact.

The European discovery of America resulted from a desire to find a western water route to the Orient. When it became obvious that North America stood in the way of this objective, the continent attracted the attention of those European powers interested in empire and mercantile trade. The Spaniards were the first to colonize the New World beginning early in the 16th century. The French established their first colony at Port Royal in Nova Scotia in 1605, the British at Jamestown in 1607. Both the Dutch and the Swedes set up short-lived colonies, and the Russians settled Alaska in the late 18th century. The British colonized the Eastern Seaboard of what is now the United States, while the French settled eastern portions of present-day Canada. The British became supreme in all of northern North America after defeating the French militarily in 1763 in the French and Indian War. The British were, in turn, evicted by the 13 colonies that officially became the United States of America in 1783. Canada remained in British hands until independence in 1926, and independence from Spain for Mexico and Central America came in 1821. By the time the westward-moving Americans had formally acquired the northern portion of Mexico in 1848, the current political boundaries of North America, for the most part, were established. The North American style of life became Latin American (Hispanic) south of the Rio Grande and Anglo-American to the north, with enclaves of French influence in Quebec (Canada) and Louisiana (U.S.). Slavery, carried on between the 16th and 19th century, and its legacy added a significant minority culture of African origin, particularly in the United States and the Caribbean islands.

The United States industrialized during the late 19th and early 20th centuries, and, by the end of World War II, it had become the wealthiest and most powerful nation in the world. The United States' huge economy, abundant natural resources, large population, and military might gave North America and its peoples considerable global influence.

The nations of North America have sought hemispheric unity as members of the Organization of American States (OAS), a group whose membership also includes South American countries. The OAS aims to strengthen the security of the Western Hemisphere and promote the peaceful settlement of disputes among member states.

Two North American countries—Canada and the United States—project military power beyond the continent. Canada maintains troops in western Europe as part of a commitment to the North Atlantic Treaty Organization (NATO). The United States, which possesses a large and sophisticated nuclear-weapons force, is the linchpin of NATO and maintains troops in western Europe, Japan, and South Korea.

North American Desert, ecological complex in western North America that basically consists of an arid region lying in the rain shadow of the Pacific mountain system to the west and bounded by the Rocky Mountains to the east. The North American Desert extends nearly 2,000 miles (3,200 km) from northern Mexico to southern Oregon and Idaho. Estimates of its size range from 500,000 square miles (1,300,000 square km) to 730,000 square miles (1,900,000 square km).

A brief treatment of the North American Desert follows. For full treatment, *see* MACROPAEDIA: North America.

The North American Desert is actually a complex of desert plains or basins that are separated from each other by north–south-trending mountain ranges or other types of terrain. The North American Desert can be subdivided into regions of cold mid-latitude (north) and hot mid-latitude desert (south). The Great Basin Desert is classified as a cold mid-latitude desert. It includes the Great Sandy Desert of southeastern Oregon, the Snake River Plains of southern Idaho, nearly all of Nevada, most of Utah, and the Painted Desert of northern Arizona and the Red Desert of southern Wyoming (the latter two considered extensions of the Great Basin Desert).

Around the southern end of the Sierra Nevada the Great Basin Desert of Nevada merges into the hot mid-latitude desert region characterized by the Mojave (Mohave) Desert, which is bounded on the south and southeast by the arid Sonoran Desert. From the coast of western Mexico to the east, the Sonoran Desert extends inland to blend into the southern Arizona Upland Desert. Farther east is the Chihuahuan Desert, stretching across the Mexican states of Chihuahua, Coahuila, and San Luis Potosí.

Because of long periods of erosion, the landforms of the North American Desert are characteristically sharp and angular and contain some beautiful scenery. Most of the soils are aridisols (a dry-soil group), but local variations occur. The vegetation of the North American Desert includes xerophytes, sagebrush, saltbrush, Joshua tree, and creosote bush. The Arizona Upland Desert is noted for the giant saguaro cactus. Fauna include coyote, bobcat, fox, skunk, and various lizards and snakes.

North American Free Trade Agreement (NAFTA), trade pact signed in 1992 that would gradually eliminate most tariffs and other trade barriers on products and services passing between the United States, Canada, and Mexico. The pact created a free-trade bloc among the three largest countries of North America.

NAFTA was inspired by the success of the European Community in eliminating tariffs in order to stimulate trade among its members. A Canadian-U.S. free-trade agreement was concluded in 1988, and NAFTA basically extended this agreement's provisions to Mexico. NAFTA was negotiated by the administrations of U.S. president George Bush, Canadian prime minister Brian Mulroney, and Mexican president Carlos Salinas de Gortari. Preliminary agreement on the pact was reached in August 1992, and it was signed by the three leaders on Dec. 17, 1992. NAFTA was ratified by the three countries' national legislatures in 1993 and went into effect on Jan. 1, 1994.

NAFTA's main provisions called for the gradual reduction of tariffs, customs duties, and other trade barriers between the three members, with some tariffs being removed immediately and others over periods of as long as 15 years. NAFTA ensured eventual duty-free access for a vast range of manufactured goods and commodities traded between the signatories. Other provisions were designed to give U.S. and Canadian companies greater access to Mexican markets in banking, insurance, advertising, telecommunications, and trucking.

North American Nebula (catalog number NGC 7000), ionized-hydrogen region in the constellation Cygnus. The nebula is a cloud of interstellar gas ionized from within by young, hot stars. Interstellar dust particles in part of this cloud absorb the light emitted by recombining atoms. The shape of the nebula roughly resembles that of North America, with the dusty region being shaped like the Gulf of Mexico. The North American Nebula is approximately 700 parsecs (2,300 light-years) from the Sun. It has a diameter of about 20 parsecs (65 light-years) and a total mass equal to 8,000 solar masses.

North American Review, American magazine (1815–1940), one of the country's leading literary journals of the 19th and 20th centuries. Founded in Boston, Mass., under the auspices of the *Monthly Anthology* (1803–11), it began publication as a regional magazine, reflecting the intellectual ideas and tastes of Boston and New England. The poet William Cullen Bryant's first contribution to the review, "Thanatopsis" (1817), made him famous. Other early contributors included Daniel Webster, John Adams, Henry Wadsworth Longfellow, and Francis Parkman.

The *North American Review* had become somewhat dull by midcentury but regained its prestige under the editorships of James Russell Lowell (1863–72) and Henry Adams (1872–76). In 1877 it was purchased by Allen Thorndike Rice, who served as editor until his death in 1889. Rice moved the review to New York City and transformed it into a national periodical dealing with contemporary issues, affairs, and movements. It became noted for its critical influence and outstanding writing concerning social and political issues. William Dean Howells, Walt Whitman, and Henry James contributed to the magazine, which attained a peak circulation of 76,000 in 1891. By the turn of the century the review's diverse contributors included William Gladstone, Oliver Wendell Holmes, Mark Twain, and H.G. Wells. The magazine's circulation fell after World War I, however, and in 1935 it was sold to Joseph Hilton Smyth, under whose editorship it ceased publication in 1940.

In 1964, with the consent of the remaining members of the North American Review Corporation, the review was revived by Robert Dana at Cornell (Iowa) College. Publication was moved in 1968 to the University of Northern Iowa in Cedar Falls.

North Aslian languages: *see* Jahaic languages.

North Atlantic Current, also called NORTH ATLANTIC DRIFT, part of a clockwise-setting ocean-current system in the North Atlantic Ocean, extending from southeast of the Grand Bank, off Newfoundland, Canada, to the Norwegian Sea, off northwestern Europe. It constitutes the northeastward extension of the

Gulf Stream; the latter issues from the Gulf of Mexico and gradually emerges as the North Atlantic Current in mid-ocean. It is composed of several broad currents with speeds of about 0.2 knots, as compared with the Gulf Stream's rather concentrated flow at 1 to 6 knots. Major branches of the current include the Irminger, Norway, and Canary currents (*qq.v.*).

North Atlantic Treaty Organization (NATO), military alliance established in April 1949 by the North Atlantic Treaty (also called the Washington Treaty) as a counterweight to the Soviet Union. Its members include Belgium, Canada, the Czech Republic, Denmark, France, Germany (West Germany, 1955–90), Greece, Hungary, Iceland, Italy, Luxembourg, The Netherlands, Norway, Poland, Portugal, Spain, Turkey, the United Kingdom, and the United States. All were original signatories except Greece and Turkey (February 1952), Germany (May 1955), Spain (May 1982), and the Czech Republic, Hungary, and Poland (March 1999). France withdrew from the integrated military command of NATO in 1966, but it remained a member of the organization.

The heart of NATO is Article 5, in which the signatory members agree that "an armed attack against one or more of them in Europe or North America shall be considered an attack against them all" and pledge to assist any member that is attacked. NATO invoked Article 5 for the first time in 2001, after terrorist attacks destroyed the World Trade Center in New York City and part of the Pentagon outside Washington, D.C., killing some 3,000 people. Article 6 defines the geographic scope of the treaty as covering "an armed attack on the territory of any of the Parties in Europe or North America."

Historical background. After World War II, western Europe was economically exhausted and militarily weak (the western Allies had rapidly and drastically reduced their armies at the end of the war), and newly powerful communist parties had arisen in France and Italy. By contrast, the Soviet Union emerged with its armies dominating the states of central and eastern Europe, and by 1948 Moscow-sponsored communists had consolidated their control of those countries and suppressed all noncommunist political activity. What became known as the Iron Curtain, a term popularized by Winston Churchill, had descended over central and eastern Europe. Further, wartime cooperation between the western Allies and the Soviets had completely broken down. Each side was organizing its own sector of occupied Germany, so that two German states would emerge, a democratic one in the west and a communist one in the east.

In 1948 the United States launched the Marshall Plan (*q.v.*), which infused massive amounts of economic aid to the countries of western and southern Europe. Under the Brussels Treaty of 1948, the United Kingdom, France, and the Low Countries concluded a collective-defense agreement called the Western European Union. It was soon recognized, however, that a more formidable alliance would be required to provide an adequate military counterweight to the Soviets.

By this time Britain, Canada, and the United States had already engaged in secret talks on security arrangements that would serve as an alternative to the United Nations (UN), which was becoming paralyzed by the rapidly emerging Cold War. In March 1948, following a virtual communist coup d'état in Czechoslovakia in February, the three governments began discussions on a multilateral, collective-defense scheme to enhance western security and promote democratic values. France, the Low Countries, and Norway eventually joined these discussions, which in April 1949 resulted in the North Atlantic Treaty.

Organization. Spurred by North Korea's invasion of South Korea in 1950, the United States sought to demonstrate that it would resist any Soviet military expansion or pressures in Europe. General Dwight D. Eisenhower, the Allied leader in western Europe in World War II, was named Supreme Allied Commander Europe (SACEUR) by the North Atlantic Council (NATO's governing body) in December 1950. He was followed as SACEUR by a succession of American generals.

The North Atlantic Council, which was established soon after the treaty came into effect, is composed of ministerial representatives of the member states, who meet at least twice a year. At other times the council, chaired by the NATO secretary-general, remains in permanent session at the ambassadorial level.

NATO's military organization encompasses a complete system of commands for possible wartime use. The Military Committee, consisting of representatives of the military chiefs of staff of the member states, subsumes two major commands: the European Command, headed by the SACEUR and located at Supreme Headquarters Allied Powers Europe (SHAPE) in Casteau, Belg.; and the Atlantic Command, headed by the Supreme Allied Commander Atlantic (SACLANT) and headquartered in Norfolk, Va., U.S. A third major command, the Channel Command (for the English Channel), was headed by the Commander in Chief Channel (CINCHAN) until it was disbanded in 1994.

During the alliance's first 20 years, more than $3 billion worth of "infrastructure" for NATO forces—bases, airfields, pipelines, communications networks, depots—was jointly planned, financed, and built. NATO funding generally is not used for the procurement of military equipment, which is provided by the member states—though the NATO Airborne Early Warning Force, a fleet of radar-bearing aircraft designed to protect against a surprise low-flying attack, was funded jointly.

The role of Germany. A serious issue confronting NATO in the early and mid-1950s was the negotiation of West Germany's participation in the alliance. The prospect of a rearmed Germany was greeted with unease and hesitancy in western Europe, but the country's strength had long been recognized as necessary to protect western Europe from a possible Soviet invasion. Accordingly, arrangements for West Germany's "safe" participation in the alliance were worked out as part of the Paris Agreements of October 1954, which ended the occupation of West German territory by the western Allies and provided for both the limitation of West German armaments and the country's accession to the Brussels Treaty. In May 1955 West Germany joined NATO, prompting the Soviet Union to form the Warsaw Pact (*q.v.*) alliance the same year. The West Germans subsequently contributed many divisions and substantial air forces to the NATO alliance. By the time the Cold War ended, some 900,000 NATO troops were stationed in West Germany.

The role of France. France's relationship with NATO became strained after 1958, as President Charles de Gaulle increasingly criticized the organization's domination by the United States and the intrusion upon French sovereignty by NATO's many international staffs and activities. He argued that such "integration" subjected France to "automatic" war at the decision of foreigners. In July 1966 France formally withdrew from the military command structure of NATO and required NATO forces and headquarters to leave French soil; nevertheless, de Gaulle proclaimed continued French adherence to the treaty in case of "unprovoked aggression." After NATO moved its headquarters from Paris to Brussels, France maintained a liaison relationship with NATO's integrated military staffs, continued to sit in the council, and continued to maintain and deploy ground forces in West Germany, though it did so under bilateral agreements with the West Germans rather than under NATO jurisdiction.

NATO during the Cold War. From its founding, NATO's primary purpose was to unify and strengthen the western Allies' military response to a possible Soviet-led invasion of western Europe. In the early 1950s NATO relied partly on the threat of massive nuclear retaliation from the United States to counter the Warsaw Pact's much larger ground forces. Beginning in 1957, this policy was supplemented by deploying American nuclear weapons in western European bases. NATO later adopted a "flexible response" strategy, which the United States interpreted to mean that a war in Europe did not have to escalate to an all-out nuclear exchange. Under this strategy, many allied forces were equipped with American battlefield and theatre nuclear weapons under a dual-control (or "dual-key") system, which allowed both the country hosting the weapons and the United States to veto their use. Britain retained control of its strategic nuclear arsenal but brought it within NATO's planning structures; France's nuclear forces remained completely autonomous.

A stalemate between the two sides continued from the 1960s through the mid-1980s. After 1985, however, far-reaching economic and political reforms introduced by Soviet leader Mikhail Gorbachev fundamentally altered the status quo. In July 1989 Gorbachev announced that Moscow would no longer prop up Europe's communist governments, thereby signaling his tacit acceptance of their replacement by freely elected (and noncommunist) administrations. Moscow's abandonment of control over central and eastern Europe meant the dissipation of much of the military threat that the Warsaw Pact had posed to western Europe, especially after the Warsaw Pact's dissolution in 1991. The reunification of Germany in October 1990 and its retention of NATO membership created both a need and an opportunity for NATO to be transformed into a more "political" alliance devoted to maintaining international stability in Europe.

NATO in the post-Cold War era. After the Cold War, NATO was reconceived as a "cooperative-security" organization whose mandate included two main objectives: to foster dialogue and cooperation with former adversaries in the Warsaw Pact and to "manage" conflicts in areas on the European periphery, such as the Balkans. In keeping with the first objective, NATO established the North Atlantic Cooperation Council (1991; later replaced by the Euro-Atlantic Partnership Council) to provide a forum for the exchange of views on political and security issues, as well as the Partnership for Peace (PfP) program (1994) to enhance European security and stability through joint military training exercises with NATO and non-NATO states, including former Soviet republics and allies. Special cooperative links were also set up with two PfP countries: Russia and Ukraine.

The second objective entailed NATO's first use of military force, when it entered the war in Bosnia and Herzegovina in 1995 by staging air strikes against Bosnian Serb positions around the capital city of Sarajevo. The subsequent Dayton Accords, which were initialed by representatives of Bosnia and Herzegovina, the Republic of Croatia, and the Federal Republic of Yugoslavia, committed each state to respect the others' sovereignty and to settle disputes peacefully and laid the groundwork for stationing NATO peacekeeping troops in the region. A 60,000-strong Implementation Force (IFOR) was initially deployed, though a smaller contingent remained in Bosnia under a different name, the Stabilization Force (SFOR). In March 1999 NATO launched massive air strikes against Serbia in an attempt to force the Yugoslav government of Slobodan Milošević to accede to diplomatic provisions designed to protect the predominantly Muslim Albanian population in the province of Kosovo. Under the terms of a negotiated settlement, NATO deployed a peacekeeping force called the Kosovo Force (KFOR).

The Kosovo crisis gave renewed impetus to efforts by the European Union (EU) to construct a new crisis-intervention force to make the EU less dependent on NATO and U.S. military resources. These efforts prompted significant debates about whether enhancing the EU's defensive capabilities would strengthen or weaken NATO. Simultaneously, some observers argued that NATO should be dissolved, noting that it was created to confront an enemy that no longer existed; others called for a broad expansion of NATO membership to include Russia. Most suggested alternative roles, including peacekeeping.

During the 1990s the United States led an initiative to enlarge NATO membership gradually to include some of the former Soviet allies. Supporters of the initiative argued that NATO membership was the best way to begin the long process of integrating these states into regional political and economic institutions such as the EU. Opponents pointed to the enormous cost of modernizing the military forces of new members; they also argued that enlargement, which Russia would regard as a provocation, would hinder democracy in that country and enhance the influence of hardliners. Despite these disagreements, Poland, the Czech Republic, and Hungary joined NATO in 1999, and the alliance agreed to revisit the question of enlargement again in 2002. (D.G.H.)

North Auckland Peninsula, peninsula of northern North Island, New Zealand, nearly coextensive with Northland (*q.v.*) local government region.

North Bay, city, seat of Nipissing district, southeastern Ontario, Canada. It lies 224 miles (360 km) north of Toronto. Named for its location on the northern bay of Lake Nipissing, the city originated as a rail yard on the Canadian Pacific Railway in 1882. It is now the southern terminus and head office of the Ontario Northland Railway and a major station on two transcontinental rail lines. Owing to these transportation links, North Bay has become an important wholesale- and retail-distributing centre and a popular summer resort. The city's industries include lumbering, dairying, and fur processing. It is the site of a large air base and Canada's first missile base. Inc. 1925. Pop. (1996) 54,332.

North Brabant (The Netherlands): *see* Noord-Brabant.

North Canadian River, main tributary of the Canadian River in the south-central United States. It rises in a high plateau in Union county, New Mexico, and flows east through the Texas and Oklahoma panhandles past Oklahoma City, joining the Canadian River in Eufaula Reservoir, below Eufaula, Okla. The North Canadian River is 800 miles (1,287 km) long and drains 14,290 square miles (37,011 square km). Above the mouth of Wolf Creek, one of its tributaries, the North Canadian is also known as Beaver River.

North Cape Current, oceanic surface current, the northernmost extension of the Norway Current (a part of the North Atlantic Current), bathing the northern coasts of Norway, Finland, and Russia's Kola Peninsula. Characterized by warm temperatures (39°-54° F [4°-12° C]) and average oceanic salinity (34-35 parts per 1,000), the current flows at speeds of about 0.5-0.8 knot, but it becomes colder and less saline as it enters the Barents Sea of the Arctic Ocean before separating into many branches. This combination produces a very unstable climate with many storms; at the same time, the higher temperatures of the current's waters produce more temperate winters and high precipitation.

North Carolina, constituent state of the United States of America, in the southeastern part of the country. It is bounded on the north by Virginia, on the east by the Atlantic Ocean, on the south by South Carolina and Georgia, and on the west by Tennessee. The state capital is Raleigh.

A brief treatment of North Carolina follows. For full treatment, *see* MACROPAEDIA: United States of America: *North Carolina.*

The first permanent white settlement in North Carolina was made in the 1650s when settlers from Virginia arrived in the Albemarle Sound area. In 1663 the English king Charles II issued a charter that established Carolina as a proprietary colony. The northern part of the Carolina colony was known as Albemarle until 1691, when it was renamed North Carolina and given a deputy governor, who ruled from Charleston. In 1712 the colony was officially divided in two, and North Carolina was given its own governor. The colony reverted to royal status in 1729, and the boundary with South Carolina was fixed in 1735. Growth accelerated after 1729. The Battle of Guilford Court House (1781) was a strategic victory for the Americans during the Revolution. North Carolina reluctantly seceded from the Union in 1861 and was readmitted in 1868.

North Carolina is divided into three physiographic regions. The Coastal Plain, constituting 45 percent of the state, is a gently rolling plain and swampy tidewater close to the Atlantic coast. The Piedmont Plateau, another 45 percent of the state's area, is west of the Coastal Plain and is characterized by rolling, forested hills. The southern extension of the Appalachian mountain system in the far west of the state includes the parallel, northeast-southwest–trending Blue Ridge and Great Smoky ranges and associated high intermontane plateaus.

North Carolina has warm summers and mild winters. Its average annual temperatures range from 66° F (19° C) in the east to 60° F (16° C) in the central region and 55° F (13° C) in the mountains. Annual rainfall averages 46–54 inches (1,170–1,370 mm) in coastal areas, 44–50 inches (1,118–1,270 mm) in the Piedmont, and 40–80 inches (1,015–2,030 mm) in the mountains.

The original Native American inhabitants of North Carolina were primarily Cherokee peoples. Though forcibly removed from the state in the 1830s, about 13,000 Cherokees (of some 80,000 Native Americans) resided in North Carolina in the late 20th century. The state has the largest Native American population of any state east of the Mississippi River. The early European immigrants were a heterogeneous group, representing a variety of religious faiths and nationalities. African Americans represented 33 percent of the population in 1790 but only 22 percent in 2000, a decline attributable to continued emigration. The population has grown faster than the national average, and in 2000 North Carolina had the 11th largest population among the states in the Union. The population is almost half rural.

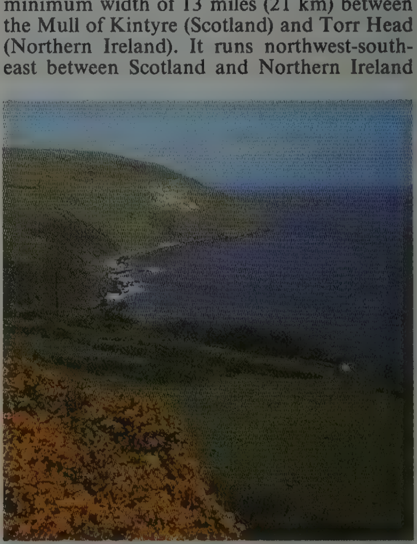
Agriculture remains important. Its principal crops include tobacco, sweet potatoes, corn (maize), soybeans, and peanuts (groundnuts). Forest products are employed in the construction of furniture and as a source of pulp and paper. The state has one of the nation's largest phosphate reserves. Tourism is also an important source of revenue. North Carolina's industrial output was eighth in the nation in the early 1990s. The major industries include textiles, tobacco, electrical equipment, metalworking, chemicals, plastics, and food processing. North Carolina has two Atlantic ports and a large trucking fleet; the state is one day's trucking time from New York and Florida.

The North Carolina Museum of Art and the North Carolina Symphony were the first state-supported institutions of their type in the nation. The University of North Carolina at Chapel Hill (1789) is the oldest state-supported university in the country. Duke University (1838) at Durham is a prestigious centre of higher education. Area 52,672 square miles (136,420 square km). Pop. (2000) 8,049,313.

North Cascades National Park, national park in northwestern Washington, U.S. The park was established in 1968 to preserve majestic mountain scenery, snowfields, glaciers, alpine meadows, and other unique natural features in the northern part of the Cascade Range. Formed of durable granites and related rocks, the northern Cascades have elevations mostly between 8,000 and 9,000 feet (2,440 and 2,740 m). The Ross Lake National Recreation Area separates the park into two sections, the northern unit extending to the Canadian border and the southern unit adjoining the Lake Chelan National Recreation Area. The park covers an area of 789 square miles (2,043 square km).

North Celebes (Indonesia): *see* Sulawesi Utara.

North Channel, strait linking the Irish Sea with the North Atlantic Ocean and reaching a minimum width of 13 miles (21 km) between the Mull of Kintyre (Scotland) and Torr Head (Northern Ireland). It runs northwest-southeast between Scotland and Northern Ireland and includes the larger Arran and Gigha islands and the smaller Ailsa Craig. The Scottish coast of the channel is deeply indented by the Sound of Jura, Kibrannan Sound, and the Firth of Clyde, and the Irish coast by the Belfast Lough.



The North Channel coast south of Torr Head, Northern Ireland

© Michael Jennet/Robert Harding Picture Library

North Channel, northern arm of Lake Huron in south-central Ontario, Canada, lying between the Ontario mainland (north) and the islands of Manitoulin, Cockburn, and Drummond (south). It is 120 miles (195 km) long and 1 to 20 miles (1.6 to 32 km) wide. The channel is connected on the west with St. Marys River (via St. Joseph Channel) and on the east with Georgian Bay. Many small islands lie within the channel. A road and rail bridge extends from the mainland to Great Cloche Island before crossing to Manitoulin Island at the town of Little Current.

North Chicago, city, Lake county, northeastern Illinois, U.S., on Lake Michigan. A wire-manufacturing plant was established there in 1891, and other industries soon followed. A strike at a plant in 1937 led to a major U.S. Supreme Court ruling in 1939 (*National Labor Relations Board* v. *Fansteel Metallurgical Corporation*) declaring sit-down strikes illegal. The city is a centre of pharmaceutical research and production. Great Lakes Naval Training Center and a Veterans Administration Hospital are to the south. Inc. 1909. Pop. (2000) 35,918.

North China Plain, Wade-Giles romanization HUA-PEI P'ING-YÜAN, Pinyin HUABEI PINGYUAN, also called YELLOW PLAIN, large alluvial plain of eastern Asia, built into the Yellow Sea by deposits of the Huang Ho (Yellow River) and a few other, comparatively minor rivers of eastern China. Covering an area of about 158,000 square miles (409,500 square km), most of which is less than 160 feet (50 m) above sea level, it is one of the most densely populated areas in the world and, since earliest history, has been a major focus of Chinese (Han) culture. It is bordered on the north by the Yen Mountains, on the west by the T'ai-hang Mountains and the Honan highlands, and on the southwest by the T'ung-pai and Ta-pieh mountains. To the south it merges into the Yangtze Plain. From northeast to southeast it fronts the Po Hai (Gulf of Chihli), the hills of Shantung Peninsula, and the Yellow Sea. Most of the rivers flow across the plain on elevated beds that are above the interstream regions. Throughout most of history, in about two years out of three, widespread flooding was common on the plain. After 1949, however, large-scale projects for flood control and irrigation were built. Wheat, cotton, sesame seed, peanuts (groundnuts), and tobacco are raised. Sea salt is sun-dried along the coast. Peking, the national capital, is located on the northwest edge of the plain, and Tientsin, an important industrial city and commercial port, is situated near the northeast coast. The Grand Canal, beginning at Peking, crosses the eastern part of the plain to the south and southeast.

North Chŏlla (South Korea): *see* Chŏlla-puk.

North Ch'ungch'ŏng (South Korea): *see* Ch'ungch'ŏng-puk.

North College Hill, city, Hamilton county, extreme southwest Ohio, U.S., residential northern suburb of Cincinnati. The first settler, probably Gershom Gard, arrived in 1795. In 1916 three subdivisions in the "Clovernook" area east of Hamilton (Meyersville, Sunshine, and Clovernook) combined to become the village of North College Hill, so named for the now-closed Farmers' College, founded in 1846 in nearby College Hill by Freeman Grant Cary. It achieved city status in 1940. The Clovernook Center for the Blind (1903) is in the northern part of the city. Pop. (2000) 10,082.

North Cornwall, district, administrative county of Cornwall, southwestern England, in the northeastern part of the county. Most of the district lies within the historic county of Cornwall, but an area extending west from Werrington along the River Otter belongs to the historic county of Devon. North Cornwall district is an area of elevated, open terrain. Bodmin Moor, a bleak granite intrusive 800 to nearly 1,400 feet (240 to 425 m) high, having only grass cover because of high winds and infertile soils, is at the centre of the southern border. A lower, rolling landscape comprising sedimentary soils suitable for fodder crops and the rough grazing of dairy cattle characterizes the southeast and southwest. The northern coast, 50 miles (80 km) long, is a wild, surf-beaten line of steep cliffs.

The small coastal resorts of Padstow, Bude, Boscastle, and Tintagel cater to rock climbers and hikers. The village of Tintagel is, according to legend, the birthplace of King Arthur. The slate quarry at Delabole, 3 miles (5 km) south of Tintagel, has been worked continuously since the reign of Henry VII (1457–1509) to provide roofing stone for most of Cornwall. Bodmin, the district seat, and Launceston are agricultural and light industrial centres. Both, at different times, were the seat of the county of Cornwall. Many prehistoric monoliths are found in the Bodmin Moor between Bodmin and Launceston. Fruits and vegetables are grown along Cornwall's eastern border. A transatlantic telephone cable extends from Widemouth Bay, near Bude in the extreme north, to Canada and the United States. Area 461 square miles (1,195 square km). Pop. (1998 est.) 80,700.

North Dakota, constituent state of the United States of America, lying in the west north-central United States, bounded on the east by Minnesota, on the south by South Dakota, on the west by Montana, and on the north by the Canadian provinces of Saskatchewan and Manitoba. The capital is Bismarck.

A brief treatment of North Dakota follows. For full treatment, *see* MACROPAEDIA: United States of America: *North Dakota.*

Various tribes of Plains Indians, especially the Mandan and the Hidatsa, were the original inhabitants of North Dakota. The first European explorer to reach the area was the Frenchman Pierre Gaultier de Varennes. Traders from Hudson Bay and Montreal began to visit North Dakota regularly in the 1790s. Most of present-day North Dakota became a part of the United States by way of the Louisiana Purchase of 1803. The explorers Meriwether Lewis and William Clark wintered among the Mandan Indians in 1804–05. The northeastern corner of the state became a part of the United States by treaty with Great Britain in 1818.

The fur trade declined in the 1860s, and white settlement began in earnest in 1871, when railroads reached the Red River. A flood of pioneers acquired land under the Homestead Act and turned to wheat farming. The Dakota Boom (1878–86) saw the population increase almost sixfold. In 1889 North Dakota became the 39th state.

North Dakota straddles two major physiographic regions. To the east is the Central Lowland, comprising the Red River valley and the Drift Prairie, the latter consisting of rolling country covered with glacial drift. To the west are the Great Plains, the North Dakota portion of which is called the Missouri Plateau. Here the landscape has been shaped by running water that in some places has carved spectacular cliffs, buttes, and valleys.

North Dakota has a continental climate with hot summers and cold winters. In July the average daytime high temperatures range from 88° F (31° C) in the south to 82° F (28° C) in the north. In January they range from 26° F (−3° C) in the southwest to 10° F (−12° C) in the northeast. Average precipitation for the whole state is about 17 inches (430 mm).

North Dakota's population is predominantly white and of northern European extraction. At the beginning of the 21st century Native Americans comprised roughly 3 percent of the population and African Americans only one-half of a percent. The earliest white settlers included many Norwegians, Canadians, and Germans. The single largest religious denomination is Lutheran, followed by Roman Catholic. During most of the 20th century, the state consistently lost population until 1970. The urban population is just less than one-half of the total, and the overall population density is relatively low.

Agriculturally, the state produces large numbers of beef cattle and ranks first in the nation in the production of barley, sunflower, and flaxseed. Wheat is the most important source of farm income, and rye, oats, sugar beets, and potatoes are also major crops. Oil is the most important natural resource, followed by lignite coal. Manufacturing accounts for only about one-tenth of the state's income.

North Dakota's transportation network includes a well-developed system of rail lines and east–west- and southeast–northwest-oriented highway routes.

Without a large metropolitan centre, the cities and towns with colleges and universities provide the main cultural leadership. Orchestras are in Fargo, Minot, and Grand Forks. Grand Forks also has the North Dakota Ballet. Indigenous folk traditions continue among the Sioux, Ojibwa, Arikara, Hidatsa, and Mandan Indians. Norwegian language and literature are taught at the University of North Dakota. Area 70,702 square miles (183,119 square km). Pop. (2000) 642,200.

North Devon, district, administrative and historic county of Devon, southwestern England, bordering the Bristol Channel on the north and west. North Devon's northern cliff-lined coast is especially popular with tourists. The district is an extensively dissected upland, descending southwesterly and westerly from the Exmoor, a bleak, misty moor at an elevation of about 1,500 feet (455 m) in the northeast, to sea level at the sand dunes embanking the River Taw estuary on the west coast. Much of the area is formed of dark shales interbedded with sandstones that have generally weathered to form soil given over to grassland. The western extensions of Exmoor along the north coast of North Devon include rugged cliffs 400 to 500 feet (about 120 to 150 m) high and headlands interspersed with wooded, narrow valleys (combes), where the resorts of Lynmouth and Ilfracombe are located. The bulk of the district is given over to the grazing of sheep and beef and dairy cattle, many of which are local breeds. The resort of Barnstaple on the River Taw, the district seat and largest town, is among the oldest boroughs in England (chartered *c.* 930). The 18th-century poet and dramatist John Gay and the 20th-century adventurer Sir Francis Chichester were born in Barnstaple. Area 419 square miles (1,086 square km). Pop. (1998 est.) 87,100.

North Dorset, district, administrative and historic county of Dorset, south-central England. North Dorset is an area of rolling countryside diagonally split by chalk downs 400 to 900 feet (120 to 275 m) high, ranging northeast to southwest, which are in turn breached northwest to southeast by the valley of the meandering River Stour. It is generally fertile, with dairy cattle and cereals raised throughout. The northerly section of the chalk downs (Cranborne Chase) was formerly part of a royal hunting preserve; much mixed deciduous forest remains. The area's largest agricultural centres, Shaftesbury and Blandford Forum, the district seat, are both old towns ("parishes") and were important button-manufacturing towns prior to the 19th century. Blandford Forum has developed a light industrial base, and a military camp is located 2 miles (3 km) northeast of the town. Area 235 square miles (609 square km). Pop. (1998 est.) 60,500.

North Down, district, Northern Ireland. Formerly within County Down, North Down was established in 1973 and consists of gently undulating lowland on the southern shores of Belfast Lough (inlet of the sea). It is bordered by the city of Belfast to the west and by the districts of Castlereagh and Ards to the south. North Down's northern border is a 15-mile (25-kilometre) coastline on Belfast Lough, extending from Holywood in the west to Orlock Point in the east. The town of Bangor, now the administrative seat of the district, grew up around a monastery founded by St. Comgall at the mouth of Belfast Lough in about 555. The monastery was destroyed by the Danes in the 9th century, rebuilt in the 12th century, and dissolved by the English in 1542. Later, Scots and Welsh Protestants founded Bangor town.

There is some dairy farming and light industry in North Down. Most of the working population, however, is employed in the city of Belfast, making North Down essentially a residential and recreational district. Tourism flourishes in the area; Bangor is a popular seaside resort. The Ulster Folk and Transport Museum (opened 1964) located outside Holywood has open-air buildings brought from their original sites and reerected in similar surroundings. A primary highway extends along the coast of North Down from Belfast to Bangor. Area 29 square miles (74 square km). Pop. (1998 est.) 73,500.

North East Derbyshire, district, administrative and historic county of Derbyshire, England. The district surrounds Chesterfield on three sides. The east and north are part of a major coalfield, though less important than formerly. Iron, steel, and heavy engineering industries are significant on the eastern side of the district. Dronfield and Eckington are also residential areas for commuters to neighbouring Sheffield. The west and south is more rural in character. The land rises in the west toward the Pennines, and part of the district is within the Peak District National Park. The district's council meets in neighbouring Chesterfield. Area 107 square miles (276 square km). Pop. (1998 est.) 98,300.

North East Fife, former district (1975–96) in the former county of Fife, Scotland. The region is now incorporated in the unitary council area of Fife (*q.v.*).

North East Frontier Agency (India): *see* Arunāchal Pradesh.

North East Lincolnshire, unitary authority, geographic and historic county of Lincolnshire, England, centred on the town of Grimsby on the River Humber estuary of the North Sea. Grimsby is the country's premier fishing port and a leading centre for food processing. Chemical plants and other industries lie along the Humber estuary. Grimsby is also the unitary authority's administrative and service centre. The unitary authority includes the neighbouring coastal resort of Cleethorpes to the east and Immingham Dock—one of Britain's most important ports for bulk cargoes—and other industrial installations to the west. Inland the rural countryside extends over the coastal flats to the lower slopes of the Lincolnshire Wolds. Area 74 square miles (192 square km). Pop. (1998 est.) 156,200.

North Frisian Islands, German NORDFRIESISCHE INSELN, Danish NORDFRISISKE ØER, part of the Frisian Islands (*q.v.*), lying in the North Sea just off the coast of northern Europe. They are divided between Germany and Denmark.

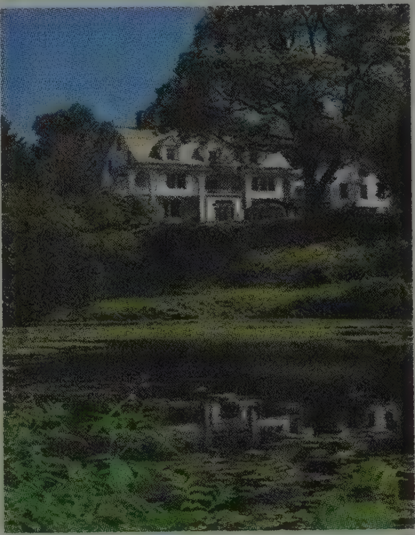
North German Confederation, German NORDDEUTSCHER BUND, union of the German states north of the Main River formed in 1867 under Prussian hegemony after Prussia's victory over Austria in the Seven Weeks' War (1866). Berlin was its capital, the king of Prussia was its president, and the Prussian chancellor was also its chancellor. Its constitution served as a model for that of the German Empire, with which it merged in 1871.

North German Plain, lowland region of northern Germany extending from the North and Baltic seas southward to the foreland of the Central German Uplands. It is a portion of the Great European Plain that spreads from the Belgian coast east into the lowlands of central Russia.

Nearly the entire North German Plain lies less than 330 feet (100 m) above sea level. The lowland is drained by the north-flowing Rhine, Ems, Weser, Elbe, and Oder rivers; a network of shipping canals and inland waterways connect the rivers from east to west. Glacial action formed the region's landform patterns, which can be divided into three major areas of relief from west to east: the alluvial deposits of the Lower Rhineland, the flat glacial sands and gravels of Lower Saxony west of the Elbe River, and the series of morainic uplands and troughs extending eastward from Schleswig-Holstein along the Baltic Sea. The climate is maritime, characterized by cool summers and mild winters, considerable precipitation, and strong northwesterly winds.

North Hempstead, town (township), Nassau county, New York, U.S. It lies on western Long Island and includes 30 incorporated villages and several large unincorporated communities.

During the American Revolution numerous British units were stationed in the area. Hessian officers were quartered in the Roslyn home of Hendrick Onderdonck (later called the Washington Tavern, to commemorate George Washington's visit, April 24, 1790). North Hempstead separated from Hempstead (*q.v.*) in 1784. It remained agrarian during the 18th century, and an active shipping trade was conducted through its harbours and bays. Sands Point Lighthouse (1806) on Cow Neck remains a conspicuous landmark. Fine examples of colonial mills survive at Plandome, Roslyn, and Saddle Rock.



Cedarmere, home of William Cullen Bryant, Roslyn, N.Y.

© Steve Gravano

Urban development was fostered by the Long Island Rail Road, which reached Mineola (1837), Roslyn (1864), and Port Washington (*q.v.;* 1898). Millionaires built large estates in the area, such as that of Clarence Hungerford Mackay at Roslyn and those of Henry C. Phipps and Cornelius Vanderbilt Whitney at Old Westbury. Many writers became residents of the town. Cedarmere, home of the poet William Cullen Bryant, is preserved at Roslyn. Other notable residents included Frances Hodgson Burnett (at Plandome), F. Scott Fitzgerald (Great Neck; *q.v.*), George M. Cohan (Kings Point), and John Philip Sousa (Port Washington). The U.S. Merchant Marine Academy was established on the former estate of Walter Chrysler at Kings Point in 1943. During World War II many new industries were located in the town, notably aircraft engineering at Port Washington. Services now predominate in North Hempstead.

The Nassau county charter of 1938 preserved the rights of existing incorporated villages but denied that option for any future villages. The larger incorporated villages are Great Neck (1921), Mineola (1906), Westbury (1932), East Hills (1931), and Williston Park (1926). Unincorporated communities include Manhasset, North New Hyde Park, and Port Washington. Pop. (2000) 222,611.

North Hertfordshire, district, administrative and historic county of Hertfordshire, southeastern England. The 400-foot- (120-metre-) high plateau area of North Hertfordshire is a northeasterly extension of the chalky Chiltern Hills. The district is cultivated throughout, but especially in the fertile loams and gravels around Hitchin in the west, where cereals (including wheat and barley) are grown. Letchworth, directly northeast of Hitchin, is the district's largest town and administrative seat; it was founded in 1903 by Sir Ebenezer Howard, an idealist and social reformer, as the world's first garden city (*q.v.*). His company's aim was to provide homes in pleasant rural surroundings for families such as Howard had seen crowded into London slums 40 miles (65 km) to the south. Many experiments of combined rural-and-urban living were first undertaken in this town.

The market towns of Hitchin and Baldock have Georgian buildings and a variety of light industries. Letchworth produces such machinery as computers, mobile cranes, and automobile gears. Sir Henry Bessemer, the 19th-century inventor and engineer who discovered the first process for manufacturing steel inexpensively, was born at Charlton, near Hitchin. Royston is the market centre for the eastern part of the district. Area 145 square miles (376 square km). Pop. (1998 est.) 116,700.

North Holland (The Netherlands): *see* Noordholland.

North India, Church of, merger in 1970 of six Christian denominations, including the United Church of Northern India; the Anglican Church of India, Pakistan, Burma (Myanmar) and Ceylon; the British and Australian Methodist churches; the Council of Baptist Churches in Northern India; the Church of the Brethren; and the Disciples of Christ.

The decolonization of India in 1947 revitalized negotiations initiated in 1929, and a draft plan of church union, submitted in 1951, was entrusted to a committee of delegates. The final plan of union was approved in 1965. The activities of the Church of North India extend beyond religious training to include education, medical and health care, and relief and social work on behalf of the orphaned, widowed, aged, and disabled in the community at large. Its headquarters are located in New Delhi.

North Indian temple architecture, style of architecture produced throughout northern India and as far south as Bijāpur district, characterized by its distinctive *śikhara,* a superstructure, tower, or spire. The style is sometimes referred to as Nāgara, a type of temple mentioned in the *Śilpa-śāstra*s (traditional canons of architecture), but exact correlation of the *Śilpa-śāstra* terms with extant architecture has not yet been established.

The typical Hindu temple in northern India, on plan, consists of a small square-shaped sanctuary (called the *garbhagṛha,* or "womb-room") housing the main image, preceded by one or more adjoining pillared *maṇḍapa*s (porches or halls), which are connected to the sanctum by an open or closed vestibule (*antarāla*). The entrance doorway of the sanctum is usually richly decorated with figures of river goddesses and bands of floral, figural, and geometric ornamentation. An ambulatory is sometimes provided around the sanctum. Above the main sanctuary rises a spire

Galaganātha Temple at Pattadakal, Karnātaka, India, North Indian style, early 8th century AD

P. Chandra

(*śikhara*), which is usually curvilinear in outline, and smaller rectilinear *śikhara*s of the *phāmsanā* type frequently top the *maṇḍapa*s as well. The whole may be raised on a terrace (*jagati*) with attendant shrines at the corners. If a temple is dedicated to the god Śiva, the figure of the bull Nandi, the god's mount, invariably faces the sanctum, and, if dedicated to the god Vishnu, standards (*dhvaja-stambha*) may be set up in front of the temple.

The centre of each side of the square sanctum is subjected to a gradated series of projections, creating a characteristic cruciform plan. The exterior walls are usually decorated with sculptures of mythological and semidivine figures, with the main images of the deities placed in niches carved on the main projections. The interior is also frequently richly carved, particularly the coffered ceilings, which are supported by pillars of varying design.

That the prototype of the North Indian temple already existed in the 6th century can be seen in surviving temples such as the temple at Deogarh, Bihār state, which has a small stunted *śikhara* over the sanctuary. The style fully emerged in the 8th century and developed distinct regional variations in Orissa, central India, Rājasthān, and Gujarāt. A classification of North Indian temples is generally made on the basis of *śikhara* types, such as the rectilinear *phāmsanā* and the curvilinear *latina*, with its two variations, the *śekharī* and the *bhūmija* (*see* śikhara).

One typical form of the North Indian style is seen in the early temples at Orissa, such as the graceful 8th-century Paraśurāmeśvara Temple at Bhubaneswar, a city that was a great centre of temple-building activity. From the 10th century a characteristic Oriya style developed that exhibited a greater elevation of the wall and a more elaborate spire. The Liṅgarāja Temple at Bhubaneswar, of the 11th century, is an example of the Oriya style in its fullest development. The Sun Temple at Konārak, the sanctum of which is badly damaged, is the largest and perhaps the most famous Oriya temple.

A development from the simpler to a more elevated and elaborate style is evident in central India, except that the *śekharī* type of superstructure, with multiple tenets, is more favoured from the 10th century onward. Interiors and pillars are more richly carved than in Orissa. The Central Indian style in its most developed form appears at Khajurāho, as seen in the Kaṇḍārya Mahādeva Temple (*c.* 11th century). There, an overall effect of harmony and majesty is maintained despite the exuberance of sculpture on the outer walls; the rich profusion of miniature shrines on the *śekharī* spire reinforces the ascending movement considerably.

Large numbers of temples are preserved in Gujarāt, but most of them have been badly damaged. The early 11th-century Sun Temple at Modhera is one of the finest.

North Island, island, the smaller of the two principal islands of New Zealand in the South Pacific Ocean, separated from South Island by Cook Strait. It rises to a central mountain range (a continuation of the South Island range), which parallels the east coast and reaches its highest point at the volcanic Mount Ruapehu (9,176 feet [2,797 m]). Rainfall, heaviest in the winter months, tends to be more evenly distributed than it is on South Island. North Island has an area of 44,204 square miles (114,489 square km). It has a majority of the national population and is gaining an increasingly larger proportion, concentrated in the vicinity of the major urban areas, Wellington (the national capital) and Auckland. Pop. (1998 est.) 2,866,300.

North Karelia (Finland): *see* Pohjois-Karjala.

North Kesteven, district, administrative and historic county of Lincolnshire, east-central England, south of the city of Lincoln. The district is partly low-lying alluvial plain and partly reclaimed marshland, both usually lower than 100 feet (30 m) in elevation. It is split in the west-central part by a narrow limestone plateau more than 200 feet (60 m) high having a steep western scarp and extending northward from the Cotswold Hills. Gradually descending to the east, the almost treeless plateau has a few scattered villages built of stone.

Both sides of the narrow plateau are agriculturally productive, but the former fens (marshlands) in the southeast, having been drained and systematically irrigated, are more intensively cultivated. Crops grown (especially in the southeast) include cereals (barley and wheat), potatoes, and assorted market-garden produce. Limestone is quarried near the village of Blankney. A principal industry at Sleaford, the district's administrative centre, in the southeast, is the malt brewery. Other industries in the district manufacture agricultural machinery and electrical equipment. The Royal Air Force College near Sleaford provides specialized training for air force officers. Examples of Decorated Gothic (1250–1375) church architecture are found throughout the district. Area 356 square miles (923 square km). Pop. (1998 est.) 87,600.

North Kingstown, town (township), Washington county, south-central Rhode Island, U.S., on Narragansett Bay. The area, settled in 1641 as Kings Towne (Kingstown from 1689), was incorporated in 1674. In 1722–23 it was divided into North Kingstown and South Kingstown (*q.v.*). North Kingstown includes the villages of Allenton, Davisville, Hamilton, Lafayette, Quonset Point, Saunderstown, Slocum, and Wickford (the administrative centre).

Early economic activities were textile milling, fishing, farming, and boatbuilding. Industrial tools and machinery are now major manufactures. Davisville was the home of the Atlantic Seabees (naval mobile construction battalions) from 1942 to 1991, when the base was closed. The area occupied by the Naval Air Station at Quonset Point until 1974 has been developed as an industrial park. The Quonset Air Museum is at what is now Quonset State Airport. Lafayette has state fish hatcheries.

Wickford is the site of the Old Narragansett Church (1707) and of Smith's Castle at Cocumscussoc (1678), used as a rendezvous for settlers who fought the Narraganset Indians in the Great Swamp Fight (1675; a battle in King Philip's War). At Saunderstown the birthplace of Gilbert Stuart, portraitist and creator of the most popular image of George Washington, has been restored; and nearby the Silas Casey Farm (*c.* 1750) is maintained as a typical New England farmstead. Pop. (2000) 26,326.

North Kyŏngsang Province (South Korea): *see* Kyŏngsang-puk.

North Lanarkshire, council area, west-central Scotland, on the eastern periphery of the Glasgow metropolitan area. It lies mostly within the historic county of Lanarkshire, but the area around Cumbernauld in the north is part of the historic county of Dunbartonshire, and the council area's northernmost extension, around Kilsyth, belongs to the historic county of Stirlingshire. North Lanarkshire encompasses a portion of the Midland Valley (Central Lowlands) extending from the valley of the River Clyde in the west to the upper valley of the River Almond in the east. It incorporates an area of rolling hills in the southeast and a section of the Kilsyth Hills in the north.

Most of the population lives in the southwestern portion of North Lanarkshire. Many of the smaller towns are residential suburbs of Glasgow. The older industrial towns of Motherwell, Wishaw, and Coatbridge owe their early development to local coal and iron ore production, which supplied a large-scale iron and steel industry. By the end of the 20th century, coal mining had ceased in the area, and the collapse of heavy industry had caused economic hardship in these towns. The development of specialized manufactures and service activities has partly compensated for this loss. North Lanarkshire also has agricultural areas in the north and east devoted largely to dairy farming, pigs, poultry, and fodder crops. Coatbridge, Cumbernauld, and Motherwell are the administrative centres. Area 180 square miles (466 square km). Pop. (1999 est.) 327,940.

North Little Rock, city, Pulaski county, central Arkansas, U.S., on the Arkansas River opposite Little Rock. It was settled in 1812 as De Cantillon, became Huntersville in 1853, and was later renamed Argenta for the Hotel Argenta, built there in the late 1850s. The community developed after the arrival of the railroad in 1853 and later became the site of freight classification yards and maintenance shops. Annexed by the city of Little Rock in 1890, Argenta was separately incorporated as a town in 1901 and renamed North Little Rock. It became a city in 1904 and absorbed the town of Levy to the north in 1946.

The city's economy is based on transportation (rail and trucking), health-related services, food processing, and the manufacture of cosmetics and wood products. North Little Rock is the home of Shorter College, a two-year institution (1886). Lake Conway and Camp Robinson Military Reservation—the latter an important training centre in both world wars—are to the north. Pop. (2000) city, 60,433; Little Rock–North Little Rock MSA, 583,845.

North Norfolk, district, administrative and historic county of Norfolk, eastern England, occupying an area of 373 square miles (966 square km), bordering the North Sea for about 55 miles (89 km) on the north and northeast. Inland North Norfolk contains fertile agricultural areas around the market centres of Fakenham in the northwest and North Walsham in the northeast. The north-central part of the district has a less fertile series of low-lying gravel ridges extending southwest from the coastal town of Cromer. The Broads, in the east, are a series of near sea-level lakes that reach some 15 miles (24 km) inland. They are surrounded by reed marshes abounding in waterfowl, and boating is popular there.

The coast has intermittent sand and gravel beaches with spits and islands at the western extreme, an area subject to accretion. East of Sheringham the coast suffers from wave erosion. Situated directly inland on the west is an alluvial plain of salt marshes and woodlands. The north-central and western-coastal resorts of Cromer, Sheringham, and the yachting centres of Blakeney and Wells-next-the-Sea are generally dependent on the summer tourist trade. Walsingham Abbey, which is located inland from Wells-next-the-Sea, is a pilgrimage site for both Roman Catholics and Anglicans; miracles have been associated with the locale since before the Norman Conquest in 1066. After 1967 the small town of Bacton on the northeast coast became the terminal for much of Britain's North Sea natural gas. Barley, wheat, and sugar beets are raised in the agricultural areas of the district, and crab and lobster fishing is locally important at Cromer and Sheringham. North Walsham and Fakenham have canning and food-processing industries. Cromer is the district seat. Pop. (1991 prelim.) 90,400.

North Ossetia, also called NORTHERN OSSETIA, or OSSETIA, Russian SEVERNAYA OSETIYA, Ossetia also spelled OSSETIYA, or OSETIYA, republic in southwestern Russia, on the northern flank of the Great Caucasus Range. It is bordered on the south by Georgia and on the north by the Sunzha and Terek ranges.

North Ossetia is mountainous, with the Glavny (Main) Range reaching 15,682 feet (4,780 m) at Mount Dzhimara and other peaks in the republic reaching more than 14,000 feet (4,250 m). Parallel to the Glavny crest range is a series of lower ranges through which the rivers have cut deep and picturesque gorges. The republic lies wholly in the basin of the upper Terek River and its fast-flowing tributaries, which emerge in the mountains and join before cutting through the Sunzha Range to the north in another deep gorge. A northern panhandle of the republic extends over the Sunzha and Terek ranges to include part of the middle Terek Plain around Mozdok.

Climate, soils, and vegetation all vary sharply with the relief. In the lowest areas there is steppe vegetation on fertile black-earth soils, which give way higher up to dense deciduous forests of oak and beech. Higher still are coniferous forests of spruce, fir, and pine, eventually giving way to alpine meadow and finally to bare rock and ice. The severity of the temperature regime and the rainfall both increase with height. In the river basins precipitation is 24 inches (600 mm) a year or less; on higher areas, up to 35 inches (900 mm).

The Ossetians are a people of mixed Iranian-Japhetic (Caucasian) origin; their language belongs to the Iranian group of the Indo-European family of languages. From the 7th century BC to the 1st century AD, Ossetia came under Scythian-Sarmatian influence, which was succeeded by that of the warlike Alani, who are believed to be the direct ancestors of the present-day Ossetians. Later the Mongol empire of the 13th century extended its sway over Ossetia, and the Alani were forced to move into the mountainous regions. Russian colonization began in the northern Ossetian area, especially after the establishment of the fortress of Vladikavkaz in 1784.

In addition to Ossetians and Russians, the republic is populated by Ingush, Armenians, Georgians, and Ukrainians. The largest city is the capital, Vladikavkaz (*q.v.*).

Industry in the republic is concentrated in Vladikavkaz and includes metallurgy and the manufacture of building materials and food products; there is also mining for lead, zinc, and boron. In the mountains, timber exploitation, particularly of beech forests, is important on both flanks of the Caucasus. Hydroelectric plants have been built on the Terek River at Vladikavkaz and on the Gizeldon River.

Agriculture is concentrated on the lower slopes and near Mozdok; the irrigated fields produce wheat, corn (maize), potatoes, hemp, and fruit. Sheep and cattle are raised on the higher slopes.

Two major highways across the Caucasus pass through Ossetia—the Georgian and Ossetian military highways, which were built in the 19th century during the Russian conquest of the Caucasus. A new all-weather highway to essentially replace these roads as a major transport route was under construction in the late 20th century. Vladikavkaz is also linked by highways with Grozny and the Caspian and with Rostov-na-Donu. The republic is also served by the Rostov-Baku railway. Area 3,100 square miles (8,000 square km). Pop. (1991 est.) 642,500.

North Platte River, one of the two main arms of the Platte River, rising in north-central Colorado, U.S. It rises in several headstreams in the Medicine Bow and Park ranges and the Rabbit Ears Range and flows north into Wyoming, bends east-southeast at Casper, and continues into western Nebraska past Scottsbluff to North Platte city. There, after a 680-mile (1,094-kilometre) course, it joins the South Platte River to form the Platte River. On the Wyoming-Nebraska boundary the river flows through Goshen Hole, where its valley widens to 50 miles (80 km) in places.

The North Platte is part of a comprehensive, multipurpose (irrigation, power, flood-control) project of the Missouri River basin. It has large reservoirs and dams (including Pathfinder, 1909; Guernsey, 1927; Seminoe, 1939; Alcova, 1938; Kingsley, 1941; Kortes, 1951; and Glendo, 1958). The North Platte's chief tributaries are the Sweetwater, Laramie, and Medicine Bow rivers.

North Polar Basin, vast and deep submarine depression in the Arctic Ocean defined by the continental shelves of Eurasia and North America. The basin is divided into two main parts, the Central Polar Basin and the Norwegian Basin, by a sill, or narrow underwater ridge, lying between north Greenland and the Svalbard archipelago of Norway. The larger of the two parts, the Central Polar Basin, has a maximum depth of 16,995 feet (5,180 m) and occupies a triangular area stretching across the North Pole from the Mackenzie River delta (northern Canada) to the Svalbard archipelago, and to the Taymyr Peninsula in northern Siberia. The Norwegian Basin is a shallower, roughly rectangular depression situated between Scandinavia, Greenland, and Iceland. A cleft in the middle of the sill separating the two basins allows free movement of deep water between the two parts. The North Polar area is characterized by unusually broad extensions of continental shelf, which cover almost two-fifths of the bottom of the North Polar Basin.

north polar sequence, group of 96 stars near the north celestial pole, used from about 1900 to 1950 as standards of magnitude and colour by which other stars are measured. First proposed by the American astronomer Edward Charles Pickering, the system has been largely superseded by the UBV system (*q.v.*).

North Pole, northern end of the Earth's axis, lying in the Arctic Ocean, about 450 miles (725 km) north of Greenland. This geographic North Pole does not coincide with the magnetic North Pole—to which magnetic compasses point and which in 1993 lay west of Ellef Ringnes Island, in the Queen Elizabeth Islands of extreme northern Canada (at about 78°27′ N, 104°24′ W)—or with the geomagnetic North Pole, the northern end of the Earth's geomagnetic field (about 79°13′ N, 71°16′ W). The geographic pole, located at a point where the ocean is 13,410 feet (4,087 m) deep and covered with drifting pack ice, experiences six months of complete sunlight and six months of total darkness each year. The American explorer Robert E. Peary claimed to have reached the pole by dog sledge in 1909; it was definitely reached by the American explorer Richard E. Byrd by airplane in 1926 and by the international team of Roald Amundsen, Lincoln Ellsworth, and Umberto Nobile by dirigible in the same year. Since then, the North Pole has been reached several times, including visits by the U.S. nuclear submarines *Nautilus* (1958) and *Skate* (1959).

North Rhine–Westphalia, German NORDRHEIN-WESTFALEN, constituent *Land* (state) of western Germany. It is bordered by The Netherlands and Belgium (west) and by the *Länder* (states) of Lower Saxony (north), Hesse (east), and Rhineland-Palatinate (south). North Rhine–Westphalia plays a leading role in the national economy. The Rhine-Ruhr region—the nation's most important industrial area—runs through the centre of the state and dominates it economically and culturally. The Rhine-Ruhr is one of the most heavily populated areas of the world, and its rich natural resources support a wide variety of highly developed industries. Outside of this complex, the state exhibits a contrasting character of rural charm grounded in the German past. The state capital is at Düsseldorf, and Bonn in the south is the seat of the national government. North Rhine–Westphalia is the most populous state of Germany, containing about one-fifth of the country's total population.

Physical geography. The state includes the upland regions of North Eifel in the south and the mountains of the Sauerland in the southeast. Volcanic rock occurs in the region of the Siebengebirge ("Seven Hills") on the eastern bank of the Rhine River. In the east, the Wester Forest—a mountainous region bordering the Weser River—is characterized by several escarpments and by the narrow, elongated ridges of the Teutoburg Forest and some small mountains. The northwest is composed of lowlands that gradually merge with the upland regions on the south and east. The north-flowing Rhine River drains the largest physical region of the state. Areas bordering on the west are drained by the Maas River, on the north by the Ems, and on the northeast by the Weser. Ultimately, the entire drainage system empties into the North Sea.

The state's proximity to the North Sea (and the Gulf Stream) makes the lowland zones mild in the winter, with mean January temperatures of about 34° F (1° C), while July temperatures average about 63° F (17° C). Precipitation is often less than 30 inches (762 mm) in the Rhine valley. The mountainous regions, however, are cool and receive high precipitation. Forests predominate in the higher mountain regions, but in the lowlands large forests are generally found only in infertile sandy areas.

The people. The principalities that existed until about 1800 in the area are recalled by regional names: Berg in the vicinity of the cities of Dusseldorf and Cologne; Sauerland in the southeast; and Münsterland in the north. The Rhineland-Westphalian boundary—running through the state from northwest to southeast—corresponds to the old border between the Saxons and the Franks and is reflected in certain dialectal variations in the German language. During the Reformation, the principalities in the area were divided between Roman Catholicism and Protestantism. These differences still exist; more than half of the total state population is Roman Catholic, but local dominance of either religion often claims more than 75 percent of a region's inhabitants. These cultural differences are strongest in the rural areas, which account for a relatively small proportion of the state's population. North Rhine–Westphalia has a great number of medium-sized and large cities, many in the Rhine-Ruhr area. Among them are Cologne, Essen, Düsseldorf, Dortmund, Duisburg, Bonn, Bochum, Aachen, Wuppertal, Solingen, and Münster.

The economy. North Rhine–Westphalia is the most important industrial, mining, and energy-producing area of Germany. Bituminous coal deposits are located in the regions of the Ruhr and Aachen, and lignite is mined west of Cologne. The state's coal production represents the vast majority of Germany's production of that mineral. Petroleum refineries concentrated in the Ruhr and along the Rhine are connected with the North Sea ports of Wilhelmshaven and Rotterdam, Neth., by a system of pipelines. The water supply used by the state's heavy industries and urban inhabitants is maintained by about 60 dams, located mainly in the mountains of the Sauerland, Berg, and north Eifel regions.

Heavy industry is the linchpin of the state's economy. Blast furnaces, steel mills, and rolling mills, using coke from local coal deposits, dot the Ruhr region, mainly in Duisburg and Dortmund. The state's raw steel production accounts for most of Germany's production of that metal. Other industries in the Ruhr produce chemicals, textiles, glass, heavy machinery, electrical equipment, and precision instruments. In the Berg region to the south, the iron and metallurgical industries and textiles play a leading role. The state's service industries are also highly developed, with many commercial enterprises, trading houses, loan societies, and banks. *See also* Ruhr.

Outside of the Ruhr, much of the state's land is devoted to commercial farms, gardens, or orchards. Wheat and sugar beets are grown in the southern lowlands, and in the north fruits and vegetables are cultivated. In Münsterland and in the regions of the lower Rhine, cattle raising and pig breeding play considerable roles. The total forested area represents almost one-quarter of the state's total land area.

The state has federal superhighways, as well as several thousand miles of federal, provincial, and county roads. The Rhine River is one of the world's most heavily traveled water routes and is the main means of transport for bulk cargoes and manufactured goods moving between the Ruhr and the ports on the North Sea. Duisburg-Ruhrort, at the mouth of Ruhr River, is the largest inland harbour in Europe. Living and health standards in the state are very high. The system of higher education includes universities in Bonn, Münster, Aachen, Cologne, Bochum, Düsseldorf, Dortmund, and Bielefeld.

History. North Rhine–Wesphalia *Land* was created in 1946 through the amalgamation of the former Prussian province of Westphalia and the northern portion of the Prussian Rhine province; the state of Lippe was incorporated in 1947. *See also* Lippe; Rhineland; Westphalia. Area 13,155 square miles (34,070 square km). Pop. (1993 est.) 17,679,200.

North Sea, shallow, northeastern arm of the Atlantic Ocean extending southward from the Norwegian Sea between Norway and the British Isles, connecting the Skagerrak (channel between Norway and Denmark) with the English Channel (between France and the United Kingdom).

A brief treatment of the North Sea follows. For full treatment, *see* MACROPAEDIA: Atlantic Ocean.

The North Sea is bordered by the Shetland Islands to the north, the United Kingdom and the Orkney Islands to the west, Norway and Denmark to the east, and France, Belgium, The Netherlands, and Germany to the south. It has an area of about 220,000 square miles (570,000 square km). Few parts of the sea are more than 300 feet (90 m) deep. The floor dips to the north and is generally irregular. Southern depths reach less than 120 feet (40 m); many shallow, shifting banks, presumably of glacial origin, have been reworked by tidal currents and present serious navigational hazards. Off northern England the vast moraine called Dogger Bank is only 50 to 100 feet (15 to 30 m) below sea level and is one of the sea's finest fishing areas. In contrast, the waters deepen in the Norwegian Trench, an unusual trench parallel to the coast of southern Norway. There are also deep trenches in the western part of the sea, including Devil's Hole east of Edinburgh, where depths exceed 1,500 feet (450 m). The North Sea is generally less saline than its North Atlantic connection because of colder, less-saline waters coming from the Baltic Sea and large quantities of fresh water contributed by the Thames, Rhine, Elbe, and other northern European rivers. Its waters are warmed by the North Atlantic Drift, which enters via the Norwegian Sea to the north. Norway, Denmark, Germany, The Netherlands, and the United Kingdom are the major beneficiaries of the huge North Sea petroleum and natural-gas fields that were developed during the late 1970s.

North Sea Canal, Dutch NOORDZEEKANAAL, waterway in The Netherlands that extends in an east-west direction from Amsterdam to IJmuiden on the North Sea coast. Navigable by oceangoing vessels, the canal is 15 miles (24 km) long, 49 feet (15 m) deep, and 771 feet (235 m) wide. Built between 1865 and 1876, it gave Amsterdam access to the sea and made that city a major port. The sea locks at IJmuiden were destroyed during World War II but later rebuilt.

North Semitic alphabet, the earliest fully developed alphabetic writing system. It was used in Syria as early as the 11th century BC and is probably ancestral, either directly or indirectly, to all subsequent alphabetic scripts, with the possible exception of those scripts classified as South Semitic (*e.g.,* Ethiopic, Sabaean). Apparently related to the earlier writing systems seen in the Canaanite and Sinaitic inscriptions, North Semitic gave rise to the Phoenician and Aramaic alphabets, which, in turn, developed into the European, Semitic, and Indian alphabets. North Semitic had 22 letters, all representing consonants, and was written from right to left; these characteristics are typical of most of the later Semitic alphabets (*e.g.,* Hebrew and Arabic).

North Shore, city in the Northern Auckland urban area, northern North Island, New Zealand. It is located on a peninsula about 2 miles (3 km) north of Auckland city across Stanley Bay, and it faces Rangitoto Channel to the east. North Shore was designated a city in 1989 and consists of the former towns ("boroughs") of Devonport and Takapuna. Devonport to the south is one of Auckland's oldest suburbs, with beaches and homes of the Auckland affluent. Takapuna to the north has some of Auckland's most popular beaches and is linked with that city through the Auckland Harbour Bridge. Pop. (1993 est.) 155,500.

North Shropshire, district, county of Shropshire, west-central England, bordering Wales to the northwest. Almost entirely rural in character, North Shropshire is an undulating plain containing large areas of former marshland. Many scenic meres (small, shallow lakes) are in the north, especially in the vicinity of Ellesmere. Dairy farming is the principal economic pursuit in the district. Assorted cereals and sugar beets, as well as pigs, are raised. The district's market centres, including Ellesmere, Market Drayton, Wem, and Whitchurch, have developed a light-industrial base. Wem is the district seat. Area 263 square miles (680 square km). Pop. (1992 est.) 53,800.

North Siberian Lowland, Russian SEVERO-SIBIRSKAYA NIZMENNOST, low-lying region, east-central Russia. It is situated between the lower Yenisey River in the west and the lower Kolyma River in the east. To the south lies the Central Siberian Plateau, to the north the Byrranga Mountains of the Taymyr Peninsula, and farther east the Laptev Sea. The western part of the plain is sometimes known as the Taymyr Plain, and the portion east of the Lena River as the Yana-Indigirka and Kolyma plains. The lowland has an east-west extent of 1,850 miles (3,000 km) and a width of up to 375 miles (600 km) and lies at 165–230 feet (50–70 m) above sea level. There are frequent low ridges and hills. The plain is extremely swampy, and the vegetation is tundra or forest-tundra in character.

North Star: *see* polestar.

North Sumatra: *see* Sumatera Utara.

North Tonawanda (New York, U.S.): *see* Tonawanda–North Tonawanda.

North Tyneside, borough and district, metropolitan area of Tyne and Wear, northeastern England. The district lies adjacent to the northeastern quarter of the city of Newcastle upon Tyne and is bordered by the Tyne River to the south and the North Sea to the east. North Tyneside includes the Tyne River industrial conurbation of North Shields and Wallsend, as well as the sandy-beach resort communities of Tynemouth and Whitley Bay on the North Sea coast. North Shields has oil-storage facilities, ship-repair yards, and fish canneries, and shipbuilding and the manufacture of marine parts and equipment are important at Wallsend. The northwestern portion of North Tyneside is a residential area for workers who commute to Newcastle upon Tyne. Area 32 square miles (84 square km). Pop. (1992 est.) 195,200.

North Vancouver, city, southwestern British Columbia, Can. It lies along Burrard Inlet of the Strait of Georgia and is linked to Vancouver by the Lions Gate and Second Narrows bridges. The community, founded shortly after a sawmill was built on the site in 1863, was for years the largest settlement on the inlet. In 1872 it was named Moodyville (after Sewell Moody, who owned the sawmill). In 1907 it was renamed North Vancouver and was incorporated as a city. Its economy depends chiefly on the shipping of grain, lumber, and ore and on shipbuilding and sawmilling. There is also some light manufacturing. Fishing, mountain climbing, and skiing attract tourists and sportsmen. Pop. (1991) 38,436.

North Warwickshire, borough and district, county of Warwickshire, central England. It is a generally rural district adjoining the West Midlands to the northeast of Birmingham and northwest of Coventry. Central North Warwickshire occupies a 500-foot- (150-metre-) high upland, which is mostly coextensive with a section of the Warwickshire coalfield extending through the district for 16 miles (26 km) in a north-south direction. Assorted cereal crops and livestock are raised in the district. There are industries producing boots, shoes, hats, and knitwear in the old market town of Atherstone, the district seat, in the eastern part of the district. Many inhabitants of the district work in nearby conurbations, including Birmingham and Coventry.

The southern portion of the district is part of what is sometimes called "George Eliot country"; Arbury Hall, south of the district boundary, is where the Victorian novelist lived as a child. Among the district towns ("parishes") are Coleshill in the west and Polesworth in the north. Area 110 square miles (286 square km). Pop. (1992 est.) 61,300.

North-West, province, north-central South Africa. It was created in 1994 from portions of Transvaal and Cape of Good Hope provinces. North-West is bordered by Botswana to the north and northwest, Northern province to the northeast, Gauteng province to the east, Orange Free State province to the southeast, and Northern Cape province to the southwest. The provincial capital is Mafikeng.

North-West province occupies the relatively flat interior plateau (Highveld) of southern Africa and stretches from the usually dry Molopo River southward to the Vaal River. Savanna and thornveld country predominate, and there are salt pans in the south. Summers are hot, and rainfall averages 20 inches (500 mm) annually.

Blacks constitute 91 percent of the population and are mostly rural Tswana-speaking peoples. Whites make up about 8 percent of the population and mainly speak Afrikaans. Corn (maize), peanuts (groundnuts), and sorghum are grown throughout the province, and tobacco, wheat, and citrus fruits are raised in the northeast. Cattle and sheep are grazed in large numbers. Mining also plays an important role in the economy. Diamonds, chromite, platinum, and uranium are mined in the province, which forms the western part of the Witwatersrand and contains the Klerksdorp goldfields. The major urban centres in the province are Klerksdorp and Potchefstroom. The latter city has a university. Area 45,834 square miles (118,710 square km). Pop. (1993 est.) 3,506,800.

North West Company, Canadian fur-trading company, once the chief rival of the powerful Hudson's Bay Company. The company was founded in 1783 and enjoyed a rapid growth. It originally confined its operations to the Lake Superior region and the valleys of the Red, Assiniboine, and Saskatchewan rivers but later spread north and west to the shores of the Arctic and Pacific oceans. It even penetrated the area then known as the Oregon Country, where it constructed posts in what are now the U.S. states of Washington and Idaho. Its wilderness headquarters was located first at Grand Portage on Lake Superior and after 1805 at Fort William (also on Lake Superior, at the site of the present city of Thunder Bay, Ont.).

Competition with the Hudson's Bay Company became especially intense when that company established the colony of Assiniboia on the Red River (in present-day Manitoba) in 1811–12, across the North West Company's line of communications. A few years later, open conflict broke out, during which North West Company men destroyed the Red River colony (*see* Seven Oaks Massacre) and Hudson's Bay Company men destroyed the North West Company post of Fort Gibraltar (located on the site of modern Winnipeg, Man.) and captured Fort William.

Under pressure from the British government, the old North West Company and the Hudson's Bay Company were merged in 1821 under the name and charter of the latter company.

The New North West Company, or XY Company, had a brief existence (1798–1804) as a competitor of the old North West Company before being absorbed by the latter.

North-West Frontier Province, northernmost province of Pakistan. It is bounded by Afghanistan to the west and north, the territory of Jammu and Kashmir to the northeast, Punjab province to the southeast, and Balochistān province to the southwest. Peshāwar is the provincial capital.

In ancient times, the state of Ghandhāra occupied the Vale of Peshāwar and adjoining areas. This kingdom was important because of its strategic location at the eastern end of the Khyber Pass. Gandhāra was annexed by the Persian Achaemenian Empire in the early 6th century BC and remained a Persian satrapy until 327 BC. The region then passed successively under Greek, Indian, Indo-Bactrian, Sakan, Parthian, and Kushān rule.

Muslim rule was first brought to the region by the Turks, whose ruler, Sebüktigin, gained control of Peshāwar in AD 988. His son, Maḥmūd of Ghazna, invaded northern India several times between 1001 and 1027 and brought a large area of the present province into the boundaries of his Ghaznavid empire. Beginning in the late 12th century, the region was held successively by the Ghurids, by various Muslim Afghan dynasties, and then by the Mughals. After the invasion of the Iranian ruler Nādir Shāh in 1738, the territory remained under a loose form of Afghan Durrānī rule. Beginning about 1818, invading Sikhs from the Punjab region of India increasingly secured control of the frontier territory until the coming of the British in 1849.

The northwestern frontier areas were annexed to India by the British after the Second Sikh War of 1849. The territories thenceforth formed a part of the Punjab until the North-West Frontier Province was created in 1901. After Pakistan attained independence in 1947, the region continued to exist as a separate Pakistani province. The inhabitants of the tribal territories, the westernmost area along the Afghanistan border, are not subject to the Pakistani legal code, however. During the 1980s the province was inundated by Afghan refugees seeking asylum from the Soviet occupation of their country.

The terrain of the North-West Frontier Province consists of mountain ranges, undulating submontane areas, and plains surrounded by hills. In the north the mountain ranges generally run north-south, while south of the Kābul River, which bisects the province from east to west, the ranges generally run east-west. The Hindu Kush region in the north, long noted for its scenic beauty, is divided by the Kunar River into two distinct ranges—the northern Hindu Kush and the Hindu Rāj. Tirich Mīr rises to 25,230 feet (7,690 m) and is the highest peak of the northern Hindu Kush. To the south of the Hindu Rāj lies the rugged country of the Pānjkora, Swāt, and Kandia river basins. The Lesser Himalayas and the sub-Himalayas are situated in the eastern part of the province and form definite ranges broken by hilly country and small plains. The fertile Vale of Peshāwar extends northward along the Kabul River. Though it covers less than one-tenth of the province's area, this region contains about one-half of its total population. The city of Peshāwar lies in the western portion of the vale. West of Peshāwar, the historic Khyber Pass is strategically important as the most easily negotiable route between Afghanistan and the Indian subcontinent. South of the Kābul River lies the east-west-trending Safed Koh Range. The Kurram, Tochi, and Gumal rivers drain the province's southern region, and the Indus River forms part of the province's eastern border.

The mountain slopes in the north of the province support stands of evergreen oak and pine. There are also extensive mountain grasslands. The hills to the south are sparsely covered with bushes, acacia, and grasses.

The North-West Frontier Province is inhabited mainly by the Pashtun, who are noted for their independence. The Pashtun comprise many tribes and clans, each taking great pride in its genealogy. Pashto is the main language in the province, except for some areas where Punjabi predominates, and virtually all the population is Muslim. Only a small part of the overall population is urban. The province has two cities, Peshāwar and Mardān.

The North-West Frontier's economy is essentially agricultural, even though the mountainous terrain is not favourable to extensive cultivation. Irrigation is carried out on about one-third of the cultivated land. Wheat, corn (maize), sugarcane, and tobacco are the major crops. The province's principal industries are the manufacture and refining of sugar, the canning and preservation of fruits and vegetables, tobacco processing, and the manufacture of small arms and accessories. Other products are cotton textiles, cement, ghee (clarified butter), furniture, and milled grains.

The Pashtun tribal order is inherently resistant to social change, and educational progress in the province has been quite slow. The literacy rate among the total population is lower than that of Pakistan as a whole.

In the tribal areas on the province's western fringe, the Pashtun tribes are free to govern themselves according to their own customs. Political and military agents who are responsible to the central government have the power to award or withhold subsidies and to control entry into and departure from the tribal areas.

Peshāwar is the site of the University of Peshāwar (1950), the Peshāwar Museum, and other colleges and cultural institutes. Area, including federally administered tribal areas, 39,282 square miles (101,741 square km). Pop. (1983 est.) including federally administered tribal areas, 13,987,000.

North West Leicestershire, district, county of Leicestershire, south-central England, incorporating one of the oldest (13th century) coal-mining areas in Great Britain. It is essentially an upland area of undulating meadows, but some cultivation of crops occurs in the southwest and along the River Soar valley in the north. The two principal towns ("parishes"), Coalville and Ashby-de-la-Zouch, are in the upland area bordering Charnwood Forest, a former royal hunting ground to the east. Charnwood Forest consists of a series of barren ridges rising above 900 feet (275 m) and exposing outcrops of late Precambrian tuffs, some of England's oldest bedrock.

Declining amounts of coal are mined near Coalville, Ibstock, and Moira. Coalville, now industrially diversified, has brick and tile making and metalworks. Ashby-de-la-Zouch manufactures biscuits (cookies) and soap.

The ruins of the 15th-century Ashby Castle are at Ashby-de-la-Zouch, and the tournament field described in Sir Walter Scott's novel *Ivanhoe* lies about 1 mile (1.5 km) north. Many monasteries were built in the district in the 12th and early 13th centuries. A mid-19th-century Cistercian (Trappist) abbey remains in Charnwood Forest.

East Midlands (international) Airport in the northern part of the district serves greater Derby, Nottingham, and Leicester. Coalville is the district seat. Area, 108 square miles (280 square km). Pop. (1992 est.) 82,500.

North Wiltshire, district, county of Wiltshire, southern England, with an area of 297 square miles (768 square km) in the northwestern part of the county, some 20 miles (32 km) east of Bristol. North Wiltshire bestrides the upper reaches of the Avon River valley. It is a fertile clay plain extending into the Cotswold

Hills on the west and bordered by the steep chalk escarpment of the Marlborough Downs on the east; in the north is a headwaters area for many watercourses, including the Thames.

Many churches of the district date from before 1500, and about 500 buildings are officially listed as being of historical importance. The nearby Cotswolds are a source of oolitic limestone used in the construction of many of the district's buildings. Lacock in the southern part of the district is one of England's prettiest villages, with winding streets, gabled roofs, and timbered buildings. Its 13th-century abbey is well preserved, and a local museum (opened 1975) commemorates the pioneer photography of William Henry Fox Talbot.

Wheat and barley are intensively raised in North Wiltshire, as are cattle, sheep, and pigs. Malmesbury and Wootton Bassett are local market centres. Calne has a bacon-curing industry, and Chippenham, the district seat, has agricultural and railway-related industries. Pop. (2001) 125,370.

North Wolds (England): *see* East Yorkshire.

North York, city, constituting, together with the cities of Toronto, Scarborough, York, and Etobicoke and the borough of East York, the municipality of Metropolitan Toronto, southeastern Ontario, Can. It is bounded by the townships of Vaughan and Markham (north); by Scarborough (east); by East York, the city of Toronto, and York (south); and by Etobicoke, York, and the Humber River (west). North York Township (created in 1922 from York Township) was constituted as a borough in 1967 and became a city in 1979. Since World War II there has been planned industrial and residential development. The city has more than 4,000 acres (1,620 hectares) of parks and open space, and the 475-acre (192-hectare) campus of York University (1959) forms part of its northern boundary. The Black Creek Pioneer Village depicts the early settlers' way of life.

North Yorkshire, administrative and geographic county in northern England, part of the historic county of Yorkshire. The administrative county comprises seven districts: Craven, Hambleton, Richmondshire, Ryedale, Selby, and the boroughs of Harrogate and Scarborough. The geographic county includes the entire administrative county; the unitary authorities of Middlesbrough, Redcar and Cleveland, and the city of York; and the part of the unitary authority of Stockton-on-Tees that lies south of the River Tees.

The geographic county has two upland regions. The one in the west comprises the Pennines, the major uplands of northern England; they reach an elevation of more than 2,200 feet (670 metres) in the northwest at Pen-y-Ghent, Whernside, Ingleborough, and Mickle Fell and are deeply dissected by the valleys (dales) of the Rivers Swale, Ure, Nidd, and Wharfe. In the east is a region of limestones and sandstones forming the upland mass of the North York Moors and Cleveland Hills. Separating these two regions is the Vale of York, a lowland with glacial clay soils. To the north the Cleveland Hills drop to the North Sea coast and the Tees valley in a dramatic escarpment.

The county is largely agricultural. The large landholdings of the Vale of York are major grain producers, while dairy farming is especially important in the wetter, western areas of the Pennine dales and lower slopes. Hill sheep farming is characteristic of the moorlands of the Pennines and North York Moors. There is some food processing and light manufacturing in the county's towns, and coal is mined around Selby, but heavy manufacturing is important only along the Tees estuary. The unitary authority of Redcar and Cleveland has steel mills, petroleum refining, chemical industries, and one of Britain's leading seaports, while neighbouring Middlesbrough is an engineering centre. Research and other service activities are significant in York and Harrogate, and high-technology firms are a growing presence in the county. The towns of Harrogate and Scarborough, frequently settings for British political conferences and conventions, are also centres of tourism associated with the Yorkshire Dales and the North York Moors national parks. The major rail and road links connecting London and Edinburgh traverse the county. Area administrative county, 3,102 square miles (8,034 square km); geographic county (excluding Stockton-on-Tees), 3,320 square miles (8,600 square km). Pop. (2001) administrative county, 569,660; (1998 est.) geographic county (excluding Stockton-on-Tees), 1,025,800.

Northam, town, southwestern Western Australia. It lies at the confluence of the Avon (upper course of the Swan) and Mortlock rivers. One of the state's oldest settlements, it was founded in 1833 and named by Governor Sir James Stirling after Northam in Devonshire, England. During the 1890s Northam was a major stop for miners eastward bound for the Yilgarn, Eastern, and Dundas goldfields. It now serves part of the eastern Wheat Belt, which also produces fodder, sheep, beef cattle, and pigs. The town's industries include flour mills, metal-fabrication and cold-storage works, a plasterboard factory, and brick and charcoal kilns. Northam is situated at the junction of several rail lines and is also at the intersection of the Great Eastern and Southern highways. It is the site of the Holden Immigration Centre, and nearby are a military training camp and Muresk Agricultural College. Along the Aron River is a sanctuary for many species of birds, including rare white swans. Pop. (2001 prelim.) 6,527.

Northampton, town and borough, administrative and historic county of Northamptonshire, in the Midlands region of England. Originating about AD 1100 as a walled town with a castle on the River Nen, Northampton was granted its first charter in 1189. The town walls survived until the Restoration (1660) after the English Civil Wars; they were then demolished because Northampton had sided with Parliament and against the king. The railway station now occupies the site of the old castle.

Much of the town was destroyed by fire in 1675. Rebuilding continued through the 18th century, providing the town with a fine range of buildings surrounding the large market square, with the focal point at All Saints Church. A Roman Catholic bishopric was founded in 1850, and the cathedral was begun in 1864 and completed in 1960. The Guildhall also dates from 1864.

Northampton is best known for its shoe and leather industry. Other industries include light engineering, primarily related to electronics, and brewing. The town is also an important retail and market centre serving Northamptonshire and North Buckinghamshire. Northampton was designated a planned new town in 1965, and expansion followed. Great Brington Church lies 6 miles (10 km) to the northwest. Area 31 square miles (81 square km). Pop. (2001) 194,472.

Northampton, city, seat (1662) of Hampshire county, west-central Massachusetts, U.S. It lies along the Connecticut River, 17 miles (27 km) north-northwest of Springfield. The site, originally known as Nonotuck (an Algonquian word meaning "middle of the river"), was settled in 1654 and named for Northampton, England. It subsequently became a self-sufficient farming community. During King Philip's War (1675–76) and Queen Anne's War (1702–13), the area was the scene of brutal raids.

A woolen mill was established in 1809, and, connected to the Connecticut communities by canal (1834) and by railroad (1845), Northampton developed as a manufacturing centre, particularly for silk (which has since declined). Great impetus was given to Northampton's growth by the establishment there in 1875 of Smith College, an exclusive school for women. President Calvin Coolidge, who practiced law in Northampton, served as mayor (1910–11) and died there in 1933; the Forbes Library (1893) houses a collection of Coolidge memorabilia.

The city's economy is now dependent on services (education and health care) and trade. Manufactures include plastic moldings and electronic equipment. Look Memorial Park is a popular recreational area. Inc. town, 1655; city, 1883. Pop. (2000) 28,978.

Northampton, EARLS AND MARQUESSES OF, titled English nobility of several creations, most notably in the families Parr, Howard, and Compton, grouped below chronologically and indicated by the symbol •. (In 1812 the Compton earl was elevated to a marquess.)

• Northampton, William Parr, Marquess of, EARL OF ESSEX, BARON PARR (b. Aug. 14, 1513, Kendal Castle?, Westmorland, Eng.—d. Oct. 28, 1571, Warwick, Warwickshire), brother of Henry VIII's queen Catherine Parr, and Protestant supporter of Lady Jane Grey and Queen Elizabeth I.

He took part in suppressing the uprising in the north of England in 1537 and, after serving as member of Parliament for Northamptonshire, was made Baron Parr in 1539. In December 1543, just after his sister had married the king, he was created Earl of Essex, a title formerly held by his father-in-law, Henry Bourchier, who had died in March 1540. Under Edward VI, who called him his "honest uncle," Parr was equally prominent, being created Marquess of Northampton in 1547 and becoming lord-lieutenant of five of the eastern counties and being great chamberlain from 1550 to 1553. He favoured the claim of Lady Jane Grey to the English throne, and consequently the accession of Queen Mary I was quickly followed by his attainder (1553), with loss of his titles. Although sentenced to death he was pardoned and released from prison at the end of 1553. After enjoying the favour of Queen Elizabeth I, he was re-created Marquess of Northampton in 1559. The title became extinct upon his death, he having been childless through three marriages.

• Northampton, Henry Howard, Earl of, BARON OF MARNHULL (b. Feb. 25, 1540, Shottesham, Norfolk, Eng.—d. June 15, 1614, London), Roman Catholic intriguer during the reigns of Elizabeth I and James I of England, known for his unscrupulousness and treachery.

He was the second son of the poet Henry Howard, Earl of Surrey, and the younger brother of Thomas Howard, 4th Duke of Norfolk. After discovery of his brother's plot to wed Mary, Queen of Scots, and of his own correspondence with her, he was arrested more than once on suspicion of harbouring treasonable designs.

At the close of the reign of Queen Elizabeth I, he joined with Robert Cecil in courting the heir to the throne in Scotland, the main object of his long letters of advice being to poison King James VI's mind against Sir Walter Raleigh and other rivals, whom he at the same time hoped to ensnare into compromising relations and correspondence with Spain. These methods, which could not influence Elizabeth, were completely successful with James, and on the latter's accession Howard received a multitude of favours. In 1603 he was made a privy councillor, and in 1604 he was made lord warden of the Cinque Ports and earl of Northampton and Baron Howard of Marnhull in Dorset.

He was one of the judges at the trials of Raleigh and Lord Cobham in 1603, of Guy Fawkes in 1605, and of Garnet in 1606, in each case pressing for a conviction. The climax of his career was reached when he assisted his grandniece, Frances Howard, Lady Essex, in obtaining her divorce from her husband in order to marry the favourite Robert Carr, earl of Somerset, whose mistress she already was and whose alliance Northampton was eager to secure for himself. He obtained the divorce by the decree of a special commission, and when Sir Thomas Overbury's influence seemed likely to prevent Somerset from completing the marriage project, he caused Overbury to be imprisoned in the Tower of London. Shortly afterward Overbury died from the effects of poison administered according to the wishes of Lady Essex; and the close intimacy which existed between Lady Essex and Northampton leaves his name tarnished with suspicion. He advised against the summoning of Parliament in 1614 and then fomented disputes to compel James to dissolve it. He died unmarried, a Roman Catholic, in 1614, at which time his title became extinct.

Northampton, Spencer Compton, 2nd earl of, Lord Compton (b. May 1601—d. March 19, 1643, Hopton Heath, Shropshire, Eng.), Royalist commander during the English Civil Wars.

The son of William Compton, 1st earl in the Compton line (whom he succeeded in 1630), he warmly supported King Charles I. On the outbreak of the Civil War he was entrusted with the execution of the commission of array in Warwickshire. After varying success and failure in the Midlands, he fought at Edgehill, and after the king's return to Oxford he was given, in November 1642, the military supervision of Banbury and the neighbouring country. He was attacked in Banbury by the Parliamentary forces on December 22 but was relieved by Prince Rupert the next day. In March 1643 he marched from Banbury to relieve Lichfield and, having failed there, proceeded to Stafford, which he occupied. Thence on March 19, accompanied by three of his sons, he marched out with his troops and engaged Sir John Gell and Sir William Brereton at Hopton Heath. In the moment of victory he was surrounded by the enemy and, refusing quarter, was slain. His son James (1622–81) succeeded him as 3rd earl.

Northampton, Assize of (1176), group of ordinances agreed upon by King Henry II of England and the magnates in council at Northampton. The ordinances were issued as instructions to six committees of three judges each, who were to visit the six circuits into which England was divided for the purpose. The first part of the assize repeated the substance of some provisions of the Assize of Clarendon (1166), but with several differences. The second part of the assize defined some of the rights of the heir, the lord (or lords), and the widow of a deceased free tenant; its protection of the heir's right to succeed to land established the possessory action known as mort d'ancestor (*i.e.,* an action to recover lawfully inherited land that had been taken by another before the heir was able to take possession). In line with this, the justices were also ordered to hear pleas of novel disseisin (an action to recover lands of which the plaintiff had been dispossessed) arising since May 1175 and to try proprietary actions commenced by the king's writ for the recovery of land held by the service of half a knight's fee or less.

The rest of the assize's text contains other instructions to the judges concerning their various administrative, political, judicial, and financial duties.

Northamptonshire, county of the East Midlands region, England. The county is oval in shape, with the long axis extending for 56 miles (90 km) in a southwest–northeast direction. A ridge of hills, an escarpment of Jurassic rocks, runs along the long axis and separates the basin of the River Nen in the south from that of the Welland in the north. Both these rivers flow east into The Wash. Among the rocks above the escarpment are the ore-bearing Northampton Sands, which yield a low-grade iron ore and have been extensively worked.

The wooded hills and well-watered valleys seem early to have attracted settlement to the area. There are pre-Celtic as well as Roman remains; parts of the churches at Earls Barton, Brigstock, and Brixworth are Saxon and may be as early as 7th century. At the Domesday Inquest ordered by William I the Conqueror in 1086, the boundaries of the shire (county) were virtually identical with those of today. Norman and Early English building styles are well-represented, but, architecturally, the chief feature of the county is the large number of mansions and country houses, from 13th-century Barnwell Castle, to Tudor Rockingham Castle and Castle Ashby, and to Sulgrave Manor, the ancestral home of George Washington's family.

In spite of its numerous aristocracy and squirearchy, the county was largely pro-Parliament in the English Civil War of 1642–45. The decisive battle, in which King Charles I was defeated, was fought just north of Naseby near the county's northern border in 1645.

In some ways Northamptonshire epitomizes the rural life of a bygone England, with great estates and parks, rolling pastoral lands, and some of Britain's best-known fox hunts (*e.g.,* the Pytchley). At the same time, however, it plays an important role in the contemporary economy. It is notable for the number of reservoirs that have been constructed on the Nen and its tributaries. Its industries are varied. Since the Industrial Revolution it has been best-known for footwear, with boot and shoe factories in all its towns and many of its villages. This industry, however, has been steadily shrinking since the 1950s, and its replacements are engineering and food processing. The county is remarkable for the number of small industrial centres it possesses rather than for major concentrations.

Crossed by two main railway routes from London to the Midlands and the north and by the main motorway link (M1), the county is well-situated for manufacturing and marketing. The steelmaking town of Corby developed in the 1930s. The continued use of lean local ores has, however, proved uneconomical in competition with rich imported ores. In addition, the aging of the steel plant has contributed to the uncertainty of the industry.

Northampton, Corby, Kettering, and Wellingborough are the principal county centres. The county has seven districts: Corby, Daventry, East Northamptonshire, Kettering, Northampton, South Norththamptonshire, and Wellingborough. Its area is 914 square miles (2,367 square km). Pop. (1985 est.) 546,100.

Northavon, district, county of Avon, southwestern England, occupying an area of 178 square miles (462 square km) directly northeast of the city of Bristol. Northavon is primarily a fertile clay valley extending eastward from the mud flats of the Severn Estuary. It crosses the steep westward-facing escarpment of the limestone Cotswold Hills (600 feet [180m]) in the extreme east. Large amounts of milk are trucked from the small valley dairies to regional urban areas; beef cattle and cereals (including wheat and barley) are also raised. Cereal cultivation has chiefly replaced sheep farming in the Cotswolds. Parts of Northavon are within the exhausted Bristol coalfield.

Parishes (towns) northeast of Bristol (such as Yate, Chipping Sodbury, and Westerleigh) are experiencing residential growth. Filton, an older industrial centre directly north of Bristol, has major aircraft works of both the British Aerospace and Rolls-Royce companies. The Oldbury nuclear power station is located adjacent to the tidal reservoir of the Severn Estuary in the northwestern corner of the district. Celestite (strontium sulfate) is quarried near Yate. The Severn suspension bridge (completed 1966) connects the district and southern England to Wales. Thornbury, a market centre in the west, is the district seat. Pop. (1985 est.) 124,100.

Northbrook, Thomas George Baring, 1st earl of, Viscount Baring of Lee, Baron Northbrook of Stratton (b. Jan. 22, 1826, London—d. Nov. 15, 1904, Stratton Park, Hampshire, Eng.), British statesman who served as viceroy of India.

The son of Sir Francis Baring, afterward 1st Baron Northbrook, he studied at Christ Church, Oxford. He was private secretary to several officials and became Liberal member of Parliament for Falmouth and Penryn (1857–66). He was a junior lord of the Admiralty (1857–58) and under secretary for India (1859–61; 1868–72) and for war (1861–66).

After the assassination of Lord Mayo, viceroy of India, in 1872, Prime Minister Gladstone appointed Baring to succeed him. Baring's general policy was to lighten taxes, reduce legislation, and give the land rest. A believer in free trade, he abolished most export duties and reduced import duties. In the Bengal famine of 1874 he sanctioned the construction of the Sone Canal and North Bengal railway as relief works. Repeatedly in disagreement with the secretary of state for India, Lord Salisbury, over matters of policy, Baring resigned in 1876. He was made earl of Northbrook in 1876 and served as first lord of the Admiralty (1880–85), during which time he was sent on a special mission to Egypt (August–November 1884) to inquire into financial problems. He parted decisively from Gladstone on the Irish question in 1886 and thereafter defended the union against Home Rule.

Northcliffe (of Saint Peter), Alfred Charles William Harmsworth, Viscount, also called (from 1905) Baron Northcliffe of the Isle of Thanet (b. July 15, 1865, Chapelizod, near Dublin—d. Aug. 14, 1922, London), the most successful newspaper publisher in the history of the British press and a founder of popular modern journalism.

After an impoverished childhood and a few attempts at making a quick fortune, young Harmsworth embarked on free-lance journalism as a contributor to popular papers, rose to editorial positions, and, inspired by the success of *Tit-Bits,* a popular weekly of informative scraps, decided to start a similar paper of his

Northcliffe, 1918

Associated Newspapers Ltd.

own called *Answers to Correspondents.* After some difficulty in securing financial backing, he began publication, soon shortening the name to *Answers*. As the paper gained public favour he was joined by his brother Harold, whose financial ability and capacity for attracting advertising, combined with Alfred's genius for sensing the public taste, made it a success. *Answers* was followed by many other inexpensive popular periodicals, chief among them *Comic Cuts* ("Amusing Without Being Vulgar") and *Forget-Me-Not,* for the new reading public of women. These formed the basis for what became the Amalgamated Press (from 1959 Fleetway Press), the largest periodical publishing empire in the world.

In 1894 Harmsworth entered the newspaper field, purchasing the nearly bankrupt *London Evening News* and transforming it into a popular newspaper with brief news reports, a daily story, and a column for women. Within a year, circulation had grown to 160,000 copies, and profits were substantial. Conceiving the idea of a chain of halfpenny morning papers in the provinces, he bought two papers in Glasgow and merged them into the *Glasgow Daily Record*. He then launched a national daily in London. The *Daily Mail,* first published on May 4, 1896, was a sensational success. Announced as "The penny newspaper for one halfpenny" and "The busy man's daily journal," it was exactly suited to the new reading public. All news stories and feature articles were kept short, and articles of interest to women, political and social gossip, and a serial story were made regular features. Although news headlines remained, at first, modest in size, far more were used than in any previous paper. With its first issue, the *Mail* established a world record in daily newspaper circulation, a lead it never lost while its founder lived.

Next Harmsworth bought the *Weekly Dispatch* when it was nearly bankrupt and turned it (as the *Sunday Dispatch*) into the biggest-selling Sunday newspaper in the country. In 1903 he founded the *Daily Mirror,* which successfully exploited a new market as a picture paper, with a circulation rivaling that of the *Daily Mail*. Harmsworth saved the *Observer* from extinction in 1905, the year in which he was made Baron Northcliffe. In 1908 he reached the pinnacle of his career by securing control of *The Times,* which he transformed from a 19th-century relic into a modern newspaper.

Northcliffe's contributions to the British war effort in World War I began with his early exposure in the *Daily Mail* of the British army's shell shortage. His criticisms of Lord Kitchener aroused intense resentment in some quarters, but he also pressed for the creation of a separate Ministry of Munitions and for the formation (1915) of a wartime coalition government. For his service as head of the British war mission in the United States in 1917, he was created a viscount that year. He acted as the British government's director of propaganda aimed at Germany and other enemy countries in 1918. By this time Northcliffe's press empire appeared to hold such power over public opinion that he tried unsuccessfully to influence the composition of Prime Minister David Lloyd George's cabinet. Always unpredictable, Northcliffe became the victim of a megalomania that damaged his judgment and led to the breakdown that preceded his death.

Northcliffe's success as a publisher rested on his instinctive understanding of the new reading public that had been created by compulsory education. His legacy lay in changing the direction of much of the press away from its traditional informative and interpretative role to that of the commercial exploiter and entertainer of mass publics.

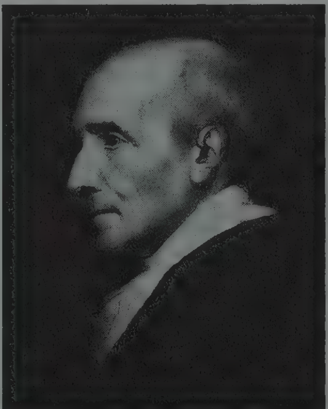
Northcote (of Exeter), Henry Stafford Northcote, Baron, also called (from 1887) SIR HENRY STAFFORD NORTHCOTE, BARONET (b. Nov. 18, 1846, London, Eng.—d. Sept. 29, 1911, Ashford, Kent), British diplomat and administrator, governor-general of Australia from 1904 to 1908.

The second son of Sir Stafford Henry Northcote (afterward 1st Earl of Iddesleigh), he attended Eton College and Merton College, Oxford (B.A., 1869; M.A., 1873). He became a Foreign Office clerk in 1868 and, as an aide, accompanied his father to Washington, D.C., in 1871 in the settlement of the *Alabama* claims. He was private secretary to Lord Salisbury in Constantinople in 1876 and private secretary to his father as chancellor of the Exchequer from 1877 to 1880. He stood election from his family's seat of Exeter and served in the House of Commons from 1880 to 1899, during which he held minor posts in Salisbury's first and second governments. Upon his father's death in 1887, he was created a baronet.

In 1899 he was appointed governor of Bombay Presidency and, before leaving England (January 1900), was created a baron. At that time the area of Bombay, including Gujarāt, was suffering from famine and plague, and Northcote tried to improve hospital conditions and effect some land reform, benefiting small cultivators. Because government funds were meagre, some of his aid came out of his own purse.

Appointed governor-general of Australia in August 1903, he was sworn in at Sydney in January 1904 and remained in Australia almost five years (returning to England in the fall of 1908). During his term of office he traveled throughout Australia, averaging yearly some 10,000 miles (16,000 km) by land and sea. He gave his office considerable prestige and, being wealthy, was able to entertain hospitably in a grand manner. After his return to England, he bore the standard of the Commonwealth of Australia at the coronation of George V (1911). Northcote died without issue, and the peerage became extinct.

Northcote, James, in full THOMAS JAMES NORTHCOTE (b. Oct. 22, 1746, Plymouth, Devon, Eng.—d. July 13, 1831, London), English portraitist and historical painter.



Self-portrait by James Northcote, detail, oil on canvas, 1827; in the National Portrait Gallery, London

By courtesy of the National Portrait Gallery, London

Northcote was apprenticed to his father, a poor watchmaker of Plymouth, and, during his spare hours, learned to use paintbrush and pencil. In 1769 he left his father and started as a portrait painter. Four years later he went to London and was admitted as a pupil into the studio and house of the great portraitist Sir Joshua Reynolds. In 1775 he left Reynolds, and about two years later, having acquired the necessary funds by portrait painting in Devon, he went to study in Italy. After his return to England three years later he settled (1781) in London, where John Opie and Henry Fuseli were his rivals. He was elected an associate of the Royal Academy of Arts in 1786 and full academician the following spring.

Northcote's many portraits were clearly influenced by Reynolds. He also executed a number of competent but dull history paintings. The "Young Princes Murdered in the Tower," his first major historical work, dates from 1786, and it was followed by the "Burial of the Princes in the Tower," both paintings, along with seven others, being executed for Boydell's Shakespeare Gallery. The "Death of Wat Tyler" was exhibited in 1787. Perhaps his most individual painting, "Emperor Alexander I of Russia Rescuing a Boy from Drowning" (1820), reflects the melodramatic Romanticism then coming into fashion.

Northcote also fancied himself a writer, and in 1813 he embodied his recollections of his old master in *Memoirs of Sir Joshua Reynolds.* In 1826 the writer William Hazlitt published in the *New Monthly Magazine* his recollections of Northcote's pungent and cynical opinions in their conversations together.

Northcote, Sir Stafford Henry, 8TH BARONET, also called (from 1885) 1ST EARL OF IDDESLEIGH, VISCOUNT SAINT CYRES (b. Oct. 27, 1818, London, Eng.—d. Jan. 12, 1887, London), British statesman and a leader of the Conservative Party who helped to shape national financial policy.

On leaving Balliol College, Oxford, he became in 1843 private secretary to William Gladstone at the Board of Trade. He was afterward legal secretary to the Board and, after acting as one of the secretaries to the Great Exhibition of 1851, cooperated with Sir Charles Trevelyan in framing the report that revolutionized the conditions of appointment to the civil service. He succeeded his grandfather as 8th baronet in 1851. He entered Parliament in 1855 and, steadily supporting his party, became president of the Board of Trade in 1866, secretary of state for India in 1867, and chancellor of the Exchequer in 1874. In the interval between these last two appointments he had been one of the commissioners for the settlement of the *Alabama* claims by the United States.

On Benjamin Disraeli's elevation to the House of Lords in 1876, Northcote became leader of the Conservative Party in the Commons. As finance minister he was largely dominated by the policies laid down by Gladstone; but he distinguished himself by his dealings with the debt, especially his introduction of the new sinking fund (1876), by which he fixed the annual charge for the debt in such a way as to provide for a regular series of payments off the capital. His temper as leader was, however, too gentle to satisfy the more ardent spirits among his own followers, and party cabals (in which Lord Randolph Churchill took a leading part) led to Sir Stafford's transfer to the Lords in 1885, when Salisbury became prime minister. Taking the titles of Earl of Iddesleigh and Viscount St. Cyres, he was included in the cabinet as first lord of the Treasury.

In Lord Salisbury's 1886 ministry Northcote became secretary of state for foreign affairs. Among Northcote's works are *Twenty Years of Financial Policy* (1862), a valuable study of Gladstonian finance, and *Lectures and Essays* (1887).

Northeast Caucasian languages: *see* Nakho-Dagestanian languages.

Northeast Passage, Russian SEVERNY MORSKOY PUT, maritime route along the northern coast of the Eurasian landmass, lying mainly off northern Russian Siberia. Early explorers of the area included Willem Barents and Olivier Brunel. Under the auspices of the Russian tsar Peter I the Great, Semyon Dezhnyov probably (1648) and Vitus Bering certainly (1728) sailed northward through the Bering Strait. Captain James Cook, however, was the first to see both sides of the strait (1778) and to demonstrate that Asia and North America are two separate continents. After many attempts the Northeast Passage was first traversed by the Swedish explorer Baron Adolf Erik Nordenskiöld in 1878–79. Since the late 1960s the passage has been kept open in the summer months by icebreakers, aided by aerial observations and radar and sonar.

Northeast Svalbard Nature Reservation, Norwegian NORDAUST-SVALBARD NATURRESERVAT, nature reserve established in 1973 by Norway in the Svalbard archipelago in the Arctic Ocean. With an area of 7,350 square miles (19,030 square km) and an average elevation of 2,740 feet (835 m), the reserve comprises all of North East Land, Kvit Island, Kong Karls Land, smaller adjoining islands, and the surrounding territorial waters. North East Land, the largest component of northeastern Svalbard, is covered by glaciers and ice caps. Animal life of the park includes arctic fox, reindeer, polar bear, walrus, and ringed and bearded seal.

Northeastern school, Portuguese COLÉGIO NORDESTINO, group of 20th-century Brazilian regional writers whose fiction dealt primarily with the culture and social problems of Brazil's hinterland Northeast. Stimulated by the Modernist-led revival of nationalism of the 1920s, the regionalists looked to the diverse ethnic and racial cultures of Brazil for inspiration.

The gifted and dedicated group of prose writers of the Northeastern school included Gilberto Freyre, leader of the movement and author of the monumental *Casa-Grande e Senzala* (1933; *The Masters and the Slaves*); José Lins do Rego, who depicted the clash of the old and new ways of life in his Sugar Cane cycle of novels (1932–36); and Jorge Amado, who gave Brazil some of its best proletarian literature in such novels as *Terras do sem fim* (1942; *The Violent Land*) and *Dona Flor e Seus Dois Maridos* (1966; *Dona Flor and Her Two Husbands*). Also associated with the school were Graciliano Ramos, who explored the inner struggle of the individual, and Rachel de Queiroz, who wrote of the bandits, religious mystics, and forgotten men who inhabit the hinterland.

Northeim, town, Lower Saxony *Land* (state), north-central Germany. It lies on the Leine River, 12 miles (19 km) north of Göttingen, and is served by two autobahn access roads and a rail junction. The site dates from the 9th century. It obtained civic rights in 1252 (being then the seat of the counts of Northeim) and later became successively a market village and a member of the mercantile Hanseatic League. A Protestant town during the Reformation, it was stormed by imperial troops in 1627 and generally suffered severely during the Thirty Years' War. It came under the control of Hanover and then Prussia (1866).

Despite such wars, the town has managed to preserve much of its medieval architectural character, with many half-timbered buildings and extensive remains of the old town walls. (Outside the walls, parts of the town have grown up in a modern style.) Of the Benedictine abbey of Sankt Blasien, founded in 1080 and dissolved at the Reformation, there survive only a chapel, some offices, and monastic houses. Other sites include the restored Church of Sankt Sixtus and various medieval houses. Northeim's industries include machinery construction, metalworking, sugar processing, prefabricated housing, and various food-processing enterprises related to local agriculture. Pop. (1995 est.) 32,476.

Northern, province, northeastern South Africa. The northernmost South African province, it is bordered by Zimbabwe on the north; Mozambique on the east; the provinces of Mpumalanga, Gauteng, and North-West on the south; and Botswana on the west and northwest. Northern was created out of part of Transvaal province in 1994. Pietersburg is the provincial capital.

Northern province consists of the vast Lowveld plain, which is interrupted by several mountain ranges rising out of the Highveld plateau in the province's south and centre. Among these ranges are the forested Soutpans Mountains, which extend about 80 miles (130 km) from east to west. The Water Mountains in the southwest rise to more than 6,500 feet (2,000 m) and are densely covered with thorn trees and shrubs. The Lowveld extends across the eastern, northern, and western parts of the province and is a subtropical parkland with mopane (mopani) and baobab trees. The Limpopo River forms the province's northern and western borders. Part of Kruger National Park lies along the eastern border. The northern part of the province has a hot, subtropical climate with 12 to 20 inches (300 to 500 mm) of rainfall annually. The southern mountains have a more temperate climate with about 30 inches (760 mm) of rainfall yearly.

The population of Northern province is composed mostly of rural blacks of the Pedi (Northern Sotho), Tsonga, Venda, and other Bantu-speaking peoples. The white minority speaks mostly Afrikaans. Many blacks earn their livelihood by subsistence farming or through work as migrant labourers. Corn (maize), sorghum, potatoes, tobacco, peanuts (groundnuts), and grapes are important crops. Citrus and other fruits are also grown in the Lowveld. Cattle raising is widespread, and goats and sheep are also herded. Asbestos and tin are mined, and there are deposits of chromite, platinum, iron ore, copper, and coal. Pietersburg, the only major city in the province, is connected by road and rail with Pretoria. Area 47,599 square miles (123,280 square km). Pop. (1994 est.) 5,201,630.

Northern Cape, province, western South Africa. It is bordered on the north by Namibia and Botswana; on the east by North-West, Free State, and Eastern provinces; on the south and southwest by Western Cape province; and on the west by the Atlantic Ocean. Northern Cape was administratively created out of northern and central Cape of Good Hope province in 1994. Kimberley is the provincial capital.

The Northern Cape's eastern half and southwest form part of the Highveld, an arid plateau that gradually rises to the Great Escarpment (more than 6,000 feet [1,900 m] in elevation) along the province's southern border. To the northwest is desert, including the sand dunes of Kalahari Gemsbok National Park. The Orange River traverses the province from east to west and provides water for irrigation. The Orange is joined by one of its main tributaries, the Vaal River, near Douglas, in the east. Thornveld is the natural vegetation of the province, and the climate is generally hot and arid. Annual rainfall increases from 4 inches (100 mm) in the west to about 14 inches (350 mm) in the east.

Northern Cape is the largest and most sparsely populated province of South Africa. About half of the population is of mixed race. Blacks make up 30 percent of the population and are mostly Tswana-speaking peoples. Whites constitute about 15 percent and mostly speak Afrikaans. The major urban centres are Kimberley and Upington.

Merino sheep are raised in the south and Karakul sheep in the north, and cattle are grazed throughout the province. Pig raising and horse breeding are also practiced. Wheat, alfalfa (lucerne), cotton, peanuts (groundnuts), citrus fruit, and grapes are grown under irrigation. Major copper mines are located near Prieska and Okiep. Diamonds are recovered from the arid region of Namaqualand in the west, along the Atlantic coast. Tungsten, zinc, lead, asbestos, iron ore, and manganese are also extracted at various locations. Area 139,692 square miles (361,800 square km). Pop. (1994 est.) 737,306.

Northern Dvina River, Russian SEVERNAYA DVINA, river formed by the junction of the Sukhona and Yug rivers at the city of Velikiy Ustyug, in Vologod *oblast* (province) of Russia. The Northern Dvina is one of the largest and most important waterways of the northern European portion of Russia. It flows 462 miles (744 km) in a generally northwesterly direction and enters the Dvina inlet of the White Sea below the city of Arkhangelsk. The river drains a basin that, with an area of 138,000 square miles (357,000 square km), is larger than the whole of Poland.

Until its confluence with the tributary Vychegda River, the Northern Dvina is also called the Little Northern Dvina, with the remainder of its course known as the Greater Northern Dvina. The Northern Dvina's important tributaries include the Sukhona, Vychegda, Vaga, and Pinega rivers, all of which are themselves large rivers. At its mouth, the river's delta has an area of 425 square miles (1,100 square km) and is laced with a multitude of channels and branches.

The landscape drained by the Northern Dvina is formed of low, undulating plains sloping gradually down to the White Sea. The river's basin is bounded on the east by the low Timansky Ridge (where the Vychegda and its tributaries have their source) and the Northern Uvaly Hills, which form the watershed with the Volga River basin to the south. The northern and central portions of the basin have a thick covering of coniferous forests, while mixed forests, with conifers predominant, are found to the south. In all, more than half the basin is forest-clad. Beyond the left (west) bank of the river there are many low-lying bogs and lakes—including the large Lake Kubena—which are often the source of tributary rivers. Only along the river's floodplain are there open meadows.

The Northern Dvina is primarily fed by melting snow, which brings a marked maximum flow of 700,000 cubic feet (19,800 cubic m) per second in the spring. In its upper course, the river begins to freeze in November and becomes ice-free again by the end of April; the lower course is frozen for a slightly longer period. The spring witnesses frequent ice jams and floods along the whole river.

The Northern Dvina is navigable for most of its length, and since early times it has been the chief waterborne-transport route of northern European Russia. Early fur hunters and colonists used the river, and monasteries and towns (including Arkhangelsk) were later established at important confluences. The river retains its economic importance and is linked with the Volga-Baltic Waterway via the Sukhona River. The Northern Dvina's main cargo is timber, which is cut on a large scale throughout the basin and rafted to sawmilling centres along the river's banks. The most important of these are Velikiy Ustyug, Kotlas, and, above all, Arkhangelsk, which is the largest sawmilling centre in Russia. Arkhangelsk is a major timber-exporting port and one of the western terminal ports of the North Sea route. At the western end of the river's delta is the port of Severodvinsk.

Northern Ireland, country of the United Kingdom lying in the northeast of the island of Ireland. The Republic of Ireland bounds it on the south and west, the Irish Sea and the North Channel on the east, and the Atlantic Ocean on the north. Northern Ireland is often referred to as the province of Ulster, though it includes only part of the historic Ulster.

A brief treatment of Northern Ireland follows. For full treatment, *see* MACROPAEDIA: United Kingdom: *Northern Ireland.*

For current history and for statistics, *see* BRITANNICA BOOK OF THE YEAR.

Physical and human geography. Topographically, Northern Ireland can be thought of as a saucer centred on Lough (lake) Neagh, its upturned rim forming the province's highlands. Five of the six former counties—Antrim, Down, Armagh, Tyrone, and Londonderry—met at the lake, and each had a highland region on the saucer's rim. To the north and east the Mountains of Antrim (which form a plateau) tilt upward toward the coast, reaching a height of 1,817 feet (554 m) at Trostan. The rounded landscape of drumlins—smooth mounds created by glaciation—in the southeast is punctuated by Slieve Croob at 1,745 feet (532 m) and culminates in the Mourne Mountains, which rise to Slieve Donard at 2,789 feet (850 m).

Northern Ireland's climate is temperate and maritime. Most of its weather comes from the southwest in a series of low-pressure systems, bringing the rain and clouds that often lend character to the landscape. Rainfall decreases from west to east, and a relatively dry spring gives way to a wet summer and wetter winter. The country is exposed to the ameliorating effects of the North Atlantic Current and experiences no extremes of heat or cold. January temperatures range from 38° F (3° C) on the northern coast to 35° F (2° C) on the eastern coast; in July, temperatures of 65° F (18° C) are common.

The economy of Northern Ireland is integrated with that of the United Kingdom. Its trade is dominated by imports from and exports to other parts of the United Kingdom. Northern Ireland is an industrialized country, with manufactured goods comprising a large volume of its exports. Industries include engineering, shipbuilding, vehicle manufacture, textiles, food and beverage processing, and clothing. The service industry employs about two-thirds and manufacturing less than one-fifth of the country's workers. Londonderry is well known for shirt and pajama production. The shipyards of Belfast, the capital city, are world famous, and Belfast also has chemical plants and rope factories. The city is a major port of the British Isles; other significant ports are Larne and Londonderry.

Dunluce Castle near Giant's Causeway, Northern Ireland
Tim Thompson

Mineral resources in Northern Ireland are meagre. For power, Northern Ireland depends on imported coal and oil, although local chalk, clays, limestone, and gravel support the production of lime, bricks, and cement. More important, Northern Ireland possesses considerable agricultural resources, which it is developing as a major part of its economy. The number of farms has declined since the 1970s, with consolidation bringing a better livelihood for fewer farmers. Mixed farming predominates, and most farm income is derived from livestock. To the south of Lough Neagh lies rich orchard country.

In the arts and cultural life it is generally difficult to distinguish between native and imported. Few traces remain of any culture predating the Tudor invasions of the 16th century and the forced settlements of Scots early in the following century. Folk participation and recreation are periodically focused on colourful and noisy religious ceremonies and processions. In other respects, the cultural milieu of Northern Ireland is one shared with the remainder of the British Isles. The accents given to the English language represent the most obvious of the few truly distinctive regional characteristics.

The University of Ulster (with campuses at Coleraine, Jordanstown, Londonderry, and Belfast) was established in 1984 by the merger of the New University of Ulster and Ulster Polytechnic. It is the principal institution of higher learning. Northern Ireland has an Arts Council, which encourages all aspects of the arts. Its activities tend to be concentrated in Belfast because this city alone can support ballet and opera companies. Belfast has theatres, a touring company based on the University of Ulster, a symphony orchestra, and a youth orchestra. In addition, it possesses a permanent art gallery, as does Londonderry. Ulster Television, Ltd., provides local programming in competition with the British Broadcasting Corporation. The Ulster Museum is the national museum, while the Ulster Folk and Transport Museum provides an interesting link with peasant origins in Northern Ireland.

History. Until the 20th century the history of Northern Ireland formed part of Irish history as a whole. Nonetheless, a distinctive Christian culture, known by the Celtic name of Ulaid (English: Ulster), developed in the northern region from the 5th and 6th centuries onward. The earliest written sources about the history of Ulster date to the 7th century.

By the 8th century the island's clans had grouped themselves into five provinces, of which Ulster under the Uí Néill dynasty was the leading one until the 11th century. Norman adventurers from England, South Wales, and the European continent succeeded in establishing themselves in Ireland by the mid-12th century. But in 1205 the English king, John Plantagenet, took control and created an earldom of Ulster.

In the 16th and 17th centuries English and Scottish settlers arrived in Ireland, predominantly in Ulster, bringing with them their Protestant beliefs. Ulster's Protestant population increased still further in the 18th century when the region became a refuge of Huguenots forced to leave their homeland after the revocation of the Edict of Nantes in 1685. The immigrants' commercial and industrial skills contributed to the development of the linen-cloth manufacture that became the foundation for the 19th-century industrialization of Belfast and the Lagan Valley.

In 1801 the Act of Union created the legislative union of Great Britain and Ireland, under the name of United Kingdom. Yet a number of crises in the 19th century, including the Great Famine of the 1840s, built momentum for Irish Home Rule (limited self-government; *see* Home Rule). The first Home Rule bill was introduced in 1886, the second in 1893, and the third in 1912–14; but the outbreak of World War I postponed implementation until after the war. In 1920 the Government of Ireland Act provided for the establishment of two modestly self-governing units, one comprising 6 of Ulster's 9 counties (now Northern Ireland), the other comprising the 23 counties of southern Ireland along with 3 counties of Ulster (which together now form the Republic of Ireland). Whereas the Roman Catholic majority in southern Ireland, radicalized by the Easter Rising of 1916, now rejected Home Rule altogether in favour of outright independence, the Protestant majority in the six Ulster counties settled for Home Rule, even though they preferred union with Great Britain.

From 1921 to 1940 Northern Ireland was an openly sectarian state, controlled by the Protestant majority and ruled in their interest. The Roman Catholic minority, even though it suffered discrimination, flocked from the countryside to the industrial centres, especially Belfast, where work was available in the textile and shipbuilding industries.

In the mid-1960s the fragile stability of Northern Ireland began to erode. By the late 1960s a civil rights movement had emerged and communal violence had increased. British forces entered Northern Ireland in the early 1970s to keep peace but were soon regarded with hostility by Roman Catholics. The Irish Republican Army (IRA) mounted a terrorist campaign to force the withdrawal of British troops as a prelude to Northern Ireland's unification with Ireland. In 1972 British Prime Minister Edward Heath suspended the constitution and parliament of Northern Ireland. Thereafter, various efforts were made to restore Home Rule and establish reconciliation, including the Anglo-Irish Agreement (1985), which gave Ireland a consultative role in the affairs of Northern Ireland. Frameworks for all-party peace talks—notably the Downing Street Declaration in 1993—were put forward, and in 1994 both the IRA and the unionist paramilitary groups announced a cease-fire.

Under the Belfast Agreement (also known as the Good Friday Agreement) of April 1998, local government responsibilities were to devolve to an elected assembly. After voters in both Ireland and Northern Ireland approved the accord, elections to the new Northern Ireland assembly resulted in the election of David Trimble, leader of the Protestant Ulster Unionist party, as "first minister" and Seamus Mallon, from the Roman Catholic Social Democratic and Labour Party, as his deputy. After international mediators temporarily resolved the issue of the decommissioning (disarmament) of paramilitary groups, including the IRA, power was officially devolved to the assembly in December 1999. The IRA's continued failure to decommission prompted Britain to suspend devolution and restore direct rule less than three months later. The assembly was recalled in May 2000. Area 5,452 square miles (14,120 square km). Pop. (1999 est.) 1,691,800.

Northern Kantō, Japanese KITA-KANTŌ, industrial region, east-central Japan, occupying portions of Gumma, Saitama, and Tochigi *ken* (prefectures). Situated just north of, and adjacent to, the Keihin (Tokyo-Yokohama) Industrial Zone, the area consists mostly of plains, interrupted by the Kantō Range and Echigo Range. Northern Kantō is neither an administrative nor a political entity.

The region's industries include the manufacture of electrical machinery, metal products, and transport equipment. Copper, zinc, and iron mining, forestry, and sericulture are other economic activities. The silk and paper industries were first mechanized in Gumma prefecture in 1912 and 1914; an iron and steel factory opened in Koyuma in 1939. Later industrial development included precision machinery (began operation in Niza, 1946); diesel engines, trucks, and buses (Ageo, 1950); motor vehicles (Ōta, an aircraft-production centre during World War II); electrical appliances (Ōra, 1959); and textiles (Ashikaga and Kiryū). During the 1960s, industrial output developed rapidly, and as industries migrated outward from the Keihin area, Northern Kantō gained further importance. Although Northern Kantō's heavy-industrial production is small compared with Japan's other industrial regions, it is strong in light manufacturing. Cameras and electrical appliances are assembled from parts manufactured in Keihin and are returned to Keihin for distribution. Agricultural products from the area include rice, livestock, mulberries, pears, and chestnuts.

Northern Kyūshū, Japanese KITA-KYŪSHŪ, industrial region of southwestern Japan, centring on the city and port of Kita-Kyūshū and bounded by the Gen Sea to the northwest and the Inland Sea to the east. The region is drained by the Onga, Chikugo, and Yamakuni rivers and is composed of portions of Fukuoka, Saga, Ōita, and Nagasaki *ken* (prefectures). The Northern Kyūshū region specializes in chemical and heavy industries, particularly iron and steel. Transport equipment, machinery, electrical appliances, and textiles are manufactured as well. Agricultural products include mandarin oranges, fish, and rice. The city of Kita-Kyūshū was created in 1963 from the former cities of Wakamatsu, Yamata, Tobata, Kokura, and Moji.

During the Tokugawa period (1603–1867), the region began to evolve as an industrial centre through limestone quarrying (for fertilizer and cement) and small-scale bituminous-coal mining. Coal production increased during the Meiji period (1868–1912), and government ironworks and related chemical factories were established in Yahata in 1901. Located on Japan's southwestern island of Kyūshū, the region maintained a strategic position for trade in iron ore with China and for national defense during the Russo-Japanese War (1904–05). Chemical industries in Minamata and heavy industries in Ōmuta and Ōita cities expanded early in the Shōwa period (1926–45). In 1932 the Yahata ironworks were converted for steel production. Military demands during the Sino-Japanese War (1937–45) and World War II were followed by economic stagnation. As land and coal-mine subsidence and the conversion of Japanese industry to oil as an energy source accelerated the region's decline, a number of industries relocated to the Keihin (Tokyo-Yokohama) and Keihanshin (Kyōto-Ōsaka-Kōbe) industrial zones. In an attempt to remedy the situation, factories for consumer goods were built in Fukuoka city and a petrochemical complex was constructed on reclaimed land in the city of Ōita.

northern lights, also called AURORA BOREALIS, luminous atmospheric display visible in the Northern Hemisphere. *See* aurora.

Northern Mariana Islands, also called NORTHERN MARIANAS, officially COMMONWEALTH OF THE NORTHERN MARIANA ISLANDS, self-governing commonwealth in political union with the United States, in the western Pacific Ocean, composed of 22 islands located north of, but not including, Guam. The islands extend 450 miles (720 km) in a north-south arc and have a land area of 184 square miles (477 square km). Saipan (47 square miles [122 square km]), Tinian (39 square miles [101 square km]), and Rota (33 square miles [85 square km]) are the principal islands and, together with Alamagan and Agrihan, are inhabited. Another island, Pagan, was evacuated in 1981 after a severe volcanic eruption. Besides Guam, the nearest neighbours are the Bonin Islands (north) and the Federated States of Micronesia (southeast). The Mariana capital is Chalan Kanoa, on Saipan.

A brief treatment of the Northern Mariana Islands follows. For full treatment, *see* MACROPAEDIA: Pacific Islands.

The land. The Mariana landscape is varied. Rota, the southernmost island, consists of a volcanic base capped with coral limestone, giving it a terraced appearance. Four southern islands (Farallon de Medinilla, Saipan, Tinian, and Agiguan) are composed of limestone and have few mountains. The islands farther north are volcanic peaks. Mount Pagan erupted several times in the 1980s. Farallon de Pajaros, the northernmost of the Marianas, and Asuncion are also notable. Agrihan volcano, the highest of the Northern Mariana group, rises to 3,165 feet (965 m).

The climate is tropical, with average yearly temperatures on Saipan ranging between 79° F (26° C) and 82° F (28° C) and rainfall averaging about 70 inches (1,800 mm). Rainfall is significantly less on the northernmost islands. Most of the southern limestone islands have tropical or scrub forests at higher elevations and coconut palms and casuarina trees along the coast. Where level or gently sloping areas occur, cattle are grazed. The steep slopes of the volcanic islands from Guguan northward are mostly barren, although coarse grass, coconut palms, breadfruit trees, and casuarina trees are found along the coasts of these islands. Soils are generally shallow and low in fertility.

The people. The indigenous people of the Northern Marianas are Micronesian. Almost one-third of the population are Chamorro, who represent a mixture of the indigenous Mariana people and a variety of European and Asian groups. Another one-third of the population are Filipino, and another one-fifteenth are Carolinians, descendants of people who migrated from the Eastern Carolines during the 19th century. Having lost most of their original Pacific Islands culture, the people of the Northern Marianas have a mode of life that is Spanish Roman Catholic but influenced by American culture since 1947. They live in villages, and vegetable gardening is the main occupation. Salaried employment, mostly available on Saipan in government offices, is another major source of income. Saipan contains more than 90 percent of the commonwealth's total population. Chamorro (related to Indonesian) and English are the principal languages.

Economy. The cash economy centres on tourism, but subsistence farming, including the cultivation of taro, cassava, yams, breadfruit, and bananas, is widely practiced. Copra production, fishing, pig and cattle raising, and the making of handicrafts provide additional revenue. Vegetables, beef, and pork are exported. The garment industry on Saipan is the chief manufacturing activity.

Transportation among the islands is by boat or air. Tinian and Saipan are the main ports. Saipan has an international airport, paved roads, a television station, and radio stations.

Government and social conditions. Part of the Trust Territory of the Pacific Islands granted to the United States by the United Nations in 1947, the Northern Marianas voted for status as a United States commonwealth in 1975. A constitution was approved, and elections were held in 1977 for a governor, a lieutenant governor, and a bicameral legislature made up of senators and representatives. The islands became internally self-governing in 1978 and became a U.S. commonwealth territory on Nov. 4, 1986. Its residents on that date became U.S. citizens. The U.S. Department of the Interior administers federal funds for the islands.

History. After their discovery by Ferdinand Magellan (1521), the Portuguese navigator sailing for Spain, the Marianas were visited frequently but were not colonized until 1668, when their name was changed by Jesuit missionaries from Ladrones Islands (Thieves Islands) to honour Mariana of Austria, then regent of Spain. The Jesuits began to forcibly convert the native Chamorros to Roman Catholicism. Guam was ceded to the United States following the Spanish-American War (1898), and the northern Marianas were sold to Germany in 1899. Occupied by Japan in 1914, they became a Japanese mandate from the League of Nations after 1919.

The Marianas were the site of fierce fighting during World War II. The successful U.S. campaign to take Saipan (June 15–July 9, 1944) cracked Japan's main defensive line in the Pacific and led to the fall of Prime Minister Tōjō Hideki and his cabinet (July 18). Tinian was occupied that same month, and one year later it served as the base for the American planes that dropped atomic bombs on Hiroshima and Nagasaki. Pop. (2000 est.) 71,900.

Northern Norway (region): *see* Nord-Norge.

Northern Pacific Railway Company, one of the northern transcontinental railroads of the United States, operating between St. Paul, Minn., and Seattle, Wash., and merged into the Burlington Northern in 1970.

The Northern Pacific was chartered by Congress in 1864 to build a line from Lake Superior westward to a port on the Pacific coast and was given a land grant of 40,000,000 acres (16,200,000 hectares). It nevertheless encountered difficulty in finding financial backing for its venture into a mostly unsettled wilderness until the Philadelphia banker Jay Cooke undertook to raise $100,000,000. In 1873 the railroad was approaching Bismarck, in the Dakota Territory, when Cooke's bank collapsed. The road went into receivership, and construction stopped for six years. In 1878 the railroad was taken over by Henry Villard, who built it westward to Helena in Montana Territory, where it was connected with the Oregon Railway to Seattle in Washington Territory in 1883.

The Northern Pacific encountered new financial difficulties in the 1890s, when it was reorganized by the banker J.P. Morgan. Morgan shared control of it with James J. Hill, whose Great Northern Railway Company was a close competitor. Hill sought to combine the two railroads with the Chicago, Burlington and Quincy Railroad Company through the Northern Securities Company, with Hill as president. In 1904 the U.S. Supreme Court declared this arrangement a violation of the Sherman Anti-Trust Act. The three railroads continued to be financially linked, however, and in 1970 they were permitted to merge as the Burlington Northern, Inc. With the addition of the St. Louis–San Francisco Railway Company in 1980, the Burlington system had about 30,000 miles (48,000 km) of track, stretching from the West Coast through the Rocky Mountains to the Great Lakes and down to the Gulf of Mexico. The Burlington Northern acquired the Santa Fe Pacific Corporation in 1995.

Northern Penner River (India): *see* Penneru River.

Northern Plateau (Mexico): *see* Mesa del Norte.

Northern Rhodesia (Africa): *see* Zambia.

Northern Sarkārs, Sarkārs also spelled CIRCĀRS, group of four, later five or six, *sarkārs* (districts into which the emperor Shēr Shāh of Sūr divided his empire). They corresponded roughly to modern Srikākulam, Vishākhapatnam, and East and West Godāvari districts of northeastern Andhra Pradesh state, India.

Their cession by Ṣalābat Jang to the French East India Company in 1753 marks the beginning of their common history. They were occupied by the British in 1758.

Northern Sotho (people): *see* Pedi.

Northern Tableland (Australia): *see* New England Range.

Northern Territory, self-governing territory of northern Australia, occupying the central section of the northern part of the continent.

A brief treatment of the Northern Territory follows. For full treatment, *see* MACROPAEDIA: Australia.

Physical and human geography. The Northern Territory is bounded by the Timor and Arafura seas on the north, Queensland and the Gulf of Carpentaria on the east, South Australia on the south, and Western Australia on the west.

The coastland and many offshore islands are flat and mostly fringed with mangrove swamps. Inland from the coastal belt and the Arnhem Land plateau there is a gradual rise to the town of Tennant Creek (1,230 feet [375 m]), which lies on a vast Precambrian plateau that extends southward and westward into neighbouring states.

The territory's vegetation is mostly open woodland with short eucalyptus trees and tall grasses of low nutritive value. In the Alice Springs area the rocky hills carry the stiff grasses called spinifex, and on the light-textured soils of the lower slopes and valleys an association of mulga (an acacia tree) with short grasses is a valuable fodder resource. The territory's mammals include the egg-laying echidna and a variety of marsupials, including rat kangaroo, rock wallaby, wallaroo, and the black wallaroo.

The pastoral potential of the territory was first recognized during construction of the Overland Telegraph Line, and, on its completion in 1872, areas near Alice Springs and Darwin were stocked with cattle. In the 1880s cattle stations were also formed on the Barkly Tableland. Beef, live cattle, and shrimp are now the major exports. Mineral products include manganese ore, copper and gold ores, uranium ores, and alumina and bauxite. Oil and natural gas are exploited in the Amadeus Basin in central Australia. Manufacturing consists only of small service industries to serve local needs. The Northern Territory has one single-track railway from Alice Springs to Adelaide in South Australia.

The Northern Territory is extremely sparsely inhabited. About three-fourths of the territory's population is of European descent and one-fifth Aborigine, with 70 other nationality groups constituting the remainder. For the most part the whites live in the towns and the Aborigines in rural areas. In 1976 the Aboriginal Land Rights Act gave Aborigines ownership of large areas of the Northern Territory. The Northern Territory (Self-Government) Act of 1978 provides for a territorial administrator and for a legislative assembly, the members of which are elected for four-year terms. The government maintains hospitals at or near Darwin, the territory capital, and provides medical and dental services as well as personnel for the Royal Flying Doctor Service of Australia. The Department of Education and Science maintains correspondence schools supplemented by School of the Air broadcasts, in which pupils may participate by two-way radio, to serve the more widely dispersed population.

History. Although Arnhem Land legends record early contact with a seafaring people, the first confirmed contact with non-Aborigines occurred in 1605, when a Dutch ship explored part of the Gulf of Carpentaria. Other Dutch ships followed, as did Indonesian peoples, but not until the surveys initiated in the early 19th century by Matthew Flinders was a thorough examination of the coast completed. The Northern Territory first became part of Australian territory in 1825, when the New South Wales colony was extended westward to the 129th east meridian; in 1863 the area was annexed to the province of South Australia with an eye toward cattle grazing. It underwent a gold rush and division into cattle stations in the following decades. Aboriginal lands were confiscated, and when Aborigine resistance was met slaughter often ensued. In 1911 the Northern Territory passed under the control of the new Commonwealth government of Australia. Little development occurred, and Aborigines continued to suffer at the hands of whites. In 1947 the Northern Territory won the right to a partly elective Legislative Assembly, and in 1974 it won the right to a fully elected body and representation in the Australian Senate. In 1978 the territory achieved self-government, with status equal to that of the other Australian states. Area 519,800 square miles (1,346,200 square km). Pop. (1993 est.) 170,800.

Northern Uvaly, range of hills in western Russia. *See* Severnye Uvaly.

Northern War, FIRST (1655–60), final stage of the struggle over the Polish-Swedish succession. In 1665 the Swedish king Charles X Gustav declared war on Poland on the pretext that Poland's John II Casimir Vasa had refused to acknowledge him; the real reason was Charles's desire to aggrandize more Baltic territories. The Swedes, allied with Brandenburg, invaded Poland with initial success; but then Russia, Denmark, and Austria declared war on Sweden, and Brandenburg deserted the Swedes to join the coalition. The Swedes were driven from Poland but twice invaded Denmark. The war ended with the Polish sovereigns renouncing their claim to the Swedish throne and the Swedes acquiring Skåne from Denmark.

Northern War, SECOND, also called GREAT NORTHERN WAR (1700–21), military conflict in which Russia, Denmark-Norway, and Saxony-Poland challenged the supremacy of Sweden in the Baltic area. The war resulted in the decline of Swedish influence and the emergence of Russia as a major power in that region.

Sweden's expansion in the Baltic Sea coastlands during the 16th and 17th centuries had antagonized the neighbouring states: Russia's access to the Baltic was blocked by Swedish-held Karelia, Ingria, Estonia, and Livonia; Denmark-Norway resented its loss to Sweden of provinces in the Scandinavian peninsula, especially Scania (Skåne), and was also aggrieved by Sweden's alliance with the ducal house of Holstein-Gottorp, which contained Denmark from the south and prevented the Danish crown's reabsorption of the duchies of Schleswig and Holstein; the German princes disliked Sweden's power in the Holy Roman Empire, and Brandenburg in particular coveted Swedish Pomerania; and many magnates of the Polish republic still thought of Swedish Livonia as Polish by right. The death of the Swedish king Charles XI in 1697, when his heir, Charles XII, was but a boy of 14, became the signal for Denmark-Norway to organize an anti-Swedish coalition.

Upon the formation of the coalition (1698–99), Augustus II the Strong, king of Poland and elector of Saxony, attacked Livonia (February 1700), while Frederick IV, king of Denmark and Norway, marched into Schleswig and Holstein (March 1700) and Peter I the Great, tsar of Russia, laid siege to Narva (October 1700). Charles XII of Sweden responded first by concentrating his forces against Denmark. Landing a few miles from Copenhagen, he compelled Frederick to withdraw from the anti-Swedish alliance and to sign the Treaty of Traventhal (August 1700), which restored the status quo. Charles next confronted the Russians, victoriously attacking them at Narva (Nov. 30, 1700). He then turned against the Poles and the Saxons, occupying Courland and forcing Augustus to retreat into Poland. Determined to depose Augustus, Charles spent six years fighting him; only after the Swedes invaded Saxony, however, did Augustus agree to relinquish his Polish crown and to break his Russian alliance (Treaty of Altranstädt; September 1706).

Meanwhile, the Russians under Peter the Great had used this period to reorganize their army and to establish themselves on the eastern Baltic coast (Peter had founded the city of St. Petersburg and the naval port of Kronshtadt in 1703. When Charles resumed his attack on Russia (late 1707), Peter defeated Charles's auxiliary corps at Lesnaya (October 1708), then decisively defeated the main Swedish army at the Battle of Poltava (July 8, 1709; *see* Poltava, Battle of). Charles fled to Turkey and induced the Turks to declare war on Russia (1710). After their victory at the Pruth River (1711), however, the Turks, satisfied with a negotiated peace that gave them control of Azov, withdrew from the war. Meanwhile, the anti-Swedish coalition, which had revived after the Battle of Poltava, began (autumn 1709) to seize Swedish possessions along the Baltic coast. In May 1713 it defeated (at Tönning in Holstein) the Swedish army that had been raised in 1712 to defend those territories. In 1714 the Russians defeated the Swedish naval fleet at Hangö (Hanko) and, having captured the Åland Islands, threatened Stockholm. Charles returned to Swedish territory in November 1714.

By this time most of Sweden's possessions along the Baltic coast were either occupied or threatened by the anti-Swedish coalition. Frederick William I of Prussia and George I of England, in his capacity as elector of Hanover, joined the coalition after they had demanded territory from Sweden in return for their continued neutrality and been substantively refused by Charles. In December 1715 Charles returned to southern Sweden proper and set about reorganizing his country effectively for a new stage of the war. He opened peace negotiations in 1717–18 while simultaneously expanding his army to 60,000 men in anticipation of a new offensive. In September 1718 Charles invaded southeastern Norway, but he was killed at the siege of Frederikshald in November 1718.

Charles had left no children, and the throne devolved upon his only surviving sister, Ulrika Eleonora, and her husband, Frederick of Hesse-Kassel (Frederick I of Sweden). Frederick negotiated a series of peace settlements in 1719–21. By the Treaties of Stockholm (1719–20), Sweden, Saxony, and Poland returned to the status quo *ante bellum,* and Denmark gave back its conquests to Sweden in return for a substantial sum of money. Sweden ceded Bremen to Hanover and gave up Stettin (Szczecin) and part of Swedish Pomerania to Prussia. By the Treaty of Nystad (Sept. 10, 1721), which concluded the war between Sweden and Russia, Sweden ceded Ingria, Estonia, Livonia, and a strip of Finnish Karelia to Russia.

Northern Wei DYNASTY: *see* Wei dynasty.

Northern Wei sculpture, Chinese sculpture dating from the Northern Wei period (AD 386–534/535) of the Six Dynasties (220–589) and representing the first major influence of Buddhism upon China. Northern Wei sculpture, produced in northern territory that was occupied and ruled by foreign invaders and that was quick to respond to Buddhism, is distinct from the more traditional indigenous art produced in the south, which was still ruled by native Chinese dynasties.

Few examples of Northern Wei sculpture survive from the period prior to 446–452, during which a major persecution of Buddhism was carried out. With surprising suddenness, however, Buddhism was restored to favour, and there followed a major period of Buddhist art. The art—consisting primarily of sculpture but also of some wall painting and reflecting various iconographic types, with simple images of the Buddha predominating—may be divided into two major periods: the first from immediately following the persecution to 494, when the capital of the Northern Wei was moved from the northern city of P'ing-ch'eng (the present Ta-t'ung, Shansi province) to the ancient centre of Chinese civilization, Lo-yang (Honan province); and the second from 494 to the end of the Northern Wei period. The style of the first period is a curious amalgam of foreign influences that are ultimately traceable to the Buddhist art of India, which emphasizes the heavy stylization of blocky volumes, giving a certain naive and archaic quality to the figures (*see* Yün-kang caves). While that style is found later, it was ultimately replaced by an entirely different Chinese, or Lung-men, style, which clothes the Buddha in the costume of the Chinese scholar and stylistically emphasizes a svelte and sinuous cascade of drapery falling over an increasingly flattened figure (*see* Lung-men caves).

Northland, local government region, the northernmost of North Island, New Zealand. It is coextensive with most of the North Auckland Peninsula. Northland extends about 96 miles (250 km) northwest from Kaipara Harbour to Cape Reinga and North Cape and is bounded on the west by the Tasman Sea and on the east by the Pacific Ocean. The North Auckland Peninsula, which is no more than 50 miles (80 km) wide, is generally lower than the rest of North Island but rises to about 2,500 feet (760 m) in the volcanic Tutamoe and Maungataniwha ranges. The peninsula's western shore is sandy and indented by the large but shallow Hokianga and Kaipara harbours. On the peninsula's east coast the shoreline is rocky, with good anchorages in Parengarenga and Rangaunu harbours, Doubtless Bay, Bay of Islands, and Bream Bay.

Northland is relatively undeveloped. Livestock is raised, and towns, with the exception of Whangarei, are small. Maoris constitute a large proportion of the region's population. Area 4,866 square miles (12,604 square km). Pop. (1993 est.) 134,000.

Northman: *see* Viking.

Northrop, John Howard (b. July 5, 1891, Yonkers, N.Y., U.S.—d. May 27, 1987, Wickenberg, Ariz.), American biochemist who received (with James B. Sumner and Wendell M. Stanley) the Nobel Prize for Chemistry in 1946 for successfully purifying and crystallizing certain enzymes, thus enabling him to determine their chemical nature.

Northrop was educated at Columbia University, where he received his doctorate in chemistry in 1915. In World War I he was a captain in the U.S. Army Chemical Warfare Service.

During World War I Northrop conducted research on fermentation processes suitable for the industrial production of acetone and ethyl alcohol. This work led to a study of enzymes essential for digestion, respiration, and general life processes. At that time the chemical nature of enzymes was unknown, but through his research Northrop was able to establish that enzymes obey the laws of chemical reactions. He crystallized pepsin, a digestive enzyme present in gastric juice, in 1930 and found that it is a protein, thus resolving the dispute over what enzymes are. Using the same chemical methods, he isolated in 1938 the first bacterial virus (bacteriophage), which he proved to be a nucleoprotein. Northrop also helped isolate and prepare in crystalline form pepsin's inactive precursor pepsinogen (which is converted to the active enzyme through a reaction with hydrochloric acid in the stomach), the pancreatic digestive enzymes trypsin and chymotrypsin, and their inactive precursors trypsinogen and chymotrypsinogen.

Northrop was first an assistant at, and then a member of, the Rockefeller Institute for Medical Research in New York City from 1916 until his retirement in 1961, when he became professor emeritus. He was also a visiting professor of bacteriology and biophysics at the University of California at Berkeley (1949–58). His book *Crystalline Enzymes* (1939) was an important text.

Northrop, John Knudsen (b. Nov. 10, 1895, Newark, N.J., U.S.—d. Feb. 18, 1981, Glendale, Calif.), American aircraft designer, an early advocate of all-metal construction and the flying wing design.

Northrop graduated from high school in 1913 and in 1916 became a draftsman and designer for the Lockheed (formerly Loughead) brothers, builders of seaplanes and sport biplanes in Santa Barbara, Calif. From 1923 to 1927 he designed fuel tanks for the Douglas Aircraft Company in Santa Monica, and then he joined Allan Lockheed as chief engineer for the Lockheed Aircraft Company, Hollywood. There he designed and built the Vega, a high-wing monoplane noted for its plywood fuselage of monocoque, or stressed-skin, construction, in which the plywood sheath, rather than heavy internal trusses, provided the structural support.

John Knudsen Northrop, 1949

By courtesy of the Northrop Corporation

In 1928 Northrop cofounded the Avion Corporation in nearby Burbank, where he perfected a light, strong "multicellular" wing, built up from a number of sheathed-over, boxlike subcompartments. In 1929 Avion was bought by United Aircraft and Transport Corporation and was renamed Northrop Aircraft Corporation. Under this arrangement Northrop produced the low-wing, aluminum Alpha, which was used to carry mail and passengers. In 1932 he formed the Northrop Corporation in partnership with Douglas, which used his multicellular wing structure on its famous DC-3 passenger and transport plane. In 1939 he founded Northrop Aircraft, Inc., and directed it until his retirement in 1952. Northrop's lifelong interest was in the flying wing, a configuration consisting essentially of a short but very broad wing with no fuselage and tail. From the 1920s he experimented with several small prototypes, and during World War II he designed a bomber 172 feet (52 m) wide and 53 feet (16 m) long. First flown in 1946, the XB-35 was powered by pusher propellers; its jet-propelled version, the YB-49, first flew in 1947. The following year the U.S. Air Force rejected the flying wing, citing as one factor the instability caused by its lack of a vertical tail fin, but four decades later the Northrop Corporation adapted Northrop's design to new control mechanisms and radar-avoiding materials in designing the B-2 stealth bomber.

Northrop Grumman Corporation, formerly (1939–58) NORTHROP AIRCRAFT, INC., or (1958–94) NORTHROP CORPORATION, American aerospace company that produces military aircraft, guidance and navigation systems, electronic countermeasure and surveillance systems, and precision-guided munitions. Its headquarters are in Los Angeles.

The company was founded in Hawthorne, Calif., in 1939, by John K. Northrop, a pioneer aeronautical engineer. During World War II he designed the P-61 Black Widow, the first night interceptor. Under the leadership of Thomas V. Jones, who became president in 1959, the Northrop Corporation diversified as a maker of various missile and aircraft systems and parts. In the 1950s the company developed the N-156, a lightweight, supersonic jet fighter built for simple maintenance. As the T-38 Talon, it became a standard air force trainer, and in its F-5 Freedom Fighter and F-5E Tiger II versions it was sold around the world. Northrop also made the F-89 interceptor and the Snark missile system. In the 1970s it helped develop the F/A-18 jet fighter in conjunction with McDonnell Douglas. Northrop also became a major supplier of guidance systems for tactical and strategic missiles. In the 1980s it developed the B-2 stealth bomber.

In 1994 Northrop purchased the Grumman Corporation, another major American defense contractor. That company had been founded by Leroy Randle Grumman in 1929 and had specialized in military aircraft. Grumman's chief products during the Cold War were the A-6 attack aircraft, the F-14 carrier-based fighter jet, and the E-2C Hawkeye early-warning aircraft. By the time it was purchased by Northrop in 1994, Grumman had reoriented its business toward battlefield surveillance and electronics systems.

Northumberland, northernmost county of England. It is bounded north by Scotland, east by the North Sea, and west and south by the counties of Cumbria and Durham and by the area of Tyne and Wear. It comprises six districts: Alnwick, the borough of Berwick-upon-Tweed, the borough of Blyth Valley, the borough of Castle Morpeth, Tynedale, and Wansbeck. Morpeth is the county town (seat). Northumberland is a county of strongly contrasting landscapes from the eastern coastal plain to the sparsely populated, rugged hills and moors of the west and the densely populated urban and industrial areas of the coalfield and the River Tyne's valley to the south.

The Cheviots, rounded hills that stand 1,000–2,500 feet (300–760 m) high, form the Scottish and Cumbrian borders. The western hills and moors, composed of grits and impure limestone, are deeply dissected by the Rivers Rede and North Tyne. Carboniferous rocks dip east and south from the Cheviot Hills to the coast and the Tyne valley. Along the coast a notable landscape feature is Whin Sill, a doleritic (lava) intrusion that forms the Farne Islands and Bamburgh Castle Rock and carries sections of a Roman wall. The coastal plain, underlain by limestone in the north and coal measures in the south, is covered by glacial deposits varying in character from light sands and gravels to heavy clays and loams. The county's upland soils are thin, acid, and peaty. The climate is cool because of its northerly latitude, elevation, and exposure to easterly winds. Winters are severe, springs late, and summers cool, temperatures rarely exceeding 60° F (16° C); the coast suffers from cool sea fogs. Rainfall is generally low, ranging from 25 inches (635 mm) on the coast to 50 inches (1,270 mm) in the Cheviot Hills. The county is famed for its wild, exposed scenery: half the area is mountain and moorland with large areas, notably Kielder, Wark, and Redesdale forests, taken over by the British Forestry Commission, a state body.

There is evidence of prehistoric settlement in the area before the period of Roman domination began in AD 122, when Hadrian's Wall from the River Tyne to the Solway Firth was constructed. In 547 the Angle king Ida built the fortress at Bamburgh (subsequently the seat of Saxon kings) and founded the kingdom of Bernicia. His grandson, Aethelfrith the Destroyer, established the predominance of the Angles in 603 by defeating the combined forces of Strathclyde Britons and Scots and by annexing the neighbouring kingdom of Deira in 605. Henceforth the area between the Forth and Humber became known as Northumbria, which was the most powerful of the 7th-century Anglo-Saxon states. Holy Island (Lindisfarne) was the centre for the spread of Christianity throughout this kingdom.

Entrance gateway, Alnwick Castle, Northumberland

A.F. Kersting

The Normans ruthlessly harried the north and built castles against invasions from Scotland and across the North Sea. Northumberland's subsequent history until the union of Scotland with England (1603) is a continuous record of border warfare. The Roman Catholic north rose in support of Mary, Queen of Scots, in 1569. In 1644 Newcastle was captured by the Scots in the English Civil Wars.

Medieval Northumberland prospered from the production and export of wool and hides. Coal was mined in Roman times, and the coal trade between London and the Tyne developed rapidly from the 13th century. Shipbuilding consequently developed, and in the early 19th century new investment and inventions (including the steam turbine) created great shipbuilding and repairing works which still dominate the economy. Local iron foundries were encouraged in the 1830s by the building of iron ships. Other industries dependent on coal also developed—salt panning at the river mouths and glassmaking, which was introduced in the early 17th century from Lorraine, in France. For about a century the Tyneside (now Tyne and Wear) chemical industries were among the most important in the country, but, like the glassworks, they failed to survive. Lead, silver, and iron were mined in Allendale from the 12th to the 19th century.

Modern industrial complexes on the Rivers Tyne and Blyth produce heavy electrical machinery, pottery, and soap. Approximately 50 percent of Northumberland is mountain and rough hill pasture, 45 percent medium-quality farmland, and 5 percent good farmland. The county was not brought into settled agricultural use until late in the 18th century: even in the 1770s at least half of Northumberland was still wasteland, and parts of the moors are still among the most sparsely populated areas of England. Much of the coastal plain is sheep, cattle, and barley country with large, highly mechanized mixed farms that include some of the richest fattening pastures in England. Sheep (mainly Cheviots) greatly outnumber cattle. Traditional salmon fishing in the Tyne and Tweed still flourishes. The larger towns and industrial and mining villages are found in the south and east of the county, while the sparsely populated fells are served by the small market towns of Wooler, Rothbury, and Bellingham. Area 1,943 square miles (5,032 square km). Pop. (1992 est.) 307,200.

Northumberland, EARLS AND DUKES OF, titled English nobility of several creations, most notably in the Percy family, grouped below chronologically and indicated by the symbol •.

• **Northumberland, Henry Percy, 1st Earl of,** Baron Percy of Alnwick (b. Nov. 10, 1341—d. Feb. 20, 1408, Bramham Moor, near Tadcaster, Yorkshire, Eng.), English statesman, leading figure during the reigns of England's Richard II and Henry IV. He and his son Sir Henry Percy, the celebrated "Hotspur," are commemorated in William Shakespeare's play *1 Henry IV.*

Son of the 3rd Baron Percy of Alnwick (d. 1368), he led English troops in France by the age of 18 and was a warden of the Scottish marches two years later. In 1376 he became marshal of England and was created Earl of Northumberland at Richard II's coronation in 1377. He served Richard in numerous capacities—military, diplomatic, and administrative—but after 1398 he supported the Duke of Hereford (afterward Henry IV) and took a prominent part in Richard's abdication.

Henry IV's success in gaining the crown was largely owed to Northumberland's support, and the earl remained an important member of the privy council. The Scottish wars in 1400–03, however, gradually turned the two Percys, father and son, against the king; they complained of inadequate funds and rewards in prosecuting the wars and of being deprived of ransoms for their Scottish prisoners. The earl made an alliance with the Welsh leader Owen Glendower, raised a large force, and with his brother and son issued a manifesto declaring that Henry had acquired his crown by fraud. In the ensuing rebellion, his son Hotspur was slain at the Battle of Shrewsbury (July 21, 1403), and his brother, the Earl of Worcester, was captured and beheaded. Northumberland took no part in the battle, having reached the scene too late with his troops. He retired northward but afterward met the king and repledged his oath of fealty.

By February 1405 he was again in league with Owen Glendower and other disaffected nobles, and the rebellion was again renewed—and again crushed by the king's army. Northumberland fled to Scotland and then to Holland, but in the summer of 1407 he was again in Scotland and, raising a force, moved southward in February 1408. His troops were defeated and he himself slain at the Battle of Bramham Moor.

• **Northumberland, John Neville, Earl of,** Lord Montagu, also called (1470–71) 1st Marquess of Montagu (b. between 1428 and 1435—d. April 14, 1471, Barnet, Hertfordshire, Eng.), leading partisan in the English Wars of the Roses. He was the son of Richard Neville, Earl of Salisbury, and the brother of Richard Neville, Earl of Warwick, the "Kingmaker."

John Neville was a ringleader in the conflict between the Nevilles and Percys in 1453, which was the real beginning of the civil war called the Wars of the Roses. This rivalry, involving an ambition to control the Scottish march, dominated Neville's career. Despite close personal ties with Henry VI, Neville supported Edward IV and, as warden of the east march, beat down the last traces of Lancastrian resistance in 1464, notably at Hedgeley Moor (April) and Hexham (May). For this he was created, in May 1464, Earl of Northumberland, a title heretofore held by the Percy family.

A hesitant man, he held aloof from Warwick's intrigues against Edward IV in the summer of 1470. But the king, suspicious of Neville, restored the earldom of Northumberland to Henry Percy (March 1470), creating Neville Marquess of Montagu, a title without lands. Neville joined the rebels, which was the immediate cause of Edward's flight abroad (October 1470), but did not attack him on his landing in Yorkshire in March 1471. However, he finally joined his brother at Coventry and was killed with him in battle at Barnet.

• **Northumberland, John Dudley, Duke of,** Earl of Warwick, Viscount Lisle, Baron Lisle (b. 1502—d. Aug. 22, 1553, London, Eng.), English politician and soldier who was virtual ruler of England from 1549 to 1553, during the minority of King Edward VI. Almost all historical sources regard him as an unscrupulous schemer whose policies undermined England's political stability.

His father, Edmund, was executed by King Henry VIII in 1510. Dudley became deputy governor of the English-occupied port of Calais, Fr., in 1538, and in 1542 he was made Viscount Lisle and appointed lord high admiral. He served under Edward Seymour, earl of Hertford, in the invasion of Scotland in 1544. In September of the same year he captured the French city of Boulogne. The title earl of Warwick was conferred upon him in 1546.

Upon Henry VIII's death (Jan. 28, 1547), Warwick became a member of the regency council set up to govern the country during the minority of Edward VI. He acquiesced while Hertford assumed almost supreme power as protector with the title of duke of Somerset. At first the two men continued to work together. Warwick's military ability was chiefly responsible for Somerset's victory over the Scots at Pinkie in September 1547. But in 1549 Warwick took advantage of popular unrest generated by Somerset's policies to join with the propertied classes and the Roman Catholics in a coalition that deposed and imprisoned the protector. When the coalition collapsed, Somerset was released (February 1550), and the two rivals were ostensibly reconciled. But Warwick was now in complete control of the government.

Warwick's foreign policy included the abandonment of English efforts to obtain control of Scotland. At home he reversed Somerset's liberal agrarian policies by suppressing peasants who resisted enclosure—normally the taking by propertied classes of arable land held in common by the peasants. In continuing the consolidation of the Protestant Reformation in England, he seized for himself and his henchmen much of the remaining wealth of the Church. A second *Book of Common Prayer* was imposed by another Act of Uniformity (1552).

The general unpopularity of his rule caused him to strengthen his position by making himself duke of Northumberland (1551) and by having the potentially dangerous Somerset arrested and (on Jan. 22, 1552) executed. Thereafter he imposed strict conformity to Protestant ceremony and doctrine. The only aspects of his policies that historians have applauded were his attempts to deal with England's economic ills by fighting inflation, stabilizing coinage, and expanding trade.

When it became evident in 1553 that the 15-year-old Edward VI would die of tuberculosis, Northumberland caused his son, Guildford Dudley, to marry Lady Jane Grey and persuaded the King to will the crown to Jane and her male heirs—thereby excluding from the succession Henry VIII's daughters, Mary and Elizabeth. Edward died on July 6, 1553, and on July 10 Northumberland proclaimed Jane queen of England. But the councillors in London and the populace backed Mary Tudor. Northumberland's supporters melted away, and on July 20 he surrendered to Mary's forces. A month later he was executed for treason. See B.L. Beer, *Northumberland* (1973).

John Dudley, duke of Northumberland, painting by J.V. Belkamp, 1551; in the collection of Lord Sackville

• **Northumberland, Thomas Percy, 7th earl of** (b. 1528—d. Aug. 22, 1572, York, Yorkshire, Eng.), English conspirator during the reign of Elizabeth I, seeking the release of Mary, Queen of Scots, and the free exercise of the Roman Catholic religion.

His father, Sir Thomas Percy (son of the 5th earl), was attainted and executed at Tyburn for his part in the Yorkshire rebellion of 1536 called the Pilgrimage of Grace (*q.v.*). His brother, the 6th earl, fearing the consequences, surrendered his estates, and the title fell into abeyance on his death the following year. In 1557, after faithful military service, Thomas Percy was made 7th earl of Northumberland.

Other honours and services followed, but his Catholicism made him an object of suspicion at the Elizabethan court, and he was passed over in various preferments that he thought due him. After Mary, Queen of Scots, crossed into England and was imprisoned, Northumberland sympathized with her misfortune, as the victim of his faith. By 1569 he was in communication with Spanish envoys and, late that year, joined like-minded nobles in issuing proclamations promising the release of Mary and the restoration of the Catholic religion. Within a month (December 1569) the northern rebels were scattered or killed by government forces, and Northumberland escaped to Scotland. At long last, in August 1572, the Scots handed him over to Elizabeth's officers on payment of £2,000. He was beheaded in the marketplace at York.

• **Northumberland, Henry Percy, 8th earl of** (b. 1532?—d. June 21, 1585, London), English Protestant member of the predominantly Roman Catholic Percy family, who nevertheless died in their cause.

Brother of the 7th earl, Henry Percy served both Mary I and Elizabeth I in several capacities. During the northern rebellion, in which his brother was a leading agent, he was on the royal side, vigorously attacking the rebels. After his brother's execution in 1572, Elizabeth permitted him to assume the title of earl of Northumberland.

Nevertheless, family persuasions eventually overcame his loyalty, and he began intriguing for the escape of Mary, Queen of Scots, from imprisonment. Under suspicion, he was seized and lodged in the Tower of London for 18 months (1571–73), then released and gradually returned to favour. He was associated with the conspiracies of Francis Throckmorton (*q.v.*) and other Catholic agents and again sent to the Tower (September 1582), to be released after a few weeks. New intrigues brought him to the Tower a third time (December 1584), where six months later he was found dead, shot through the heart. The official verdict, probably accurate, was suicide.

• **Northumberland, Henry Percy, 9th earl of** (b. 1564, Tynemouth Castle, Northumberland, Eng.—d. Nov. 5, 1632, Petworth, Sussex), English Roman Catholic imprisoned in the Tower of London from 1605 to 1621 on suspicion of complicity in the Gunpowder Plot (*q.v.*).

On the death of his father, the 8th earl, in 1585, he succeeded to the earldom and settled in London. Although an unavowed Catholic, he wished only open toleration for English Catholics and ardently favoured the accession of James I after the Scottish king had given assurances on the question.

During the first two years Northumberland supported the new regime but then fell out over the punishment of his friend Sir Walter Raleigh and the continued punishment of Catholics. How deeply or marginally he was involved in the Gunpowder Plot (in which his kinsman Thomas Percy played a leading role) is unclear, but he was arrested, tried in 1606, and sentenced to life imprisonment in the Tower. He was released on clemency in 1621 and took no further part in public affairs.

• **Northumberland, Algernon Percy, 10th earl of,** also called (1627–32) BARON PERCY (baptized Oct. 13, 1602, London—d. Oct. 13, 1668), English Roman Catholic moderate during the turbulent reign of Charles I of England.

He became a peer as Baron Percy in 1627 and succeeded his father, the 9th earl, as earl of Northumberland in 1632. During the years immediately preceding the English Civil War he served as an admiral, making earnest but unsuccessful efforts to reform the navy, and in 1637 he was made lord high admiral of England. In 1639 Charles I appointed him general of the forces north of the Trent and a member of the council of regency.

Northumberland played a distinguished and honourable part in the troubled times of the Civil War. He was a friend of the Earl of Strafford, and gave evidence at his trial which, though favourable on the important point of bringing the Irish army to England, was on the whole damaging; and he afterward leaned more and more toward the Parliamentary party, of which he soon became leader in the House of Lords. He was a member of the Committee of Safety and later of the Committee of Both Kingdoms (England and Scotland), and he took an active part in the attempts to come to terms with the King, whom he visited at Oxford for that purpose in 1643 and at Uxbridge two years later.

Northumberland helped to organize the New Model Army; and in 1646 he was entrusted by Parliament with the charge of the King's younger children. He led the opposition in the House of Lords to the proposal to bring Charles I to trial, and during the Commonwealth he took no part in public affairs.

At the Restoration he was called to the privy council by Charles II and with his habitual moderation he deprecated harsh proceedings against the regicides. On the death of his son Joceline, the 11th earl, in 1670, the male line of Percy earls of Northumberland became extinct.

Northumbria, Old English NORTHANHYMBRE, one of the most important kingdoms of Anglo-Saxon England, lying north of the Humber River. During its most flourishing period it extended from the Irish Sea to the North Sea, between two west–east lines formed in the north by the Ayrshire coast and the Firth of Forth and in the south by the Ribble River, or the Mersey, and the Humber.

Its military strength was greatest in the 7th century, when the supremacy of three of its rulers, Edwin (616–632), Oswald (633–641), and Oswiu (641–670), was recognized by the southern English kingdoms. But Northumbria's most significant contribution to Anglo-Saxon history was made in the late 7th and in the 8th century, in the religious, artistic, and intellectual achievements of what has often been called a golden age. The twin monasteries of Wearmouth and Jarrow achieved preeminence in the intellectual life not only of England but also of western Europe. The Venerable Bede (died 735), a theologian and historian who won international fame, was a monk of Jarrow; but the excellent library there, which made his scholarship possible, was probably equalled in the monasteries of Hexham, Whitby, and Lindisfarne. The Gospel book from Lindisfarne (now in the British Museum) epitomizes Northumbrian attainment in writing and illumination, and the skill of Northumbrian sculptors survives in the stone crosses at Bewcastle and Ruthwell.

Northumbria was formed from the coalition of two originally independent states, Bernicia, which was a pirate settlement at Bamburgh on the Northumberland coast, and Deira, lying to the south of it. Aethelfrith, ruler of Bernicia (593–616), won control of Deira, thereby creating the kingdom of Northumbria. He was killed in battle by supporters of Edwin, a representative of the Deiran royal house, who then ruled both kingdoms; but thereafter, apart from a few very short intervals, Bernician royalty controlled a united Northumbria. The kingdom probably reached the west coast by the mid-7th century, and it also rapidly expanded northward, at one time extending as far as the River Tay.

The cultural life and the political unity of Northumbria were destroyed by the arrival of the Danes. The Danish "great army" captured York in 866, and many of its members settled in that area. Early in the 10th century other Scandinavians entered and settled western Northumbria from the Irish Sea. Meanwhile, in the north, the newly formed kingdom of Scotland drove the Northumbrian boundary back to the River Tweed. Eventually the rulers of the southern kingdom of Wessex imposed their authority throughout England. After the last Scandinavian ruler of York was expelled in 944, there ceased to be independent kings of Northumbria, which then became an earldom within the kingdom of England.

Northwest, also called PACIFIC NORTHWEST, region, northwestern U.S., including the states of Oregon and Washington and part of Idaho.

Originally claimed by Spain, Britain, Russia, and finally the United States, the Northwest was jointly occupied by Britain and the United States until 1846, when the 49th parallel was made the boundary between the United States and British-held Canada. The area had been explored by Meriwether Lewis and William Clark in 1804–06 and by various trappers and fur traders, and settlers began arriving there by way of the Oregon Trail in the 1840s. Farming and trapping were the original economic mainstays, to be followed in later years by lumbering, fishing, and mining.

A region of spectacular beauty and valuable natural resources, the Northwest has attracted relatively few immigrants largely because of its basically wet climate. Furthermore, the economy has tended to rely on a few big industries, such as timber, and aeronautics in Washington, so that fluctuations in the business cycle are particularly severe in the region.

Growth rates in the Northwest have been high but generally below those of neighbouring states in the Southwest. Government, particularly in Oregon, has tended to be progressive and especially sensitive to environmental issues.

Northwest Airlines, Inc., American airline founded in 1926 as Northwest Airways, Inc., and incorporated on April 16, 1934, under its current name. Originally flying a mail route between Chicago and Minneapolis–St. Paul, Minn., the company expanded in subsequent decades to eventually include a domestic and international system radiating from Chicago, Minneapolis–St. Paul, and Seattle, Wash., to other points in the United States, Canada, the Far East, and Europe. The company's trade name is Northwest Orient. Northwest's parent holding company, NWA Incorporated, was created in a corporate reorganization in 1984. Headquarters are at Minneapolis–St. Paul International Airport.

From 1928 to 1933 Northwest expanded westward, city by city, through the Dakotas, Montana, and Washington state. In 1945, after serving the U.S. government in various northern and Pacific theatres of war, the airline secured an extension of its routes eastward from Minneapolis–St. Paul to New York City, via Milwaukee and Detroit, and thereby became the nation's fourth transcontinental airline—although, unlike TWA, United, and American, it did not initially serve the California market. The following year Northwest was certified to fly to the Far East and began service in 1947. In 1958 it secured the lucrative Florida route from the Midwest. Northwest started service to the Benelux countries and London in 1979 and 1980, respectively. In 1982 it established routes to South America and China; the latter had not been linked directly to the United States by air in more than 30 years. In 1986 Northwest purchased Republic Airlines, Inc., thereby acquiring routes to Mexico and the Caribbean.

Northwest Caucasian languages: *see* Abkhazo-Adyghian languages.

Northwest Coast Indian, member of any of the native North American Indian peoples who inhabited a narrow but rich belt of coastland and offshore islands from Yakutat Bay in the north, near the border of Alaska, to Cape Mendocino in the south, in northwestern California. From north to south there were the following linguistic divisions: Tlingit; Haida; Tsimshian; northern Kwakiutl, or Heiltsuq; Bella Coola; southern Kwakiutl; Nootka; Coast Salish; Quileute-Chimakum; Kwalhioqua; and Chinook. Along the Oregon coast and northwestern California there were a series of smaller divisions: Tillamook, Alsea, Siuslaw, Umpqua, Coos, Tututni-Tolowa, Yurok, Wiyot, Karok, and Hupa.

A brief treatment of the Northwest Coast Indians follows. For full treatment, *see* MACROPAEDIA: American Peoples, Native.

The Northwest Coast Indians were primarily hunters and gatherers, who relied mostly on salmon fishing and the collection of such other marine life as mollusks, which was plentiful on the seashores. Because of the richness of its resources, the Northwest Indian territory was densely populated by comparison with other areas, with some of its villages numbering hundreds of inhabitants. The villages were permanent, the houses being built of planks around a rectangular floor plan and usually constructed large enough to accommodate several families. The people might migrate at certain seasons, following the salmon runs or the harvest fluctuations, but they always returned to their permanent dwelling places.

In a group, the highest ranking member was the chief; subsequent chiefs descended in a direct line from him. The chief was the administrator of the group, the one who set the times for fishing, determined the ceremonies attendant on the first salmon caught in the new season, and guided the group from its summer to winter habitations. The chief also determined the times of the "potlatch," a ceremonial feast to which other groups were invited and which celebrated certain occasions in the life cycle of the group: the death of a chief, the bestowal of rank or prerogatives, or the assumption of power by an heir.

The economy of the Northwest Coast Indians was built around the fishery. In the main, they used dugout canoes, some very large, being built for the transport of the chief and his retinue, and others being used to transport lumber, fish, and foodstuffs.

Northwest Coast Indians were also skilled craftsmen. Their famous totem poles were only one aspect of elaborate decoration in wood that involved animal and ancestral figures in highly stylized representations.

Northwest Ordinances, also called ORDINANCES OF 1784, 1785, AND 1787, several ordinances enacted by the U.S. Congress for the purpose of establishing orderly and equitable procedures for the settlement and political incorporation of the Northwest Territory—*i.e.,* that part of the American frontier lying west of Pennsylvania, north of the Ohio River, east of the Mississippi River, and south of the Great Lakes.

Until about 1780 the lands of the Northwest Territory were claimed by several existing states, including New York and Virginia. These states soon ceded their territorial holdings to the central government, and by the time that the U.S. War of Independence ended in 1783, specific measures were needed to guide the settlement and division of the Northwest Territory. The Ordinance of 1784, drafted by Thomas Jefferson and passed by Congress, divided the territory into a handful of self-governing districts. It stipulated that each district could send one representative to Congress upon its attaining a population of 20,000, and it would become eligible for statehood when its population equaled that of the least populous existing state. (This ordinance was superseded by the Ordinance of 1787.)

The Ordinance of 1785 provided for the scientific surveying of the territory's lands and for a systematic subdivision of them. Land was to be subdivided according to a rectangular grid system; the basic unit of land grant was the township, which was a square area measuring six miles on each side. A township could then be subdivided into a number of rectangular parcels of individually owned land. The minimum land sale was set at one square mile (640 acres), and the minimum price per acre was one dollar. One section in each township was to be set aside for a school. These procedures formed the basis of American public land policy until the Homestead Act of 1862.

The Northwest Ordinance of 1787, the most important of the three acts, laid the basis for the government of the Northwest Territory and for the admission of its constituent parts as states into the Union. Under this ordinance, each district was to be governed by a governor and judges appointed by Congress until it attained a population of 5,000 adult free males, at which time it would become a territory and could form its own representative legislature. The Northwest Territory must eventually comprise a minimum of three and a maximum of five states; an individual territory could be admitted to statehood in the Union after having attained a population of 60,000. Under the ordinance, slavery was forever outlawed from the lands of the Northwest Territory; freedom of religion and other civil liberties were guaranteed; the resident Indians were promised decent treatment; and education was provided for. Under this ordinance, the principle of granting new states equal rather than inferior status to older ones was firmly established.

Northwest Passage, historical sea passage of the North American continent, representing centuries of effort to find a route from the Atlantic Ocean to the Pacific Ocean through the Arctic archipelago of what became Canada. One of the world's severest maritime challenges, the route is located 500 miles (800 km) north of the Arctic Circle and less than 1,200 miles (1,930 km) from the North Pole. It consists of a series of deep channels through Canada's Arctic Islands, extending about 900 miles (1,450 km) east to west, from north of Baffin Island to the Beaufort Sea, above Alaska. To reach the Northwest Passage from the Atlantic requires a hazardous voyage through a stream of about 50,000 giant icebergs, up to 300 feet (90 m) in height, constantly drifting south between Greenland and Baffin Island. The exit to the Pacific is equally formidable, because the polar ice cap presses down on Alaska's shallow north coast much of the year and funnels masses of ice into the Bering Strait, between Alaska and Siberia.

Since the end of the 15th century, Western explorers have attempted to establish a commercial sea route north and west around the American land barrier encountered by Christopher Columbus. Such an accomplishment would realize an objective that has eluded man since King Henry VII of England sent John Cabot in search of a northwest route to the Orient in 1497. Five years earlier, Columbus had set out in search of a westward route after conquest of the Middle East by the Ottoman Turks in the mid-15th century disrupted Europe's overland routes to the East. Vasco da Gama sailed south around Africa to India in 1498; Ferdinand Magellan sailed southwest around South America to the East Indies in 1521; and Dutch explorers vainly sought a northeast passage around Russia. But it was the Northwest Passage that captured the imagination of many of the world's famed explorers, including Jacques Cartier, Sir Francis Drake, Sir Martin Frobisher, and Captain James Cook. All met with failure, and many with disaster. Sir Humphrey Gilbert, whose treatise on the passage inspired many voyages by others, drowned on his own attempt in 1583. Henry Hudson, his young son, and seven others were cast adrift by a mutinous crew in 1611, when his discovery of Hudson Bay proved to be an icy trap instead of the passage he sought. Knowledge of an Arctic passage came slowly, over hundreds of years, from information gathered during voyages by such explorers as John Davis, William Baffin, Sir John Ross, Sir William Parry, Frederick William Beechey, and Sir George Back, augmented by overland expeditions by Henry Kelsey, Samuel Hearne, and Sir Alexander Mackenzie. The worst tragedy came when Sir John Franklin and 128 men aboard HMS *Erebus* and HMS *Terror* vanished in 1845. One searcher for the lost expedition, Robert McClure, entered the passage from the west, became locked in the ice for two winters, then sledged overland to another rescue ship coming from the east to complete the first Northwest Passage in 1854. Adolf Erik Nordenskiöld led a Swedish-Russian voyage through the Northeast Passage over the top of Eurasia in 1878–79, and Soviet polar icebreakers have opened this route to limited use in modern times. But the Northwest Passage was not finally conquered by sea until 1906, when the Norwegian explorer Roald Amundsen, who had sailed secretly to escape creditors seeking to stop the expedition, completed an arduous three-year voyage in the converted 47-ton herring boat *Gjöa.* The first single-season transit was achieved in 1944, when Sergeant Henry A. Larsen, of the Royal Canadian Mounted Police, made it through in a schooner.

Opening the Northwest Passage to regular commercial ocean traffic would have worldwide economic significance in natural resources, transportation, and trade relations among nations. The greatest impact would be on the United States and Canada, but effects could be felt from the Persian Gulf to Panama, and from Chile to Scandinavia. But competitive developments, governmental policies, and many complex economical issues are likely to determine how soon, and how much, such a route would be used. The cost of strengthening ships against ice and the probable high insurance rates for vessels used in Arctic service, however, could inhibit use of the Northwest Passage as a trade route. But it would cut the distance between London and Tokyo, for example, to less than 8,000 miles (12,870 km) from the 14,670-mile (23,600-kilometre) route around Africa made necessary when the Suez Canal was shut down (1967–75). The Northwest Passage would permit use of far larger vessels than allowed by dimensions of the Panama and Suez canals. Icebreaking techniques learned in the Northwest Passage could be applied in other ice-locked waters from the Great Lakes to the Baltic Sea, including Russia's Northeast Passage with its vast Siberian oil fields. Canada has held sovereignty over the Arctic Islands since 1880, but some countries, including the United States, contend that much of the Northwest Passage is in international waters. Canada has indicated that it would welcome international commerce over the route, subject to pollution-control regulations.

Northwest Spitsbergen National Park, Norwegian NORDVEST-SPITSBERGEN NASJONALPARK, national park and bird sanctuary established in 1973 by Norway on the northwestern corner of the island of Spitsbergen, in the Svalbard archipelago in the Arctic Ocean. With an area of 1,268 square miles (3,283 square km), the park typifies a high-arctic-tundra biologic community. The glaciated uplands of Albert I Land and Haakon VII Land, together with offshore islands, constitute the park, which ranges in elevation from sea level to 4,311 feet (1,314 m). The park is particularly rich in bird life, containing five separately established bird sanctuaries in the south and west of the park: Kongsfjorden, Blomstrandhamna, Guissezholmen, Skorpa, and Moseøya. Animal life includes Arctic fox and reindeer; walrus congregate on Moffen Island, the northern extremity of the park.

Northwest Territories and Nunavut, vast region of northern Canada, divided into the federally administered territories of Northwest Territories in the west and Nunavut in the east. Nunavut was created out of the eastern portion of the Northwest Territories in 1999. Yellowknife is the capital of the Northwest Territories, and Iqaluit is the capital of Nunavut. Area 1,322,910 square miles (3,426,320 square km), of which about 733,000 square miles (1,900,000 square km) is in Nunavut. Pop. (1999 est.) Northwest Territories, 41,668; Nunavut, 27,146.

A brief treatment of the Northwest Territories and Nunavut follows. For full treatment, *see* MACROPAEDIA: Canada.

The territories stretch across the roof of the North American continent. They reach into the Arctic Circle and include thousands of islands, the largest of which are Victoria Island in the west and Baffin Island in the east. The flat relief of the Canadian Shield dominates much of the region, though the land rises in the west in the Mackenzie Mountains. The climate is largely cold Arctic, though it is moderated somewhat in the southwestern lowlands.

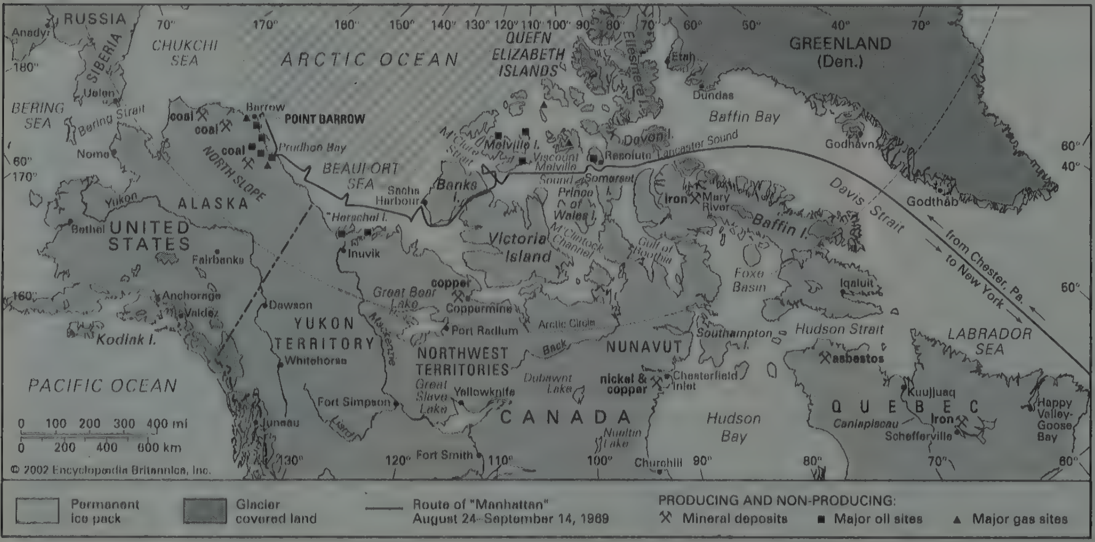
About one-third of the people in the Northwest Territories are American Indians (who call themselves Dene). Nearly all the rest are of European descent or are Métis (mixed ancestry), with a tiny proportion of Inuit. Virtually the entire population of Nunavut is Inuit.

The Athabaskan-speaking Dene consisted of small hunting bands that readily adapted to the fur trade when it reached the Mackenzie area (the western portion of the region) in the 18th century. No Dene reserves were established. The decline of the fur trade in the 20th century left many Dene unemployed.

The Inuit living in the region can be traced to the prehistoric, maritime Thule culture. Their numbers were reduced in the 19th century by European diseases. The Inuit learned to adapt to the fur trade in the 20th century and came to depend upon outside sources for necessities.

The region's ecology has been subject to serious threats. The introduction of firearms and, later, oil spills from ships did much to upset the fragile balance of nature in the region. As fuel and game resources near settlements were depleted, the population began to concentrate around trading posts and missions. Most of the population now lives in small settlements along the Mackenzie River and the Arctic coast.

Mining is the principal industry and centres on the petroleum and natural-gas fields in the western and northern Arctic coastal regions.



The Northwest Passage

Gold is mined at Yellowknife and near Bathurst Inlet, Nunavut, and diamond deposits are worked in the Northwest Territories. Fur trapping provides income for some native people. Forestry is limited, and sawmills process timber for local use only. Some crops are grown for local consumption, but most foodstuffs are imported, and transportation costs are high. Nearly all passenger and much freight traffic is carried by scheduled and chartered air services. Surface transportation for heavy freight is mainly by water. Snowmobiles have largely replaced the dogsled for overland winter travel.

Tourism has increased with the construction of hotels and the development of the vast Wood Buffalo, Nahanni, and Auyittug national parks. Public policies favour the revival of traditional Inuit arts and crafts, and cooperatives have developed to market Inuit craftwork, both to tourists and by shipment to other provinces.

Each territorial government consists of a 19-member Legislative Assembly elected by universal adult suffrage. A commissioner, appointed by the Canadian federal government, is the chief executive for each territory and is responsible to the Department of Indian Affairs and Northern Development. Each government also has an executive council composed of assembly members; the territorial-government leader serves as the minister responsible for the executive. One elected member represents each territory in the Canadian Parliament.

In the Northwest Territories the judiciary consists of a territorial court, a police magistrate, and justices of the peace; in Nunavut there is a single level of trial courts. Police service is provided by the Royal Canadian Mounted Police (RCMP) in the Northwest Territories and by community-based police (aided by the RCMP) in Nunavut. The territorial governments retain the same rights as a provincial government, except that the federal government controls and administers the development of resources aside from game, forestry, and fire suppression.

Housing, health, social, and educational services are provided by the territorial government, but with heavy federal funding. Free compulsory public elementary, secondary, and vocational education is provided through the 12th grade, and a wide range of special- and adult-education programs have been developed to serve special needs. Higher education is available for qualified students in the provincial universities, although each territory provides some postsecondary programs and courses.

Explorers in the 16th and 17th centuries searched for the fabled Northwest Passage to East Asia. In the 18th century Samuel Hearne journeyed inland as an employee of the Hudson's Bay Company, as did Alexander Mackenzie for the Northwest Company. European settlements were first established to serve the whaling fleet. Fur traders, missionaries, and police dominated the Northwest Territories until the 1920s, when the Canadian government established a territorial administration after the discovery of oil. The Inuit began negotiating in the 1980s for a separate territory, resulting in the formation of Nunavut in 1999.

Northwest Territory, U.S. territory created by Congress in 1787 encompassing the region lying west of Pennsylvania, north of the Ohio River, east of the Mississippi River, and south of the Great Lakes. Virginia, New York, Connecticut, and Massachusetts had claims to this area, which they ceded to the central government between 1780 and 1800. Land policy and territorial government were established by the Northwest Ordinances of 1785 and 1787. Ultimately, five states—Ohio, Indiana, Illinois, Michigan, and Wisconsin—were organized from the territory, and a small part, the land lying between the St. Croix and Mississippi rivers, was incorporated into Minnesota.

Consult the INDEX *first*

Northwich, town ("parish"), Vale Royal borough, administrative and historic county of Cheshire, England. Local brine springs have been used to produce salt since Roman times, but their exploitation has caused severe subsidence of buildings in the town. The present large-scale chemical industry has developed from the ancient salt trade. Other manufactures include iron and steel, leather goods, carpets, and clothing. Pop. (1991) 34,520.

Northwood, John (b. 1836, Wordsley, Staffordshire, Eng.—d. 1902), English glassmaker, a technical innovator who sparked a resurgence of British interest in classical Greek and Roman glassworking methods, particularly in the art of cameo glass.

Northwood studied art before serving as an apprentice in the large glass-manufacturing firm of W.H., B., and J. Richardson, at Wordsley (in the glassmaking district of Stourbridge). After working for a time in his brother's carpentry workshop, Northwood went to work for Benjamin Richardson, a former partner in the firm, who had established his own glassmaking business. Richardson's admiration for ancient glass and his desire to produce comparable modern pieces inspired Northwood's ventures into new techniques for carving and etching glass. After studying the Elgin Marbles and the Portland Vase in the British Museum, Northwood began work on his Elgin Vase (1873), commissioned by the glass-factory owner Benjamin Stone. The two-handled urn—encircled by a frieze carved in relief and decorated with etched classical motifs—inspired many British glassworkers to similarly embellish their works, with the aid of a glass-etching machine developed by Northwood himself.

Northwood's major work, his Portland Vase (completed in 1876), was a copy of the Roman original made during the 1st century AD. Instead of using glass-etching tools to cut into the superimposed layers of coloured glass (an opaque white casing over a dark blue ground), Northwood worked by hand, with steel tools of his own design, to create the white-on-blue cameo figures. The piece took more than three years to complete, during which time Northwood repeatedly visited the British Museum to see and handle the original. Although Richardson had, many years earlier, offered £1,000 to any glassmaker who could produce a replica of the famous Roman vase, Northwood's masterpiece was commissioned by another local manufacturer, Philip Pargeter.

Northwood's Portland Vase was the first such successful reproduction in the original medium, and his accomplishment was celebrated by glassmakers throughout the world. The art of cameo glass, thus revived in England, was carried on by numerous craftsmen of note, including Northwood's nephew William (1858–1937) and his son, John Northwood II (1870–1960).

Norton, town (township), Bristol county, south-central Massachusetts, U.S., 12 miles (19 km) southwest of Brockton. It was settled in 1669 by a cabin boy, William Wetherell, according to local lore, and incorporated in 1711. Norton was a centre of witchcraft hysteria in the early 18th century. It was known for the presence of the alleged witches Dora Leonard and Naomi Burt, and Major George Leonard was supposed to have sold his soul to the devil there in return for gold.

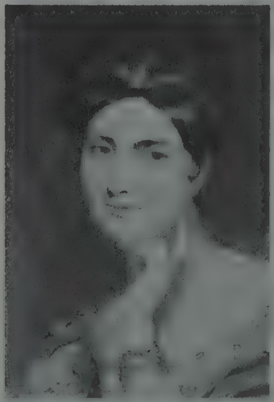
Norton is notable for Wheaton College. Opened in 1835 as Wheaton Female Seminary by Judge Laban Wheaton, in memory of his daughter, the college occupies a 100-acre (40-hectare) campus studded with Georgian colonial buildings. It was one of the pioneer institutions dedicated to the education of women; it was chartered as a college in 1912, and it has admitted men since 1988. The town economy is based on services (including education and the distribution of food products), retail trade, and light manufacturing. Pop. (2000) 18,036.

Norton, town, north-central Zimbabwe. It was named after a farm family murdered (1896) in the Shona uprisings. Developed in the 1960s as a planned industrial township, it is located 29 miles (46 km) west of Harare (formerly Salisbury) on the road and rail line to Bulawayo and 5 miles (8 km) from Lake McIlwaine. Adjacent to the town's industrial zone is Chibero College of Agriculture (1961), and to the north lies the Darwendale Dam, Lake, and Recreational Park. Pop. (1992) 20,405.

Norton, Caroline (Elizabeth Sarah), *née* SHERIDAN (b. March 22, 1808, London, Eng.—d. June 15, 1877, London), English poet and novelist whose matrimonial difficulties and her resultant efforts to secure legal protection for married women made her a notorious figure in mid-Victorian society.

One of three granddaughters of the playwright Richard Brinsley Sheridan, she began to write while in her teens. In 1827 she made an unfortunate marriage to the Honourable George Norton, whom she left after three years. In retaliation, Norton brought action against her friend Lord Melbourne for seducing his wife. The suit may have been a political move to discredit Melbourne (then prime minister). When the case came to trial in 1836, the evidence was so flimsy that the jury decided against Norton without leaving the courtroom. Norton then refused his wife access to their children, and her outcries against this injustice were instrumental in introducing the Infant Custody Bill, which was finally carried in 1839. In 1855 she was again involved in a lawsuit because her husband not only refused to pay her allowance but demanded the proceeds of her books. Her eloquent letter of protest to Queen Victoria had great influence on the Marriage and Divorce Act of 1857, abolishing some of the inequities to which married women were subject.

Among her contemporaries, Mrs. Norton held a high literary reputation. *The Dream, and Other Poems* appeared in 1840 to critical enthusiasm, and *Aunt Carry's Ballads* (1847), dedicated to her nephews and nieces, was written with tenderness and grace. Her novels—*Stuart of Dunleath* (1851), *Lost and Saved* (1863), and *Old Sir Douglas* (1867)—



Caroline Norton, detail of an oil painting by John Hayter

By courtesy of the trustees of the Chatsworth Settlement, Derbyshire were based on her own unhappy experiences. After her husband's death in 1875, she married Sir William Stirling-Maxwell.

Norton, Charles Eliot (b. Nov. 16, 1827, Cambridge, Mass., U.S.—d. Oct. 21, 1908, Cambridge), American scholar and man of letters, an idealist and reformer by temperament, who exhibited remarkable energy in a wide range of activity.

Charles Eliot Norton, 1903
By courtesy of the Library of Congress, Washington, D.C.

After graduating from Harvard in 1846, Norton opened a night school in Cambridge, was director of a housing experiment in Boston, and worked zealously as an editor for the Union cause during the Civil War. From 1864 to 1868 he was coeditor of the *North American Review,* and he helped found *The Nation* in 1865. From 1874 to 1898 he lectured on the history of art at Harvard, where he was one of the most popular teachers of the day. A friend of many literary men, including Thomas Carlyle, Ralph Waldo Emerson, John Ruskin, Henry Wadsworth Longfellow, and James Russell Lowell, he contributed valuable editions of their letters and other biographical material. Norton also wrote on art and edited collections of poetry, notably that of John Donne (1895–1905). Probably Norton's best literary work was his prose translation of Dante's *The Divine Comedy* (1891–92). His letters, published in 1913, were edited by Sara Norton and M.A. De Wolfe Howe.

Norton Sound, arm of the Bering Sea, indenting for 125 miles (200 km) the west coast of Alaska, U.S., with a width of 70 miles (115 km) between the Seward Peninsula (north) and the Yukon River delta (south). The sound is navigable from May to October. The city of Nome, on the northern shore, is the commercial centre of northwestern Alaska. Captain James Cook noted the sound in 1778 and named it for the speaker of the British House of Commons, Sir Fletcher Norton.

Nōrūz, also spelled NŌ RŪZ, or NŌ-RŪZ, the New Year festival often associated with Zoroastrianism and Parsiism. The festival is celebrated in many countries, including Iran, Iraq, India, and Afghanistan. It usually begins on March 21, which in many of these countries is the first day of the new year.

Among the Parsis, the Nōrūz ("New Day") is a celebration that warrants the performance of five prescribed liturgies: the Āfringān, prayers of love or praise; the Bāj, prayers honouring *yazata*s ("ones worthy of worship") or *fravashi*s ("preexistent souls"); the Yasna, a rite that includes the offering and ritual drinking of the sacred liquor, *haoma;* the Fravartigan, or Farokhshi, prayers commemorating the dead; and the Satum, prayers recited at funeral feasts. Throughout the day, Parsis greet one another with the rite of *hamāzor,* in which one's right hand is passed between the palms of another. Words of greeting and good wishes are then exchanged.

Norwalk, city, Los Angeles county, southwestern California, U.S. Once a part of the Rancho Los Coyotes, a 1784 Spanish land grant, it was founded as Corvallis in 1868 by Gilbert and Atwood Sproul. The city was renamed for Norwalk, Conn. After the arrival of the Southern Pacific Railroad in 1875, it became a service point for logging, dairying, and ranching. Located at the intersection of major freeways, it experienced rapid industrial development after World War II. Since 1964 Norwalk has held an annual Space, Science and Technology Show. Cerritos Community College was founded there in 1955. Inc. 1957. Pop. (1994 est.) 100,744.

Norwalk, city, coextensive with the town (township) of Norwalk, Fairfield county, southwestern Connecticut, U.S., on Long Island Sound at the mouth of the Norwalk River. Roger Ludlow purchased the land from the Norwalk (Norwaake, or Naramake) Indians in 1640. In 1779, during the U.S. War of Independence, the settlement was burned by Loyalist forces under Major General William Tryon. It was from Norwalk that Nathan Hale crossed Long Island Sound to Long Island, where he was captured by the British and executed as a spy. The manufacture of hats, long the principal industry, is now part of a diversified industrial economy including textiles, machinery, and hardware. Although Norwalk was known for its oysters in earlier years, overexploitation and pollution of the waters have virtually ended the oyster fishery. It is a summer resort and has the Norwalk Community-Technical College, which opened in 1961.

The town of Norwalk, organized in 1651, contained the cities of Norwalk (incorporated borough, 1836; city, 1893) and South Norwalk (incorporated 1870), as well as some small villages. In 1913 all these divisions were consolidated and incorporated as the city of Norwalk. Located in nearby New Canaan is the Silvermine Guild Arts Center, with exhibits of mostly New England artists and craftsmen. Pop. (1994 est.) city, 78,710; Stamford-Norwalk PMSA, 331,835.

Norwalk, city, seat (1818) of Huron county, northern Ohio, U.S., 59 miles (95 km) west-southwest of Cleveland. It was originally part of the Western Reserve known as the Sufferers' Lands, or Firelands, set aside in 1792 for Connecticut residents whose homes were burned by Loyalists during the U.S. War of Independence. The settlement was founded by Platt Benedict in 1817 and named for Norwalk, Conn. Many Classic Revival houses, built in the early 19th century by its New England settlers, survive. The Firelands Museum, formerly Preston Wickham House (1836), contains Indian and pioneer relics. Rutherford B. Hayes, later U.S. president, attended the Norwalk Academy, a widely known institution in the 1830s. Since World War II both population and industry have grown steadily. Manufactures include wire products, auto seats, truck cabs, thermostats, furniture, and candy. Inc. village, 1828; city, 1881. Pop. (1994 est.) 15,204.

Norway, officially KINGDOM OF NORWAY, Norwegian KONGERIKET NORGE, Europe's fifth largest country, located in the western part of the Scandinavian Peninsula. Dotted with more than 160,000 lakes, this mountainous country lies between latitudes 58° and 72° N (about 1,089 miles [1,752 km] north-northeast to south-southwest) and longitudes 4° and 32° E (about 267 miles [430 km] wide from east-southeast to west-northwest). It is bordered by the Barents Sea (north), the Norwegian Sea and North Sea (west), Skagerrak (Skager Strait; south), and Sweden, Finland, and Russia (east). The capital is Oslo. Area 125,050 square miles (323,878 square km). Pop. (1995 est.) 4,355,000.

A brief treatment of Norway follows. For full treatment, *see* MACROPAEDIA: Norway.

For current history and for statistics on society and economy, *see* BRITANNICA BOOK OF THE YEAR.

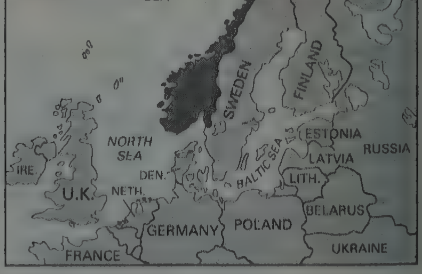
The land. More than half of Norway lies at elevations of less than 1,600 feet (500 m), with only some 15 percent higher than 3,200 feet (975 m). Geologically, it is formed of some of the oldest rocks (1,000,000,000 to 2,000,000,000 years old) on Earth. Its mountain system is a continuation of the Caledonian System of the British Isles; Galdhø Peak (8,100 feet [2,469 m]), the country's highest elevation, is in the south. Glåma (Glomma) is the principal river (372 miles [598 km] long), and Lake Mjøsa is the largest lake (142 square miles [368 square km]). Glaciated several times in the Quaternary Period (began 1.6 million years ago), Norway still has about 1,700 glaciers; fjords indent the northern and western coasts.

Norway is situated in almost the same northern latitudes as Alaska; its warmer climate is caused by the Gulf Stream, which usually keeps the fjords from freezing. Mean July temperatures vary from 63° F (17° C) in the south to 50° F (10° C) in the north, and mean January temperatures from 28° F (−2° C) in the southeastern coast to 14° F (−10° C) in the inland valleys. Annual mean precipitation varies from less than 30 inches (750 mm) in the east to about 80 inches (2,052 mm) in the west. The country is subject to frequent gales and weather changes. Northern Norway is the land of the midnight Sun; there, the Sun does not set from mid-May to the end of July, and conversely, the Sun does not rise above the horizon from the end of November to the end of January.

Deciduous forests (oak, ash, elm, and maple) are found at the lower elevations, coniferous (spruce and pine) up to 2,800 feet (850 m), and willows and dwarf birch at higher elevations. North of the Arctic Circle, pine grows mainly in inland valleys. Reindeer, wolverines, lemmings, foxes, martens, and otters are found throughout the country. Wolves and polar bears are considered to be endangered.

Norway traditionally has been a fishing and lumbering country, but since the end of World War II it has greatly increased its mining and manufacturing activities. It is one of the world's largest exporters of iron-based alloys and metals combined. Norway has western Europe's largest offshore petroleum and natural-gas fields and Europe's largest deposit of ilmenite (titanium ore), and it ranks among the world's largest producers of hydroelectric power and magnesium metal.

The people. Most of the population (98 percent) is of Germanic (Nordic, Alpine, Baltic) stock, and the largest minority group is the Sami (Lapps), who constitute less than 1 percent. Almost 90 percent of the population is Lutheran, and Norwegian is the official language. Norway has a relatively low population density. The population under 15 years of age is about one-fifth of the total, and the 60-years-and-over age group also is about one-



Norway

fifth. Life expectancy is very high, 74 years for males and 80 years for females.

Since World War II the birth rate has decreased. The death rate has also decreased because of improved health care that has especially alleviated infant mortality and tuberculosis. Migration from rural to urban areas since World War II has been extensive; three-fourths of the population is urban. A balance between immigration and emigration rates helps to maintain a low rate of overall population increase.

The economy. Norway has a developed mixed economy that is largely based on services, the production of petroleum and natural gas, and light and heavy industries. The gross national product (GNP) is growing about as rapidly as the population, and the GNP per capita remains among the highest in the world.

Agriculture accounts for less than 3 percent of the gross domestic product (GDP) and employs some 5 percent of the workforce. Only about 3 percent of the total land area is arable, and it is concentrated in valleys and around lakes and fjords. The chief crops are barley, potatoes, oats, and wheat, and the principal livestock are sheep, cattle, and pigs. Foxes (blue and silver) and minks are raised for fur.

Forests cover more than one-fourth of the land, and forestry is an important industry. Conifers predominate.

Norwegian boats land herring, blue whiting, capelin, Atlantic cod, prawn, and shrimp, and frozen and canned fish are exported. Beginning in the 1970s, fish-farming has been developed by the government.

Norway has been a significant exporter of petroleum from its North Sea fields since 1975. The government participates in the exploration and production of offshore petroleum and natural gas through Statoil (the Norwegian Government Oil Company). Norway is one of the world's major producers of aluminum, made from imported bauxite. Copper is widely mined, as are iron pyrites and iron ore. Coal is mined only on the island of Svalbard in the Barents Sea.

Industry accounts for about one-seventh of the GDP and employs a comparable fraction of the workforce. Manufactures are mainly based on domestic raw materials such as iron, timber, and fish. Abundant hydroelectric power has helped to expand the production of aluminum. Computer services and the manufacture of paper, furniture, silicon alloys, and electrotechnic products have become important industries. Electricity is largely generated by hydroelectric-power plants.

Norway's merchant marine is one of the largest and most modern in the world, but, owing to economic difficulties in the shipping industry after 1975, sales to foreign firms reduced the country's number of ships, and the shipbuilding industry itself began to decline.

Labour unions have been active since the late 19th century. Settlements between labour and management have tended to equalize wages by granting larger increases to workers with lower incomes.

Taxes are highly progressive. Public expenditures account for approximately one-fourth of the GDP, and expenditures for social security have increased since the 1960s.

Norway's major trading partners include the United Kingdom, Germany, and Sweden. Machinery and transport equipment (including road vehicles and ships), metals and metal products (including iron and steel), and food products are the principal imports. Exports include petroleum and natural gas, machinery and transport equipment, and metals and metal products (including aluminum).

Government and social conditions. Norway is a hereditary constitutional monarchy. Its constitution, adopted in 1814, vests legislative power in the modified unicameral parliament, the Storting. Its members are elected by proportional representation to a four-year term. After elections, one-quarter of the members form the Lagting (upper house) and the remaining members form the Odelsting (lower house); the two houses meet separately or jointly depending on the legislative issue. Executive power is nominally held by the monarch, whose functions are mainly ceremonial; the State Council, led by the prime minister, exercises executive authority. The monarch nominally selects the prime minister and the State Council with the agreement of the Storting. The major political parties are the Norwegian Labour Party (Det norske Arbeiderparti) and the Conservative Party (Høyre).

The judicial system includes the Supreme Court, the final arbiter of legal decisions; courts of appeal; and local courts. Norway is a member of the North Atlantic Treaty Organization (NATO).

Norway's comprehensive welfare system provides benefits for sickness and maternity, family allowances, and pensions for old age, disability, or loss of support that guarantee a standard of living close to that achieved during the individual's working life. The compulsory national health-care system provides free hospital care and physician's compensation. Well-staffed health facilities, along with extensive programs of preventive medicine, have nearly eliminated most serious infectious diseases, notably tuberculosis. A national housing shortage created by World War II is no longer felt. Government housing assistance includes rent allowances and low-cost loans for construction and improvement of homes.

Norway's virtually 100 percent literacy rate reflects its comprehensive educational system. Education is compulsory between the ages of 7 and 16, and almost all school-aged children are enrolled. General elementary education is followed by specialized secondary education offering a choice of technical training or continuation of a general curriculum leading to university study. Institutions of higher education have greatly expanded to accommodate the growing number of students.

Norway's press has high standards, and the independence of its editors is universally recognized. Most newspapers are affiliated with a political party. Television and radio broadcasting is controlled by the Norwegian Broadcasting Corporation (Norsk Rikskringkasting). Educational and informational programs have priority over entertainment.

Cultural life. Arts and crafts and industrial design flourish side by side, often inspired by archaeological finds from the Viking age, by the culture of the northern Sami, and by advanced schools of design. Furniture, enamelware, textiles, tableware, and jewelry design may reflect historical, ethnic, or avant-garde styles.

Although Norway is one of the world's smaller language communities, the country is among the leaders in publishing. Most of the new titles released are of Norwegian origin. Norwegian writers have made important literary contributions. Best known among them is the playwright Henrik Ibsen. Other internationally prominent writers are Bjørnstjerne Bjørnson, Knut Hamsun, and Sigrid Undset. Permanent theatres have been established in several cities, and the state traveling theatre, the Riksteatret, organizes tours throughout the country. Notable, too, are the musical compositions of Edvard Grieg.

Norwegian painters of the 20th century have excelled in mural painting to such an extent that they are rivaled only by Mexican painters. Other artists are world-renowned for their multimedia assemblages, pictorial weaving, and nonfigurative art in sculpture as well as painting. Edvard Munch, probably Norway's best-known painter, is regarded as a founder of Expressionism. The works of Gustav Vigeland are assembled in Oslo's Vigeland sculpture park. Architecture has drawn inspiration from medieval stave churches (built of upright logs) as well as houses of horizontal logs notched at the corners. Private homes, almost all of which are made of wood, are built to fit snugly into the terrain.

Science and research have limited means, but in the natural sciences individual efforts have won substantial acclaim. Beginning with Vikings Erik the Red and his son Leif Eriksson and continuing in modern times with such men as Fridtjof Nansen, Roald Amundsen, and Thor Heyerdahl, Norwegians have been renowned explorers.

History. The earliest known traces of human occupation in Norway are stone tools dating to 7000–6000 BC that have been found along the coast. Between 3000 and 2500 BC new migrants settled in eastern Norway. During the first four centuries AD the people of Norway were in contact with Roman-occupied Gaul. The period of the collapse of the Roman Empire in the West (AD 400–600) is characterized in Norway by chieftains' graves containing magnificent weapons and gold objects. The years 800 to 1050 were those of the Viking age, when Scandinavians set out on innumerable plundering expeditions. Men of Norwegian descent settled in Greenland and undertook expeditions to Vinland (the coast of Newfoundland).

Harald I, who took control of the western coastal districts late in the 9th century, is traditionally held to be Norway's first king, though local rule by chieftains remained the standard. Olaf II Haraldsson became the first effective king of all Norway in 1015. Olaf returned to Norway from England instilled with the beliefs of Christianity and organized the conversion of many Norwegians.

Between 1130 and 1240 civil wars were fought among several claimants to the Norwegian throne. During the later years of civil war the authority of the crown was strengthened, and Norway was ruled by one king, Haakon IV (1217–73). Through the remainder of the 13th and most of the 14th centuries, the wealth and power of the crown grew.

In 1389 Eric of Pomerania was crowned king of Norway and later (1397) king of Sweden and Denmark also. After Eric's deposition in 1442, Norway was ruled by Danish kings until 1814, when it was united with Sweden, although retaining a degree of independence and receiving a new constitution. This rule by the Swedish crown continued until 1905, when King Oscar II relinquished the crown of Norway and the Norwegians voted to reestablish their own monarchy rather than institute a republic. Prince Charles of Denmark was elected Haakon VII.

Between 1905 and 1914 Norway experienced rapid economic growth. A number of social reforms were enacted, such as health insurance, a 10-hour workday, and a 48-hour week. In 1913 the right to vote was extended to women.

Norway remained neutral during World War I, although its shipping industry played a vital role in the conflict. Following the war, government economic policy pursued a liberal course. By 1927 unemployment in Norway had reached 20 percent, and during the Great Depression of the 1930s it rose to 33 percent. Despite these economic difficulties, the period between the wars produced economic expansion and industrial growth.

Norway declared itself neutral at the outbreak of World War II in 1939, but in 1940 German troops invaded and defeated the Norwegian army. The king and government fled to England. German occupation continued until the end of the war, when German troops capitulated with little resistance.

From 1945 to 1965 the Norwegian Labour Party governed almost without interruption.

Many of the social programs initiated in the 1930s were continued. A right-wing coalition ousted the Labour government in 1965 and remained in power until 1971. After that, the Labour Party was intermittently in power until 1981; during part of that time it was under the leadership of Gro Harlem Brundtland, Norway's first female prime minister. Norway's first Conservative administration in more than 50 years took power from 1981 to 1986, but thereafter Labour and the Conservatives seesawed for control, each sometimes having to lead minority governments.

Norway, Church of, Norwegian NORSKE KIRKE, established, state-supported Lutheran church in Norway, which changed from the Roman Catholic faith during the 16th-century Protestant Reformation.

Unsuccessful attempts were made to win converts to Christianity in Norway during the 10th century, but in the 11th century Kings Olaf I Tryggvason (reigned 995–*c.* 1000) and Olaf II Haraldsson (reigned 1015–30), each of whom had been baptized outside Norway before becoming king, forced many of their subjects to accept Christianity. Olaf II brought clergy from England to organize the church. After he was killed in battle, he became a national hero and was eventually canonized as Norway's patron saint (1164). The country was primarily Christian by the end of the 11th century. In 1152 the church was organized nationally, with the seat of the archbishop in Nidaros (now Trondheim).

The Reformation was brought to Norway by Christian III, king of Denmark and Norway (reigned 1534–59), who was converted to Lutheranism as a young man. Norwegians officially accepted the new faith in 1539. Roman Catholic bishops and clergy who would not accept Lutheranism were forced out of the church, and the church's property was taken over by the government. By the end of the 16th century the church had been reorganized, and Lutheranism was accepted by most of the people and clergy.

During the 17th century, Lutheran orthodoxy prevailed, but in the 18th century the church was influenced by Pietism. A work with a Pietistic emphasis, *Truth Unto Godliness,* an explanation of Martin Luther's Small Catechism published in 1737 by Erik Pontoppidan, a Danish-Norwegian Lutheran professor and bishop, extensively influenced Norwegian religious life for about 200 years. A Pietistic revival from 1797 to 1804 was led by Hans Hauge, a peasant's son who experienced a religious conversion when he was 25 years old. Although laymen were legally forbidden to preach, Hauge did so throughout the country and established brotherhoods that met for religious study and prayer. Despite being opposed by some of the clergy and being imprisoned several times for his activities, he and his followers remained within the Church of Norway and influenced it greatly. The work of Gisle Johnson, a theological professor from 1849 to 1873 who combined Lutheran orthodoxy and Pietism, also influenced the clergy and people and led to the establishment of mission programs.

In the 20th century the church experienced theological disagreements between liberals and conservatives. During World War II the bishops and clergy led the resistance movement against the Nazis, who attempted to control the church after defeating Norway. The bishops gave up their state offices, and almost all the clergy resigned from their parishes, but they continued to work with and were supported by the people. After Germany's defeat, pastors returned to their churches, and the state church again resumed functioning.

Norway is divided into dioceses, each headed by a bishop, with the bishop of Oslo as the primate of the bishops. The king and the Storting (parliament) retain power to determine church organization, practices, doctrine, and education in the church. The king has complete freedom in appointing bishops and pastors, and the government has refused to authorize changes in church organization requested by the bishops that would allow more autonomy for the church. Since 1845 a Norwegian could legally withdraw from the state church and join another or no church, but nearly 90 percent retain official membership in the state church.

Norway Current, branch of the North Atlantic Current, sometimes considered a continuation of the Gulf Stream (issuing from the Gulf of Mexico). The Norway Current enters the Norwegian Sea north of Scotland and flows northeastward along the coast of Norway before flowing into the Barents Sea. With subsurface temperatures ranging from 46° F (8° C) in the south to about 39° F (4° C) in the north, the current exerts a moderating influence on the climate of Norway and northern Europe. The main flow of water reaches a velocity of about 0.5 knot and is dispersed westward in eddies that meet those of the southwest-flowing East Greenland Current. This thermal mixing of the water creates excellent fishing grounds, especially around coastal regions of the Faroe and Shetland islands and of Norway.

Norway lobster: *see* scampi.

Norwegian elkhound, breed of dog that originated thousands of years ago in western Norway, where it was used as an all-purpose hunter, shepherd, guard, and companion. It generally excels in tracking European elk and has also been used for hunting bear, lynx, and lion. A medium-sized dog with erect, pointed ears, the Norwegian elkhound has a short, compact body and a thick, smooth coat of black-tipped gray hairs; it carries its tail curled high over its back. It stands 18 to 20 inches (46 to 52 cm), weighs 40 to 50 pounds (18 to 23 kg), and is characterized as a bold, energetic dog.

Norwegian elkhound

Sally Anne Thompson

Norwegian language, Norwegian NORSK, North Germanic language of the West Scandinavian branch, existing in two distinct and rival norms—Dano-Norwegian (Bokmål, or Riksmål) and New Norwegian (Nynorsk). Dano-Norwegian stems from the written Danish introduced during the union of Denmark and Norway (1380–1814). New Norwegian was created by the language scholar Ivar Aasen during the mid-19th century, primarily from the dialects of the western rural districts, in order to carry on the tradition of Old Norse. The use of Dano-Norwegian is more widespread than that of New Norwegian; it is used in all national newspapers and in most of the literature. Both of these mutually intelligible languages are used in government and education, and plans have been made to bring them closer together gradually into a common Norwegian language, Samnorsk, though resistance to these plans has been vigorous.

Old Norwegian had diverged from the other Scandinavian languages by the end of the 12th century. Spoken language in Scandinavia underwent rapid evolution late in the Middle Ages. This change, the lack of a printing press in Norway until 1643, and the influence of unions with Sweden (1319) and then Denmark (1380) hindered the development of a national written language in Norway. Between the late 14th and the early 16th centuries Middle Norwegian became the tongue of most native speakers, though the urban elite were influenced by Danish.

Norwegian literature, body of writings of the Norwegian peoples.

A brief treatment of Norwegian literature follows. For full treatment, *see* MACROPAEDIA: Scandinavian Literature.

Among the literatures of modern Europe, Norwegian literature is remarkable for being so late-flowering and yet so impressively deep-rooted. Only after the separation of Norway from Denmark in 1814 is it possible to point to a literature that is unambiguously Norwegian; its roots, of course, reach back more than 1,000 years into the pagan Norse past.

In its evolution Norwegian literature became intertwined with Icelandic and then with Danish literatures. A distinctively Norwegian literature had its origins in the work of the dramatist Henrik Wergeland (1808–45), who in his passionate, revolutionary poetry and oratory engendered the age of "national Romanticism" in Norway. By the end of the 19th century, however, Norwegian literature—particularly by virtue of the achievements of Henrik Ibsen—occupied an influential position in Western literature. Twentieth-century Norwegian writers of note include Knut Hamsun and Sigrid Undset, both winners of the Nobel Prize for Literature.

Norwegian Sea, Norwegian NORSKEHAVET, section of the North Atlantic Ocean, bordered by the Greenland and Barents seas (northwest through northeast); Norway (east); the North Sea, the Shetland and Faroe islands, and the Atlantic Ocean (south); and Iceland and Jan Mayen Island (west). The sea reaches a maximum depth of about 13,020 feet (3,970 m), and it maintains a salinity of about 35 parts per 1,000. A submarine ridge linking Greenland, Iceland, the Faroe Islands, and north Scotland separates the Norwegian Sea from the open Atlantic. Cut by the Arctic Circle, the sea is often associated with the Arctic Ocean to the north. The warm Norway Current flows northeastward off the Norway coast and produces generally ice-free conditions. Colder currents mixing with this warm water create excellent fishing grounds (mainly for cod, herring, and whitefish), especially around coastal regions of Iceland and Norway and the Shetland and Faroe islands.

Norwest Corporation, former American bank holding company that merged with Wells Fargo (*q.v.*) in 1998. The company was incorporated in Minnesota as Northwest Bancorporation in 1929 to control banks, trust companies, and other financial institutions in the north-central United States. It conducted a general banking business through its subsidiary banks, all of which provided a full range of commercial services and many of which provided trust services. Northwest Bancorporation merged with Dial Financial Corporation, an Iowa-based consumer loan company, in 1982. The corporate name was changed from Northwest Bancorporation to Norwest Corporation in 1983.

Norwest's ties to Wells Fargo reached back to William G. Fargo, who in 1872 had been one of the original investors in the North Western

National Bank of Minneapolis. By the start of the 21st century, this and other mergers made Wells Fargo the fifth largest financial service company in the United States.

Norwich, city (district), administrative and historic county of Norfolk, England. It is located along the River Wensum above its confluence with the River Yare, about 100 miles (160 km) northeast of London.

The site does not seem to have been occupied until Saxon times, when the village of Northwic was founded on a gravel terrace above the Wensum. By 1004, when Norwich was sacked by the Danes, it had become an important market centre. Shortly after the Norman Conquest (1066), the cathedral church and a Benedictine monastery were founded near the river. The distinctive cathedral has a Norman apse and nave; among its Perpendicular Gothic additions is a 15th-century stone spire rising to 315 feet (96 metres), one of the tallest in England. The cathedral also has well-preserved cloisters that are the largest in England. A Norman castle (12th century) east of the town's principal market has been since 1894 the city's main museum and art gallery, with an archaeological collection and paintings of the Norwich school, which flourished in the 19th century.

Until the late 18th century Norwich was one of the most prosperous of English provincial towns, challenged only by Bristol and York. The first charter dates from 1158. The prosperity of the medieval town is reflected in the number of churches dating from this period, 30 of which still exist. The town's prosperity was based upon the woolen industry, which was aided by Edward III, who induced Flemish weavers to settle in Norwich in 1336, and also by the influx of immigrants (mainly from the Low Countries) during the reign of Elizabeth I. In 1579 nearly one-third of the town's population of 16,000 were immigrants. During the 15th century the flint Guildhall was built overlooking the market square. At the time of the English Civil Wars (1642–51) the population was predominantly behind the Parliamentary cause, and the town saw little strife. From the 18th century Norwich declined in relation to the new industrial centres of the north. Today Norwich is one of England's largest centres of footwear manufacturing. Engineering, printing, and the processing of mustard are also important.

The University of East Anglia, founded in 1964, includes the Centre of East Anglian Studies and is situated at Earlham Hall, long associated with the Gurney family. The city also has a central library and the little Maddermarket Theatre.

Norwich is one of England's major agricultural and livestock markets and serves as a shopping and entertainment centre for an extensive area. It is the traditional regional capital of East Anglia and an important centre of modern administration; located there are headquarters of the Norfolk county authority, as well as those of the county districts of Broadland, Norwich City, and South Norfolk. Area 15 square miles (39 square km). Pop. (1998 est.) 124,000.

Norwich, city, coextensive with the town (township) of Norwich, New London county, southeastern Connecticut, U.S. It lies at the confluence of the Yantic and Shetucket rivers, which there form the Thames.

The settlement, which was begun in 1659 by a company from Saybrook led by Captain John Mason and the Reverend James Fitch, became a legal township in 1662. Shipbuilding and shipping and the production of cotton, paper, and nails were important to its economy in the 18th century, and from the U.S. War of Independence to the American Civil War firearms were made there. Textiles then dominated the economy until after 1912, when there was a trend toward diversification. Norwich is the birthplace of the Revolutionary War traitor Benedict Arnold. It is also the site of Leffingwell Inn, scene of Revolutionary War councils and the Native American Burial Grounds for members of the Mohegan Indian tribe. The homes of the Huntington family, many members of which led early American civil and military affairs, are also there. Norwich is the seat of Thames Valley State Technical College (1963) and Mohegan Community College (1969). The city was incorporated in 1784 and consolidated with the town in 1952. Pop. (1990) city, 37,391; New London–Norwich MSA, 290,734; (2000) city, 36,117; New London–Norwich MSA, 293,566.

Norwich school, significant group of English regional landscape painters that was established in 1803 as the Norwich Society of Artists and flourished in Norwich, Norfolk, in the first half of the 19th century. The work of the leaders of the group, John Crome (d. 1821) and John Sell Cotman (d. 1842), was inspired by the Dutch landscapists and by the English painter Thomas Gainsborough. Other members of the Norwich school were Miles Edmund and John Joseph Cotman (sons of John Sell), John Bernay Crome (the son of John), George Vincent, James Stark, John Thirtle, Joseph Stannard, John Middleton, Robert Dixon, and Henry Bright.

Norwich terrier, short-legged terrier breed developed about 1880 in England, where it soon became a fad with Cambridge students. It was later used by various American hunt clubs and has also drawn notice as a rabbit hunter. It is stockily built, with either erect or hanging ears, and it has a dense, wiry, weather-resistant coat, usually reddish brown. A small, characteristically rugged and loyal dog, the Norwich terrier stands about 23 to 28 cm (9 to 11 inches) and weighs 4.5 to 6.5 kg (10 to 14 pounds).

Norwich ware, delft (tin-glazed) earthenware produced in Norwich, Norfolk, Eng., of which little is known. About 1567 two Flemish potters, Jasper Andries and Jacob Janson, who had moved to Norwich from Antwerp, may have made paving tiles and vessels for apothecaries and others. So far nothing made by them in Norwich has been identified, and they moved to London about 1570. Potting was still active in the town in 1696, but although posset pots and other white ware, as well as a type of puzzle jug often decorated with a tulip on the front, are known, they were probably imported from Delft, Holland, or Antwerp. Some wares of this type have Norfolk placenames.

Norwid, Cyprian Kamil (b. Sept. 24, 1821, Laskowo-Głuchy, near Warsaw, Pol., Russian Empire [now in Poland]—d. May 23, 1883, Paris, France), Polish poet, the most original and innovative of the 19th century, whose genius was not appreciated until his rediscovery in the 20th century.

Norwid lived in exile after the suppression of the Polish insurrection against Russia of 1830–31. From 1842 he lived for some time in Italy, where he studied painting and sculpture. In 1849 he went to Paris and in 1852 to the United States but in 1854 returned via England to Paris, where he led a life of penury and obscurity until his death.

His literary failure in his own day resulted from his idiosyncratic and difficult literary style. He wrote poems (*Poezye,* 1863), plays (*Krakus,* 1863; *Wanda,* 1901; *Kleopatra,* 1904), and a treatise on aesthetics, in prose and verse, included in *Poezye*. His poetry is essentially philosophical. Norwid's work was restored to posterity by Zenon Przesmycki (pseudonym Miriam), who began publishing his works in 1901.

Norwood, town, Norfolk county, eastern Massachusetts, U.S., on the Neponset River, southwest of Boston. Settled in 1678, it was incorporated (from parts of Dedham and Walpole) in 1872. The town has a diversified economy that includes industry, engineering research, and many corporate headquarters. The Norwood Memorial Municipal Building has a lofty 170-foot (52-metre) tower containing a 52-bell carillon. Area 10.5 square miles (27 square km). Pop. (2000) 28,587.

Nosaka Sanzō (b. March 30, 1892, Yamaguchi prefecture, Japan—d. Nov. 14, 1993, Tokyo), politician who was the leading figure in the Japanese Communist Party (JCP) throughout the late 1950s and '60s. He was responsible for the party's pursuit of its revolutionary goals through peaceful participation in parliamentary politics.

Nosaka first became interested in Communism following the 1917 Bolshevik Revolution in Russia. He graduated in 1917 from Keiō University, where as a student he had joined the Yūaikai, a labour organization formed by Suzuki Bunji. After studying in England, he joined the English Communist Party in 1920 and was deported a few months later. He returned to Japan in 1922 and played a major role in establishing the Japanese Communist Party. Arrested in 1923, he was released at the end of the year and became active in the Japanese labour movement. He was arrested again in 1928 as a result of mass arrests of Communists known as the March 15th Incident but was released because of ill health and went to the Soviet Union in 1931 as the JCP representative to the executive committee of the Comintern, the Soviet organization in charge of the international activities of the Communist Party. Under orders of the Comintern, Nosaka went to the United States twice in the 1930s to do underground work such as smuggling Communist tracts into Japan. In 1940 he went to the Chinese Communist liberated area in Yenan, where he engaged in propagandist activities against the Japanese army, which was attempting to occupy China.

In 1946 Nosaka returned to Japan, where he was elected to the Central Committee of the reestablished Japanese Communist Party and was elected also to the Lower House of the Diet (parliament). As one of the major Japanese Communist theoreticians, he was blamed by the Cominform, the postwar equivalent of the Comintern, for his doctrine of peaceful evolution into Communism. When the U.S. occupation authorities purged Communists from Japanese politics during the 1950s Cold War era, Nosaka went underground to avoid arrest. In 1955 he reemerged as first secretary and leading figure of the Japanese Communist Party, calling for unity among Communists.

Nosaka was subsequently elected a member of the House of Councillors in 1956, a post that he held until 1977. He became chairman of the Central Committee of the party in 1958, retiring from that position in 1982 at the age of 90. Nosaka was dismissed as honorary chairman of the JCP in 1992 after party leaders claimed to have discovered documents indicating that in the late 1930s he had falsely denounced a Japanese Communist leader to the Soviet Union.

nose, the prominent structure between the eyes that serves as the entrance to the respiratory tract and contains the olfactory organ. It provides air for respiration, serves the sense of smell, conditions the air by filtering, warming, and moistening it, and cleans itself of foreign debris extracted from inhalations.

The nose has two cavities, separated from one another by a wall of cartilage. The external openings are known as nares or nostrils. The roof of the mouth and the floor of the nose are formed by the palatine bone, the mouth part of which is commonly called the hard palate; a flap of tissue, the soft palate, extends back into the nasopharynx, the nasal portion of the throat, and during swallowing is pressed upward, thus closing off the nasopharynx so that food is not lodged in the back of the nose.

The shape of the nasal cavity is complex. The forward section, within and above each nostril, is called the vestibule. Behind the vestibule and along each outer wall are three elevations, running generally from front to rear. Each elevation, called a concha, hangs over an air passage. Beside and above the uppermost concha is the olfactory region of the nasal cavity. The rest of the cavity is the respiratory portion. The respiratory area is lined with a moist mucous membrane with fine hairlike projections known as cilia, which serve to collect debris. Mucus from cells in the membrane wall also helps to trap particles of dust, carbon, soot, and bacteria. Sinus cavities are located in the bony skull on both sides of the nose.

In the olfactory (smelling) portion of the nose, most of the lining is mucous membrane. A small segment of the lining contains the nerve cells that are the actual sensory organs. Fibres, called dendrites, which project from the nerve cells into the nasal cavity, are covered only by a thin layer of moisture. The moisture dissolves microscopic particles that the air has carried into the nose from odour-emitting substances, and the particles dissolved in the fluid stimulate the olfactory nerve cells chemically.

For a depiction of the nasal passages in human anatomy, shown in relation to other parts of the body, see the colour Trans-Vision in the PROPAEDIA: Part Four, Section 421.

nose ring, ornament inserted through different parts of the nose for personal adornment and used sometimes to signify social rank. Nose ornaments have been found especially among people in India, New Guinea, Polynesia, the pre-Columbian Americas, Australia, and parts of Africa.

Sometimes, the ala, or wing of the nose, and the septum are perforated. Often, only a small hole is made through the septum; but the hole can also be big enough for a finger to be passed through. Not only gold and jewels are worn in the nose: in New Guinea, especially among the Tuburi and the Solomon Islanders, the men wear great pointed sticks or the tusks of wild pig through holes in the nose.

nosebleed, also called EPISTAXIS, an attack of bleeding from the nose. It is a common and usually unimportant disorder but may also result from local conditions of inflammation, small ulcers or polypoid growths, or severe injuries to the skull. Vascular disease, such as high blood pressure, may provoke it, and such diseases as scurvy and hemophilia also may be responsible. Usually it is easily controlled by rest and application of cold and pressure. On occasion it may require expert care.

nosegay, also called TUSSIE-MUSSIE, or POSEY, small, hand-held bouquet popular in mid-19th-century Victorian England as an accessory carried by fashionable ladies. Composed of mixed flowers and herbs and edged with a paper frill or greens, the arrangement was sometimes inserted into a silver filigree holder. When supplied by an admirer, a nosegay became a vehicle for the floral "language of love"—*e.g.,* a red tulip was a declaration of love; a sprig of dogwood returned by the young lady was a sign of indifference; a variegated pink meant that she rejected her suitor's affection. This variety of bouquet has enjoyed periodic revivals.

noselite, also called NOSEAN, variety of the feldspathoid mineral sodalite (*q.v.*).

Nosema, genus of parasitic spore-forming protozoans, of the order Microsporida, found in host cells where it undergoes repeated asexual divisions followed by spore formation.

The species *N. bombycis,* which causes the epidemic disease pébrine in silkworms, attacks all tissues and all developmental stages from embryo to adult. In advanced infections, small brown spots cover the body of the silkworm. Diseased larvae, which either are unable to spin cocoons or else spin them loosely, die without pupating. Louis Pasteur identified the spores ("corpuscles") of *Nosema* as the disease agent in 1865 and suggested control by destruction of infected silkworm colonies and improved sanitation.

Another species, *N. apis,* attacks the gut epithelium of honeybees (especially workers) and causes nosema disease, a serious form of dysentery in animals.

Noshiro, city, Akita *ken* (prefecture), Honshu, Japan. It is located at the mouth of the Yoneshiro River, where it meets the Japan Sea. During the Tokugawa period (1603–1867), the city was a trading centre and shipping port for products (mostly rice) from the Yoneshiro Plain. Toward the end of the Meiji period (1868–1912), the cedar lumber industry developed there, and the city became a major producer. South of Noshiro, on the coast of the Japan Sea, pears are grown and shipped to other parts of northeastern Japan. Pop. (1985) 59,170.

Noske, Gustav (b. July 9, 1868, Brandenburg, Prussia [Germany]—d. Nov. 30, 1946, Hannover, Ger.), right-wing Social Democratic German politician, notorious for his ruthless suppression of a communist uprising in Berlin, who was defense minister of the Weimar Republic from 1919 to 1920.

A member of the Reichstag (parliament), Noske became controversial within his own party for his support of imperial military and colonial programs. He joined other conservative socialists after 1914 in supporting Germany's participation in World War I. Regarded as his party's military expert, he was commissioned by the last imperial government to restore order at Kiel following the sailors' mutiny of October 1918. In December he was elected to the six-member ruling council, which, until the accession of the Weimar National Assembly (February 1919), provided an interim republican government for Germany.

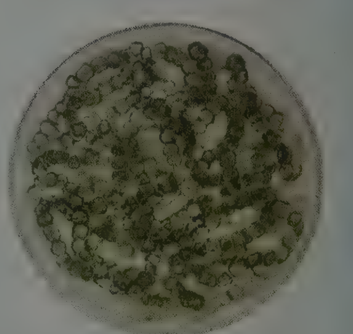
In January 1919 Noske was called upon to suppress the communist insurrection in Berlin, a task that he accomplished brutally but with dispatch. He served as minister of defense in the first Weimar Cabinet from February 1919 until he resigned in March 1920 under growing socialist criticism in the aftermath of an abortive right-wing attempt to overthrow the government (the Kapp Putsch). Subsequently, Noske served as governor of the province of Hanover (1920–33) and in July 1944 took part in the unsuccessful coup against Adolf Hitler.

Nossi-Bé (Madagascar): *see* Nosy Be.

Nossob River, also spelled NOSSOP RIVER, or NOSOB RIVER, intermittently flowing river, west-central Namibia, formed by two intermittent streams, the White Nossob and the Black Nossob, both of which rise northeast of Windhoek (the national capital). Their confluence is north of Leonardville, which is located near the tropic of Capricorn. The Nossob then follows a southeasterly course, passing through the thick, porous sands of the semiarid western Kalahari (Desert). Upon leaving Namibia, it forms a part of the border between Botswana and South Africa and bisects the Kalahari Gemsbok National Park that sits astride the border of these two countries. At the southern extremity of the park, the Nossob is joined by the intermittently flowing Auob River, which rises to the southwest of the Nossob in central Namibia and roughly parallels its course. From its confluence with the Auob River, the Nossob flows southward into the southwestward-extending, intermittently flowing Molopo River, a tributary of the Orange, which flows westward into the Atlantic Ocean.

The Nossob has a length (including the Black Nossob) of some 460 miles (740 km) to its confluence with the Molopo. The Nossob's drainage area of roughly 40,000 square miles (100,000 square km) is sparsely covered by varied grasses, low shrubs, and thorny woodland, typical of the Kalahari. Because of irregular precipitation and scant desert runoff, the wide riverbed of the lower Nossob has contained flowing water only a few times in the past century. Its high groundwater table, however, provides water for grasses and other vegetation, and its watering holes are visited by animals (especially antelope).

Nostoc, genus of blue-green algae with cells arranged in beadlike chains that are grouped together in a gelatinous mass. Ranging from microscopic to walnut-sized, masses of *Nostoc* may be found on soil and floating in quiet water. Reproduction is by fragmentation. A special thick-walled cell (akinete) has the ability to withstand desiccation for long periods of time. After 70 years of dry storage, the akinete of one species germinates into a filament when



Nostoc colony (highly magnified)

Winton Patnode—Photo Researchers/EB Inc.

moistened. Like most blue-green algae, *Nostoc* contains two pigments, blue phycocyanin and red phycoerythrin, and has the ability to fix nitrogen. A terrestrial species is a food source in the East.

Nostradamus, also called MICHEL DE NOTREDAME, or NOSTREDAME (b. Dec. 14, 1503, Saint-Rémy, France—d. July 2, 1566, Salon), French astrologer and physician, the most widely read seer of the Renaissance.

Nostradamus began his medical practice in Agen in 1529 and moved to Salon in 1544, where he gained renown for his innovative medicine and treatment during outbreaks of the plague at Aix and Lyon in 1546–47. He began making prophecies about 1547, which he published in 1555 in a book entitled *Centuries.* The work consisted of rhymed quatrains grouped in hundreds, each set of 100 called a century. Astrology was then at a peak, and an enlarged second edition, dedicated to the French king, appeared in 1558.

Some of his prophecies appeared to be fulfilled, and his fame became so widespread that he was invited to the court of Catherine de Médicis, queen consort of Henry II of France, where he cast the horoscopes of her children. He was appointed physician-in-ordinary by Charles IX when Charles became king in 1560. The subject of many commentaries, Nostradamus' prophecies were condemned in 1781 by the Congregation of the Index, the body set up by the Roman Catholic church for the examination of books and manuscripts. Because of their cryptic style and content—commingling French, Spanish, Latin, and Hebrew words—the prophecies have continued to create much controversy. Some of them are thought to have foretold actual historical events that have occurred since Nostradamus' time, including certain details of the French Revolution of the 18th century. Others, having no apparent meaning, are said to foretell events that have not yet occurred.

Nosy-Be, also called NOSSI-BÉ, island lying about 5 miles (8 km) off the northwestern shore of Madagascar. The name means "big island." It is 19 miles (30 km) long and 12 miles (19 km) wide and has an area of 120 square miles (300 square km). Nosy-Be is a volcanic island that has forests and numerous craters and crater lakes. Its highest point is Mount Passot (1,079 ft [329 m]). It has an annual rainfall of 78–118 inches (1,975–3,000 mm). The island's products, chiefly sugar and oils for perfumery, also include rum, vanilla, black pepper, and bitter oranges. The capital, in the south, is Hell-Ville, a resort and port for foreign shipping and trade along the west coast of Madagascar. There is an airfield at Fascène, 7 miles (12 km) away.

Beach on Nosy-Be, Madagascar
Gerald Cubitt

The arrival of Captain Passot's warship *Colibri* in 1840 initiated the cession of the island to the French, and the town Hell-Ville was named after Passot's commander in chief, Admiral de Hell. The island has been part of Madagascar since 1896. Pop. (latest est.) 39,000.

Not-Being, denial of, in Eleatic philosophy, the assertion of the monistic philosopher Parmenides of Elea that only Being exists and that Not-Being is not, and can never be. Being is necessarily described as one, unique, unborn and indestructible, and immovable.

The opposite of Being is Not-Being (*to mē eon*), which for the Eleatics meant absolute nothingness, the total negation of Being; hence, Not-Being can never be. Parmenides knew that the assertion that Not-Being also exists must be wrong, although no formal logic existed that would enable him to say precisely what was wrong with it. But he was nonetheless certain about his position: "For you cannot know Not-Being (*to mē eon*), nor even say it."

The problem of the existence of total nothingness, or "the void" (Greek: *kenon*), was important in the theoretical foundations of Greek atomism, which asserted, despite the seemingly rigorous logic of the Eleatics, that nothingness must in fact exist.

The Eleatic denial of the void is sometimes seen as a direct refutation of an earlier Pythagorean view, a pre-Parmenidean atomism asserting that a kind of Not-Being, understood as a cosmic air, exists. No documentary evidence for such a view has survived, however.

In the 20th century the question was treated in a revolutionary way by the German existentialist philosopher Martin Heidegger, who summarized the function of Not-Being in the neologistic words *das Nichts nichtet* ("Not-Being, or Nothingness, Denied").

Notabile (Malta): *see* Mdina.

notary, also called NOTARY PUBLIC, public official whose chief function in common-law countries is to authenticate contracts, deeds, and other documents by an appropriate certificate with a notarial seal. In Roman law the *notarius* was originally a slave or freedman who took notes of judicial proceedings. The work of the modern notary, however, corresponds more to that of the Roman *tabularius,* who took and preserved evidence. In medieval times the notary was an ecclesiastical officer who preserved evidence, but his duties were mainly secular.

The modern notary is appointed, after making application, by a secular official; the appointment usually becomes effective on payment of a fee, on the taking of an oath of office, and, in many parts of the United States, on the deposit of a bond to assure the proper performance of duties.

In the United States, qualifications for the position vary little from state to state, and, in general, a notary must be a citizen of legal age and a resident of the area in which he desires appointment. The jurisdiction of the notary's office is limited to the state or, in some states, only the county in which he resides. In countries such as France and Italy, however, and in the Canadian province of Quebec, which follow the civil-law tradition, there are educational requirements for notaries similar to those for lawyers.

In the civil-law countries of western Europe, and in Latin American and French areas of North America, the office of notary is a much more important position than in the United States and England. The civil-law notary may be roughly described as a lawyer who specializes in the law relating to real estate, sales, mortgages, and the settlement of estates but who is not allowed to appear in court. Documents prepared by him or authenticated in the proper manner are, in these countries, admissible in court without further proof of their authenticity; the notary guarantees the identity of the parties.

In the Anglo-American–law countries, on the other hand, courts will not accept as true the facts certified by a notary except in the case of a bill of exchange protested abroad. Nor may a notary draw up legal documents such as wills, contracts, mortgages, and deeds for a fee, for such work constitutes the practice of law. Nevertheless, many statutes require that the authenticity of specified documents be certified by a notary; the most common of these in the United States are deeds conveying land. In these cases the notary must not take the acknowledgment of a person who does not appear before him or who is not known to him unless evidence of identification is presented.

Certain other officials may be given notarial functions by statute, such as justices of the peace, consular officials, certain military officers, and various court officials.

note, in the notation of Western music, sign indicating pitch by its position on the staff and showing duration by its shape. Notes evolved in the 13th century from neumes (*q.v.*), signs indicating relative or absolute pitch and nuance but not necessarily rhythm. The earliest notes were the longa, 𝆷, and brevis, ■; and their derivatives, the maxima, 𝆶, and semibrevis, ◆. In modern notation the brevis and semibrevis correspond to the double whole note, 𝅜, and the whole note, 𝅝. Other modern notes, in diminishing time value, are the half note, 𝅗𝅥; quarter note, 𝅘𝅥; eighth note, 𝅘𝅥𝅮; sixteenth note, 𝅘𝅥𝅯; thirty-second note, 𝅘𝅥𝅰; and sixty-fourth note, 𝅘𝅥𝅱.

"Note" may also refer to a tone, the sound either produced by a singer or musical instrument or represented by a pitch name (such as G, or sol), a neume, or a written note. The term is also used in describing the French lai form.

Noteburg (town, Russia): *see* Shlisselburg.

Noth, Martin (b. Aug. 3, 1902, Dresden, Ger.—d. May 30, 1968, Ḥorvot Shivta, Israel), German biblical scholar who specialized in the early history of the Jewish people.

In his book *Das System der zwölf Stämme Israels* (1930; "The Scheme of the Twelve Tribes of Israel"), written when he was just 28, Noth proposed the theory that the unity called Israel did not exist prior to the covenant assembly at Shechem in Canaan (Joshua 24), where, in his view, the tribes, theretofore loosely related through customs and traditions, accepted the worship and the covenant of Yahweh imposed by Joshua. Oral traditions from the various tribes were combined in the Pentateuch after the covenant union, and it was only at the time of Ezra that the traditions were finally written down, often combining different narrative elements into a single tale. Thus, the story of the Passover and that of the Exodus, once separate traditions, were linked in the written books of Moses. The two major narrative traditions, the Jehovistic and Elohistic (so called from the name used for God in each), formed a framework around the other traditional elements.

Noth served as professor of theology at the University of Bonn from 1945 to 1965, continuing his studies after his retirement.

Notharctus, extinct genus of primitive primates (family Notharctidae) that were among the evolutionary ancestors of modern lemurs. The genus is well known from complete fossil remains found in Eocene deposits (those formed between 57.8 and 36.6 million years ago) in Europe and North America.

Notharctus was small and resembled the modern lemurs on Madagascar. Its skull was about 5 cm (2 inches) long, with a prominent muzzle and a long lower jaw. Its canine teeth were still primitive, and four premolars were retained instead of three; but the upper incisors were relatively modern. The legs and tail were long and slim, and the first digit of the feet and hands was set off from the rest. *Notharctus* must have been an able and agile climber. During the Eocene it inhabited the dense subtropical forests that flourished over much of North America and Eurasia. At the close of the Eocene, conditions changed, and *Notharctus* and related forms disappeared from the Northern Hemisphere. Other, more modern lemurs continued on in tropical forests elsewhere and were particularly successful on Madagascar, where they remained relatively free from competition.

nothingness (mysticism and religion): *see* emptiness.

Nothosaurus, genus of primitive marine reptiles found as fossils in Triassic rocks (those formed 245 to 208 million years ago) of southwestern and eastern Asia, North Africa, and especially of Europe. *Nothosaurus* was characterized by a slender body, long neck and tail, and long limbs. Although it was an aquatic form, the limbs were not particularly specialized for life in the water, even though webbing probably was present between the digits. In many ways, *Nothosaurus* and related forms, known as the nothosaurs, resembled the more successful plesiosaurs but were not ancestral to them. The palate in the nothosaurs was closed, and the air passages were separated from the food passages, an adaptation to aid feeding while in the water. Numerous pointed teeth were present along the margins of the jaws. *Nothosaurus* probably swam through the water and could whip its long, slender neck about in pursuit of fleeing fish. It is probable that *Nothosaurus* and related forms evolved from terrestrial reptiles.

Notitia Dignitatum, official list of all ancient Roman civil and military posts, surviving as a 1551 copy of the now-missing original. It is a major source of information on the administrative organization of the late Roman Empire—late 4th and early 5th centuries—and is divided into two sections, covering the eastern and western parts of the empire as divided in AD 395.

The document goes into detail about the chief civil and military officials of the empire, together with their departmental staffs and, occasionally, the areas of their expertise or competence. The manuscript includes drawings of the insignia or regimental shield of each magistrate and the fort of each military commander.

Notke, Bernt (b. *c.* 1440, Lassahn, Pomerania [now in Germany]—d. before May 12, 1509, Lübeck), sculptor, painter, and engraver who was one of the most important artists in eastern Germany and the surrounding area during the 15th century. His intense and expressionistic works were instrumental in the development of sculpture in Germany.

In 1505 Notke was named *Werkmeister* of Petrikirche in Lübeck, and he also lived in other parts of the Baltic Sea area. Though he was a highly productive artist, few of his works are preserved. During the 1480s and '90s, Notke lived intermittently in Sweden. He produced his major sculptural group, "St. George and the Dragon," in Stockholm in 1489. Other documented works include the high altar at Tallinn (1482), the high altar at Århus, Den. (1479), and the "Triumphal Cross" in the Cathedral of Lübeck (1477).

Noto, town and episcopal see, Siracusa *provincia,* southeastern Sicily, Italy. It lies on the southern slopes of the Hyblaei Hills southwest of Syracuse. Noto was founded in 1703 about 4 miles (7 km) southeast of the Siculan and Roman city of Netum, which was destroyed in the earthquake of 1693. The town's 18th-century cathedral and the Palazzo Ducazio are notable among its many fine Baroque churches and palaces. Between 1837 and 1865 Noto replaced Syracuse as the provincial capital. The communal library houses a small local museum.

SS. Mira e Corrado Church, Noto, Sicily

Art Resource

An agricultural centre, Noto has light industries including food processing. Pop. (1993 est.) mun., 21,811.

Noto Peninsula, Japanese NOTO-HANTŌ, peninsula in Ishikawa *ken* (prefecture), Honshu, Japan, jutting into the Sea of Japan and enclosing Toyama Bay. The largest peninsula on the northern Honshu coast, it extends northward for 50 miles (80 km) and has a width of about 19 miles (30 km). The peninsula is separated from mainland Honshu by the Lake Ōchi graben (a depression of the Earth's crust bounded by faults). The peninsula's mountainous interior is similar to that of Sado, an island to the northeast.

The Noto Peninsula has been settled since ancient times, and there is evidence of early contact with the island of Tsushima and with northern Korea and Manchuria. The town of Wajima, at the peninsula's northern tip, is known for its women pearl divers and its production of elaborate lacquer ware. Parts of the peninsula were designated national park land in 1968.

notochord, flexible rodlike structure of mesodermal cells that is the principal longitudinal structural element of chordates and of the early embryo of vertebrates, in both of which it plays an organizational role in nervous system development. In later vertebrate development, it becomes part of the vertebral column. The notochord derives during gastrulation (infolding of the blastula, or early embryo) from cells that migrate anteriorly in the midline between the hypoblast and the epiblast (inner and outer layers of the blastula). These cells coalesce immediately beneath the developing central nervous system. With the formation of the vertebral column, the notochord is incorporated into the column as the centres of the intervertebral discs, called the nuclei pulposi, which cushion the vertebrae.

notopterid, also called KNIFEFISH, or FEATHERBACK, any of about eight species of air-breathing, freshwater fishes constituting the family Notopteridae, found in quiet waters from Africa to Southeast Asia. Notopterids are long-bodied, small-scaled fishes with a small dorsal fin (if present) and a long, narrow anal fin that runs along most of the undersurface and continues into the tail fin. Undulations along the anal fin enable the fishes to swim both forward and backward. Notopterids are predacious and nocturnal and, in some areas are sought as food. The largest (*Notopterus chitala*) may grow to a length of about 80 cm (32 inches). The species *Xenomystus nigri* is sometimes kept in aquariums.

Knifefish, or featherback (*Xenomystus nigri*)

Jane Burton—Bruce Coleman Ltd.

Notoungulata, extinct group of mammals found as fossils, mostly in South America, in deposits of the later Paleocene Epoch (66.4 to 57.8 million years ago); the oldest forms seem to have an East Asian origin. The peak of notoungulate evolution occurred during the Oligocene Epoch (36.6 to 23.7 million years ago). By the Pliocene Epoch (5.3 to 1.6 million years ago) they had been reduced in numbers and diversity; the reason may have been climatic. In South America the notoungulates evolved and diversified free from competition from more advanced forms that were evolving elsewhere. When North America and South America were rejoined late in the Pliocene, the notoungulates, apparently unable to compete with more efficient forms from North America, became extinct.

In their time the notoungulates included a variety of hoofed animals whose development paralleled the evolution of more advanced forms elsewhere. One group, the toxodonts, was clumsily built and rather massive; *Toxodon* itself stood about 2 m (6 feet) high at the shoulder. Other notoungulates developed along lines similar to the rabbits and rodents.

Notre Dame, University of, private institution of higher learning in Notre Dame, near South Bend, Ind., affiliated with the Roman Catholic church. Formerly a men's university, it became coeducational in 1972.

The university was founded in 1842 by the Congregation of the Holy Cross, a French religious community led by Father Edward Sorin (president from 1842 to 1865). It included a men's college, an elementary school, a college-preparatory school, a vocational ("manual labour") school, and a novitiate. A sister school for women, St. Mary's Academy (later St. Mary's College), was opened in 1843. The university added science, law, and engineering departments, an academic press, and a library in the 1860s and '70s.

In the 1920s the secondary school was discontinued and the university was reorganized into colleges of arts and letters, science, engineering, and business administration. The university also has a graduate school and a law school. It was in the 1920s that Notre Dame's reputation in intercollegiate football was first built under a famous coach, Knute Rockne. Under the presidency (1952–87) of the Reverend Theodore M. Hesburgh, undergraduate and graduate programs were strengthened.

Notre-Dame de Paris, also called NOTRE-DAME CATHEDRAL, cathedral church in Paris, France. It is the most famous of the Gothic cathedrals of the Middle Ages and is distinguished for its size, antiquity, and architectural interest.

Notre-Dame lies at the eastern end of the Île de la Cité and was built on the ruins of two earlier churches, which were themselves predated by a Gallo-Roman temple dedicated to Jupiter. The cathedral was initiated by Maurice de Sully, bishop of Paris, who about 1160 conceived the idea of converting into a single building, on a larger scale, the ruins of the two earlier basilicas. The foundation stone was laid by Pope Alexander III in 1163, and the high altar was consecrated in 1189. The choir, the western facade, and the nave were completed by 1250, and porches, chapels, and other embellishments were added over the next 100 years.

Notre-Dame Cathedral consists of a choir and apse, a short transept, and a nave flanked by double aisles and square chapels. Its central spire was added during restoration in the 19th century. The interior of the cathedral is 427 by 157 feet (130 by 48 m) in plan, and the roof is 115 feet (35 m) high. Two massive Early Gothic towers (1210–50) crown the western facade, which is divided into three stories and has its doors adorned with fine Early Gothic carvings and surmounted by a row of figures of Old Testament kings. The two towers are 223 feet (68 m) high; the spires with which they were to be crowned were never added. At the cathedral's east end, the apse has large clerestory windows (added 1235–70) and is supported by single-arch flying buttresses of the more daring Rayonnant Gothic style, especially notable for their boldness and grace. The cathedral's three great rose windows alone retain their 13th-century glass.

Notre-Dame de Paris

By courtesy of Electa, Milano

Notre-Dame Cathedral suffered damage and deterioration through the centuries, and after the French Revolution it was rescued from possible destruction by Napoleon, who crowned himself emperor of the French in the cathedral in 1804. Notre-Dame underwent major restorations by the French architect E.-E. Viollet-le-Duc in the mid-19th century. The cathedral is the setting for Victor Hugo's historical novel *Notre-Dame de Paris* (1831).

Notre-Dame-des-Ermites (Switzerland): *see* Einsiedeln.

Notre Dame Mountains, French MONTS NOTRE-DAME, mountain range in eastern Quebec province, Canada. The mountains are a continuation of the Green Mountains of Vermont, U.S., and an outcrop of the northern Appalachians. Named by Samuel de Champlain, the French explorer, they extend for about 500 miles (800 km) in a northeasterly direction through the Gaspé Peninsula. Elevations average 3,500 feet (1,070 m). An extension, the Mont Chic-Choc (Shickshock Mountains), forms the backbone of the Gaspé Peninsula and follows the south shore of the St. Lawrence River for 100 miles (160 km), reaching a maximum height of 4,160 feet (1,268 m) at Jacques Cartier, or Tabletop, in the Gaspesian Provincial Park.

Notre-Dame school, during the late 12th and early 13th centuries, an important group of composers and singers working under the patronage of the great Cathedral of Notre-Dame in Paris. The Notre-Dame school is important to the history of music because it produced the earliest repertory of polyphonic (multipart) music to gain international prestige and circulation. Its four major forms are organum (*q.v.*), a setting (for two to four voice parts) of a chant melody in which the chant is sung in sustained notes beneath the florid counterpart of the upper voice(s); clausula (*q.v.*), actually a section within an organum composition corresponding to a melismatic (many notes per syllable) section of the chant and characterized by a decisive acceleration of pace in the voice having the chant; conductus (*q.v.*), a processional composition in chordal style and not derived from any preexistent chant; and motet (*q.v.*), similar to the clausula, from which it evidently evolved, but with the addition of new texts, often secular, in the upper parts.

The composers of the Notre-Dame school are all anonymous except for two, Léonin (*q.v.*), or Leoninus (late 12th century), and Pérotin (*q.v.*), or Perotinus (flourished *c.* 1200), both of whom are mentioned in a 13th-century treatise by an anonymous Englishman studying in Paris. According to the treatise, Léonin excelled in the composition of organa and, in fact, composed the *Magnus liber organi* ("Great Book of Organa"), which contains a series of two-part organa for the entire liturgical year. Pérotin, the apparent successor to Léonin, is cited for his three- and four-voice organa, as well as his "substitute clausulae," newly composed clausulae intended for insertion within the older organa.

Nottawasaga Bay, large inlet of Georgian Bay (and Lake Huron) indenting Grey and Simcoe counties in southeastern Ontario, Canada, and fed by the Nottawasaga, Bighead, Beaver, and Pretty rivers. The bay's entrance lies between Cape Rich (west) and Christian Island (east). Many apple orchards are located near the bay's shores, which form a popular summer-resort area, most notably near the town of Wasaga Beach. Important settlements around the bay include Meaford, Thornbury, and Collingwood. The name is from Huron Indian words meaning "outlet of the river of the Iroquois" (whose war parties used the Nottawasaga River to attack the Hurons).

Nottaway River, river in western Quebec province, Canada. The river drains Lake Matagami at 765 feet (233 m) above sea level, flows northwestward for 140 miles (225 km), and empties into Rupert Bay at the south end of James Bay. Its chief headstreams, the Bell, Chibougamau, and Waswanipi, all flow into Lake Matagami; each adds more than 150 miles (240 km) to the length of the main stream. The swift-flowing Nottaway, with its great hydroelectric potential, was explored by Robert Bell, a Canadian government geologist, in the 1870s.

Nottingham, city and district, county of Nottinghamshire, England. The city lies along the River Trent.

The original site, on a sandstone hill commanding a crossing of the Trent, was occupied by the Anglo-Saxons in the 6th century. Colonizing the area by river, they gave their settlement the name of Snotingaham, the "ham," or village, of Snot's people. Peaceably occupied by the Danes in the 9th century, the community became one of the five towns of the Danelaw. After the Norman Conquest (1066), new rulers founded a borough that existed side by side with the older Saxon town, both communities being separately administered until about 1300. In 1449, Henry VI confirmed all previous privileges, instituted the office of sheriff, and granted that the town (excepting the castle and jail) should function as a county in itself.

A marketplace, mentioned in the charter of 1155, was established in the small valley between the Norman and Saxon settlements. The old market square, 5.5 acres (2 hectares) in area, is now one of the major features of the townscape in central Nottingham. Dominated on the eastern side by the Council House (opened 1928), the square is flanked with shops, but the central area is reserved for pedestrians. The old Saxon town is now marked by Nottingham Castle on Standard Hill, so named because there, in 1642, Charles I raised his standard at the outbreak of the English Civil Wars. The present castle, after renovation by the corporation (1875–78), houses a museum and art gallery. The link between Nottingham and the legendary outlaw Robin Hood is commemorated by a statue on Castle Green. University College was opened in Nottingham in 1881 and moved to its present site west of the city in 1928. The land was given by Lord Trent, otherwise Jesse Boot, founder of Boots Company, Ltd., who subsequently financed much of its development. The university was incorporated in 1948. The city has two important theatres—Theatre Royal (1865) and the Playhouse (opened 1963)—and literary figures associated with Nottingham include the poet Lord Byron and the novelist D.H. Lawrence.

Nottingham, the county town (seat), lies at the heart of the East Midlands coalfield and is a major route centre. It is also traditionally associated with the hosiery trade and the lace industry; a distinctive lace quarter still survives in the southeast corner of the central area of the city. The city has pharmaceutical and tobacco industries and a bicycle-manufacturing plant. The service sector of the economy provides the major proportion of employment; but the city's diversified economic structure has resulted in sustained prosperity. Area 29 square miles (75 square km). Pop. (2001) 266,995.

Nottingham, EARLS OF, titled English nobility of several creations, notably in the families Mowbray, Howard, and Finch, grouped below chronologically and indicated by the symbol •.

• **Nottingham, Thomas Mowbray, Earl of:** *see* Norfolk, Thomas Mowbray, 1st Duke of.

• **Nottingham, Charles Howard, 1st Earl of,** also called (1573–97) 2ND BARON HOWARD OF EFFINGHAM (b. 1536—d. Dec. 14, 1624, near Croydon, Surrey, Eng.), English lord high admiral who commanded England's fleet against the Spanish Armada. Although he was not as talented a seaman as his subordinates Sir Francis Drake and John Hawkins, Howard's able leadership contributed greatly to this important English victory.

Howard, the son of William, 1st Baron Howard of Effingham, was a cousin of Queen Elizabeth I. In 1569 he helped suppress a rebellion of the Roman Catholic lords of northern England. He succeeded to his father's title of Lord Howard of Effingham in 1573 and in 1585 became lord high admiral.

Charles Howard, 1st Earl of Nottingham, detail of an oil painting by an unknown artist, 1602; in the National Portrait Gallery, London

By courtesy of the National Portrait Gallery, London

In mobilizing his forces against the Armada, Howard, on the flagship *Ark,* led the main body of the fleet to join Sir Francis Drake's advance force off the southwest coast of England (May 1588). As the Spanish fleet approached, Howard harassed it from a distance with long-range cannon and slowly shepherded it up the English Channel. His cautious tactics proved successful, but he was open to criticism for stopping to capture a crippled vessel at the moment when the rest of the Armada, its close formation broken by English fireships, was being mauled by Drake off the coast of France (Aug. 7–8, 1588).

In 1596 Howard and Robert Devereux, 2nd Earl of Essex, commanded the expedition that sacked Cádiz, Spain. The queen made Howard earl of Nottingham in 1597, and in the summer of 1599 he was given the exceptional office of lord lieutenant general of England, which he held until 1619. He helped put down Essex's uprising against Elizabeth (1601) and served as a commissioner at Essex's trial. It was to Howard that Elizabeth, on her deathbed, named James I as her successor. The venerable earl served on ambassadorial missions and investigatory commissions throughout most of James's reign.

•**Nottingham, Heneage Finch, 1st Earl of,** BARON FINCH OF DAVENTRY (b. Dec. 23, 1621, Kent, Eng.—d. Dec. 18, 1682, London), lord chancellor of England (1675–82), called "the father of equity."

He was descended from an old family, many of whose members had attained to high legal eminence, and was the eldest son of Sir Heneage Finch, recorder of London. He was educated at Westminster and at Christ Church, Oxford, where he remained until he became a member of the Inner Temple in 1638. He was called to the bar in 1645 and soon obtained a lucrative practice. He was a member of the Convention Parliament of April 1660, and shortly afterwards he was appointed solicitor-general, being created a baronet the day after he was knighted. In May of the following year he was chosen to represent the University of Oxford in Parliament. In 1670 he became attorney general and in 1675 lord chancellor. He was created Baron Finch in 1674 and Earl of Nottingham in May 1681.

His most important contribution to the statute book is "The Statute of Frauds." While attorney general he superintended the edition of Sir Henry Hobart's *Reports* (1671). He also published *Several Speeches and Discourses in the Tryal of the Judges of King Charles I* (1660); *Speeches to Both Houses of Parliament* (1679); *Speech at the Sentence of Viscount Stafford* (1680).

Nottinghamshire, county of the East Midlands of England, bordered by the counties of Leicestershire, Derbyshire, Humberside, and Lincolnshire and by the area of South Yorkshire. Its area is 836 square miles (2,164 square km). The county has eight districts: Ashfield, Bassetlaw, Broxtowe, Gedling, Mansfield, Newark, Rushcliffe, and the city of Nottingham.

The county is oval in shape and extends 51 miles (82 km) from north to south but only half that distance from east to west, while the major routes of communication of the county follow a north-south direction. This is in part dictated by geology, for Nottinghamshire lies on the eastern slope of the Pennine chain, the "spine" of England. Geological formations outcrop in north-south belts, the oldest in the west and the youngest in the east, while the surface generally falls from west to east.

In the west lie coal measures, and the exposed coalfield, with its multiple railway lines and numerous mining towns, forms the principal north-south highway in the west of the county. The centre of Nottinghamshire is occupied by a broad belt of Triassic pebble beds and sandstones. The chief feature of this central belt is its infertility; its natural vegetation is forest and heath, and it is here that the great medieval forest of Sherwood, the haunt of Robin Hood, stretched north across the county from the city of Nottingham. While little of the original oak forest now remains, subsequent plantings conserve at least some impression of the original woodland.

On the east, underlain by clays and marls, is lowland Nottinghamshire, effectively the valley of the River Trent and the adjoining Vale of Belvoir. The Trent forms the second main north-south channel of the county. The river carries a small amount of traffic, but its principal use today is to provide cooling water for a remarkable concentration of thermal electric power stations along its banks.

Southwestern Nottinghamshire, comprising the coalfield area and the city of Nottingham itself, is a densely populated and heavily industrialized tract, with mining, steelmaking, engineering, chemical, and textile (lace and hosiery) industries. Industrial outliers are found in Mansfield, Worksop, and Newark. The centre of the county is empty by contrast: the former royal forest of Sherwood was gradually converted into a series of great estates (sometimes collectively described as The Dukeries), and the sandy, infertile land was given over to new forest plantations, park landscapes, and imposing mansions (*e.g.,* Welbeck, Wollaton, Newstead). This is one of the few agricultural regions of Great Britain where irrigation is extensively used to cultivate the so-called Forest Sands.

The largest uninterrupted area of farmland in the county is to be found in the Vales of Trent and Belvoir. Agriculture is mixed and comprises dairying (including the manufacture of Stilton cheese), the production of cereal grains, and the growing of sugar beets, which are refined at Newark.

The county's major buildings of note are the great mansions of The Dukeries and the cathedral at Southwell. There is a university and a polytechnic in the city of Nottingham. Pop. (2001) 1,015,498.

Nouadhibou, formerly PORT-ÉTIENNE, town, northwestern Mauritania, on Ras Nouadhibou (formerly Cape Blanc) peninsula facing a protective bay on the Atlantic coast. It has developed as a fishing centre, and fishing continues to be important; but, since 1964, with the completion of a special pier and a 419-mile (674-kilometre) railway to the Iron Mountains near Zouîrât and Fdérik, the port's main economic importance has rested on exports of high-grade iron ore to Europe and the United States. Nouadhibou is the site of an international airport. Pop. (2000) 74,414.

Nouakchott, city, capital of Mauritania, on a plateau near the West African Atlantic coast, about 270 miles (435 km) north-northeast of Dakar, Senegal. Originally a coastal village on the desert trail north from Dakar, it was developed after independence (1960) as the capital of the new nation. Nouakchott was a major refugee centre during the Saharan droughts of the 1970s, and its rapid growth during that period (together with a sharp decline in the number of Mauritania's nomads) was attributed to migration and urbanization in response to the droughts. The city focuses on a square, the Place de l'Indépendence, and includes an airport and industrial area. It is centrally located on the main north-south highway, connecting the more populated agricultural south with the sparsely populated but mineral-rich north. A port facility has been built about 5 miles (8 km) west for the export of petroleum and copper. The copper is mined near Akjoujt (120 miles (195 km) northeast). While there has been a steady increase in the port's activity, the level of traffic remains below that of the more northern port of Nouadhibou. The University of Nouakchott was founded in 1981. Pop. (2000) 611,883.

Place de l'Indépendence in Nouakchott, Mauritania

Picturepoint, London

nougat, aerated confection made by mixing nuts and sometimes fruit pieces in a sugar paste whose composition is varied to give either a chewy or a brittle consistency. Nougat originated in Mediterranean countries, where honey, together with almonds or other nuts, was beaten into egg whites and then sun-dried.

In the modern preparation of nougat, honey or sugar and egg albumen are cooked at a temperature below which the albumen coagulates. The resulting mass is then stiffened to the desired degree under heat and combined with hard-cooked sugar and corn syrup. Vegetable fats such as coconut oil are often added to facilitate cutting and biting.

Nougat is traditionally flavoured with almonds or pistachio nuts. Crystallized fruit pieces are sometimes incorporated.

Nouméa, also spelled NUMEA, city, port, and capital of the Territory of New Caledonia, southwestern Pacific, in the southwestern corner of the island of New Caledonia. It was founded in 1854 under the name Port-de-

France. It is situated on an excellent deepwater harbour protected by Nou Island and a reef. The Grand Quai has a 1,450-foot- (442-metre-) long frontage. The city, backed by low hills, has modern buildings, a large public market, and St. Joseph's Cathedral, an old stone structure. Also located there are a campus of the French University of the Pacific, a coral aquarium, a hydroelectric plant at Yaté Falls, and a nickel-refining plant at nearby Duiambo Point. The city is served by two international airports, Tontouta and Magenta. Pop. (1989 prelim.) 65,110.

noumenon, plural NOUMENA, in the philosophy of Immanuel Kant, the thing-in-itself (*das Ding an sich*) as opposed to what Kant called the phenomenon—the thing as it appears to an observer. Though the noumenal holds the contents of the intelligible world, Kant claimed that man's speculative reason can only know phenomena and can never penetrate to the noumenon. Man, however, is not altogether excluded from the noumenal because practical reason—*i.e.*, the capacity for acting as a moral agent—makes no sense unless a noumenal world is postulated in which freedom, God, and immortality abide.

The relationship of noumenon to phenomenon in Kant's philosophy has engaged philosophers for nearly two centuries, and some have judged his passages on these topics to be irreconcilable. Kant's immediate successors in German Idealism in fact rejected the noumenal as having no existence for man's intelligence. Kant, however, felt that he had precluded this rejection by his refutation of Idealism, and he persisted in defending the absolute reality of the noumenal, arguing that the phenomenal world is an expression of power and that the source from which this power comes can only be the noumenal world beyond.

Nourrit, Adolphe (b. March 3, 1802, Montpellier, France—d. March 8, 1839, Naples [Italy]), French dramatic tenor who created many new roles in French opera.

His father, Louis Nourrit, was both a leading tenor at the Paris Opéra and a diamond merchant. Adolphe studied voice with Manuel García, a famous tenor of the time, and at 19 years of age he made his successful debut at the Paris Opéra as Pylades in Christoph Willibald Gluck's *Iphigénie en Tauride.* Within five years he succeeded his father as the leading tenor at the Paris Opéra. During the next decade, Nourrit created such new roles in leading French operas as Aménophis in Gioacchino Rossini's French version of his *Mosè* in *Egitto,* Arnold in Rossini's *Guillaume Tell,* Eléazar in Fromental Halévy's *La Juive,* for which Nourrit wrote the lyrics of the aria "Rachel, quand du seigneur," Robert in Giacomo Meyerbeer's *Robert le diable,* and Raoul in his *Les Huguenots.* He also wrote scenarios for four ballets, among them *La Sylphide,* and translated some of Franz Schubert's songs for French performance.

When his rival, Gilbert Duprez, was also hired by the Opéra in 1837, Nourrit decided to leave Paris. He traveled to Italy for his health and to study with Gaetano Donizetti. He performed in Naples, but his voice was affected by his poor health. His career faltered in Italy, he became depressed, and finally he jumped to his death from his hotel in Naples.

Nouvelle Amsterdam, island in the southern Indian Ocean, administratively a part of Terres Australes et Antarctiques Françaises (*q.v.*). An extinct volcano rising to 2,989 feet (911 m) above sea level with an area of 18 square miles (47 square km), it was discovered in 1522 by members of Ferdinand Magellan's crew and named in 1633 by a Dutch explorer, Anthony van Diemen. With the island of Saint-Paul, it was annexed by France in 1843. In 1949 a permanent research and administrative station, Camp Heurtin, was established on the island.

Nouvelle-Calédonie, Territoire de la: *see* New Caledonia.

nouvelle cuisine, eclectic style in international haute cuisine developed during the 1960s and '70s that stressed freshness, lightness, and clarity of flavour. In reaction to some of the richer and more calorie-laden extravagances of classic French haute cuisine, nouvelle cuisine sought to emphasize the natural flavours, textures, and colours of foodstuffs. Acknowledging the unhealthiness of a diet heavy in fats, sugars, refined starches, and salt, it minimized the use of these ingredients.

The basic characteristics of nouvelle cuisine included the use of sauces thickened not by roux (a cooked mixture of flour and fat) but rather by purees of vegetables or fruits; the serving of novel combinations of foods in very small quantities that were artistically arranged on large plates; a return to the importance of purchasing of food; and infinite attention to texture and detail.

Luxury was achieved through meticulous preparation and imaginative presentation and through the liberal use of fresh seasonal fruits and vegetables. Kiwi fruits, raspberries, mangoes, and other fruits were frequently combined with meats and seafood, and fruit-flavoured vinegars were a popular seasoning.

The phrase nouvelle cuisine was coined by the French food critics Christian Millau and Henri Gault to describe the styles created by a group of French chefs, notably Paul Bocuse, Jean and Pierre Troisgros, Michel Guérard, Roger Verge, and Paul Haeberlin.

Nouvelle Revue française, La (NRF), leading French review of literature and the other arts. It was founded in February 1909 (after a false start in November 1908) by a group that included André Gide, Jacques Copeau, and Jean Schlumberger. The *NRF*'s founders wished to emphasize aesthetic issues and to remain independent of any political party or moral or intellectual school. During the period between the two world wars, under the editors Jacques Rivière (1919–25) and Jean Paulhan (1925–40), the *NRF* became France's leading literary journal, publishing works by many notable writers. After the German occupation of France in 1940, Pierre Drieu La Rochelle became editor, and the *NRF* became pro-fascist; it ceased publication in 1943. The review was revived in 1953 as *La Nouvelle Nouvelle Revue française,* under the direction of Paulhan and Marcel Arland; it resumed its original name in 1959. The publishing house Editions Gallimard was established in 1911 as an offshoot of the *NRF.*

nouvelle vague (cinema): *see* New Wave.

Nouvelles-Hébrides (Pacific Ocean islands): *see* Vanuatu.

nova, plural NOVAS, or NOVAE, any of a class of exploding stars whose luminosity temporarily increases from several thousand to as much as 100,000 times its normal level. A nova reaches maximum luminosity within hours after its outburst and may shine intensely for several days or occasionally for a few weeks, after which it slowly returns to its former level of luminosity. Stars that become novas are nearly always too faint before eruption to be seen with the unaided eye. Their sudden increase in luminosity, however, is sometimes great enough to make them readily visible in the nighttime sky. To observers, such objects may appear to be new stars; hence the name nova from the Latin word for "new."

Most novas are thought to occur in double-star systems in which members revolve closely around each other. Both members of such a system, commonly called a close binary star, are aged: one is a red giant and the other a white dwarf. In certain cases, the red giant expands into the gravitational domain of its companion. The gravitational field of the white dwarf is so strong that hydrogen-rich matter from the outer atmosphere of the red giant is pulled onto the smaller star. When a sizable quantity of this material accumulates on the surface of the white dwarf, a nuclear explosion occurs there, causing the ejection of hot surface gases on the order of $^{1}/_{10,000}$ the amount of material in the Sun. According to the prevailing theory, the white dwarf settles down after the explosion; however, the flow of hydrogen-rich material resumes immediately, and the whole process that produced the outburst repeats itself, resulting in another explosion about 1,000 to 10,000 years later. Recent research, however, suggests that such outbursts may recur at much longer intervals—every 100,000 years or so. It is explained that a nova eruption separates the members of the binary system, interrupting the transfer of matter until the two stars move close together again after a considerable length of time. *See also* supernova.

Nova, João da, Spanish JUAN DE NOVA (b. 15th century, Galicia, Spain—d. 1509, Cochin, India), Spanish navigator who in the service of Portugal discovered the islands of Ascension and St. Helena, both off the southwestern coast of Africa.

Commanding a fleet of four ships, Nova left Portugal on a voyage to India in 1501. His crews included Amerigo Vespucci, after whom America was later named. En route he discovered Ascension Island. In India he established a trading post at Cannanore. During his return voyage to Portugal Nova discovered St. Helena.

Returning to India later, Nova favoured the sea captain Francisco de Almeida in a power struggle with Afonso de Albuquerque. Nova remained associated with Almeida, who was made the first viceroy of Portuguese India. The chronicles indicate that on his return to Portugal he became immensely popular.

Nova Cassiopeiae 1572: *see* Tycho's Nova.

Nova Friburgo, city, east-central Rio de Janeiro *estado* ("state"), in eastern Brazil, on the Rio Grande in the Serra de Nova Friburgo, 2,776 feet (846 m) above sea level.

Nova Friburgo has textile mills but is best known as a summer mountain resort built in Swiss Alpine style. It can be reached by railroad and highway from Niterói, southwest, and from Rio de Janeiro, the state capital. Pop. (1991 prelim.) mun., 166,941.

Nova Herculis, also called DQ HERCULIS, one of the brightest novas of the 20th century, discovered Dec. 13, 1934, by the British amateur astronomer J.P.M. Prentice, in the northern constellation Hercules. It reached an apparent visual magnitude of 1.4 and remained visible to the unaided eye for months. At its centre was found an eclipsing binary pair of small stars, revolving around each other with a period of 4 hours and 39 minutes.

Nova Iguaçu, city and northwestern suburb of the city of Rio de Janeiro, Rio de Janeiro state, Brazil. Formerly called Maxambamba, it lies in the Sarapuí River valley, at 85 feet (26 m) above sea level. The city's varied industries include marmalade and orange juice factories, vegetable canneries, and plants manufacturing chemicals and pharmaceutical products. Extensive orange groves are in the agricultural hinterland. The main railroad and highway linking Rio de Janeiro with São Paulo pass nearby. Pop. (2000 prelim.) 915,364.

Nova Lamego (Guinea-Bissau): *see* Gabú.

Nova Lima, city, east-central Minas Gerais *estado* ("state"), Brazil. It lies along the Cristais River at 2,444 feet (745 m) above sea level. Nova Lima was made the seat of a municipality in 1891 and became a city in 1936. It is known for its Mineração Morro Velho ("Old Mountain Mine"), British-owned from 1834 until 1959, when it was sold to a Brazilian concern. The air-cooled shaft, which penetrates 8,501 feet (2,591 m), is one of the deepest in the Americas. The mine accounts for as much as half of Brazil's gold production. Ore crushed at the site is shipped by rail and road to nearby Belo Horizonte, the state capital, and to other neighbouring communities. Pop. (2000 prelim.) 62,951.

Nova Lisboa (Angola): *see* Huambo.

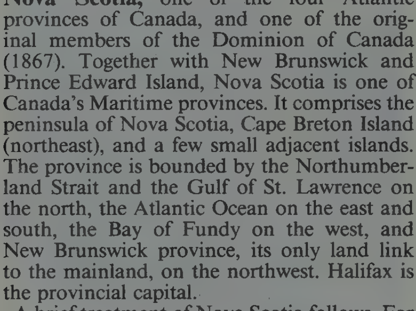
Nova Ophiuchi 1604: *see* Kepler's Nova.

Nova Persei, bright nova that attained an absolute magnitude of −9.2. Spectroscopic observations of the nova, which appeared in 1901, provided important information about interstellar gas. The shell thrown off by the exploding star was unusually asymmetrical, and a bright nebulosity near the star appeared to be expanding incredibly fast, at practically the speed of light. This apparent speed is thought to have been an effect of reflection within a preexisting dark nebula around the star. From this phenomenon, sometimes called a light echo, it was possible to calculate the distance of the nova from Earth, about 650 light-years.

Nova Scotia, one of the four Atlantic provinces of Canada, and one of the original members of the Dominion of Canada (1867). Together with New Brunswick and Prince Edward Island, Nova Scotia is one of Canada's Maritime provinces. It comprises the peninsula of Nova Scotia, Cape Breton Island (northeast), and a few small adjacent islands. The province is bounded by the Northumberland Strait and the Gulf of St. Lawrence on the north, the Atlantic Ocean on the east and south, the Bay of Fundy on the west, and New Brunswick province, its only land link to the mainland, on the northwest. Halifax is the provincial capital.

A brief treatment of Nova Scotia follows. For full treatment, *see* MACROPAEDIA: Canada.

Originally settled by the Micmac Indians, the region was first visited by Norse Vikings about AD 1000 and was sighted in 1497 by John Cabot, who claimed it for England. French settlers arriving in 1605 adopted the Micmac name, Acadie, or Acadia, for the region. Theirs was the first permanent European settlement in North America lying north of Florida. The arrival of English and Scottish colonists after 1621 led to a long conflict between France and England over control of the area, which was awarded to Britain under the terms of the Treaty of Utrecht (1713). The region was renamed Nova Scotia, and in the 1750s the descendants of the first French settlers, who refused to swear loyalty to Britain, were expelled from the colony; many of these Acadians resettled in Louisiana, where they became known as Cajuns. (The Acadians' tragedy was vividly portrayed in *Evangeline,* by the American poet Henry Wadsworth Longfellow.) The province still retains some of the feeling of 17th-century Acadia.



Bay St. Lawrence, a fishing village on Cape Breton Island, Nova Scotia

Bill Brooks/Masterfile

Britain's offers of free land attracted immigrants not only from the British Isles but also from New England. The New Englanders helped secure the first elected assembly in the province, and, by the time of the American Revolution, they constituted roughly one-half of Nova Scotia's population. During the Revolution and afterward, some 35,000 American loyalists (*i.e.,* supporters of British rule) immigrated to the province. Meanwhile, Prince Edward Island had split off from Nova Scotia in 1769, and New Brunswick followed in 1784, though Cape Breton Island was reunited with Nova Scotia in 1820. In 1848 Nova Scotia became the first British colony to exercise the right of government responsible to the people through their elected representatives. Despite opposition, the union of Nova Scotia with Ontario, Quebec, and New Brunswick was carried out in 1867, forming the Dominion of Canada.

Nova Scotia's five upland regions reach a maximum elevation of more than 1,700 feet (520 m) in the Cape Breton Highlands of the northeast. The most important lowlands lie along the Bay of Fundy and the Minas Basin, in the southwest, and along the Northumberland Strait. Almost nine-tenths of Nova Scotia's land area is unsuitable for agriculture, owing either to poor soils or hilly or mountainous terrain. More than 3,000 lakes and hundreds of short streams have been impounded by, or have cut through, the irregularly varied landforms of the province.

Nova Scotia has a modified continental climate with a marked maritime effect along the coasts. The temperature rarely exceeds 88° F (31° C) or falls below 14° F (−10° C) anywhere in the province. Rainfall ranges from 55 inches (1,400 mm) in the south, where fog commonly occurs, to 40 inches (1,000 mm) elsewhere. Forests, consisting mostly of softwoods (balsam, spruce, hemlock, and pine), occupy about four-fifths of the land area.

Both Nova Scotia's past and present are tied closely to the maritime life of fishing, shipbuilding, and transatlantic shipping. In the age of "wood, wind, and water," Nova Scotia was famous for its shipbuilding. In modern times, the export trade—particularly from the port of Halifax, with its container piers—provides an important source of income. Shipyards, a naval dockyard, construction industries, and assembly plants also provide a major source of employment in the Halifax-Dartmouth area. Despite economic setbacks caused by competition with U.S. ports, Halifax seems to be regaining some of the importance that it once had in the days of sail and the West Indies trade.

Fisheries remain a major activity, with lobster, cod, scallops, haddock, and herring being the significant catches. One of North America's largest fish-processing plants is located in Lunenburg. Extensive forestry resources supply the province's pulp and paper mills and numerous sawmills and provide Christmas trees and maple syrup as well. Coal is the leading mined product and provides nearly three-fourths of the province's energy requirement. Salt, barite, anhydrite, and gypsum are other important minerals. The limited farming in Nova Scotia has focused on dairy products, livestock, poultry and egg production, and fruit cultivation. Subsistence living on family farms traditionally characterized the province's agriculture, though more efficient land use and increasing mechanization have reduced the number of farms and made them more productive.

The offshore exploration of oil and natural gas near Sable Island continues, and the continent's first tidal-energy project harnesses the tides of the Bay of Fundy for hydroelectric energy. The province is well served by highways, railways, and airlines, while ferries operate between it and New Brunswick, Prince Edward Island, and the U.S. state of Maine.

Representative government in Nova Scotia was established in 1848, and the province joined Canada in 1867. Since then it has had a unicameral legislative assembly, elected by universal adult suffrage. The premier is the leader of the majority party in the assembly, and he selects and heads the executive cabinet. The lieutenant governor represents the British monarch and is appointed by Canada's governor-general. Judges are appointed by the federal government.

Primary and secondary school through the 12th grade, including technical and vocational, is free and compulsory. Nova Scotia has several universities, including Halifax's Dalhousie University (1818), with the Bedford Institute of Oceanography and a medical research centre that coordinates activities with the city's hospitals.

The cultural inheritances of both the Acadians and British immigrants have been preserved. The Nova Scotia Museum and Parks Canada jointly administer historical sites at the Annapolis Royal Habitation, Fortress Louisbourg, Halifax Citadel, and other sites. Halifax is the home of the Neptune Theatre and the Atlantic Symphony Orchestra. St. Francis Xavier University (1853) in Antigonish offers courses in Celtic studies, and the Gaelic College in St. Ann's, Cape Breton, fosters folk arts such as piping, singing, dancing, and handicrafts. Clan gatherings take place annually at the Gaelic College, and summer festivals are held in many communities. St. Francis Xavier University has attracted international interest with its adult-education programs. Area 21,425 square miles (55,490 square km). Pop. (1999 est.) 940,825.

Nova Sofala (Mozambique): *see* Sofala.

novaculite, very dense, light-coloured, even-textured sedimentary rock, a bedded chert in which microcrystalline silica (silicon dioxide, SiO_2) in the form of quartz predominates over silica in the form of chalcedony. Deposits of novaculite exhibit stratification. The name is applied chiefly to formations in Arkansas, Oklahoma, and Texas. *See also* chert and flint.

Novaës, Guiomar, in full GUIOMAR NOVAËS PINTO (b. Feb. 28, 1896, São João da Boã Vista, Braz.—d. March 7, 1979, São Paulo), Brazilian pianist known especially for her interpretations of works by Frédéric Chopin and Robert Schumann.

After early studies in São Paulo with Luigi Chiafarelli, Novaës was sent by the Brazilian government to the Paris Conservatory, where she took first place in the entrance examinations (1909). There she studied with Isidor Philipp, graduating with a first prize in 1911. Acclaimed at her debuts in Paris (1911), London (1912), and New York City (1915), she enjoyed a concert career of more than 50 years. She championed the works of Brazilian composers, including those of her husband, Octavio Pinto. Her graceful, poetic, and intensely lyrical style is shown to full advantage on only a few of the many recordings she made after the early 1920s.

Novaia Zemlia (Russia): *see* Novaya Zemlya.

Novák, Vítězslav (b. Dec. 5, 1870, Kamenice nad Lipou, Bohemia, Austria-Hungary [now in Czech Republic]—d. July 18, 1949, Skutec, Czech. [now in Czech Republic]), Czech composer, one of the principal proponents of nationalism in Czech music and the teacher of many Czech composers of the 20th century.

Novák studied under Antonín Dvořák at the Prague Conservatory and in 1909 began teaching there. His early works were influenced by German Romantic music, but, after a visit to Moravia, he began to write music that reflected the spirit of his homeland and made use of its folk music. He was also influenced by Claude Debussy and Richard Strauss. His works include four operas, two ballets, and the orchestral works *V Tatrach* ("In the Tatra") and the *Slovakian Suite*. The *De Profundis* for orchestra and the *May Symphony* were written during World War II. He also composed chamber works, songs, and choral works.

Novalis, pseudonym of FRIEDRICH LEOPOLD, BARON (Freiherr) VON HARDENBERG (b. May 2, 1772, Oberwiederstedt, Prussian Saxony [Germany]—d. March 25, 1801, Weissenfels, Saxony [Germany]), early German Romantic poet and theorist who greatly influenced later Romantic thought.

Novalis, detail of an engraving by Edouard Eichens, 1845

By courtesy of the Staatliche Museen zu Berlin, Germany; photograph, Walter Steinkopf

Novalis was born into a family of Protestant Lower Saxon nobility and took his pseudonym from "de Novali," a name his family had formerly used. Young Novalis studied law at the University of Jena (1790), where he became acquainted with Friedrich von Schiller, and then at Leipzig, where he formed a friendship with Friedrich von Schlegel and was introduced to the philosophical ideas of Immanuel Kant and Johann Gottlieb Fichte. He completed his studies at Wittenberg in 1793, and in 1796 he was appointed auditor to the Saxon government saltworks at Weissenfels.

In 1794–95 Novalis fell in love with and was engaged to the 14-year-old Sophie von Kühn. She died of tuberculosis in 1797, however, and Novalis expressed his grief in the beautiful *Hymnen an die Nacht* (1800; *Hymns to the Night*). In these six prose poems interspersed with verse, Novalis celebrates night, or death, as an entry into a higher life in the presence of God and anticipates a mystical and loving union with Sophie and with the universe as a whole after his own death. In 1797 he went to the Academy of Freiberg to study mining. In 1798 Novalis again became engaged (to Julie von Charpentier), and in 1799 he became a mine inspector at the saltworks at Weissenfels, but he died of tuberculosis in 1801 before he could marry.

Novalis' last years were astonishingly creative, filled with encyclopaedic studies, the draft of a philosophical system based on idealism, and his real poetic work. Two collections of fragments that appeared during his lifetime, *Blütenstaub* (1798; "Pollen") and *Glauben und Liebe* (1798; "Faith and Love"), indicate his attempt to unite poetry, philosophy, and science in an allegorical interpretation of the world. His celebrated mythical romance *Heinrich von Ofterdingen* (1802), set in an idealized vision of the European Middle Ages, describes the mystical and romantic searchings of a young poet. The central image of his visions, a blue flower, became a widely recognized symbol of Romantic longing among Novalis' fellow Romantics.

In the essay *Die Christenheit oder Europa* (1799; "Christendom or Europe"), Novalis calls for a universal Christian church to restore, in a new age, a Europe whose medieval cultural, social, and intellectual unity had been destroyed by the Reformation and the Enlightenment.

Novara, Latin NOVARIA, capital of Novara *provincia,* Piemonte (Piedmont) *regione,* northwestern Italy. It lies along the Agogna River, west of Milan. It originated as the Roman colony of Novaria, which was founded by Julius Caesar and destroyed in the 5th century; a new commune, established in the 6th century, was burned by the Holy Roman emperor Henry V in 1110. It recovered to become a member of the Lombard League (an alliance of northern Italian towns) in 1167. Novara was dominated by Milan until it passed to Austria in 1714 and to Savoy in 1738. It was the scene of Austrian victories in 1821 and 1849; in the last battle, the Austrians, under Joseph Radetzky, defeated Piedmontese forces led by Charles Albert, king of Sardinia, leading to the latter's abdication.

The city's notable buildings include the cathedral (rebuilt 1863–69) with an ancient baptistery, the Church of San Gaudenzio (rebuilt 1577–1659), the ruins of a castle of the medieval Sforza family, a civic museum, and a picture gallery.

An important agricultural market, particularly for rice, Novara also has growing industries that include cotton and silk mills, chemical and printing plants, cheese and biscuit (cookie) factories, and the Agostini cartographic and geographic institute. Pop. (1991 prelim.) mun., 102,473.

Novara, Battle of (March 23, 1849), battle of the first Italian War of Independence in which 70,000 Austrian troops under Field Marshal Joseph Radetzky thoroughly defeated 100,000 poorly trained Italian troops (not all of whom were actually employed in the battle) under Charles Albert, king of Sardinia-Piedmont. It was fought at Novara, 28 miles (45 km) west of Milan, 11 days after Charles Albert had denounced the armistice that he had signed the previous August after his defeat at the first Battle of Custoza. This new defeat, a result of Radetzky's military superiority and Piedmont's lack of support from the smaller Italian states, led to a treaty on Aug. 9, 1849, which included an indemnity of 65 million francs to be paid to Austria. The defeat also led to the abdication of Charles Albert in favour of his son Victor Emmanuel II.

Novatian, Latin NOVATIANUS (b. *c.* 200, Rome [Italy]—d. *c.* 258), the second antipope in papal history, in 251. He was the first Roman theologian to write in Latin and inspired the Novatian Schism—a break from the Christian church by rigorists who condemned apostasy. (His name was certainly Novatianus, not Novatus, as given by the Greeks.)

Novatian was ordained at Rome and about 250 became a leader of the Roman clergy, in whose name he wrote two letters to Bishop Cyprian of Carthage concerning the *lapsi*—*i.e.,* those early Christians who renounced their faith during the persecutions. He had shared with Cyprian a moderate attitude toward apostates, but, when Cornelius was elected pope in 251, Novatian became the champion of rigorism. By then he had a high reputation as a learned theologian. While a majority favoured Cornelius as pope, a minority declared itself for Novatian, and he set himself up as antipope. His rigorist doctrine was uncompromising, and, by denying the administration of penance, he refused to admit the *lapsi* into the church. Novatian and his followers were excommunicated at a synod convened by Cornelius in 251.

Although Cyprian and Cornelius joined forces against the Novatianists, the schism developed into a sect that spread across the empire and lasted for several centuries. Despite opposition, Novatian managed to build his own church with his own bishops throughout Christendom. During the persecution of Christians from 251 to 253, he fled Rome. The assertion of the church historian Socrates (d. *c.* 445) that Novatian was martyred about 258 under the Roman emperor Valerian appears confirmed by the inscription "novatiano . . . martyri" found in a cemetery near San Lorenzo, Rome, in 1932.

Novatian's apologetic *De trinitate* ("On the Trinity"), considered to be his most important work, summarizes and defends the orthodox doctrine of the Trinity against contemporary heresies. In *De cibis Judaicis* ("Concerning Jewish Foods"), he points out that dietary laws and other practical prohibitions of the Old Testament must be understood spiritually rather than literally. In *De spectaculis* ("On Spectacles"), he condemns Christians who attend public games, and, in *De bono pudicitiae* ("Concerning the Value of Chastity"), he praises chastity.

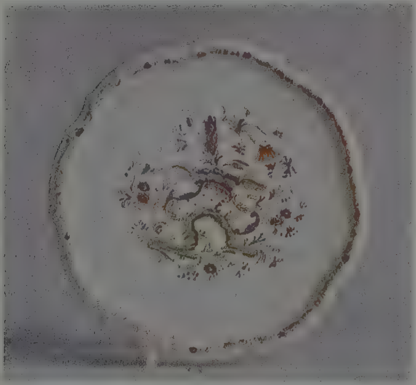
Novato, city, Marin county, western California, U.S. It lies along Novato Creek, between San Pablo Bay (east) and Point Reyes National Seashore (west). The original site was partly on the Rancho de Novato, an 1839 Mexican land grant that occupied most of the Canada de Novato (a valley probably named for a Christianized Indian chief). Francis C. DeLong acquired the land and founded the community in 1888. It remained a small agricultural village until 1935, when Hamilton Field (now Hamilton Air Force Base) was established there. Postwar development has been mainly residential, the chief industry being the large McGraw-Hill Book Distribution Center. Inc. 1960. Pop. (1991 est.) 48,576.

Novaya Zemlya, also spelled NOVAIA ZEMLIA, archipelago in northwestern Russia, lying in the Arctic Ocean and separating the Barents and Kara seas.

Novaya Zemlya ("New Land") consists of two large islands, Severny (northern) and Yuzhny (southern), aligned for 600 miles (1,000 km) in a southwest-northeast direction, plus several smaller islands. The two major islands are separated by a narrow strait, Matochkin Shar, only about 1 to 1.5 miles (1.6 to 2.4 km) wide. The most southerly point, the island of Kusova Zemlya, is separated from Vaygach Island and the mainland by the Kara Strait. The island group has an area of 31,900 square miles (82,600 square km).

Novaya Zemlya, a continuation of the Ural Mountains system, is for the most part mountainous, though the southern portion of Yuzhny Island is merely hilly. The mountains, which rise at most to 5,220 feet (1,590 m), consist of igneous and sedimentary materials, including limestones and slates. More than one-quarter of the land area, especially in the north, is permanently covered by ice, and most of the northern island, as well as part of the southern, lies in the zone of Arctic desert. The climate is severe, and temperature varies from 3° to −8° F (−16° to −22° C) in winter to 36° to 44° F (2° to 7° C) in summer. There are frequent fogs and strong winds. The vegetation in those portions of the islands free from ice is predominantly low-lying tundra, with much swamp, though low bushes are found in sheltered valleys. Lemmings, Arctic foxes, seals, walruses, and occasionally polar bears are found on Novaya Zemlya; a rich bird life abounds in summer. Novaya Zemlya has been known since at least medieval times, though it was not explored until the 18th and 19th centuries. Pop. (latest est.) 400.

Nove ware, primarily majolica, or tin-glazed earthenware, made in Nove, Italy, in the 18th century. The factory was founded by Giovanni Battista Antonibon in 1728, and in the latter part of the century it had connections with a factory in nearby Bassano, where majolica had been made two centuries earlier.



Nove majolica plate, *c.* 1750; in the Victoria and Albert Museum, London

By courtesy of the Victoria and Albert Museum, London; photograph, EB Inc.

Most Nove ware was in the prevalent Rococo style. From 1752 the factory also produced a porcelain painted with deep reds and yellowish greens. Nove also produced a fine-quality cream-coloured earthenware (*terra inglese*).

Novecento movement, group of Italian artists, formed in 1922 in Milan, that advocated a return to the great Italian representational art of the past. The nationalism of the Novecento (20th-century) movement led to a commitment to fascism. Members included the sculptors Marino Marini and Arturo Martini and the painters Ottone Rosai, Massimo Campigli, Carlo Carrà, Mario Sironi, and Felice Casorati.

novel, an invented prose narrative of considerable length and a certain complexity that deals imaginatively with human experience usually through a connected sequence of events involving a group of persons in a specific setting. Within its broad framework, the genre of the novel has encompassed an extensive range of types and styles: picaresque, epistolary, Gothic, romantic, realist, historical—to name only some of the more important ones.

A brief treatment of the novel follows. For full treatment, *see* MACROPAEDIA: Literature, The Art of.

Although forerunners of the genre are to be found in a number of places, including classical Rome, 11th-century Japan, and Elizabethan England, the European novel is usually said to have begun with the *Don Quixote* of Miguel de Cervantes (part I, 1605). In its juxtaposition of impossible idealism and earthy practicality in the figures of the knight and his squire, this work adumbrates what was to become one of the central concerns of the Western novel, just as its playful exploitation of the authorial *persona* anticipates many of the technical questions raised by later novelists.

Despite some interesting works in 17th-century France, it was in England that the genre first took permanent root. Daniel Defoe, Samuel Richardson, and Henry Fielding were all writing in the first half of the 18th century, and their works did much to establish the novel as the most popular literary form in England. This popularity soon became a general phenomenon, leading in the 19th century to an extraordinary surge of fiction writing, particularly in Britain, France, Russia, and the United States.

A partial explanation of the novel's popularity is to be found in the scope it gave writers to explore areas of human experience that had previously lain outside the province of literature. For the first time, the minutiae of daily life became a fit subject for the writer's attention. The heroes and heroines of this new genre were as likely to be servants as courtiers. Their lives did not have to display preeminent virtue or vice; there needed be nothing epic in their destinies. Inevitably, this shift in emphasis was helped or hindered by the social and historical context in any given country.

When all the exceptions have been counted, however, it remains the case that the mainstream of the European novel has based its appeal on the claim to provide a more faithful image of everyday reality than can be achieved by any other literary form. Even the extravagant fantasies of the Gothic novel or the modern novel of science fiction depend for their impact on the detailed rendering of surface reality. The history of the novel is in part a history of the changes in conventions established to achieve this verisimilitude. Perhaps because of the novel's realist bias, its greatest period is usually held to be the mid- to late-19th century, a time when improved literacy rates had increased the size of the potential audience and the modern mass media had not yet arrived to diminish it. Across this period and just before, Charles Dickens, William Makepeace Thackeray, and George Eliot were writing in England; Honoré de Balzac, Gustave Flaubert, and Émile Zola in France; Ivan Turgenev, Leo Tolstoy, and Fyodor Dostoyevsky in Russia; and Nathaniel Hawthorne and Herman Melville in the United States.

With the coming of the 20th century the novel began to change somewhat in character. The old certainty that experience could be adequately represented by the language and structures of the conventional novel was increasingly called into question. Writers such as James Joyce, Virginia Woolf, and Dorothy Richardson began to examine the ways in which reality eluded the grasp of literature. In trying to capture the complex and fragmentary quality of experience, some of these writers stretched the limits of the conventional novel to a point at which it became more and more remote from the expectations—and sometimes the comprehension or interest—of the average reader, a process that perhaps culminated in the mid-20th century in the so-called antinovel, or *nouveau roman.* These modernist experiments sometimes produced works of outstanding interest, but they also tended to widen the gap between the popular and the "literary" novel.

novel of sensibility: *see* sentimental novel.

novella, short and well-structured narrative, realistic and satiric in tone, that influenced the development of the short story and the novel throughout Europe. Originating in Italy during the European Middle Ages, the novella was based on local events, humorous, political, or amorous in nature; the individual tales often were gathered into collections along with anecdotes, legends, and romantic tales. Writers such as Giovanni Boccaccio, Franco Sacchetti, and Matteo Bandello later developed the novella into a psychologically subtle and highly structured short tale, often using a frame story to unify the tales around a common theme.

Geoffrey Chaucer introduced the novella to England with the *Canterbury Tales.* During the Elizabethan period, William Shakespeare and other playwrights extracted dramatic plots from the Italian novella. The realistic content and form of these tales influenced the development of the English novel in the 18th century and the short story in the 19th century.

In Germany, where it is known as the *Novelle,* the novella flourished in the 18th, 19th, and early 20th centuries in the works of writers such as Heinrich von Kleist, Gerhart Hauptmann, J.W. von Goethe, Thomas Mann, and Franz Kafka. As in Boccaccio's *Decameron,* the prototype of the form, German *Novellen* are often encompassed within a frame story based on a striking news item (plague, war, or flood), either real or imaginary. The individual tales are related by various reporter-narrators to divert the audience from the misfortune they are experiencing. Characterized by brevity, self-contained plots that end on a note of irony, a literate and facile style, restraint of emotion, and objective rather than subjective presentation, these tales were a major stimulant to the development of the modern short story in Germany. The *Novelle* also survived as a unique form, although unity of mood and style often replaced the traditional unity of action; the importance of the frame was diminished as was the necessity for maintaining absolute objectivity.

Sometimes "novella" is used interchangeably with "short novel," or "novelette," to describe a prose form longer than a short story but shorter than a full-length novel.

Novello, Ivor, original name DAVID IVOR DAVIES (b. Jan. 15, 1893, Cardiff, Glamorganshire, Wales—d. March 6, 1951, London, Eng.), Welsh actor-manager, composer, and playwright, best known for his lush, sentimental, romantic musicals.

Novello, the son of the celebrated Welsh singing teacher, Dame Clara Novello Davies, was educated at Magdalen College, Oxford, and served with the Royal Naval Air Service during World War I. He became famous with a phenomenally successful patriotic wartime song, "Keep the Home Fires Burning" (1915). After he was demobilized in 1919, he accepted a motion-picture role in *The Call of the Blood,* and he acted in several other motion pictures throughout his career. His real love, however, was the theatre.

He first appeared on stage in 1921, and he presented his first play, *The Rat* (written with Constance Collier), in 1924. Though he was not an extraordinary actor, his many talents and winning personality made him a great popular success. Thereafter he wrote, produced, and acted in such successful comedies as *The Truth Game* (performed 1928), *A Symphony in Two Flats* (performed 1929), *Party* (performed 1932), and *Fresh Fields* (performed 1934). He was best known, however, for his Ruritanian musicals, especially *Glamorous Night* (performed 1935), *Careless Rapture* (performed 1936), *The Dancing Years* (performed 1939), *Perchance to Dream* (performed 1945), and *King's Rhapsody* (performed 1949)—all with lyrics by Christopher Hassall.

Novello, Vincent (b. Sept. 6, 1781, London, Eng.—d. Aug. 9, 1861, Nice, Fr.), English composer, conductor, and founder of the Novello music publishing house.

From 1797 to 1822 Novello was organist at the Portuguese embassy chapel, where he directed the first English performances of masses by Joseph Haydn and W.A. Mozart. In 1812 he became pianist and conductor at the Italian Opera, London. From 1840 to 1843 he was organist at the Roman Catholic chapel at Moorfields, London. A founder of the Philharmonic Society, he had a distinguished circle of friends, including the Lambs, Leigh Hunt, P.B. Shelley, and John Keats. Although Novello was a prolific composer, his work as an editor and publisher was more significant. His *Collection of Sacred Music* (1811) marks the founding of the publishing house of Novello. He retired to Nice in 1849.

His daughter Clara Anastasia Novello (1818–1908) was one of the most famous sopranos of her time. His son Joseph Alfred Novello

(1810–96) began a career as a bass singer but in 1829 became active in the publishing house, developing the business greatly and introducing inexpensive editions of large-scale choral works to England.

November, 11th month of the Gregorian calendar. *See* month.

November Insurrection (1830–31), Polish rebellion that unsuccessfully tried to overthrow Russian rule in the Congress Kingdom of Poland as well as in the Polish provinces of western Russia.

When a revolution broke out in Paris (July 1830) and the Russian emperor Nicholas I indicated his intention of using the Polish Army to suppress it, a Polish secret society of infantry cadets staged an uprising in Warsaw (Nov. 29, 1830). Although the cadets and their civilian supporters failed to assassinate the Emperor's brother Grand Duke Constantine (who was commander in chief of the armed forces in Poland) or to capture the barracks of the Russian cavalry, they did manage to seize weapons from the arsenal, arm the city's civilian population, and gain control of the northern section of Warsaw.

The insurgents' partial success was aided by the Grand Duke's reluctance to take action against them and his eagerness to retreat to safety. But lacking definite plans, unity of purpose, and decisive leadership, the rebels lost control of the situation to moderate political figures, who restored order in the city and futilely hoped to negotiate with Nicholas for political concessions. Although the rebellion gained widespread support and its new leaders formally deposed Nicholas as king of Poland (Jan. 25, 1831), the conservative military commanders were unprepared when Nicholas' army of 115,000 troops moved in (Feb. 5–6, 1831). The Polish Army of 40,000 offered strong resistance at several battles, but it was unable to stop the Russian advance toward Warsaw until February 25, when it fought a major but indecisive battle at Grochów.

The Russians then settled into winter camps, and uprisings sympathetic to the Poles broke out in Russian-controlled Lithuania, Belorussia, and the Ukraine (spring 1831). Nevertheless, the Polish commanders hesitated to strike and then quickly retreated. Furthermore, the divided political leaders not only refused to pass reforms to win the support of the peasantry but also failed to gain the foreign aid that the generals were depending on.

As a consequence, the rebellion lost its impetus, particularly after a major Russian victory at Ostrołęka on May 26, 1831. The uprisings in the western Russian provinces were crushed, and people in the cities began losing confidence in the revolution's leaders. When the Russians finally attacked Warsaw on September 6, the Polish Army withdrew to the north two days later. Leaving the territory of Congress Poland, which subsequently fell under stricter and more repressive Russian control, the Poles crossed the border into Prussia (October 5) and surrendered, thus ending the November Insurrection.

Novembergruppe, English NOVEMBER GROUP, group of artists formed in Berlin in November 1918 by Max Pechstein and César Klein. Taking its name from the month of the Weimar Revolution, this group of Expressionist artists hoped to bring about a new unity in painting, sculpture, architecture, crafts, and city planning, and to bring the artist into close contact with the worker. In an attempt to reach the working masses, the Novembergruppe established Workers' Councils for Art in 1919; support, however, came from the middle classes who, with greater education and more leisure time, more readily accepted this radical, intellectual group and their new (and often abstract) art forms. Among the leading artists associated with the Novembergruppe were the architects Walter Gropius, Erich Mendelsohn, Ludwig Mies van der Rohe, Hans Poelzig, and Bruno Taut; the painters El Lissitzky, Lyonel Feininger, Otto Müller, and Heinrich Campendonck; the sculptors Gerhard Marcks, László Moholy-Nagy, and Rudolf Belling; the filmmakers Hans Richter and Viking Eggeling; the composers Alban Berg, Paul Hindemith, and Kurt Weill; and the dramatist Bertolt Brecht.

The most important activity of the Novembergruppe consisted of public exhibitions (held through the 1920s); but it also sponsored lectures and avant-garde concerts and film presentations. The group's support of Socialism and its ideal of unification of the arts were common concerns of this period and the goals of other organizations as well, notably of the Weimar Bauhaus, established in 1919 by Walter Gropius (*see* Bauhaus).

Noventa y Ocho, Generación del (Spanish literature): *see* '98, Generation of.

Noverre, Jean-Georges (b. April 29, 1727, Paris—d. Oct. 19, 1810, Saint-Germain-en-Laye, Fr.), distinguished French choreographer whose revolutionary treatise, *Lettres sur la danse et sur les ballets* (1760), still valid, brought about major reforms in ballet production, stressing the importance of dramatic motivation, which he called ballet d'action, and decrying overemphasis on technical virtuosity. His first choreographic success, *Les Fêtes chinoises* (1754), attracted the attention of David Garrick, who presented it in London in 1755. After producing such masterpieces as *Medée et Jason* and *Psyché et l'Amour* (at Stuttgart, 1760–67), he was appointed ballet master at the Paris Opéra in 1776.

Novgorod, *oblast* (province), northwestern Russia, occupying an area of 21,300 square miles (55,300 square km) and extending across the morainic Valdai Hills, which rise to 971 ft (296 m); the lowland basins of Lake Ilmen lie to the west and of the upper Volga River to the east. Much of the *oblast*'s terrain is in swamp of peat bog or reed and grass marsh, with innumerable small lakes. The remainder (about 60 percent) is mostly in mixed forest of spruce, oak, pine, and birch, and soils are usually infertile. Agriculture is poorly developed, with under one-tenth of the area plowed. Dairying, especially to supply the Leningrad market, is the principal activity, with some cultivation of flax, rye, oats, and potatoes. Since 1870, much swamp has been drained for pasture and improved forest. Much peat is cut for fuel. Machine-building, metalworking, chemical, and food-processing industries have been developed. Aside from Borovichi, Staraya Russa, and the *oblast* headquarters, Novgorod city, settlements are small and engaged in processing timber and flax. Pop. (1991 est.) 754,600.

Novgorod, city and administrative centre of Novgorod *oblast* (province), northwestern Russia, on the Volkhov River just below its outflow from Lake Ilmen. Novgorod is one of the oldest Russian cities, first mentioned in chronicles of 859. In 882 Oleg, prince of Novgorod, captured Kiev and moved his capital there. In 989, under Vladimir, Novgorod's inhabitants were forcibly baptized. In 1019 Prince Yaroslav I the Wise of Kiev granted the town a charter of self-government; the town assembly, or *veche,* elected their prince, chiefly as a military commander. After 1270 the *veche* elected only a burgomaster, and sovereignty resided in the town itself, which was styled Lord Novgorod the Great. The town was divided into five ends, each with its own assembly and each responsible for one-fifth of Novgorod's extensive territorial possessions. It flourished as one of the greatest trading centres of eastern Europe, with links by river routes to the Baltic, Byzantium, Central Asia, and all parts of European Russia. Trade with the Hanseatic League was considerable since Novgorod was the limit of Hanseatic trade into Russia. Prosperity was based upon furs obtained in the forests of northern Russia, much of which came under Novgorod's control. "Daughter" towns were founded by Novgorod in the 12th century at Vologda and Vyatka.

Monument in the kremlin at Novgorod city, Russia, commemorating the 1,000th anniversary of Russia (1862), designed by M.O. Mikeshin

Shostal

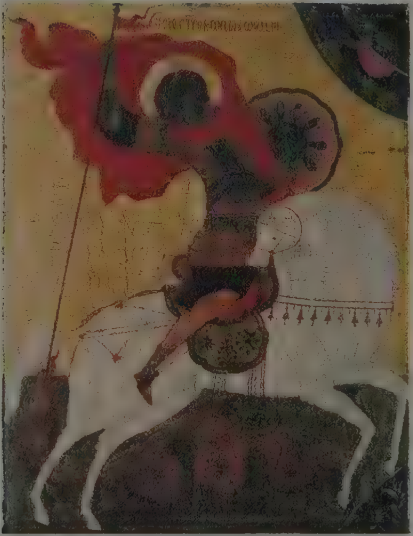
During the 12th century, Novgorod was engaged in prolonged struggles with the princes of Suzdal and gained victories in 1169 and 1216. Although the town avoided destruction in the great Tatar invasion of 1238–40, Tatar suzerainty was acknowledged. Under Alexander Nevsky, prince of Vladimir, Novgorod's defenders repulsed attacks by the Swedes on the Neva River in 1240 and by the Teutonic Knights on the ice of Lake Peipus in 1242. During the 14th and 15th centuries, Novgorod was involved in a long, bitter struggle for supremacy with Moscow and frequently sought help from Lithuania. Although the city survived Muscovite onslaughts in 1332 and again in 1386 by Dmitry Donskoy, it was defeated by Vasily II in 1456. It continued to oppose Moscow and again sought Lithuanian assistance, but in 1471 Ivan III the Great defeated Novgorod and annexed much of its northern territories, finally forcing the city to recognize Moscow's sovereignty in 1478. Opposition by its citizens to Moscow continued until Ivan IV the Terrible in 1570 massacred many of them and deported the survivors. In 1611 Novgorod was captured by the Swedes, who held it for eight years. From the reign (1682–1725) of Peter I the Great, the city declined in importance, although it was made a provincial seat in 1727.

During World War II, the city suffered heavy damage, but the many historic buildings were subsequently restored. These include the kremlin on the Volkhov left bank (the Sofiyskaya Storona). It was first built of wood in 1044, and its first stone walls date from the 14th century. Within the kremlin, the St. Sofia Cathedral, built in 1045–50 on the site of an earlier wooden church, is one of the finest examples of early Russian architecture, with magnificent bronze doors from the 12th century. From the 15th century date the Granite Palace (1433), the bell tower (1443), and the St. Sergey Chapel. The Chapel of St. Andrew Stratilata was built in the 17th century. Across the Volkhov (the Torgovaya Storona) stands the Cathedral of St. Nicholas, dating from 1113. In and around Novgorod are many other surviving churches, including the 12th-century cathedrals of the Nativity of Our Lady and of St. George, the 14th-century churches of the Transfiguration and of St. Theodore Stratilata, and the 17th-century Znamensky Cathedral.

Modern Novgorod is important as a tourist centre and as a major producer of chemical fertilizers. It also has radio and woodworking industries. Pop. (1993 est.) 234,400.

Novgorod, Treaty of (June 3, 1326), the peace treaty ending decades of Russo-Norwegian hostilities in the extreme northern area of present-day Norway and Russia's Kola Peninsula—then generally known as Finnmark (including the present Norwegian province of Finnmark). The treaty, rather than delimiting a clear frontier between Norway and the principality of Novgorod, created a buffer zone, the "common districts." Nominally under Norwegian sovereignty, the buffer zone offered Norwegians, Swedes, Finns, and Russians taxing rights over the indigenous Lapps and freedom to exploit the fish and fur of the region. This arrangement remained in effect until the present Norwegian-Russian frontier was established in 1826.

Novgorod school, important school of Russian medieval icon and mural painting that flourished around the northwestern city of Novgorod from the 12th through the 16th century. A thriving merchant city, Novgorod was the cultural centre of Russia during the Mongol occupation of most of the rest of the country in the 13th and 14th centuries. During that period it preserved the Byzantine traditions that formed the basis of Russian art and at the same time fostered the development of a distinct and vital local style, a style which, though provincial, contained most of the elements of the national Russian art that eventually developed in Moscow in the 16th century.



"Miracle of St. George over the Dragon," icon by an anonymous artist of the Novgorod school, egg tempera on panel, beginning of the 15th century; in the State Tretyakov Gallery, Moscow, I.A. Ostroukhov Collection

Novosti Press Agency

The first important phase of the Novgorod school lasted through the 12th century and the first half of the 13th, a period during which the Byzantine tradition spread from southern Kiev, the first capital and cultural centre of Russia, to the northern centres of Novgorod and Vladimir-Suzdal. In this period fresco painting was the dominant art form. In the second half of the 12th century the hieratic, aristocratic artistic tradition of Kiev was abandoned in favour of a more informal approach that combined Byzantine severity of style with a tenderness of gesture and an anecdotal picturesqueness. This spirit was matched in the beginning of the 13th century by a shift toward lighter, brighter colours and flatter forms, a softening of facial types, and an increasing definition of form by means of a graceful, rhythmic line. The progressive importance of line over modeled form in Novgorod painting brought about a gradual change in the Byzantine image. Strongly modeled Byzantine figures were characterized by a direct and penetrating gaze that in turn engaged that of the viewer. But as the predominance of line flattened the figures and faces in Novgorod painting, the direct gaze receded into a dreamy, abstracted, introspective look. In addition, the line invited a contemplation of its abstract patterns; Novgorod painting began to emphasize the lyricism of these patterns rather than the immediate presence of the figures.

In the early 14th century, a new artistic impetus was provided by the introduction of the iconostasis, a screen standing before the sanctuary on which icons, formerly scattered over the walls of the church, could be hung in a prescribed arrangement. The stylistic tendencies of the previous period of artistic activity, which had been dominated by fresco painting, were brought to bear on the visual problems created by the iconostasis and coalesced into a definitive Novgorod style. The complex of paintings on the iconostasis demanded a coherent overall impression. This overall effect was achieved through the use of strong, rhythmic lines and colour harmonies in each icon. Novgorod painters used jewellike juxtapositions of brilliant yet delicately balanced colours, dominated by yellow, emerald green, and fiery vermilion. The silhouette became all-important, as did the line, which assumed unprecedented grace with an elongation of the figure that became standard in Russian art. A number of Greek artists who arrived from Constantinople at the end of the 14th century brought a more varied subject matter to the Novgorod school and introduced the use of more complex architectural backgrounds. The most influential of these Byzantine immigrants was a mural painter, Theophanes the Greek. Theophanes contributed a greater understanding of the human form and a subtler use of colour and design to later Novgorod painting.

At the end of the 15th century Novgorod painting became somewhat repetitive, and, although works of outstanding quality continued to be produced, they lacked the freshness of the earlier paintings. The leadership in Russian painting passed in the 16th century to the more cosmopolitan art of the Moscow school (*q.v.*), and the final dissolution of the Novgorod school came with the forcible transfer of Novgorod artists to Moscow after a fire in the capital in 1547.

Novhorod-Siverskyy, Russian NOVGOROD-SEVERSKY, also spelled NOVGOROD-SEVERSKIJ, city, Chernihiv *oblast* (province), northern Ukraine. The city, now a tourist centre, is believed to date from the early 11th century. From 1098 it was the capital of Novhorod-Siverskyy principality, which defended the Russian nation from incursions by nomadic tribes from the steppe regions. There are many old buildings in the city, including the 17th-century Cathedral of the Assumption and the Monastery of the Transfiguration. Pop. (1991 est.) 15,600.

Novi Ligure, town, Alessandria *provincia,* Piedmont *regione,* northwestern Italy, north of Genoa. A free commune until 1192, it then fell successively to Tortona and Milan before passing to Genoa in 1447. It was the scene of an Austro-Russian army's defeat of the French in 1799. Novi Ligure is now an important rail and road junction with iron and steel, food, and textile industries. Pop. (1993 est.) mun., 29,653.

Novi Pazar, town, southern Serbia, Yugoslavia. It lies in the Raška River valley, in rough and hilly country near the site of Ras, which was the capital city of the medieval Serbian state in the 12th–14th century. In the vicinity are Roman baths, and the Church of St. Peter, one of the oldest in Yugoslavia (7th or 8th century), is an interesting example of early Slav architecture. A few miles west is the Monastery of Sopoćani, built in 1260. Its vast frescoes, done before 1264–65 and painted in the Byzantine manner, portraying the Gospels, are considered by many to be the finest in Europe from this period.

The town of Novi Pazar ("New Bazaar") was rebuilt by the Ottoman Turks after their conquest of the Balkans in the 15th century. It became an important market town and was the administrative centre of a Turkish military district. The Altum Alem Mosque (16th century) dates from the Ottoman period, as does an 18th-century caravansary on the town's main square.

Novi Pazar began to decline in the 18th century and was burned three times by the Serbs in the 19th century. After the Balkan Wars of 1912–13 it was ceded to Serbia. Agricultural trade is now the main economic activity, and industrial development since 1945 has centred on textiles. More than four-fifths of the inhabitants are Muslims. Pop. (1991) 51,749.

Novi Sad, German NEUSATZ, Hungarian ÚJVIDÉK, city and administrative capital of the ethnically mixed autonomous region of Vojvodina, Serbia, Yugoslavia. It is a transit port on the heavily trafficked Danube River northwest of Belgrade and is also situated on the Belgrade-Budapest rail line. The Bačka canal system connects with the Danube at Novi Sad, which is the economic and cultural focus for northern Vojvodina. The ethnic diversity of the region is exemplified by Radio Novi Sad, which broadcasts in Serbo-Croatian, Hungarian, Slovakian, Romanian, and Ruthenian.

Novi Sad, Yugos.

Salmer—Plessner International

Before the 18th century Novi Sad was a small fishing village called Petrovaradinski šanac ("Petrovaradin Ditch"). In the south bend of the Danube is the Serb Petrovaradin Fortress, which was rebuilt by the Austrians into the present huge structure after 1699 as part of the military frontier with the Ottoman Empire. During the period of Turkish rule of Serbia south of the Danube, Novi Sad became a centre of Serbian culture in Austrian lands, especially after the Serbian literary society Matica Srpska was founded there in 1826.

Novi Sad is the nucleus for Vojvodina's productive agricultural region, and the city hosts an annual international agricultural fair. The city's industrial development includes food processing, milling, textiles, chinaware, soap, oils, electrical apparatus, and dental equipment. A major petroleum refinery at Novi Sad, until 1978 supplied by river, began to receive oil in that year from Nadrljan via a 53-mile (86-kilometre) pipeline. The city's cultural centres include a university (1960), an art academy, a Serbian National Theatre (1861), and museums. Pop. (1991) 178,896.

Novial, artificial language constructed in 1928 by the Danish philologist Otto Jespersen, intended for use as an international auxiliary language, but little used today. Its grammar is similar in type to that of Esperanto or Ido. Novial has one definite article, no gender for nouns except those denoting persons, noun plurals in *-s,* forms for a possessive (genitive) and an objective (accusative) case (although these need not be used), adjectives with uninflected form, and verbs that are not inflected for person or number. The chief difference between Novial and Esperanto or Ido is the former's much larger use of Germanic word roots and grammatical structures (such as auxiliary verbs *sal* "shall, will," *vud* "would," *ha, had* "have, had," and *tu* "to" to mark the infinitive of the verb: *tu perda* "to lose").

Novikov, Nikolay Ivanovich (b. April 27 [May 8, New Style], 1744, Bronnitsky, near Moscow, Russia—d. July 31 [Aug. 12], 1818, Bronnitsky), Russian writer, philanthropist, and Freemason whose activities were intended to raise the educational and cultural level of the Russian people and included the production of social satires as well as the founding of schools and libraries. Influenced by Freemasonry, Novikov converted his journals and his ambitious publishing enterprise into vehicles of freethinking and even criticized Empress Catherine II the Great. She suspended publication of his journals and had him arrested in 1792. He was released by Emperor Paul in 1796 but was forbidden to resume his journalistic activities.

Novo Hamburgo, city, eastern Rio Grande do Sul *estado* ("state"), southern Brazil. It was founded by Germans in 1927 and named for Hamburg, Germany. Novo Hamburgo lies at 115 feet (35 m) above sea level. An industrial city, it manufactures shoes, hides, and leather from the cattle and hogs raised in the surrounding area. It is linked by rail and road to Pôrto Alegre, the state capital, which lies to the south. Pop. (1991 prelim.) 199,479.

Novo-Mariinsk (Russia): *see* Anadyr.

Novo Mesto, city, southern Slovenia, on the Krka River. Novo Mesto was founded in 1365 by Rudolf IV of Austria and became an important military base on the Ottoman frontier in the 15th century. Though ravaged twice by fire (1576 and 1664) and once by plague (1599), Novo Mesto developed into an important regional centre. The modern city has a hydroelectric power plant as well as textile, automobile, and chemical-pharmaceutical industries. Uranium deposits have been discovered nearby. Pop. (1992 est.) 22,760.

Novocherkassk, also spelled NOVOČERKASSK, city, Rostov *oblast* (province), southwestern Russia. It lies at the confluence of the Tuzlov and the Aksay rivers. The original 16th-century town of Starocherkasskaya stood along the Don River, but it was frequently inundated and was moved to its present site in 1805. Novocherkassk long served as the capital of the Don Cossack region and was a centre of opposition to the Bolsheviks in 1917–20 during the Russian Civil War. Modern Novocherkassk produces electric locomotives, mining machinery, machine tools, and chemicals for plastics and synthetic fibres. The city has numerous institutions of higher education and research. Pop. (1993 est.) 188,000.

Novohrad-Volynskyy, Russian NOVOGRAD-VOLYNSKY, also spelled NOVOGRAD-VOLYNSKIJ, city, Zhytomyr *oblast* (province), western Ukraine. It lies at the confluence of the Sluch and Smilka rivers. Documents first record the existence of the town in 1257. It was incorporated in 1795, before which it was known as Zvyagel. It contains the ruins of a 14th-century castle. Today the city has machine-building and woodworking industries. Pop. (1991 est.) 56,100.

Novokuybyshevsk, also spelled NOVOKUJBYŠEVSK, or NOVOKUIBYSHEVSK, city, Samara *oblast* (province), western Russia, near the Volga River. It was founded in 1948 in connection with the development of the oil industry and received city status in 1952. Novokuybyshevsk is situated amid the Volga-Urals oil field and has oil refining, petrochemicals, and associated industries. Synthetic alcohol, synthetic rubber, and plastics are also manufactured. Pop. (1993 est.) 115,600.

Novokuznetsk, also spelled NOVOKUZNECK, formerly KUZNETSK, (1931–32) NOVOKUZNETSK, or (1932–61) STALINSK, city, Kemerovo *oblast* (province), south-central Russia. The city lies along the Tom River just below its confluence with the Kondoma, in the Kuznetsk Coal Basin. Originally the small village of Kuznetsk, founded in 1617, stood on the river's right bank; it had about 4,000 inhabitants in 1926. In 1929, under the Soviet First Five-Year Plan, an ironworks was founded on the opposite bank; around the works a new town grew up, renamed Stalinsk in 1932. Development was extremely rapid, and the fully integrated iron plant became one of the largest in the Soviet Union. A second such plant was built in 1960–68. In 1961 the city was renamed Novokuznetsk. In addition to iron and steel, it produces ferroalloys and aluminum. There is also a chemical industry, using by-products. The city's principal heavy-engineering products are mining machinery and bridge girders. Large-scale coal mining is also carried on near the city. Novokuznetsk has metallurgical and teacher-training institutes. Pop. (1993 est.) 597,500.

Akademgorodok, a science centre, near Novosibirsk city in Novosibirsk *oblast,* Russia

Novosti Press Agency

Novomoskovsk, formerly (until 1934) BOBRIKI, or (1934–61) STALINOGORSK, city, Tula *oblast* (province), western Russia, situated on the upper Don River. Founded in 1930 as Bobriki, the town developed as a major chemical centre, making fertilizers and plastics and mining lignite (brown coal). Pop. (1993 est.) 145,000.

Novomoskovsk, city, Dnipropetrovsk *oblast* (province), east-central Ukraine. The city lies along the Samara River a few miles above its confluence with the Dnieper River, and on the Kharkiv-Dnipropetrovsk railway and the Moscow-Crimea highway. The settlement of Samarchik, or Novoselitsa, dating from 1650, was resited there in 1784 and renamed Novomoskovsk. The modern city produces metal pipes, railroad ties, and furniture. The major historical landmark is an 18th-century cathedral. Pop. (1991 est.) 76,600.

Novorossiysk, also spelled NOVOROSSIJSK, or NOVORSSIISK, city, Krasnodar *kray* (region), southwestern Russia. It lies at the head of Tsemes Bay on the northeastern coast of the Black Sea. Founded as a fortress in 1838, it developed as a seaport, especially after the coming of the railway in 1888. In pre-Revolutionary days Novorossiysk was the largest grain-exporting port of Russia after Odessa. It is still a major Russian port on the Black Sea, with a naval base, shipbuilding yards, a refrigeration plant, grain elevators, and an oil-pipeline terminal. Novorossiysk is now one of the largest producers of cement in Russia. Pop. (1993 est.) 191,600.

Novoshakhtinsk, also spelled NOVOŠACHTINSK, city, Rostov *oblast* (province), southwestern Russia, on the Maly Nesvetay River. It developed as a major anthracite coal-mining centre, achieving city status in 1939. The city's dependence on the coal industry, which suffered as oil and natural gas increased in importance as fuels in the 1960s, led to a slight decline in its population between the 1959 and 1970 censuses after it had doubled in size between 1939 and 1959. Pop. (1993 est.) 107,200.

Novosibirsk, *oblast* (province), south-central Russia, in western Siberia. It lies across an extremely level plain known as the Baraba Steppe in the north and Kulunda Steppe in the south, most of which is exceptionally swampy, with many lakes. The *oblast* is drained by the Ob River and by tributaries of the Irtysh River. Lake Chany, which has no outlet, is a basin of inland drainage. The swampy forest, or taiga, of the north gives way southward to forest-steppe of birch groves and finally to true steppe on fertile soils.

Apart from the city of Novosibirsk, which is the economic and cultural capital of an area of Siberia that is vastly wider than the limits of the *oblast,* the towns are small, and the economy is almost wholly agricultural. In the north, wheat, rye, and flax are grown, while in the more fertile south, which is largely cultivated, spring wheat, oats, barley, and sunflowers predominate. Dairying is dominant in the swampy Baraba Steppe, which has been partly reclaimed. Fishing is important in the Lake Chany region. Area 68,000 square miles (178,200 square km). Pop. (2000 est.) 2,744,000.

Novosibirsk, city, administrative centre of Novosibirsk *oblast* (province) and the chief city of western Siberia, in south-central Russia. It lies along the Ob River where the latter is crossed by the Trans-Siberian Railroad. It developed after the village of Krivoshchekovo on the left bank was chosen as the crossing point of the Ob for the Trans-Siberian Railroad in 1893. The settlement was known variously as Gusevka or Aleksandrovsky, but in 1895 it was renamed Novonikolayevsky in honour of the accession of Tsar Nicholas II. The bridge was completed in 1897, and in 1903 town status was conferred.

Opera and ballet theatre, Novosibirsk, Russia
Sovfoto

The continued development of the town was based chiefly on its proximity to the Kuznetsk (Kuzbass) Coal Basin coalfield to the east and the establishment of important railway routes. In 1925 the town was renamed Novosibirsk ("New Siberia"). The city's industry was especially stimulated in World War II, when many factories were evacuated from European Russia to the area. It is now one of the largest cities in Siberia.

Novosibirsk is a major manufacturing centre. Although it has a wide range of industries, metallurgy and engineering predominate. The old, pre-Revolutionary iron industry has been transformed into the modern Kuzmin steelworks. The city also has a large tin smelter and a highly specialized gold refinery. Engineering works produce heavy machinery, hydraulic presses, electrothermal equipment, ore-concentrating and mining machinery, and agricultural machinery. Precision- and light-engineering plants make machine tools, instruments, radios, and automatic looms. There are also ship and locomotive repair shops. The chemical industry has developed rapidly. Consumer products include furniture, pianos, shoes, textiles, knitwear, and foodstuffs. Power is provided by a dam and hydroelectric station above Novosibirsk and several thermal stations in the city itself.

In addition to the trunk railway services via the Trans-Siberian, Kuzbass, and Turksib lines, local electric commuter trains link the suburbs to the city centre. There are two airports, a smaller one serving local air connections and a large main airport with direct flights to Moscow and other major cities of Russia. The Ob River is navigable. Transportation within the city is by bus, streetcar, and trolleybus.

Novosibirsk is the principal cultural and educational centre in Siberia. It has an opera and ballet theatre, botanical gardens, an art gallery, and museums, as well as a symphony orchestra.

There are many educational institutions, headed by the Novosibirsk State University, founded in 1959; other higher-educational establishments include railway engineering, electrotechnical, medical, agricultural, and teacher-training institutes. The university and a number of these institutes are located in the satellite town of Akademgorodok ("Academic Town"), on the southern outskirts of the city. Also in Akademgorodok are most of the specialist research institutes that the Academy of Sciences of Russia maintains in Novosibirsk. Pop. (1999 est.) 1,402,400.

Novosibirskye Ostrova (Russia): *see* New Siberian Islands.

Novosiltsev, Nikolay Nikolayevich, Count (Graf) (b. 1768—d. April 8 [April 20, New Style], 1838, St. Petersburg, Russia), Russian statesman and confidant of Tsar Alexander I, who made him a member of the Secret Committee (1801–03) for the planning of reforms. Under Alexander and his successor, Nicholas I, Novosiltsev served in the administration of Russian Poland.

Novosiltsev received his early training in the corps of pages and served in the military from 1783 to 1796. In 1803 he was named president of the St. Petersburg Academy of Sciences. Between 1804 and 1809 he served on a variety of diplomatic missions in Europe and in 1813 became the vice president of the provisional council charged with the administration of the duchy of Warsaw, in which capacity he was known for his severity toward the Poles.

He became chairman of the Council of State and the Cabinet of Ministers in 1832 and was granted the title of count in 1833.

Novotný, Antonín (b. Dec. 10, 1904, Letňany, near Prague, Bohemia, Austria-Hungary [now in Czech Republic]—d. Jan. 28, 1975, Prague), Czech communist leader of a Stalinist faction who was deposed in the reform movement of 1968.

Trained as a locksmith, Novotný became a member of the Communist Party in 1921. He was arrested during the German occupation of Czechoslovakia in 1938 and placed in Mauthasen concentration camp (1941–45). In 1946 he was elected to the party's Central Committee, and in February 1948 he took a leading role in the Stalinist communist takeover of the Czech government. He was admitted to the Politburo in 1951 and became first secretary of the Communist Party in 1953. After the death of Antonín Zápotocký (Nov. 13, 1957), he assumed the presidency and in 1964 was reelected to a five-year term.

Continuing his close cooperation with Moscow, Novotný had to face increasing criticism from the party's more nationalistic and less dogmatic reform factions. In January 1968 he was forced to resign the party leadership to Alexander Dubček, and in late March General Ludvík Svoboda replaced him as president. His party offices and membership were withdrawn later in the year. At the party congress of May 1971, with the Stalinists back in power, a compromise was worked out whereby Novotný was reinstated in the party in exchange for leniency toward the ousted Dubček.

Novotroitsk, also spelled NOVOTROICK, city, Orenburg *oblast* (province), west-central Russia. It lies along the Ural River, in the Orsk-Khalilovo industrial district of the southern Urals. The centre of ferrous metallurgy in the area, the city has a major integrated iron and steel plant that was developed in the 1950s on the basis of nearby iron-ore deposits. Chemical production is also of importance. Pop. (1999 est.) 109,700.

Novy Chardzhuy (city, Turkmenistan): *see* Chardzhou.

Novy Margelan (Uzbekistan): *see* Fergana.

Novy Mir (Russian: "New World"), literary journal, a highly influential monthly published in Moscow. Founded in 1925, it was an official organ of the Writers' Union of the U.S.S.R. Its pages carried the work of many of the Soviet Union's leading writers, and a good number of them were either censured or denied further publication there for expressing impermissible political views. Under the liberal editorship of Aleksandr Tvardovsky (1958–70), *Novy Mir* was the first to publish Aleksandr Solzhenitsyn's novel *One Day in the Life of Ivan Denisovich* (1962). The censorship of the magazine in the 1970s and '80s contributed to the development of a large underground press in the Soviet Union. *Novy Mir* still features literary criticism and commentary concerning the problems of contemporary Russian literature, and occasional analysis of domestic and international political issues.

Novykh, Grigory Yefimovich (Russian mystic): *see* Rasputin, Grigory Yefimovich.

Nowa Huta, industrial section of Kraków (Cracow) city, southern Poland, on the Vistula River. The original medieval village settlements of Mogiła and Pleszów grew up around a 13th-century Cistercian monastery. Population grew rapidly after 1949, attracted by the large modern Lenin iron and steel complex developed on the site. Nowa Huta, originally a separate city located just east of Kraków, was incorporated (1951) into Kraków.

Nowa Sól, German NEUSALZ, town, Lubuskie *województwo* (province), west-central Poland, on the Oder River. A railroad junction and port on the Oder, Nowa Sól has metalworks, paper and textile mills, chemical and glue plants, and an oil refinery. A museum houses ethnographic and historical displays of the region. Pop. (2000 est.) 42,367.

Nowell, Alexander (b. *c.* 1507, Whalley, Lancashire, Eng.—d. Feb. 13, 1602, London), English scholar, Anglican priest, and dean of St. Paul's Cathedral in London whose tactless preaching brought him into disfavour with Queen Elizabeth I. He was the author of the catechism still used by the Church of England.

Made master of Westminster School, London, in 1543, Nowell became prebendary at Westminster Abbey in 1551. On the accession of the Catholic queen Mary I in 1553, he was deprived of his position and fled to Europe, where at Strassburg and Frankfurt he developed Puritan views. When Mary was succeeded in 1558 by Elizabeth I, who promised religious toleration, he returned to England and received the deanery of St. Paul's, a post he held until his death. His sermons frequently antagonized Elizabeth; on one occasion in 1564 she interpreted his remarks against veneration of the crucifix as alluding to one she kept in the royal chapel.

Nowell's "Small Catechism," inserted before the order of confirmation in the Prayer Book of 1549 and supplemented in 1604, remains the official Anglican catechism. He was also the author of a "Larger Catechism" and a "Middle Catechism," designed for school use, both printed in 1570.

Nowgong (Assam state, India): *see* Nagaon.

Nowgong, also called NAOGAON, city, northern Madhya Pradesh state, central India. Nowgong is connected by road with other centres and is a major agricultural distribution centre. Chemical and pharmaceutical works and a distillery are the major industries. An important civil centre and military cantonment, Nowgong served as the British headquarters of the Bundelkhand Agency. The town has a hospital, a government polytechnic institute, a college affiliated with Awadesh Pratap Singh University, and a college for officer training. Pop. (2001) 33,024.

Nowra-Bomaderry, urban area in Illawarra district, southeastern New South Wales, Australia. It lies along the Shoalhaven River delta. Nowra was proclaimed a town in 1857 and given as a name the Aboriginal word for "black cockatoo." Made a municipality in 1871, it was incorporated into the shire of Shoalhaven in 1948 and became a city in 1979. The town of Bomaderry lies opposite Nowra on the northern bank of the Shoalhaven. Nowra-Bomaderry lies on the Prince's Highway and is the terminus of the South Coast rail line from Sydney (75 miles [121 km] northeast). It serves a region supporting dairy products, pigs, vegetables, corn (maize), and hardwoods. Manufactures include paper and rubber goods. A growing tourist industry is based on scenic river, coastal, and forest surroundings. A lyrebird festival is celebrated each October. Pop. (1996) 23,823.

Nowshera, also spelled NAUSHAHRA, town, North-West Frontier Province, northern Pakistan. Lying on a sandy plain surrounded by hills, on the banks of the Kābul River (there bridged), Nowshera is a commercial and industrial centre that is connected by rail and road with Dargai (Malākand Pass), Mardān, Peshāwar, and Rāwalpindi. The town's industries include cotton, wool, and paperboard mills and chemical and newsprint factories, powered by the Malākand-Dargai and Warsak hydroelectric projects. Nowshera has a government college affiliated with the University of Peshāwar. Pop. (1998) 84,428.

Nowy Sącz, town, Małopolskie *województwo* (province), southern Poland. It lies along the Dunajec River, a tributary of the Vistula. Nowy Sącz is situated in the fertile Kotlina Sądecka (Sącz Dale), a plain of the Carpathian Mountains noted for its apples. Its scenic surroundings and historic buildings make it a tourist centre as well. The regional museum is located there. The valley, which has been inhabited since prehistoric times, was chosen as the site for Nowy Sącz by King Wenceslas (Wacław) II in 1292. The town became an administrative, economic, and cultural centre for the region. Pop. (2000 est.) 84,382.

Noyes, Alfred (b. Sept. 16, 1880, Wolverhampton, Staffordshire, Eng.—d. June 28, 1958, Isle of Wight), English poet, a traditionalist remembered chiefly for his lyrical verse.

Noyes's first volume of poems, *The Loom of Years* (1902), published while he was still at the University of Oxford, was followed by others that showed patriotic fervour and a love for the sea. He taught modern English literature at Princeton University in the United States from 1914 to 1923. Of Noyes's later works, the most notable is the epic trilogy *The Torch-Bearers* (1922–30), which took as its theme the progress of science through the ages. His autobiography, *Two Worlds for Memory,* appeared in 1953.

Noyes, John Humphrey (b. Sept. 3, 1811, Brattleboro, Vt., U.S.—d. April 13, 1886, Niagara Falls, Ont., Can.), founder of the Oneida Community, the most successful of the utopian socialist communities in the United States.

The son of a well-to-do New England businessman, Noyes graduated from Dartmouth College (Hanover, N.H.) in 1830 and seemed bound for a legal career. But, after one year of studying law, he was swept up in the religious revival of the evangelist Charles Finney and decided to become a minister. He enrolled first at the Andover (Mass.) Theological Seminary but later transferred to Yale University.

It was there that Noyes first enunciated his belief in perfectionism, the idea that it is possible for an individual to become free of sin in this life through religious conversion and will power. Noyes declared himself free of sin and in a state of perfection. Because his views were in direct opposition to the prevailing Calvinist orthodoxy, he was refused a license to preach and forced to leave Yale. He then wandered around the Northeast, talking to other perfectionists and to social reformers.

In 1836 he organized a group of "Bible Communists" in Putney, Vt. The following year he wrote his "Battleaxe Letter," in which he advocated free love, but it was not until 1846 that the Putney community abandoned "simple" (monogamous) marriages in favour of Noyes's "complex" marriages.

In complex marriages, all the women of the community were wives of all the men and all men of the community were husbands of all the women. Sexual relations were permissible as long as there was mutual agreement and as long as men practiced continence so as to preclude pregnancy. Childbearing was a community decision and was based on selective breeding.

The Putney practices led to Noyes's arrest for adultery. He jumped bail and in 1848 established a new community at Oneida, N.Y. The Oneida Community (*q.v.*) lasted more than thirty years, evolving from a faltering agriculturally based economy to a highly successful industrial organization. Until 1879, when Noyes succumbed to outside pressure and declining popularity, Oneida did not waver from his principles. That year the community abandoned complex marriages, and in 1880 it reorganized itself as a joint-stock company specializing in the manufacture of silver flatware. Noyes, meanwhile, was forced to flee to Canada to avoid legal action.

Eager to provide the outside world with candid and complete knowledge of his views, Noyes throughout his lifetime published several books of perfectionist doctrine: *The Berean* (1847), *Bible Communism* (1848), *Male Continence* (1848), *Scientific Propagation* (1873), and *Home Talks* (1875). He also wrote *History of American Socialisms* (1870), an investigation of utopian communities in the United States.
